As the tree rises, the lower branches should be suffered gradually to extend, which they will be able to do, if the branches above them are not permitted to overhang their extremities, and the conical shape will thus be preserved, and its appearance will be somewhat like that of the figure. This system of pruning is intended for deciduous trees; but it may be partially applied to evergreens with advantage. It is well adapted to exposed situations, as the leading shoots grow stronger and are better able to bear the exposure, and the closeness of the foliage and small branches assists in protecting the stem from the chilling and drying influences of wind and weather. The tree should receive no other kind of pruning than the above, if it were not required that the timber should, as far as possible, be uninjured by knots. But on this consideration only it will be necessary, when the tree attains the height of about 12 or 15 feet, to commence pruning away gradually the lower branches, by cutting off one tier only every year, smooth and close to the stem, leaving no snags, but taking care not to carry this process too far—not denuding the stem for more than about half the height of the tree. When trees are intended for shelter or a screen, the lower branches ought not, of course, to

be cut off. This method of pruning is not adapted to trees intended for ornament, particularly single trees, where beauty is desired; for Nature, when left to herself, is usually most picturesque. But it may, however, with advantage be modified for ornamental trees, according to the taste and intentions of the grower. A fine tall tree, with a straight stem and full of foliage, is, in many situations, a beautiful object, and denotes care and culture, and when required may be rendered useful. Whenever the trees touch each other, thinning is required; and as this is of great importance, it should on no account be neglected.—*A. Thompson, Whitehaven.*

PINE-APPLES AT KNOWSLEY.

The following is an account of the Pines cut here from suckers grown upon the old plant, &c. The suckers are the produce of plants, the fruit of which was cut early in 1843; a good strong sucker has been left upon each plant for a third fruit, to be produced next year from the same plant. The plants have been grown in pots, plunged in a common pit filled with leaves and tan. The twins are produced by allowing two suckers to remain upon the old plant to fruit in one pot:—

1844. When cut.	What kind.	Weight.	How Grown.	Remarks.
		lbs. oz.

ENTOMOLOGY.

Diseases of the Larch.—This handsome tree, as well as the other Coniferæ, is subject to the attacks of various insects; and, amongst others, to a species of Coccus, I believe; but its economy requires to be more rigidly investigated before the genus can be accurately determined. From the number of communications I received in the early part of the year regarding these insects, I am induced to enter upon their history, imperfect as my materials may be; and I trust that it will lead to the study of these curious animals, and to a more perfect knowledge of their economy the ensuing spring, when I doubt not they will make their appearance, as I never searched for them unsuccessfully.

Towards the end of last April, the Larch-trees, as they burst into leaf, were infested with a disease somewhat resembling the American blight, occasioned by a little black soft animal (fig. 7*, the underside highly magnified), the apex being more or less covered with a short white cottony substance. These creatures, which are exceedingly like the various species of Coccus, or rather of Aspidiotus, when the scale is removed from them, are somewhat orbicular or oval, and not larger than a pin's head; they have six very small legs, and a short stout proboscis, from which proceeds a long flexible setiform tube of exceeding fineness, which was inserted into the scales of the bud; the apex of the abdomen was slightly conical, and exhibited several segments, and others were less visible in the region of the trunk; they were either seated upon the buds, where the leaves are produced, or behind them; and close to this animal were clusters of minute eggs (fig. 2), amounting to 30 or 40 in each (fig. 3, several magnified); they are attached by a longish, excessively fine thread, proceeding from one end (fig. 4), and are of a yellowish colour, but often completely powdered over with a fine lilac bloom. At the same time, scattered over the leaves were minute black specks, scarcely visible to the naked eye (fig. 5), but which, under a lens, proved to be black insects, which I suspected at the time were bred from the eggs; and this opinion was strengthened by the fact, that as their numbers increased, the clusters of eggs became emptied of their contents. They moved about freely at first, but when they had fixed upon a leaf, their fine rostrum was at once inserted into it, and from that time they appeared to rest in a dormant state; some were not unfrequently lying on their backs—others, small as they were, had cast their skins, which were either adhering to their tails, or stuck to the leaf at a short distance off. Under a microscope, these black atoms exhibit a very different appearance to their female parent, if such the Coccus be; they are elliptical, and have large black heads, with two short stout antennæ; the two basal joints are large, the remainder tapering; the thoracic segments are distinctly visible, and furnished with six short legs; there are four rows of minute tubercles down the back, and the lateral margins are likewise tuberculated (fig. 6).

In the beginning of June I observed these young animals had spread themselves over the leaves of the Larch-trees, and were beginning to be clothed with a cottony substance. Here my observations were interrupted, for I returned to London, and the twigs I took with me did not remain fresh long enough to throw any more light upon their economy.

These animals seem to form a connecting link between the Scale insects (Coccus and Aspidiotus), and the genus Eriosoma, which unites them to the Aphides or Plant-lice. What I take to be the female agrees very well in structure with the Cocci; but it is destitute of a scale, and the eggs are deposited, not beneath the mother, being too large to occupy such a position, but on one side of her, and most curiously attached by a pedicel to each; and here another question arises: Are these fleshy females the authors or the produce of the adjacent eggs? for it is possible the female eggs might have been laid the previous autumn, and that the inmates had hatched and assumed their present form before the minute black ones made their appearance; but this is merely a conjecture. The young, if I be correct, are not like the generality of Cocci, having no setiform tails, still they are not very different in form from the Coccus (Trechocorys) Adonidum, and it is possible they may be the Adelges laricis of Vallot, but I think not. Most of these doubts would be set at rest by detecting the adult males, which are probably winged.

With regard to the best means of freeing the Larch-trees from these and similar insects, I fear it will be impossible to suggest any that could be applied until the foliage has fallen; for whilst the leaves remain, the same difficulties would present themselves as in the bristly Pines, where scrubbing and painting the branches cannot be resorted to, as in fruit-trees, &c. Such, however, is not the case with the Larch after it is deprived of its foliage, when any application may be tried, should it be found expedient; and perhaps none is more simple or better than brushing on a good coating of lime or clay, or both mixed, which would render the trees less unsightly. Such a process, if persevered in, would certainly destroy the delicate eggs we have described, wherever the brush reached them, and the coating, when it dried, would prevent any of the young broods from piercing the buds; it would, however, be a tiresome mode if well performed, and not feasible in an extensive plantation. —*Ruricola.*

DISEASES OF PLANTS.—No. VII.

It was remarked in a former Number, that there are two great divisions of Fungi, distinguished by the mode in which the reproductive organs are developed. In the one they are external; in the other contained in little sacs. There is, however, a small group, which though at first sight related to the second class, inasmuch as the fructification is, according to the letter, internal, are really more nearly related to the former. The fact is, that the reproductive bodies are truly spores, though produced within a sac, the vesicle which surrounds them being of the nature of a veil, and indeed a mere continuation of the outer membrane of the matrix. The structure is beautifully illustrated by a very pretty species of mould figured by Corda, in which it will be at once seen that so soon as the vesicle is removed, there is nothing to distinguish it from the sporiferous moulds; and a strong proof of this is afforded by the fact that in more than one instance the early and mature plant have been assigned to different genera, and where this has not been the case, much doubt has existed as to the real structure of the fruit, because the outer vesicle is extremely fugacious, and the spores remain for a long time attached to the internal vesicle.

Acrostalagmus cinnabarinus. 1. A patch, the natural size. 2. Plants very highly magnified. 3. A portion of the fructification still more magnified. 4, 5. Spores plunged in gelatinous heads. 6. A point of a branch with two spores remaining upon it.

Another curious point is, that as in the Mushrooms, the same spicule has been observed to produce a succession of spores, so in the plant now figured, one spore as soon as it is ripe falls off, and makes room for another, the whole being retained within the globular sac till its rupture.

To this group belong a portion of the Fungi known under the name of moulds. That which occurs so frequently on bread affords a familiar example. They are reproduced with extreme rapidity, and when they establish themselves on a tender juicy matrix, are very destructive. The most common, perhaps, is Mucor mucedo, which abounds on fruit and substances containing fecula or sugar. The spores are at first internal; but the outer vesicle soon bursts, leaving a little frill at the base, and after the spores are washed off, a clavate columella is seen, on which they were at first generated.

Mucor Mucedo, L.

Considered as the causes of disease, the Mucors and allied genera are destructive to fruits, or very succulent parts only, as they require abundant nutriment. They may, indeed, sometimes be seen forming juicy masses upon the wood of shrubs which have been cut off after a hard winter; and though in such cases new shoots are not sent up so vigorously as usual, this may arise not from any evil influence of the mould, but from the loss of the sap which should have nourished the shoots. It is, however, to fruits principally that they are injurious, and any slight wound from insects or cracks arising from a too copious supply of water after a few dry days, affords a matrix of which they soon avail themselves. Mr. Hassall has made some interesting observations on the decay of fruit, in consequence of the growth of moulds, but attention will be pointed to these when we come to that group to which more especially they belong. The species now under consideration seldom appears except where there has been some previous injury exposing the soft cellular substance, though they spread like wildfire as soon as they are once established, as may often be seen in autumn in large Gourds and Cucumbers, which are subject to the attack of a species so minute, that the heads are scarcely visible except under a lens. They afford very pretty objects for a microscope of small magnifying power; indeed, few are more beautiful than the branched mould, which so often destroys woodland Mushrooms; and the purple-fruited species, which sometimes grows on Pears, is scarcely less splendid than a plume studded with amethysts.—*M. J. B.*

Home Correspondence.

Botanical Lecture at Shoreditch Church.—This lecture, of which inquiry is made by your correspondent "T.G.H.," was established in consequence of a fund being left for the purpose by Thomas Fairchild, a distinguished market-gardener of the last century. He was one of the few cultivators of the soil, living during his period, that combined science with practice. He made experiments on the circulation of the sap, which appeared in the "Philosophical Transactions" for 1724, and was the author of the "City Gardener," published in 1722, as well as of various communications to be found in the works of Dr. Bradley. He died in 1729, at Hoxton, where he cultivated a vineyard, almost the latest on record, and bequeathed money to trustees for insuring the delivery of a lecture on Whit-Tuesday annually, in the church of St. Leonard's, Shoreditch. The subject must be either "The wonderful Works of God in the Creation;" or "The Certainty of the Resurrection of the Dead proved by the certain changes of the animal and vegetable parts of the Creation." It is well known as the Fairchild Lecture, but whether it continues to be delivered, as it undoubtedly ought, I cannot say.—*G. W. Johnson.*

The Strawberry.—The following is the result of a few observations on this plant, in the different stages of its growth, from which I hope to be able to prove that an easily-understood method of cultivation may be successfully adopted. If you examine a Strawberry-plant, or runner, in October, it will be found to have produced several straight and succulent roots springing from a bulb-like hard but succulent stem, and several leaves, more or less in number in proportion to the vigour of the plant. In the axil of each of these leaves a bud is formed, and it is the general opinion of gardeners that the fruit is produced directly from these buds. This is, I think, an error; for I have always found that the blossoms are produced from the crown of the offset or runner, and I have seldom found any strong, healthy blooms on these crowns after the first year of bearing. The runner is generally considered to be a perfect plant, that will, if placed under favourable circumstances, very

seldom fail to produce fruit in perfection the following year. In the months of March and April following, if the same plant is again examined, the buds that were observed in the axil of each leaf will be found to have produced a few leaves, and blossoms will be perceived at the crown of the runner; during the time that it is perfecting its fruit, the buds before mentioned will in one part be formed into runners whose sarmentum will have removed them to a distance, whilst the other part of them will be formed into offsets, which are closely attached to the parent stem. It is of importance to observe, that at the same time the offsets are producing leaves, that roots are also formed which strike into the soil, and those that are nearest the surface will be observed to produce longer roots than those that are a little elevated above the soil, but they are distinctly visible in all. The crown of the original plant will, during this time, be considerably elongated, and the roots proceeding from it will be found to have become ligneous and fibrous, and of a deep brown colour. From this, the original crown, as before stated, I have reason to believe no fruit worth notice is afterwards produced. Having now brought the examination down to September or October in the year following that in which the first runner was examined, we have next to look into the state of the plant in the following year. The runners, having taken root at a distance, will require no particular notice, as they will be in the same state that the single runner was at the same period in the preceding year, when we commenced our observations; but we shall find the offsets under very different circumstances. Each offset has become a perfect plant, with leaves and roots, and is qualified to produce fruit; which it would no doubt do, were it not prevented by want of space in which it might develope itself. I have counted 36 offsets upon one Strawberry-plant, at this period of its growth; now, it cannot fail to be observed that each of these offsets and runners will, after this time, annually produce its runners and offsets, until the bed becomes a dense mass of unproductive plants from the want of space, and from being deprived of sun and air, so necessary for forming and elaborating the sap for the production of fruit.—*W. Darke*, 335, *Coventry-road, Birmingham.*

Bees.—In consequence of reading Mr. Pettigrew's Articles on Bees. I was induced to make a large hive, 20 inches in diameter and 13 inches in depth, on the 13th of May last. I placed a good first swarm in this hive, and on the 26th of the same month I put a second swarm into one of Mr. Golding's hives. Both swarms worked well until September, when I removed the bees from both hives and took the honey. The large hive, from which I was led to expect so much, yielded me 10 lbs. of honey, and the small one, from which I expected but little, gave me 12 lbs. What might have been the result had I waited until another season I cannot tell; but I am disposed to think that Mr. Pettigrew's hives are much too large for a locality like this, where the honey-gathering season is of short duration. So much time is necessarily spent in furnishing these hives with combs, that but little is left for storing them with honey.—*Thomas Buckland, Reigate.*

Covering for Frames.—About a month or two ago I prepared the coverings of some frames with the varnish described by "Devoniensis" at p. 301, 1843, and again at p. 392, 1844. I gave them two coats, allowing the first coat to get quite dry before the second was put on—(it did not dry so quickly as I anticipated); after the coverings were finished they were very transparent and almost colourless, and they remained so until a few days ago, when I perceived that they had become quite yellow; they were not in use, but were hung up in a dry airy place; others which were varnished a few days before, and which are in use, remain as transparent and colourless as when first done. Can you tell me what is the probable cause of this change, and whether there is any way of restoring them to their original state?—*Y. Y. Y.* [Perhaps "Devoniensis" will be so good as answer this.]

Potter's Guano.—I have this year tried Potter's guano, which I have found to be quite equal to the character which it receives. I used it for annuals, at the rate of 6 oz. to the square yard; the flowers were both larger, and remained longer in beauty than any I have seen this season. The annuals were sown on a border where Gooseberry trees had grown for several years; it had not had any manure given it for two years. I have also used Potter's guano for Onions, at the same rate, and the result was quite equal to that from old horse manure, but not better. For flowers I consider it far superior to any manure I have tried.—*C. J. Perry, Handsworth.*

Planting Fruit-trees.—This spring I limed three newly-planted standard Apple-trees, having previously cut away, close in, two-thirds of the shoots, applying Forsyth's plaster to the wounds in a careless way. The dry spring has much damaged new-planted trees; these three Apple-trees have, however, made splendid shoots. The stems have grown very much, and the bark the most smooth, clean, and shining that can be conceived. They had one washing only. The other trees similarly treated but not limed are very inferior in appearance, although standing with them. I applied turpentine to one which was covered with the white blight, brought from the nursery. It killed the blight where it went, but burned the tree, or something like it. Would a weak solution answer?—*M. U.* [No. Spirits of tar are the best remedy for American blight.]

Jets d'Eau.—There are few things in gardens that give more pleasure to the eye than a diversity in the play of water, more especially on a hot sultry day, when it contributes to cool the air, as well as enliven the prospect. Whatever be the direction of the jet, the discharge of water is always the same, provided that the ajutage and the altitude of the reservoir be the same. This is a necessary consequence of the equal pressure of fluids in all directions. Water spouting from a small ajutage has sufficient velocity to carry it to the same height as the water in the reservoir, but it never attains entirely this height, being prevented by various concurring causes:—1st, Friction in the tubes; 2d, Friction against the circumference of the aperture; 3d, The resistance of the air; its weight obstructs the rising column. Thus the Emperor Fountain, lately erected at Chatsworth, with a fall of 301 feet, only raises a jet 267 feet in height. The above causes account for the less; as all are aware if a pipe were laid to a corresponding height, the column of water would then rise to the height of the place from whence it was supplied. In order to make large jets rise higher than small ones, the conduit-pipe must be large enough to furnish a sufficient quantity of water to supply them. History informs us that the ancients were far before us in this delightful ornament. Greek cities were adorned by them; in Corinth there were several; in Rome, Frontenus was employed in erecting fountains; Pompeii had many, some of which remain to this day. The Fountain of Trevi, and the Pauline Fountain at San Pietro, in Montono, are immense piles of architecture. Italy has employed all her talent in designs for this purpose, and Paris has many—we may call it the City of Fountains; but London, although well supplied with water, is almost destitute of this ornament. However, I am glad to perceive a growing taste for them in the nobility and gentry, for decorating their flower-gardens, &c., as well as in the Government, for placing them in the public parts of the metropolis. I need scarcely remark that it would add much to the cleanliness of this vast city if one was erected at the corner of every street, where there is space. I hail the present day as one of great improvement in this particular. Mr. Roe, in the Strand, has turned his attention to the subject, and I trust he will meet with encouragement. He has also improved the Hydraulic Ram, by which he can raise water from a fall of 10 feet to the height of 300 feet, without labour. The following are a few of the largest fountains in Europe:—

The Emperor, at Chatsworth, height of jet	267 feet
Wilhemhœhe Fountain in Hesse Cassel	190
Fountain St. Cloud	160
Peterhoff, Russia	120
The Old Chatsworth	94
Versailles	90

—*

Jointing Earthenware Pipes.—I see by the *Chronicle*, that many of your correspondents are inquiring for a mode of cementing earthen pipes for conducting hot water. I have never used any such myself, but if some of them would try the following, if it has not already been tried, probably it might answer their purpose; in which case I trust they will make known the result to the public. I have seen it used by potters, where pots have cracked in the kiln, and afterwards have found them to be quite sound and useful. Take one pint of sweet milk, nearly two pints of buttermilk, mix the milks, and put them on a slow fire till they turn into curds; then strain them and save the curds. Previously get some good roche lime, pound it fine, and sift it through a fine sieve. Mix the lime with the curd well, until it is tough, and then lute the joints well with it; the pipes should be dry when the cement is applied. It will be sufficiently hard in a few hours, and will not, I think, be affected by hot water. More cement than can be used in half-an-hour ought not to be mixed at a time, as it will get so hard as to be unfit for use. It may be coloured, if necessary, with a little Spanish brown.—*J. Lyons.*

Fuchsias.—Observing in a late *Chronicle* the statement of "A. C." respecting the keeping of strong shoots of Fuchsias among powdered charcoal through the winter, has induced me to mention the following plan, which I tried last year with success. On the 20th of Nov., when I cut down the Fuchsias in the shrubberies, I selected the strongest shoots, and making them into cuttings, planted them into the open border, in rows about 1 foot apart. The plants stood about 3 inches apart in the row, and were covered over with fresh leaves to keep out the frost. The leaves were removed in the month of March; and at that time the buds on the Fuchsias were breaking. I took up one or two of the plants, which I found had made fibres about 2 inches in length. I put in 900 cuttings in this same way, and out of the 900 about 880 struck roots and flowered well through the summer. Another plan is to tie them up into bunches, and placing them below a Laurel bush, for the purpose of keeping them from frost, to make them into cuttings in spring, and plant them then; but they flower much earlier when put in in November. About the place where I reside, there are some thousands of Fuchsias in the shrubberies. When I cut them down last year, I dug into the ground some of the branches, which struck root next spring, and set up young shoots. They grow here as freely as Willows.—*W. C., Forfarshire.*

Fish-ponds.—In answer to "E. W. M." (p. 784,) respecting these, I beg to quote the opinion of Salter—a good angler, and a person who seems to have studied the nature of fishes. He says, "It is improper to plant trees close to a fish-pond, because when the leaves fall they rot, and make the water unclean, and consequently injurious to the fish." These remarks apply more particularly to stews or small ponds: on the other hand, if the ponds are large, and have a good stream running through them, the trees, I conceive, would be beneficial, on account of insects dropping from them into the water, and serving as food for the fish.—*A Reader.*

Morphology.—The recommendation of "A Gardeners' Wife" to be careful, is one which will apply to every person, at all times, and under all circumstances;—for instance, too much care and study can hardly be bestowed, before forming an opinion which is adverse to the plain truths of Morphology. It is true that opposition, like the fiery furnace, will serve to refine it, and separate its dross; but it is not so apparent that those who condemn, without giving it a candid and unprejudiced examination, are altogether blameless. When this lady can spare time from her domestic engagements, to give this subject such a consideration, I have no doubt that her opposition to it will cease; and, intimately connected as she is with the profession of gardening, perhaps no study, apart from her own peculiar province, would present an equally engaging field for the exercise of her mental faculties. With respect to the Archænes, she will then, perhaps, distinguish between expressions which respectively relate to proximate and ultimate results. I may mention, that in as far as I have meddled with this subject, I have sought rather to excite inquiry, than to make converts, and I am happy to find that this object has been realised.—*T. Moore.*

The Golden Pippin.—From several statements in the *Chronicle*, it would appear that an opinion generally prevails, that the Golden Pippin cannot now be successfully grown in this country. This arose, I believe, from a speculative opinion of the celebrated Mr. Knight, that this variety was in the last stage of decay. It has likewise been stated that "repeated attempts have not been wanting by planters to substitute these old fruits as orchard-trees again, but all have hitherto proved unsuccessful." I have known the Golden Pippin for these 40 years, and can safely aver that I have seen as few symptoms of decay about it, as about any other fine variety of the Apple whatever, when under proper treatment. The first Golden Pippins which I remember to have seen, were growing in Castlestead's garden, Dalkeith Park, then celebrated for its Golden Pippins and May Duke Cherries; the trees were trained against a stone wall which was 10 feet in height, and each tree covered a space of 50 feet in length. I can well remember the excellency of the fruit, but I have no recollection of any appearance of decay or canker about the trees; the soil was light, about 2 feet in depth, and the subsoil was a bed of gravel. About 22 years ago, an old Golden Pippin tree was blown down in the cottage garden, Nonsuch Park. I was directed by my employer to endeavour to obtain a few grafts of it, as he was desirous that so good an Apple should be preserved in the neighbourhood. I went and found that the stem was, indeed, in the last stage of decay: the top had already been cut into faggots, and was piled on the wood-stack, to the top of which I had to scramble. It was with great difficulty that a few grafts could be got, the young wood not being above half an inch in length; the scions were grafted on Crab stocks, and did well. The young trees were, after two years' growth, all given away, except one, which was planted in an open, unsheltered situation, in a very stiff soil; the subsoil was a strong clay. The ground had, however, previously been well drained, and has, ever since the tree was planted, been under a course of vegetable culture. How those trees which were given away may have succeeded I do not know, but the one which was retained has done exceedingly well. It is now a fine healthy spreading tree, with not the least symptom of canker about it, freely producing fruit, which is sound, and without blemish, of a rich yellow colour, with an abundance of spots or freckles of a russet tinge. That this is the true old or original Golden Pippin, I have little doubt; the tree from which the scions were taken, to judge from the size of the trunk, must at least have been 60 years of age, and I believe that the varieties of the Golden Pippin which we now possess have been obtained at a period subsequent to 80 years ago. Now, if a scion taken from a tree in the last stage of decay can, by grafting it upon a proper stock, and growing it in a suitable soil, be so invigorated that it increases yearly in size, health, and luxuriance, producing fine crops during the greater part of 22 years, may we not reasonably suppose, that under the same circumstances it may be continued to a much longer period, and that it may be renewed and continued indefinitely? I have seen the Downton Pippin in such a state of disease and canker that it was taken up and thrown away as worthless, and after lying about for a week, when replanted in a different soil and situation, it has become healthy, divested itself of all appearance of canker, and produced an abundance of fruit. The Old Nonpareil, too, I have known to be so much diseased, that out of a bushel of fruit scarcely six Apples have been worth preserving for dessert; but by trenching and renewing the soil, and properly pruning the tree, it has so far recovered, that latterly, and this year more particularly, it has borne as fine fruit as I have ever seen. Again, Apple trees, apparently in the last stage of decay, have by being grafted with sorts that are coarser feeders, having stronger organs of digestion, had their enfeebled stems overlaid with new and healthy wood, the bark has become clean, and all appearance of disease has vanished. But when we take into consideration the way in which orchards have generally been managed, the too frequent neglect of judicious pruning, and the consequent exhausting crops with no return of restorative nutriment to the soil, with occasional ungenial seasons, we need not wonder that Moss, Lichens, canker, and other debilitating causes soon render the Golden Pippin and other

fine varieties of the Apple unsuitable and unprofitable as orchard Apples. From these facts, may we not safely conclude, that the decay of the Golden Pippin in our orchards proceeds from other causes rather than from the variety being in the last stage of decay?—*James Falconer, Cheam.*

The Tom-tit.—If we succeeded, as "Dodman" (p. 766) wishes, in extirpating this, which he terms "a garden enemy," because it eats one or two choice Pears, which were left unprotected by a gauze bag, or some other simple contrivance, I fear we would be clearing a way for whole legions of real enemies, that would not only destroy a little fruit, but the tree itself! for, what bird works with more assiduity in the destruction of insects and larvæ of every description, and at all seasons, than the tom-tit? Only watch him peeping into every crevice, and multiply the thousands of destructive insects which he in one day destroys by the thousands they would have generated to ravage our gardens during the next season! and I think it will make "Dodman," or any other lover of birds and gardens, think twice before they killed one tom-tit; and lead him to preserve the tit-mouse as one of his best friends. Fond as I am of birds, I can say little in defence of the bullinch, knowing something of his operations upon Plum, Cherry, and Gooseberry trees; but viewing, as I do, nature as a great chain in which the most minute creatures form a link, the destruction of one family would cause a confusion, all having a special duty to perform; and, I doubt not, that assigned to the bulfinch is a most important one. Should "Dodman" not consider the soul-enlivening music of the blackbird in our groves, sufficient to repay him for the little fruit they destroy, then must the rural walks of his neighbourhood lose their greatest charm, the sweetest and most delightful of nature's harmony.—*A Lover of Birds, The Aviaries, Cheltenham.*

The Blue Tom-tit.—Your correspondent "Dodman" may very easily rid himself of the presence of this destructive ravager among the fruit gardens, by a little artifice. He will require about three double trap-cages, such as are sold by bird-fanciers and wire-workers. In the lower part of each cage, place a Blue Tit as a call-bird, and bait the upper part with bruised hemp-seed, and a morsel of suet, or a meal-worm, pinned down on the moveable perch, which is supported by the elasticity of the spring-wire which forms part of the machinery of the cage. In less than a week, nearly every depredator may be secured.—*William Kidd, New Road, Hammersmith.*

Covering for Frames.—Seeing several complaints in the *Chronicle* about Whitney's composition for covering frames rotting the cotton, I beg to mention that I glazed some covers of hot-beds here this spring, with a composition of my own, which I found to answer the purpose quite well, and to admit light nearly equal to glass. After having stretched the cotton (very open coarse cotton) on the frames by means of small sprigs or tacks, I put on the composition with a soft clean painter's brush, giving two coats, one as soon as the other was dry. The mixture consists of ⅔ of linseed oil boiled a little, ⅓ spirit of turpentine put in and stirred well, and a little white rosin ground and boiled in the oil. I should suppose a little bees'-wax might also be of service; the worst of this composition is, that dust sometimes attaches itself on the outside of the covers or sashes when they are damp; however, a rub with a wet sponge cleans this off; the cotton is quite sound as yet, and does not admit one drop of water.—*A. W. Muiryfold.*

Dry-Rot in Timber.—No recipe for the prevention and cure of dry-rot having as yet appeared in the *Chronicle*, although a request for communications on this subject was made some months ago, I beg to refer to Sir Samuel Bentham's "Naval Papers," No. 6, p. 18, where he states—"I have known the impregnation of wood with sulphate of iron used as a preservative against and cure for dry-rot, as in the instance of the Negro-house mentioned in my Minute of the 13th Sept. last; and which impregnation I have understood to be very efficacious in that and some other instances." The timber of that Negro house (in Jamaica) had been so prepared at the recommendation of Dr. George Fordyce; and I myself, about half a century ago, under the instructions of that gentleman, applied a solution of sulphate of iron to the frame of a window where dry-rot was making rapid progress, but which was effectually stopped by this application. He directed me to scoop out as much of the already-decayed wood as could be done without materially disfiguring the outer casing of paint; then to make a saturated solution—a pint at a time—of sulphate of iron in boiling water, and immediately to inject it with some little force into every part of the frame infected. After this, dry-rot made no farther progress in the frame, or neighbouring wood-work. I may mention, too, that a large Oak beam, in a cellar at Wandsworth, was attacked by dry-rot, which was prevented from spreading by the same means.—*M. S.*

Acorus Calamus (or Sweet-flag).—This highly fragrant plant may be cultivated in abundance on rivers, ponds, or lakes. I have it growing in the river Lark, which bounds the Botanic Garden in this ancient town; and although swans, ducks, and a variety of water-fowl, frequent the stream, not a leaf is injured, while other aquatics are totally destroyed. I am informed that ducks will feed on the Nymphæas, but that swans reject them; can anybody confirm this?—*N. S. H., Bury St. Edmunds.*

Cucumber Frames.—I understand that there is a large ironmonger in the country who grows Melons and Cucumbers to perfection, by building a common brick-pit, with a false iron bottom, supporting the earth for the plants. Underneath this bottom he throws in, through a trap-door, the dung fresh from the stable, keeping up what heat he pleases. He scrapes out the spent dung from another trap-door. Is not this an excellent plan to keep the dung out of sight in ordinary frames; and will it not preserve the strength more perfectly from its being guarded from the weather?—*Northwood.* [No doubt. A similar plan has often been adopted.]

Wilmot's new Black Hamburgh Grape.—I hope that I shall not be thought presuming in doubting both your [not ours] and Mr. Mearns's opinion, that the Grapes lately exhibited at one of the Horticultural Society's meetings, as Wilmot's new Black Hamburgh, and described to be all indented as if beaten with a hammer, has any peculiarity different from well-grown Grapes of the common variety. Between 10 and 12 years ago, I paid a visit to the garden of a distinguished florist and Grape-grower at Norwich, and was much struck at seeing all his Black Hamburghs exactly resembling the description you gave of Wilmot's. Indeed I have often remarked a black Hamburgh under my own care, which was inarched on a stronger-growing Vine than itself (the Black Portugal I believe) produce fruit of the same description, while the parent Vine had its fruit perfectly round.—*J. M.* [Wilmot's is *not* Black Hamburgh, as we long since stated in a Leading Article.]

Gathering Pears.—I quite agree with the paragraph (p. 766), relative to "the moving of Peach-trees;" and in reply to the question asked by "Dodman," whether by the gathering of Pears at the time when the leaves change colour, the quality of the fruit be not impaired, I would say, that so far as I have had experience of their culture—and I have been a Pear-grower for the last 25 years, having 40 trees of different kinds trained against walls, some of which extend more than 40 feet—I have found it best to gather the fruit by the 10th or 12th of October. Perhaps in this cold and almost northern county, that time may be best for any aspect, either south, east, or west, to gather them, and quite late enough, the fruit then generally leaving the branch easily. I think the fruit can hardly acquire any additional valuable flavour from hanging on the trees longer, and the leaves at that time are almost a full green colour.—*Francis Darby, Colebrook Dale, Shropshire.*

Mealy-Bug.—Hereman's lotion destroys the Mealy-bug without injuring the foliage, if speedily washed off; but it is dear to buy, and dear to use. 1st. Because the contents of a 5*s.* bottle costs but 6*d.*, and will do but a few plants. 2d. Each insect or little coterie has to be touched with a camel-hair brush dipped in the lotion, and its use cannot be safely trusted to a boy. I think a boy at 1*s.* a day would, in two days, with a sponge and soap and water, destroy more bugs than a man in one day, at 5*s.* a day, with a 5*s.* bottle of lotion. 1*s.* 6*d.* a bottle for what is now charged 5*s.* would be ample, unless sent by post.—*Flora.*

Mignonette.—Possibly it may not be known to some, that Mignonette preserved in a house during winter, and turned out into the open ground in spring, will flower as freely as fresh plants, and at least a month earlier. I had, in boxes and pots, a few plants which flowered in the autumn of 1843, in a window having a northern aspect; they were turned out last spring, and are now in good condition.—*Paddy.* [Mignonette in its warm native country is a perennial, or rather an under shrub.]

Destroying Wasps and Bees.—In reply to Professor Henslow's queries respecting destroying wasps' nests, I beg to state that I lately dug out two nests about a week after they had a dose of turpentine, and found death and corruption begun in both. In a former Paper I advised the nests to be dug out and destroyed, but now I think, with Professor Henslow, that that operation may be dispensed with, provided the entrances to the nest are well closed, to keep in the fumes from the spirit. There is little doubt but that bees might be destroyed with turpentine, as mentioned by Professor Henslow, but not so quickly as by sulphur; waving the popular notion of pain or cruelty by the latter, still, where sudden death is intended, it is the best. By the former, the bees would meet a lingering death, and many would struggle and die in the cells, and must be picked out. The smell from both is bad, but perhaps that from turpentine lasts the longest. Smoke from sulphur is blamed for discolouring the cells; but the small quantity used can hardly affect them: they are rendered dark by the heat and traffic of the bees. Lately I observed such honeycombs in the shops in London, and was a little surprised to see so many bees squeezed amongst them, which showed the operation of killing the bees had been badly performed.—*J. Wighton.*

Calceolarias.—About this time of the year, what a miserable appearance do the generality of old plants possess, particularly if compared with the luxuriant foliage of seedlings! I therefore hope that the following remarks upon the treatment of Calceolarias after the blooming season may be acceptable to the cultivator of this favourite flower. If the old plants are to be saved, they must not be allowed to exhaust themselves by blooming too long; as soon as the flowers are past their best, they should be cut off a few inches above the leaves, and the plants should be at once placed in a shady situation where the soil in the pots must not be allowed to become soddened. They should be examined occasionally and carefully, to see that ants are not establishing themselves in the pots, and for the purpose of removing all decayed leaves. Here they should remain until frost or snow makes it desirable to remove them into frames or into the greenhouse, where they should be watered very sparingly and with judgment, for if the soil becomes saddened the plants will soon damp off. About the [illegible] the year they will begin to move, and then is the time to break them up and to plant all the healthy pieces into small pots. These should be placed in a gentle [illegible] heat, and care must be taken to keep the surface of the soil in the pots clear of Moss. The plants will soon begin to grow, and in a short time with the advancing season they will indicate, from their increasing size, the pots into which they require to be moved. I would recommend any one who possesses very favourite sorts to keep a small plant of each, and not to allow them to flower if he wishes to keep the bloom on his specimens to the last, or to obtain seed from them. Whilst upon the subject, I may mention my regret at the miserable prizes offered by the Horticultural Society for specimens of this favourite flower—for a dozen plants in pots the first prize is 3*l.* 10*s.* I quite expect that they will disappear under this frigid treatment. No longer a grower or raiser of Calceolarias myself, I see with regret the fine old varieties of blotches and selfs giving way to spots and letters of the alphabet. The latter are very valuable as varieties, but if grown to the exclusion of the former it is to be regretted.—*Veritas.*

Gardeners' Benevolent Institution.—This Institution is objected to by some persons on the ground that its benefits are mostly restricted to the vicinity of London. The objectors say that a candidate living in a remote part of the country, however deserving he may be, has almost as much chance of becoming a pope as a pensioner; and, that there is some real or supposed difficulty in the way, is proved by the fact that applications for votes are very rarely received from destitute gardeners in the provinces. I have now before me letters from three applicants, all residing within a few miles of London, and I cannot at present call to mind more than two former candidates from a distant part of the country—one from Torquay, and the other from Carlisle, the last of whom has been twice in a minority. I mention this fact in order to draw to it the attention of the managers of the Institution, as I have reason to believe that the impression I allude to prevents some gardeners from supporting this useful Institution.—*J. B. Whiting.*

Walnuts.—I beg to call the attention of the public to the advantages of planting these ornamental and productive trees, the wood being very valuable. With regard to culture, sow the nuts in beds, which should be kept free from weeds, and at the end of three years plant finally 160 trees to the acre. Walnuts will grow in the poorest soil, and mixed with forest trees form good belts, &c. In the 10th year they will begin to bear, and taking the average produce per tree at only 1 bushel, the value of which is 10*s.*, they will give 80*l.* per annum for the acre; deduct 6*d.* per bushel for picking, and 2*l.* a-year rent for the land, and it will leave 54*l.* of clear profit. The expense of planting, first cost of seed, and every expense included, will be about 20*l.* per acre.—*Juglans.*

Miscellaneous.—*Mr. Chorlton* observes, in reference to the destruction of small birds, that the Tom-tit, although much persecuted by gardeners, seldom does much mischief in a garden. On the contrary, he states that it effectually cleared his Pear-trees from brown scale without at all injuring the buds. He further remarks that blackbirds and thrushes are exceedingly useful for destroying insects; he says that he is a friend to small birds, which he considers to be of great service in a garden.

Societies.

LINNEAN SOCIETY.

Tuesday, Nov. 19th.—Robert Brown, Esq., in the chair. A collection of dried plants was presented through Mr. Joseph Janson. This collection was formed in Van Diemen's Land by Messrs. Milligan, Gunn, and Firlie, and presented by J. E. Bicheno, formerly Secretary of the Society, and now Colonial Secretary at Van Diemen's Land.—A Report was presented by Mr. Aaron Price, on the Timber-trees of Norfolk Island, accompanied with 20 specimens of woods. Some of these had a beautiful appearance, and were evidently well adapted for the various purposes to which wood is applied.—A stuffed specimen of the Iguana tuberculata, (Cuv.), from the Island of Grenada, in the West Indies, was presented by Mr. Alcard, F.L.S.—A collection of 300 specimens of dried plants, from the Tyrol, were presented by the Ferdinandean Society of Innsprück.—A Paper was read from Mr. Griffiths, on the Development of the Ovulum in a species of Osyris, in which he found that, like that of Santalum album, there was no cell or body in the sac of the embryo independent of the pollen tube. A second Paper was also read on the Development of the Ovulum in two species of Avicennia: the elongation of the sac is remarkable, and seems to be confined to those plants which have the same peculiar form of the free central placenta. The prolongation of the sac, in this instance, takes place only posteriorly. In this genus also, a protrusion of the radicular end of the embryo, independent of the process of germination, took place. The observations made on the ovules of these plants were not such as to lead to the conclusion of the penetration of the pollen-tube, but were in favour of an influence being exerted by this agency.—Mr. T. S. Ralph exhibited a new species of the Linnæan genus Bruchus, from Bombay, which was found inhabiting the seed of a leguminous plant.

COUNTRY SHOWS.

Morningside Practical Gardeners' Society, Nov. 5.—This was the last meeting for the season. The Prizes were awarded as follows:—*Chrysanthemums:* 1, Mr. J. Downie, gr., Canaan

Bank, for Adventurer, Lucidum, Magnet, Mirabile, Queen, and Marquis; 2, Mr. T. Turner, for Globe. *Leeks:* Mr. J. Gourlay, gr., Bruntsfield House, for Musselburgh Flag. *German Greens:* Mr. T. Ovens, gr., Grange Bank. *Red Beet:* Mr. T. Ovens. *Carrots:* Mr. J. Downie, for Altringham. *Broccoli:* Mr. J. Swanie, gr., Ormsby Lodge, for Gilespie's Early. *Endive:* Mr. W. Ewen. *Celery:* Mr. J. Gourlay, for Sang's flat-stemmed White. *Brussels Sprouts:* Mr. J. Downie. *Pears:* Mr. J. Douglas, for Citron des Carmes and Gansel's Bergamot. *Apples:* Mr. J. Douglas, for Ribstone Pippin, Golden Reinette, and Blenheim Pippin. AMATEURS'.—*Savoys and Leeks:* Mr. J. Steel, for Cape Savoy and Scotch Flag Leek. The Prize offered by Messrs. Dickson and Sons for the best *Red and White Celery* was won by Mr. Gourlay, with Sang's flat-stemmed and Manchester Red. The Prize by the same for the *best Six Onions* was gained by Mr. J. Douglas with the Strasburgh. As a proof of the flourishing state of this Society, there were sent for competition 121 articles.

Hampshire Horticultural Society, Nov. 14.—This was the 26th Anniversary Meeting of this Society. The display of Chrysanthemums was good, particularly the Warden's and Mr. Ralfe's. The stove and greenhouse plants were but few. The fruit was fine, particularly Pears. Mr. Chandler, of Vauxhall, exhibited two trays of Chrysanthemum blooms, of superior quality. The Prizes were awarded as follows:—*Class* 1.—12 *Chrysanthemums*, in pots, four to the cast, S. G. Medal, Mr. Ralfe, for Queen, Reine de Prussi, Coronet, David, Achmet Bey, Mirabile, Rosetta, Malvina, Minerva, Duke de Cornegliano, De Crequi, and Madame Pompadour; 12 ditto, in pots, four to the cast, S. G. Medal, Rev. the Warden, for Mirabile, Formosum, Vesta, Duke de Cornegliano, Theresa, Madame Pompadour, De Crequi, Memnon, Minerva, Superb, Clustered Yellow, Campestroni, and Exquisite; 3 ditto, in pots, eight to the cast, Mr. Ralfe, for Incomparable, Princess Maria, Vesta, Memnon, Rosenm, Gui Laborde, Duchesse de Montebello, Horatio, Horace, Princesse de Lamballe, Isolier, and Marie; 4 ditto, in pots, eight to the cast, the Warden, for Columbus, Duchesse de Montebello, Irene, Solon, Princesse de Lamballe, Orion, Coronet, Fechier, Incomparable, Louis-Philippe, Marshal Auguine, and Bijou; 5 ditto, in pots. 16 to the cast, Mr. Wm. Barnes, for Mirabile, Formosum, Vesta, Duke de Cornegliano, Theresa, Madame Pompadour, Exquisite, Campestroni, Superb, Clustered Yellow, Minerva, De Crequi, Memnon, Princess Maria, Coronet, Grandee, Princesse de Lamballe, Marie, Grand Napoleon, Changeable Yellow, Queen, Incomparable, Beauty, Triumphant, and Adventurer.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

SALVIA PRUNELLOIDES. Prunella like Sage. (*Hardy Perennial*). Labiatæ, Diandria Monogynia.—Of the many Salvias described in botanical works, there is decidedly a preponderance of species with flowers of a cerulean tint. Some of these now hold a deservedly eminent station amongst the summer-garden decorations, and we are glad to be enabled to give prominence to another, which, although it has been known in nurseries since 1840, is rarely seen beyond their precincts. The comparative obscurity in which it has been fated to continue, may perhaps be traced to the introduction about the same time of the more showy Salvia patens, the magnitude and superior loveliness of the flowers of that species having completely engrossed the attention of cultivators in the desire so universally manifested to possess it, to the almost entire exclusion of all less-favoured competitors. In its habit of growth S. prunelloides is unexceptionable. The stems are produced closely, without appearing crowded, and rarely grow more than a few inches high, when planted in a border. The foliage is of that happy medium size, which has neither the coarseness of some of the larger-growing species, nor yet the scantiness of many of the smaller kinds. The plant spreads by means of underground stems, which develope shoots with great rapidity, that soon acquire a flower-bearing maturity; and though the blossoms, individually, are rather minute, yet, when a number of flower-stems (rarely more than 8 or 10 inches long) are borne in close proximity, they produce an effect decidedly ornamental. For some time it was a matter of doubt whether it would endure the severity of our climate without protection during winter. We are, however, enabled to state its perfect hardiness, plants having stood without the slightest protection for three successive winters, in the nursery of Mr. Bunney, at Stratford. It ought to be planted in a well-drained and airy situation; and, unless the soil is tolerably nutritive, the flowers will be much inferior in size. A hardy plant, with bright blue flowers, to contrast with Verbenas, &c., in the parterre, must be useful. We believe the merit of raising and flowering the first plants in this country, is due to Mr. Moyes, of Durdham Down Nursery, Bristol, who received roots from Mexico. Humboldt and Bonpland met with it on the volcanic mountain of Jorullo, where it grows in rocky situations: it has also been found in New Spain, by Mocino and Lesse, and in various parts of Mexico, by different individuals.—*Paxton's Magazine of Botany.*

ABUTILON VITIFOLIUM. Vine-leaved Abutilon. (*Greenhouse Shrub*). Malvaceæ. Monadelphia polyandria.—This fine Malvaceous plant is a native of Chili, whence it appears to have been introduced about the year 1836, by Captain Cottingham of Dublin. It was noticed in this work in July 1840, when it was stated that it had proved quite hardy in Ireland, having stood in a south border, without protection for three years. Under such circumstances it must be a noble looking shrub, for it is said to maintain a stature of 6 feet, and to become one mass of blossom. With us in England it does not, however, prove fit for the open ground. It may be grown in a large pot or tub, but where it can be planted out in a conservatory bed it will succeed much better. The soil most suitable is heath-mould mixed with silver sand. Being a greenhouse plant, air should be given at all times when the weather is favourable, and it must be exposed as much to the light as possible. It is propagated from cuttings in the usual way. The worst of the plant is, that it occupies a great deal of room, and therefore can only be grown in large houses, and it is, like all its family, a favourite resort of red-spider. When, however, the first is of no consequence, and the second can be kept down, it is well worth growing; for we have few plants whose flowers form such broad gay masses.—*Botanical Register.*

THUNBERGIA CHRYSOPS. Golden eyed Thunbergia. (*Climbing Evergreen*) Acanthaceæ. Didynamia Angiospermia.—Charming as most of the Thunbergias are, the superiority of this species must at once be admitted by every beholder; for the beautiful variety of tint exhibited in its large blossoms fully entitles it to the first rank in the genus. It was discovered by Mr. Whitfield in the interior of Sierra Leone, who, as we learn from the "Botanical Magazine," at considerable danger and risk succeeded in securing specimens, which he brought safely to England, to the gardens of the Earl of Derby, at Knowsley Hall, near Prescot, Lancashire, from whence it has already been dispersed throughout many parts of the country, and now exists in most extensive nursery establishments in the kingdom. When supplied with a very warm and humid atmosphere and planted in a large pot, it grows very exuberantly, and will soon extend its shoots to many feet in length. But if kept in an airy, cool place, it loses its rambling climbing habit, and assumes more of the character of an ordinary erect-growing shrub, and is less profuse of its flowers. In the nursery of Mr. Knight, King's-road, Chelsea, a fine specimen was placed over a tank in a propagating-house, and was, doubtless, greatly assisted by the degree of bottom-heat with which it was favoured, in forming the numerous flowers which appeared all along the shoots. No doubt a close pit or frame in which a little heat can be kept up, in conjunction with a uniformly moist air, will be the very best place for exciting it to the desired freedom of growth. A rich soil, a well drained and roomy pot, together with copious waterings during active growth, are also conditions by which success is greatly influenced. And to ward off the pestiferous attacks of the red-spider, which determinedly infest all this tribe of plants whenever attention loiters, the syringe should be frequently brought into requisition, applying the water well to the under surface of the leaves. Cuttings take root with the most perfect readiness, and by their removal confer an immense advantage on young plants, particularly when large specimens are wanted; for an increased number of shoots will be produced, and what is lost in time by retarding the blooming of the plant, will be gained in ultimate effect. The bright golden eye in the centre of the flower, surrounded by a field of blue and violet, being the most striking feature of the species, has been very aptly chosen as the foundation of the distinguishing specific term.—*Paxton's Magazine of Botany.*

Garden Memoranda.

The Dublin Botanic Garden, Nov. 1844.—The following is an abstract of the Second Annual Report on the state of this Garden to the Botanical Committee and Members of the Royal Dublin Society, by the curator, Mr. Moore:—The incongruity, he says, which has so long existed between the plant-houses here and the Garden generally, is now being done away with, and owing to the able manner in which the efforts made last year have been carried into effect, one wing of a new range of conservatories has been erected, on the newest and most approved principle, being commodious, handsome, and in keeping with the exterior of the Garden; and there is every certainty of a much larger portion being immediately built, Government having generously voted a sum for that purpose. It is also stated, that the increasing interest taken by the public in this establishment shows that they duly appreciate the improvements going forward; this is manifest from the greater number of donations of seeds from friends, both at home and abroad, and also by the prevailing classes who visit the Garden. It may be here mentioned that, owing to the great facilities now afforded for the transmission of seeds, &c., in small parcels, through the Post-office, instances have occurred this season of seeds being collected from plants growing at Meerut, and other parts of the East Indies, sent home by the overland mail, sown and vegetated in the hothouses within nine weeks from the time they were collected. The new house has been recently filled with plants, which show to good advantage, affording, at the same time, the means for visitors to examine such of them as they may desire, with ease; which is of great importance in a public garden. The whole of the arrangements of hardy exotic plants are being removed, re-arranged, and condensed, in order to make room for the British plants, which now occupy a site assigned for new buildings. In the Arboretum, many of the trees which have been recently added, natives of the Mexican and Himalayan mountains, as well as of other parts of the world, are now beginning to establish themselves, and prove their suitableness for the climate of Ireland, particularly the Coniferous or Pine family, which have of late years become such great *desiderata* among planters. The experience of two winters enables Mr. Moore, with a considerable degree of certainty, to state, that the following species, natives of Mexico, will prove sufficiently hardy for most parts of Ireland, viz., Pinus Montezumæ, Pinus Teocote, Pinus Apulcensis, Pinus Hartwegii, Pinus patula, and Pinus macrophylla. The Pinus Russelliana and Abies religiosa (two beautiful species, also natives of Mexico), were cut up considerably with frost, although slightly protected; still it is expected that they will prove nearly hardy when once well established, particularly in the southern counties; and should this be the case, the latter will be a most interesting addition, being one of the most beautiful of the tribe, attaining to a great size on the Mexican mountains, at an elevation of from 7000 to 9000 feet. Some of the fine species from the N.W. coast of America are offering to do well, such as Pinus ponderosa, Pinus Sabini, Pinus Coulteri, Abies nobilis, and Abies amabilis; but those which appear of greatest importance are some of the Himalayan species, Abies deodara, Pinus excelsa, and Abies morinda, which are both ornamental and very valuable trees. The experiments which have been made at this place with artificial manures have been mostly with a view of following up those of last year, which were as extensively made as means permitted, and the result proved, beyond the slightest doubt, that the mixtures called Murray's Fertilizers, and guano, produced the desired effect for one season at least; but that part of the experiment, not the least interesting, remained to be proved, whether a subsequent crop would be benefited by those stimulating substances, or whether the whole of the fertilising powers were spent on the first crop. With a view of endeavouring to prove this, the ground which was experimented on last season with a Potato crop was sown down with Wheat after the Potatoes were dug, which showed very little difference as the crop progressed towards maturity, though that sown on the portions where the fertilising mixtures were, vegetated sooner, and continued stronger through the winter than that on the stable manure, but the latter appeared to overtake and even surpass it as the summer advanced. The portions of Grass-land which were top-dressed with the fertilisers on the previous year, showed very little difference from the adjoining parts, which got no manure of any kind. The inference, therefore, to be drawn from those experiments is, that most, if not all the fertilising effects are given off during the year the substances are supplied to the soil; but there are so many things to be considered along with the manner in which manures act on soil, that isolated, imperfect experiments prove little or nothing. In conclusion, it is added that, if the important improvements now projected are carried out, this establishment will be worthy of the country, and highly creditable to the Royal Dublin Society, as well as to every person connected with it.

Miscelianeous.

New Zealand.—The specimens of New Zealand woods which are now being exhibited at the Company's office in Broad-street, City, are of an entirely novel and beautiful description. Several articles of decorative furniture have been made by M. Levrin, the importer, to show the great superiority of those woods over all others hitherto used by the cabinet-maker of this country. When they become more generally known, we have no doubt they will be used for drawing-room furniture, as we understand the New Zealand Company intend to import their woods on a large scale, and which must become the source of great advantage to the colony.—*The Times.*

China.—We are happy to state that Mr. Fortune's mission for the Horticultural Society proceeds very favourably. His last letters are dated, Shanghae, June; and it appears that the objects of his mission are likely to be entirely fulfilled. He had collected many very fine things, some Azaleas, and Moutan, several handsome shrubs, and a beautiful, hardy, evergreen tree, supposed to be Cryptomeria japonica. The Chinese were obliging and accessible, and he had *actually been present in the Green-Tea country about Ningpo in the midst of the gathering season.* Mr. Fortune had received the greatest assistance from Her Majesty's Consuls, Capt. Balfour at Shanghae, Mr. Thom at Ningpo, and Mr. Lay at Canton. He had also received valuable aid from Lieut. Shadwell and Dr. Maxwell, and from Dr. Lockhart and Mr. Medhurst, of the Missionary Society.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE CONSERVATORIES, &c.

SPATHODEA cam. undulata, and Clerodendron splendens, two plants from a very hot climate on the west coast of Africa, near the equator—where, also, Nepenthes distillatoria is found—form a striking example of how we may be deceived in our treatment of stove plants of whose habits we know only that they are from such and such a country: the former we treat as a stove plant, yet it is so hardy that it will grow just as well in the open air from the end of May to the latter part of September, and then it may be wintered in the conservatory if kept rather dry; the Clerodendron splendens prefers a cool, shady part of the stove, and is better fitted for an intermediate house, but it will grow freely in a good conservatory if not allowed much light, which is disagreeable to it when growing. There can be little doubt but that many other stove plants will prove sufficiently hardy to do in the conservatory, and this is the best time to begin the experiment. Look out duplicates, and place them by themselves, to be kept cooler through the winter than the rest of the collection; they should also be placed in the coolest end of the house.

Conservatory.—The earliest of the Chrysanthemums will now be nearly over, and when they are turned out the best way is not to cut them down, as is generally done, but to store them in light dry soil, under a west wall, turned out of the pots; the tops being left on will keep the suckers more backward, and also sooner them in some degree: the less the suckers grow before March the better plants they will make next year. Spring-forced Camellias now in bloom should be guarded against currents of cold air and damp. Cinerarias, which are great ornaments for the house in winter, are thirsty plants, and good subjects on which to try experiments with some of the new fertilisers mixed in the water given them; they are also liable to the attacks of insects, and unless they are looked after they will soon establish these among other plants. The fine large varieties of the Chinese Primrose, although they grow well near the glass, do best in shaded places where the sun cannot reach them: two parts rough leaf-mould, and one of very old cow-dung, with a little sand, is the best compost for them, and in this they like plenty of moisture. Besides the double white and double pink, which are very showy at this season, there are some of all shades, from pure white to very dark purple, some with fringed edges, which look gay; but florists are discarding this class for smooth entire edged ones, of good substance, size, and colour; and probably the pin-eyed ones will not be thought much of now that they are become florists' flowers.

Pits.—Half-hardy plants stored away in winter in pits and temporary structures, are likely to have a severe trial before the winter is over. Prepare against severe weather with additional coverings. Keep such plants as dry as they can bear, and expose them on every favourable day.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

As the leaves are now all in a great measure off the trees, the pruning of common shrubs may be proceeded with, and the borders put in order for the season. I have previously spoken against digging; and as the ground must be cleared of leaves, it is best, where they are not wanted for other purposes, to draw them into ridges in the back part of the shrubbery, and there to let them lay and rot, to be distributed over the ground about this time twelve months. It is not a bad plan to all holes intended for American or other choice plants with wet leaves, and to place the ball level with the surface of the ground: as the leaves decay the plant will sink to its proper level, and grow admirably.

Pits and Frames.—Look sharply to the protection of these structures, as 10° of frost in November is a pretty good earnest of a severe winter. Keep the plants as dry as possible; and if the atmosphere is damp, it is not a bad plan to dry it a little, by placing a pan or two of burning charcoal in the pits, at the same time giving plenty of air. This should be done on a dry day.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Polyanthuses—Are throwing up a great number of autumnal blooms this season. The variety called Hufton's Lord Rancliff, a remarkably hardy as well as a pretty sort, appears more disposed to bloom late than older varieties. I have noticed that on beds where the plants have all been divided at the same period, and the roots healthy and doing well, that two-thirds of this sort flower, whilst not one in ten of such varieties as Crownshaw's Invincible, Tantarara, Alexander, Fletcher's Defiance, Stead's Telegraph, Martin's Prince William Henry (red), &c. &c., which are much older, throw up a bloom. These last mentioned sorts must have their autumnal blooms removed, but the other (Lord Rancliff) is so luxuriant, and so extremely robust, that it appears to make not the slightest difference, as I have had them blooming profusely till Christmas, and also have had flowers at the proper season able to compete with the best of my neighbour's. *Auriculas*—Must continue to have every attention; water very sparingly, and remove all dead leaves. When opportunity offers, procure a supply of willow dust, which is a most excellent ingredient in Auricula compost. *Tulips.*—The recurrence of fine weather will give opportunities for all Tulips to be planted, as they are now suffering much if

kept out of the grounds; no time should therefore be lost. *Carnations*—Must be occasionally watered, but at the same time sparingly; remove decayed leaves, or those which are affected with the "black spot;" and be particular that dirt or other extraneous matter is removed from the axils of the leaves. We hear that a scarlet bizarre raised at Derby, blooms of which were awarded prizes at the Coppice Show, near Nottingham, on the 6th of August last, has been sold to a Florist of Staffordshire. Many orders were taken at 10*s.* 6*d.* per pair; we trust that the flower has been sold "with all its engagements," else we fear considerable dissatisfaction will be engendered. *Pinks.*—The beds must be kept free from weeds, and should frost occur they must be looked over, and the plants pressed down, or fastened, as they are apt to be raised out of the ground, especially if planted late.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—There has been such a variety of methods recommended (each as the best) for the cultivation of the Pine-apple, that it has become rather a difficult task to decide which really has the best claim to that title. For my part, I confess that I have become a convert to what is called "Hamilton's system;" and for the following reasons: first, because the treatment is remarkably simple; and second, because a greater weight of fruit may be obtained in a given space, and at a much less expense, than by any other method known. No second pit is required, which is in itself a great recommendation to amateurs who may take a fancy to Pine growing. I do not know Mr. Hamilton, nor have I ever seen his Treatise, but I know that one of the most successful exhibitors of Pines at Chiswick has grown them on this plan for years; and wherever I have seen the same plan in operation, I have been struck with the excellence of the fruit, and the comparative small size of the plants. This may seem a departure from the objects of a Calendar; but as beginners in Pine-growing, as in other things, are often puzzled to know which method to adopt, a disinterested opinion on a mode of culture of which all have heard, but of which few have had an opportunity of judging for themselves, may not be out of place here.

Vineries.—In regulating the temperature of Vineries recently shut up, regard must be had to the external atmosphere. In mild weather the day temperature may be 75° by fire-heat, and if the sun raises the thermometer 10° or 15°, so much the better, as the fire need not then be made till late in the evening, if needed at all. It is not necessary to maintain a heat of 55° on cold nights; during frost or cold winds, 45° by night will be sufficient till the buds begin to swell. The late house should be kept at 45° or 50° by night, while the fruit lasts. It is better to keep the lights closed during the day in close, hazy weather, in order to keep the damp out of the house.

Peach houses.—The directions given for the temperature of the Vineries this week, will apply equally well to the Peach-house started last week. It is not uncommon to see air admitted wherever the sun shines on a house just commenced forcing. This is unnecessary, as, if the trees are frequently sprinkled with the syringe at this season, a day's sunshine is more beneficial in exciting the buds than a week's firing without sunshine.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peach-trees.—If the present frost should be likely to continue, those who find that the leaves of their Peach-trees are still in a green adhesive state had better protect the trees slightly by straw-rope netting, or by sticking Fern, &c. among the branches, as a sudden check to the growing system after such mild weather would be more prejudicial now than after the trees had got accustomed to variations of temperature.

Radishes, Small Salading, Lettuce, Endive, Cauliflower, &c. will be quite safe where they are in pits or frames, as there is little difficulty in keeping them from frost in such circumstances. Although we do not yet expect much severe weather, no time should be lost in securing plenty of Endive, Cauliflower of the June and July sowing, &c. to be protected with straw or reed covers in turf pits, &c. I may here repeat my method of making these covers: Take three slips of wood, from 2 to 3½ inches broad, and from one half to three quarters of an inch thick, according to the intended length and width of the cover; put two pieces for the sides of the cover, at the distance of from 3 to 4 feet apart, and the third one in the middle between the two; nail pieces of wood of similar thickness across the two ends, and in the intervening space use lighter wood at the distance of from 1 foot to 1½ foot apart; turn the frame of wood thus formed, and fill it neatly with reeds or straw to the thickness of the three longitudinal pieces; then nail on slips of wood, opposite to those on the other side; cut the ends of the straw, and the cover is fit either for turf pits or glass frames. Using lighter wood for the cross pieces in the middle, is for the purpose of causing less strain to be placed on the longitudinal pieces when moving the covers, and also for rendering them lighter. I prefer Wheat-straw to reeds, as being less expensive and not so liable to break when exposed to frost and wet alternately, but the straw ought to be drawn before the crop is threshed, and all the ears cut off, otherwise it will be bruised by the flail or machine, and the ears will not only act as a sponge for retaining moisture, but will offer an inducement to birds to pick your covers to pieces. Such covers are not quite so effectual in excluding rain, as painted canvass, glazed calico, &c.; but they are a valuable protection from frost, are inexpensive where straw is to be had, and afford a means of employment to labourers in unfavourable weather. *Sea Kale and Rhubarb.*—We have had a good supply of the former from the beginning of the month, by taking up the roots as previously recommended. The most economical method of growing the latter, is to sow every year, and take up and force it in a similar manner. Those who depend on beds out of doors for a first supply, must examine the state of their fermenting material, to see that it is not getting overheated; nothing is better than tree leaves alone. Those who desire a tolerably early supply with little trouble, should cover their beds with any litter they can procure, so as to prevent the escape of the heat now existing in the soil. *Routine*—Clear and attend to Mushroom-beds; examine your Asparagus in frames. Protect the roots of globe Artichokes for the winter; earth up Celery when you can, and dig, trench, or ridge all vacant ground.—*R. F.*

VII.—COTTAGERS' GARDENS.

In case of severe frost those cottagers who have the convenience of a frame for keeping half hardy plants in over winter, had better place round it some dry Fern, Pea-haulm, or other litter, recommended to be collected and saved some time ago, for the purpose of excluding frost. Cover the glass with a dry mat, and shaking upon this a little hay or straw, cover again with another mat. When the frame is uncovered in the morning, let the under mat and hay be removed into some place where it will be kept dry. By this means Pelargoniums, and such like plants, may be effectually protected during winter. Keep the soil in the pots as dry as the health of the plants will admit of; and in watering, take care to scatter as little water as possible. Air should be given at all times, when it can be done with safety. In damp weather, tilt up the sashes; and in dry days, when not too cold, remove them altogether. If some of the harder varieties of Fuchsia, as Riccartonii, gracilis, &c., permitted to winter in the open ground, have their stems protected for a few inches with Fern, and their roots covered with leaf-mould, litter, or some such material, they will survive the winter in good condition, and flower considerably earlier next year than if they had been left without any protection. Artichokes will require to have a small quantity of leaves or litter placed round their stems. Seakale, if any, and wanted early, should now be covered. The weather proving still favourable, advantage should be taken of it for forwarding any operations that could not be attended to last month, especially the digging and trenching of vacant ground, which should now be completed as soon as possible, laying it up rough, in order that it may profit by the winter frosts. Continue to prune fruit-trees, and forward every operation of the season as much as possible.—*J. M'H.*

State of the Weather near London for the week ending Nov. 23, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—Many of the Numbers advertised last week having been since sold, we repeat the list of those which may still be had. Any subscriber who will forward to our publisher Post-office stamps equivalent to as many Numbers as are required, shall have them sent:—
1841:—1, 6, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34.
1842:—4, 6, 8, 11, 18, 30, 33, 42, 50, 51, 52.
1843:—9, 10, 11, 12, 13, 14, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 38, 40, 41, 42, 43, 48, 50.
1844:—All the Numbers for the present year; but parties are requested to complete their sets forthwith.

The Reprint of Mr. PAXTON'S COTTAGERS' CALENDAR is now ready, price 3*d.* each Copy. An Index has been added to this present Edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5*s.*

APRICOTS.—*Queris'.*—In summers like the past, the Breda ripened on a standard becomes exceedingly rich.

AZALEAS.—*An Inquirer.*—The following are good and distinct varieties:—viz., Indica alba, Danielsiana, Addisonii, Floribunda, Gladstonesii, Jacksonii, Lateritia, Phœnicea coccinea, P. superba, Pulchra, Rosea, Splendens, and Fulgens.‡

BOOKS.—*Peckham.*—The Botanical Register, Botanical Magazine, Taylor's Annals of Natural History, Hooker's London Journal of Botany. All these are monthly periodicals devoted either wholly or partially to Botany.

CHRYSANTHEMUMS.—*J. M. S.*—These plants are very subject to sports, and it is thus that some of the kinds have been obtained. No one is able to account for such things, any more than they can tell why domestic animals are of all sorts of colours.

DISEASES.—*Priory Queen.*—Your Pelargoniums and Camellias are either too cold or too damp, and in all probability both. The spot is no doubt produced by this cause, and certainly not by insects. Either enable the plants to digest the excess of water, by giving them plenty of warmth, light, and air, or render their digestion unnecessary by withholding excessive moisture. Perhaps the drainage is bad; perhaps the ventilation of their house; *possibly both.*

FRUIT-ROOM.—*Clericus Hibernicus.*—You will find full information upon this subject in some Leading Articles at pp. 611 and 643, 1841, to which we would beg to refer you. We cannot recommend you to line the walls with Wheat-straw, because it will get mouldy, and injure the fruit. The mould of straw will inoculate the fruit itself. Beneath the slate roof, straw would be unobjectionable, because the house would probably be ventilated there, and so be kept quite dry, when mould would not be able to grow. Otherwise we see nothing to object to in your plan. The great points are to exclude light and to maintain a low even temperature, without frost.

FRUIT-TREES.—*An Amateur.*—Add to your list of Peaches the Grosse Mignonne and Bellegarde. For the late yellow Nectarine, substitute the Peterborough; add the Royal Apricot. The late Admirable is the best late Peach, when it ripens; but if your climate is not sufficiently favourable for this variety, the Bellegarde will afford the latest good supply.‡

GREENHOUSE PLANTS.—*G. H. S.*—No tender plants will live in a glass house, without artificial heat, unless the winter is mild, or they are half-hardy, as is the case with such shrubs as Acacia armata and alata, Aloysia citriodora, Azalea sinensis, Camellias, Orange-trees, Coronilla glauca, Correæa speciosa, Daphne odorata, Fabiana imbricata, Hydrangeas, Fuchsias, and the hardier sorts of Cape Heath.‡

HEATING.—*An Amateur.*—Your two pits, with a surface of 40 square feet each, being intended for forcing Cucumbers, and propagating flowers, must be so heated as that much or little moisture may be fully at command. You will therefore require a boiler of the smallest description, and tanks that will allow the escape of vapour directly from the surface of the hot water, but capable of being rendered perfectly close when moisture is not required. These tanks should be placed almost close to the walls, and below the support of the soil. A clear space of 2 inches along the sides of the pit will be necessary for the communication of heat from the tanks to the space above the soil. The fuel will probably average less than 1*s.* per week.‡

HEREMAN'S LOTION.—*Leander.*—We have been informed that this is composed of camphorated spirits of wine, coloured with bitter aloes; but we cannot vouch for the fact.

HYBRIDISING.—*Botanicus.*—Remove the pollen with a dry camel's hair pencil. A very small quantity will answer the purpose. The best means of heating a small greenhouse is by a small boiler, and a few 4-inch iron pipes. All other contrivances are makeshifts. If you want a stove for the purpose, an Arnott, *if you can manage it*, or a Stephenson's will be useful.

INSECTS.—*A. T.*—The small substances on the back of your Oak-leaves are Oak-spangles, which are fully described at p. 52, vol. 1843.‡——*R. S.*—Nothing but the greatest attention and perseverance in applying the remedies can assist you. The habits of the American Blight were given in the *Gardeners' Chron* p. 116, which will enable you to study their economy. *B.*——*R. C.*—Please to send direct to Mr. Curtis, at Hayes, near Uxbridge, as many as you can of the Caterpillars, in a pill-box, supported inside by a piece of cork, and he will advise you. Those you sent were annihilated by pressure. Do they destroy the foliage only? *R.*

MANURES.—*J. W. J.*—Pigeons' manure is excessively powerful. It acts like guano of the best quality; but it will burn your crops unless it is largely and thoroughly mixed with earth. Charcoal mixed with it will much improve it. If the soil of your Vine border is very adhesive, you will do the border more good by mixing with it such bones, charcoal lumps, and pieces of old mortar, than by manure alone. Soils for Vines should be very loose and very well drained.——*A Subscriber.*—Urine mixed with soapy water is a very good liquid manure, but it should never be applied during winter. The growing season is that alone in which manure of this sort should be used. If it is thrown on a manure heap, the latter will be much improved in quality, provided you do not let it waste away again.

NAMES OF FRUITS.—*Sesima.*—1, Worthless—certainly not Brown Beurré; 2 and 3 are correct; 4, Easter Beurré; 5, Napoleon; 6, Messire Jean; 7, Kentish Fip, in all some; 8, Dutch Mignonne; 9, Christie's Pippin.——*Ingram.*—1, Passe Colmar; 2 and 4, Glout Morceau; 3, Hacon's Incomparable; 5, Easter Beurré; 6 and 7, Beurré Diel; 8, Duchesse d'Angoulême.——*A Young Gardener.*—2 and 3, Passe Colmar; 5, Winter Pearmain; 7, Reinette du Canada; 8, Franklin's Golden Pippin; 9, Kentish Fill-basket; 11, Beauty of Kent; 12, Glout Morceau.

NAMES OF PLANTS.—*V. N.*—Specimens out of flower cannot be named with any certainty, unless the plants are common and well known. Seeds of Pyracantha and Cotoneaster should be treated exactly like Whitethorn.——*J. M.*—1, Oncidium coccineum; 2, Niphobolus rupestris.§

PEACHES.—*Querist.*—The double-blossomed Peach does produce fruit occasionally, and so do other varieties with double flowers—the Plum for example; although in such all the stamens may depart from their normal condition

PEARS.—*Querist.*—The Winter Bon Chrétien will not ripen its fruit as a dwarf standard in this climate; nor will the Crassane, d'Auch, or Colmar, succeed on a north wall

PELARGONIUMS.—*A Country Subscriber.*—The best place to grow them in is a good greenhouse, the next best a good pit: but it must be capable of being thoroughly ventilated, and not be damp. It does not matter how it is glazed. The laps should not be puttied, but left well open, so as to allow plenty of air to get in and out. The aspect does not signify. You cannot grow Geraniums well unless you keep your pit or house free from excessive damp: and if that is likely to trouble you, it will be *indispensable*, in the first instance, to drain your ground thoroughly.——*J. H.* says, that in the course of a tour he has lately made in Germany, he observed the beds of Scarlet Pelargoniums were a compact mass of the most brilliant flowers, and the growth of the plants had evidently been controlled; and he asks for information as to the mode in which this is accomplished, as the Pelargoniums in England run to growth and leaf, with here and there a straggling spike of blossom. His observations were made during the months of August and September. Dry soil, a dry atmosphere, and a hot sun are the causes of the condition of the German Pelargoniums. Our garden ground is often much too rich and moist for them.

PROTECTION.—*W. C.*—You cannot have anything better than branches of the Spruce Fir as a protection against moderate frost for scarlet Geraniums in an open bed, or for tender climbing Roses, not growing on their own bottoms. The roots require covering quite as much, or more, than the upper branches. For hard frost this material answers well, provided there is enough of it. The branches should be packed over the plants in the form of a cone.

TRANSPLANTING.—*Quadriformis.*—The present is the best of all seasons for transplanting all kinds of hardy plants, let your advisers say what they like. Drain your border well, plant your Yuccas a little above the soil, steady them by some means, so that they cannot be blown about by wind, and remove them at once. That is what we have done, and should do again.

TUSSAC GRASS.—*B.*—We should sow the seed of this plant immediately, in damp peaty soil in a greenhouse. It had better be sown *thinly*, and if it comes up, encouraged to become strong before being planted out. If it is sown as thick as hay-seeds are, then it would be desirable to separate the plants which grow, and place them in separate pots; still keeping them through the winter in a cool greenhouse or well ventilated pit. It grows naturally in the peat bogs of the Falklands.

VINERIES.—*Susan.*—Plants do not do well on the back walls of Vineries. You may, however, try Camellias, the Cape Plumbago, and Scarlet Geraniums; and if you pull a brick out here and there near the roof, so as to form a nest for its seeds, you may get Mignonette to become a bush and to flower all the winter. Any light loose soil will do for Cacti; old mortar rubbish is a favourite of theirs. It rarely happens that plants can be named unless very common, if they are not in flower. Yours is apparently some Cape Bulbine; if you give it heat and plenty of light, without much water, it will bloom no doubt.

VINES.—*S. S.*—Royal Muscadine will ripen earlier than the Black Hamburgh and others you mention.

MISCELLANEOUS.—*J. A.*—We have no idea what ails your Yucca, which always flowers so late as to be cut with frost—unless the roots have got into springy soil, in which case laying its roots dry would cure the evil. It is, no doubt, a local affection, the nature of which can hardly be judged of without actual inspection. In all probability the evil lies at the roots.——*M. B. G.*—We are sorry to be unable to assist you. An advertisement offers the only means we can suggest of obtaining the information you are in search of.——*A Reader.*—It is not common for a standard Magnolia to be in full blossom in the open ground at this season.‡——*A Subscriber.*—Thompson's "Aleedo" was published in 1812, and sold by Carpenter & Son, Bond-st. *J. G.*—*J. S. W.*—Edensor is situated at the gates of Chatsworth Park.——*A. Z.*—Most certainly raise your Vine roots, which are buried nearly 3 feet deep in clayey loam, as near the surface of the border as you can. The Vines will do no good while the roots are so completely removed from the influence of heat and air.‡——*A Subscriber.*—Stephanotus floribundus cannot be expected to thrive in a cold pit; it is a stove plant, and should be kept during winter in a temperature of about 60°. Cut down the withering stems of your Erythrina Crista-galli, and by gradually withholding water allow the root to dry off. Place it where it will be free from frost, and keep it dry through the winter.‡——*Querist*, &c.—The best and ultimately the cheapest fence for keeping rabbits out of a flower-garden is a wire one. It should be about 3½ feet in height. We cannot recommend dealers or give prices; that is the business of advertisers. The roots of Gentiana acaulis may be removed, and divided in spring.‡——*T. G. B.*—The fruit of Passiflora quadrangularis is eatable as a dessert fruit. The Seedling Primula is only the common fringed variety of Primula sinensis.‡——*W.*—Of the three specimens of sheet glass sent you, choose the cheapest. The sun does not scorch plants more under one size of pane than under another.‡——*R. H. L.*—The watering of your Camellias, which are growing in a low temperature, rather freely three times a week, is the cause of their leaves turning yellow, and of the flower-buds dropping off. See that the pots are properly drained, water sparingly, and place the plants in a temperature of about 50°, and they will possibly recover.‡——*A Novice.*—A good description of pit for growing Cucumbers, Melons, &c., in, when fermenting material is employed for heating, is the Heckfield, a plan of which is given at p. 502, vol. 1843; but if hot water in tanks is used, a plan given at p. 102 of the present year may be consulted with advantage.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

The Agricultural Gazette.

SATURDAY, NOVEMBER 30, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 4—Agricultural Society of England.
THURSDAY, Dec. 5—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Dec. 11—Agricultural Society of England.
THURSDAY, Dec. 12—Agricultural Imp. Soc. of Ireland.

As we informed a correspondent a few weeks ago, the general result of Mr. CAMPBELL'S PROCESS AND MATERIAL FOR STEEPING SEED, so far as we know it, has been unfavourable. The attention of our readers was called to this subject in an early Number of the *Gazette*, and there appears no necessity for qualifying or retracting any remarks that were then made. The season has been peculiar, and so severe upon all our crops, especially upon those sown in spring, that the results from such sources must, in great measure, be considered consequences of the weather—of Nature's rather than of the farmer's treatment. In spite, therefore, of the failure of this year's trials, we persist in recommending the subject as a fair one for experiment.

Though very probably original with Mr. Campbell, his process is by no means new, as indeed several correspondents have pointed out to us; and the practice which has been generally prevalent of steeping seed Wheat in brine or stale urine, may be considered evidence of this, for, though it be professedly for another purpose, it is doubtless beneficial also as impregnating the seed with fertilising material. This and the *à priori* probability that seed admits of being benefited in this way, combine to render the subject worthy of continued investigation.

Of course, no practical man believes that these steeps are to take the place of manures—they will always be necessary—all that we can suppose them capable of effecting is to give the plant a vigorous start in life; and, considering the numerous foes by which the *young* plant is surrounded, this is by no means unimportant.

The experiments we made on the subject this summer have utterly failed, *i. e.*, various circumstances at seed-time, and more especially the subsequent unequal and extreme ravages of game, have combined to render their results worthless. Their results have only been obtained within the last few weeks; and, had we not previously promised it, we should not now publish them—as, if taken unqualified, they are only calculated to mislead.

One thing must first be specified; Mr. Campbell's system of steeping seeds—we shall have a word or two to say about *it* presently—is in no way responsible for the following detail. It is not in the mere art of steeping seed; it is in the choice of the material to be used that the merit of the process lies. All manner of evil consequences may arise from want of judgment in this; but so long as none of them are attributable to the particular mixture put forth by Mr. Campbell, he, of course, cannot be considered answerable for them. We have no wish to praise up this gentleman's corn-steep, as it is termed: indeed, the only evidence we have of its composition—an analysis published in our columns some weeks ago—is by no means evidence in its favour; we only wish that where blame is due it should not be laid upon the wrong shoulders.

It may be remembered that we proposed steeping seed Wheat in eight different salts, viz., silicate, sulphate, nitrate, and phosphate of soda (*a*, *b*, *c*, and *d*, respectively), nitrate of potash (*e*), muriate, nitrate, and sulphate of ammonia (*f*, *g*, and *h*, respectively). This was done early in March; and after steeping in sufficiently strong solutions for about 50 hours, the several parcels were taken out, and on that and the following days they were sown (hoed in) at the rate of two bushels per acre, on plots of land each equal to a quarter of an acre, with intervening strips of half the size between each. When the process was commenced, it promised, as we thought, a continuance of fine weather, but the Corn had not been a day in the water before it began to snow, and the seed was thus put in the land under most unfavourable circumstances. In the course of three or four weeks, it became evident that lots *a* and *h* had been killed by the process; fresh parcels of Wheat were therefore steeped in silicate of soda and sulphate of ammonia, only for a shorter time than before, and the plots were re-sown, and they very soon exhibited a better appearance than any of the rest, and were evidently better also at harvest-time; but, owing to the irregularity just stated, they are of course excluded from the comparison which we have now to make.

In May, the whole field had a fair and blooming appearance, as we then stated to a correspondent, who mourned over the failure of similar experiments which *he* then had in progress; but rabbits and hares were at work, and all the upper part of the field was soon eaten off nearly bare.

It thus soon became evident that no dependence could be placed on results calculated from the *whole* of the field—that in fact the only parts of the plots which could be taken as at all representing the probable effect of the process were those at the lower end of the field, which would be cut off by a line across it, about 15 yards from the bottom. The plots were thus reduced from fourths and eighths, to pieces 1-20th and 1-40th of an acre. Notwithstanding the smallness of these patches, there is a singular uniformity in the amount of their produce. The following is a Tabular account of the quantity of grain threshed from each plot. It may be mentioned that the yield of straw appeared pretty uniform over the whole; there certainly was no such variety as to indicate the difference in the produce of grain.

Reference to steep.	Weight of grain in lbs.	Extent of plot in perches.	Weight of grain per acre in lbs.	Bushels per acre.
*	68	4	2720	42

* These are the unsteeped parcels.

From this it appears that the ammoniacal salts and the phosphate of soda are the best, or rather, to be in accordance with the figures, we should say, the least injurious of the steeps. These results certainly could not have been anticipated; it is difficult to account for them. The seed may have been steeped too long, and its vegetative powers may thus have become injured. Be this as it may, we shall not be deterred from repeating the experiment this year; but instead of trying each salt by itself, we shall use only two steeps—the one recommended by Professor Johnston, as published lately in the *Gazette*, and the other, sold by Mr. Campbell.

The experience of that gentleman this year, though probably better than our own, has certainly, if one may judge from his published circular, not been very favourable. The following are among the most encouraging testimonies he has received:—

On a farm in Forfarshire.—The soil, originally moorish, on a retentive bottom, having been for upwards of half a century under superior management, has now the appearance of a blackish loam, of moderate depth and consistency, with an admixture of old red sandstone chips and *debris*. Nine ridges, containing 2.3 imperial acres, were sown with eight bushels of Barley, subjected to Campbell's Steep. Cost of the Steep 24*s.*; crop, 10 quarters, weighing 52½ lbs. per bushel; and 1½ quarter weighing 50½ lbs. per bushel. Nine ridges contiguous to the former, containing 2.30 imperial acres, were sown with 10 bushels of Barley, manured with 1 cwt. guano at 9*s.* Crop, 10½ quarters, weighing 52½ lbs. per bushel; and 1½ quarter, weighing 50½ lbs. per bushel. Sown in the last week of April; reaped 16th September.

Diff. in favour of Campbell's Steep per acre,				£0	1 4

—*James Sime, Land Surveyor, Murraygate.*

Before we can admit the accuracy of this balance of the accounts, we must know if any of the guano that was applied remained in the land, as it is very probable some did, after harvest. If so, no credit is here given for it.

The following is a very decided statement in favour of the steep—though we rarely like to attach much value to mere estimates or "guesses."

—"with the Oat-steep the crop was good, upon bad land, at a guess *four times more than where nothing was used*. There was a saving of a bushel of seed per acre. It was sown in a field where salt, guano, nitrate of soda, and nothing had been applied. All ripened equally, and were cut together. . ."—*James Hunter, Auchterarder House.*

Besides these, a variety of communications are published, most of them indifferent; some absolutely conclusive against the system; and, as we said before, if these are the best testimonies Mr. Campbell can produce, we fear general experience this year is against him.

The season, however, has been exceedingly unfavourable, and we hope some of our readers will join us in giving the process another year's trial.

AN EXPERIMENT ON POTATOES.

By JOHN GREY, Esq., of DILSTON.

ALTHOUGH the instances of failures in the Potato crop in this district are fewer, and to much less extent this year, than in many former seasons, a detail of an experiment which I have now proved, showing the comparative produce of autumn and spring-planted Potatoes, both of which were very full crops on the ground, may throw some light on the subject, and at all events shew that the fear of the plants being destroyed by frosts in the winter, on tolerably dry land—and no one should plant Potatoes on any other—is visionary.

Immediately after the harvest in 1843, I had a piece of Oat stubble turned up with three horses in a plough, as deep as the soil would admit of. The land was a damp loam, on a retentive subsoil, but had been thorough-drained the previous year; it was then ploughed across, and made up into drill-rows of the width of 30 inches. About the 20th October, when the Potatoes of that year were taken up, it was planted, partly with small Potatoes whole, and partly with large ones cut in two, having had a moderate quantity of dung, but slightly fermented, applied to it; the drill-rows were then ploughed up pretty deep, so as to give the plants a good cover. In the latter end of April, 1844, a harrow was run along the rows, to break the crust and admit the air, as well as to give an opportunity of picking off any couch or roots that might be turned up. Very soon after this operation, the shoots of the young crop appeared in great vigour, to the surprise of some of my good neighbours, who thought that I was adopting a very heterodox practice. The land underwent the usual course of hand-hoeing and scuffling, until the time came when, the tops being sufficiently large, it was necessary that the rows should be earthed up. Before doing so, I had 1 cwt. per acre of guano sown broadcast over them, which the plough immediately following, turned up against the plants. I did this on the ground that the tubers, which are thrown out laterally from the stem, require more support to bring them to perfection, than they can derive from the manure which is placed in the hollow centre of the drills. The crop went on with a promising appearance throughout, but did not exhibit any unusual bulk of tops. On each side of this plot, a piece of ground was worked and planted with Potatoes in the end of April, in rows of the same width, and receiving in every respect the same treatment, except that the dung having lain longer in a heap, and become more compressed, must have been applied in rather a larger proportion. The plants in this case consisted entirely of large Potatoes cut in two; and the same application of guano was given to them as to the others. In these plots no failure occurred; the ground was well covered, and the tops were more luxuriant than in the autumn-planted piece, so that it seemed very doubtful which of the two would in the end be the most productive. The tops of the autumn-planted ones fell, indicating ripeness, a fortnight before the others, and were taken up in the beginning of October. The adjoining rows of each plot were carefully taken up with the grape, or three-pronged fork, and put into sacks, so that no mixture could take place, and afterwards a row in the middle of each plot, so as to come to a

correct average; the sacks were then weighed, and the result was as follows:—

The autumn planting with small Potatoes whole, gave at the rate of	100 loads pr. acre of 20 stones ea.		
Ditto with large Potatoes cut in two	111	do.	do.
Spring planting with ditto.	86	do.	do.

The kind of Potato on which this experiment was tried, is that known in these parts by the name of Hen's-nest. The quality is good in all the plots, but the autumn-planted, if anything, rather more mealy.

I am repeating the experiment this year, and have planted, a fortnight ago, some whole Potatoes, and some cut in two; but in the former, I have this time kept out the very small ones, and planted only those of a medium size, whole; for it seemed to me last year that some of them had been planted of too small a size, which caused them to put out too many shoots, and with inadequate vigour. Another experiment may, perhaps, vary the comparative produce, and tend to establish the point of preference between autumn and spring-planting. As no failure took place in any of these plots, we have no right to presume, from this experiment, that autumn-planting will prove an antidote to that growing calamity; but as far as my observation goes, I am strongly inclined to think that it affords a security against it, and that the principal causes of failure are to be traced to injury sustained by the seed, from being improperly kept through the winter, and its vegetative power being frequently exhausted by shoots that have been made before planting in the spring, as well as by the planting being deferred till the ground, under the process of working, has been too much deprived of its moisture. Against these causes of failure the autumn-planting is a security; and if the result of future experiments should bear out that which I have now detailed, the advantage of planting in autumn will, I think, be fully established. It has been stated as an objection to autumn-planting, that time is not allowed for cleaning the land sufficiently, so as to make it fit for sowing to Grass with the ensuing Corn crop; but I should call it bad farming to have land so foul, after one crop of Corn, as to present that difficulty. Besides which, as autumn-planted Potatoes are generally ready to be taken up in the beginning of October, a considerable time is available for preparing the land, either for receiving winter Wheat, or spring Corn. Independent of which, it is possible so to arrange it as to have the Potato crop succeeded in the following year by one of Swedish, or other Turnips; and thus affording the fullest opportunity of sowing the land to Grass in the best possible condition.—*John Grey, Dilston House, Oct.* 31, 1844. [See a Leading Article in another part of this Paper.]

THE PLOUGH.

(Continued from page 787.)

Before drawing the inference as to the proper form of the mould-board from what we have thus shown to be the proper position of the turf, I may as well first say, that the amount of surface exposed depends wholly on the relation between the dimensions of the furrow-slice, and not in the least upon its actual dimensions. The surface exposed will be a maximum, if the sods be cut rectangular, and if the proportion between their depth and breadth be that of about 7 to 10; and if these two conditions be insured, then the amount of surface exposed will be constant, it will not vary, however the actual depth or the actual breadth of the sod be altered. The same surface is exposed in a double as in a single roof, the span and the slope being in either case the same.

There is one other point regarding the proper mode of ploughing, still to mention. It is not always the object of the farmer to expose the greatest surface of ground that he can to the action of the air. His aim is sometimes merely to cover, and that in a very shallow way, manure or other matter laid on the surface of the land. This will, of course, be most perfectly effected, the flatter that the sods are made to lie, the shallower and the wider they are cut. And here it may be well to say a word or two regarding the economy of having your implement to do exactly what you want done, though it should be at the expense of additional force.

In ordinary farm work there is every possible variety, arising from the variable nature of weather and of soil; and, possibly, economy would advise the farmer to have two or more mould-boards, of forms varying so as to suit two or more cases in which this difference is extreme, these mould-boards being all attachable to the same framework; but it must always be borne in mind that nothing is so economical as simplicity, and that there cannot in Great Britain be circumstances so different as to justify the Berkshire farmer in retaining his clumsy implement, with its cumsier appendages, of wheels, framework, &c.; or the Kentish farmers in retaining their strange-looking form of the turnwrest plough; while all over the varying climates and soils of Scotland there is but one form of plough used, or at least ploughs varying nothing in principle, and but little in detail. All this, however, may be true; and yet the truth of the general proposition, that economy tries to get its work well done, though it be at additional expense, is undeniable; and I shall have immediate occasion to apply it. It will not do to have mould-boards varying in form, so as to suit every little difference of circumstance; and this is the less necessary because, as we have seen, the position of the sod is dependent, not so much on the form of the mould-board as on its own form—the relation between its breadth and its depth—and thus the farmer can get his manure covered perfectly and by a thin covering of earth, whatever be the form of his plough. Notwithstanding this, the circumstance of the position of the sod being dependent on the form of the sod, and not on that of the mould-board, is not to induce us to leave the furrow-slice to find its own position. We must have our implement such that the sod will not merely fall off the mould-board into its ultimate position, but that it will be pressed into its proper place. This is more necessary in ploughing lea land, where, by a mould-board of a good form, the upper edge of the sod may be pressed in so as entirely to bury the grassy surface. It is also well on arable land, because, if the land be in a proper state for ploughing, it will tend to break the sod, and so facilitate the after action of the harrow, &c.

We have thus seen that the best mode of ploughing for general purposes is when the furrow-slice is cut rectangularly, and of such dimensions that it shall be at an angle of 45°. It is a question which, perhaps, chiefly affects the draught of the plough, but certainly also, in some measure, its performance, that the turf shall be cut perfectly by the coulter and share, that there may be no tearing when it is moved by the mould-board; and it is also a point affecting the draught as much as the performance of the implement, that there be no lateral thrust tending to push the turf bodily aside. This will only increase the draught of the plough, and tend to spoil its work. The form of the implement, then, so far as the nature of its work is considered, must be this:—The coulter and sock must be so far before the mould-board, and their position with regard to each other must be such that the sod be cut of a rectangular form, and that it be perfectly cut before the moving part of the implement come to act upon it. The mould-board should be such that the line where it touches the ground may be a straight line, corresponding in direction and position with the corner about which the turf turns, and that the commencement of its curved surface may be a straight horizontal line, where it joins on to the share, while its termination is a straight line hanging over on the other side of the perpendicular, at an angle of 45°. The curve between these two lines must be as uniform as possible, in order that the turf may be twisted gradually, not abruptly. The length of the mould-board must be such, that the angle its surface forms with the turf as it passes over it, may be such, that when the implement is working on a loose soil, that soil may slide over its surface and be laid aside rather than be pushed before it. The mould-board and the plough generally should be fitted for an extreme case, and then it will be sure to be fitted for all ordinary cases, though it may then work under a disadvantage. The angle, then, which the surface of the mould-board makes with a line at right angles with that in which the implement moves, must never be less than the angle of repose of soil on iron.* It is evident that a great number of curves may be drawn, each possessing all the properties which are here required of a mould-board, that it may work well; we now have to consider what is to guide us in choosing from among these the one which works easiest.—*M. S.*

* The angle of repose of one substance on another, is the angle at which the surface of the latter is inclined when the former just ceases to slide over it.

REMARKS ON CHALKING.

Having read your remarks on the subject in a late *Gazette*, and asking, as you do, for further particulars on this subject, allow me to offer a few observations on the mode adopted in this neighbourhood, where it has been carried on to a very considerable extent for many years past, and with the most beneficial effects, on the strong clayey loams as well as all other descriptions of "sour red land" in this vicinity. The plan for raising the chalk is the same here as is practised in Hertfordshire; there is, however, a very material difference in the cost, a much larger quantity being here spread per acre for a much less sum than is given in your account; and this, in my opinion, is to be attributed to our having no "middleman" between the farmer and workmen: generally, one of the best labourers is selected as foreman, who shares with the others in the work, but with the understanding that his wages are to be 1*s.* per week above the others; in many cases, also, he takes the job himself, employing the rest on his own responsibility. Our method, also, of sinking pits is precisely the same as mentioned by you; but now comes the difference: here it is paid for by the acre, and at so many bushels per pole, which being never less than 18, makes 2880 bushels per acre, and the price from 35*s.* to 40*s.*, generally 38*s.*, including the filling in of pits, &c. The buckets in common use contain 1½ bushels each, and the chalk is wheeled away at once into heaps, making about 1920 to the acre; if, then, these heaps are at the beginning placed in two lines, at right angles, and at a distance of about 4 feet in one direction, and 5 feet in the . . . . . other, they will have the appearance of the . . . . . annexed diagram on the ground. A very . . . . . simple plan of ascertaining that the full . . . . . quantity is deposited on the ground is . . . . . thus obtained, as by a very casual observation before spreading, it will be seen whether the heaps are kept in their proper rows, and at regular distances. The advantages of chalking are now so fully appreciated by all farmers in this neighbourhood, that but few, if any, having lands of the description above mentioned, but what are availing themselves of it where it can be procured, and it is generally to be met with at a depth of from 7 to 10 feet: in cases, however, where it cannot be so soon obtained, many go to the nearest chalk pits and employ their horses in frosty weather and at other times when convenient. As regards the chemical composition of the chalk, this is beyond me; there is, however, a somewhat significant term in use amongst the workmen, that the more "soapy" the chalk the better it is, being more speedily pulverised by the frost, and it is generally found to be more "soapy" the greater the depth. The fields most commonly selected for chalking are old fields in course for Wheat, and sometimes Wheat stubble in preparation for the ensuing crop. In addition to the great good effected on the land, another weighty reason is in the employment it affords to the numerous unemployed poor who are to be found in most parishes at this season of the year; and as an inducement to their tenants, several of the large landowners in this county have most handsomely contributed, for several seasons past, in some cases one-third, and in a few nearly one-half, of the cost per acre.—*F. M. C., Savemake Forest, Marlborough.*

[Can you forward us a specimen of your best chalk?—1 oz. will suffice.]

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Rotations of Crops.—The general adoption of alternate husbandry has been already mentioned as one of the peculiar features of East Lothian Agriculture; although, generally speaking, every farmer in this county is prevented by express covenants in his lease from growing, upon the same piece of land, two white or exhausting crops in succession, without an intervening green or restorative one, yet none of them is restricted to any specified rotation of cropping. The choice of a judicious course being mainly regulated and determined by the quality of the soil and the local circumstances of particular farms, is very properly left to the judgment and discretion of the tenant himself. The proprietor, therefore, lays down no special rotation of crops or system of cultivation for the guidance or observance of the farmer; the only period during which he interferes with the mode of management—provided two white or corn crops are not taken in succession—is the last four or five years of the lease. No obligatory covenants, however, are requisite to enforce the observance of alternate husbandry in East Lothian, except perhaps towards the close of a lease whose renewal is not expected or desired. The farmers follow certain courses of cropping suited to the soil and circumstances of their respective farms, from a conviction that it is advantageous for themselves to do so; that is, from a regard to their own interest.

Although a rotation of some kind or other is generally adhered to on every farm, yet particular circumstances frequently render slight deviations from the regular course expedient. Some farmers, for instance, often take Potatoes after Grass, and Turnips after Potatoes—both evident violations of the principles of alternate husbandry. Sometimes, also, when a Grass field, in consequence of a failure of the Clover or some other cause, does not afford or promise a good pasturing, it is ploughed up for Oats after the first year, although, according to the rotation pursued, the field may properly require to lie two years in Grass. To rectify this deviation, and to equalise as far as possible the quantities of the different crops annually grown on the farm, some one of the other Grass fields included in the same course is allowed to remain in pasture a year longer than the usual period. Slight deviations of this kind are of general occurrence in the best managed farms.

Upon the strong clay soils, of which the greater part of the county consists, the rotation pursued and the crops cultivated are nearly similar. The following is the most general course of cropping throughout the county on adhesive soils:—

1st year	. .	Fallow, dunged
2d ,,	. .	Wheat, with Clover and Rye-grass seeds
3d ,,	. .	Grass for Hay, soiling, or pasture
4th ,,	. .	Oats
5th ,,	. .	Beans, dunged
6th ,,	. .	Wheat.

After which the fallow is repeated and the rotation recommences again.

As remarked in my last paper, the extension of furrow-draining, by rendering the soil more easily pulverised and cleared of root-weeds, has obviated to a great extent the necessity for resorting to a bare fallow, even upon stiff, adhesive clays. Swedish Turnips are now, therefore, not unfrequently substituted, and begin the rotation, instead of fallow. The above course, which has been found peculiarly adapted to the soil of the greater part of this county, is sometimes modified and extended by allowing the land to remain two years in Grass instead of one. The Grass, in the latter case, is either cut for hay or soiling the first year, and depastured the second, or it is depastured both years. When the crop happens to be good, it is generally mown the first year, partly for hay, and partly for soiling the working horses in the stables, and the fattening cattle in yards, as previously adverted to.

Upon the light and medium descriptions of land, suited to Turnip husbandry, the following rotation is that usually followed, viz.:—1st year, Turnips; 2nd, Barley, Oats, or spring Wheat; 3d. Grass, generally depastured; 4th. Pasture; 5th. Oats. Upon this kind of land the Turnips, or a certain portion of them, are eaten on the ground by sheep. The Grass break is also frequently extended to three years, as this quality of land is not calculated to undergo as close and severe cropping as that of a stiffer and more adhesive character. I may here observe, that upon very strong retentive clays it is considered injudicious and unprofitable to allow the land to remain in Grass for a longer period than one year, or two at the farthest. The foregoing rotations are those in general practice throughout the low and middle parts of the county. In the upland district Wheat is but rarely grown, and bare fallows are never resorted to. Turnips invariably begin the rotation, followed with Barley or Oats, and several years of Grass. I should observe that as the nature and texture of the soil of large farms are often very different,

two rotations are not unfrequently pursued on the same farm, each adapted to the particular soils. Upon the dry, loamy, and fertile district of Dunbar, the following course of cropping, somewhat different from the rotations already enumerated, is that usually adhered to, viz.:—1. Turnips, dunged, and generally fed off; 2. Wheat, with Clover and Rye-grass seeds; 3. Grass fed off with cattle or sheep; 4. Oats (generally of the Potato variety); 5. Beans, dunged; 6. Wheat. Instead of Oats, Wheat is often taken the fourth year, which confines the rotation to four crops.

The following interesting and valuable observations in reference to this rotation of crops, and to alternate husbandry in general, are extracted from the "Statistical Account of the parish of Dunbar," written by the Rev. J. Jafrey, its present minister, who is a zealous practical agriculturist, and published in the "New Statistical Account of Scotland:"—"This course (speaking of the above), peculiar to the parish, has been called the Dunbar system; but objections have been made to it. Wheat, every second year, it is said, exhausts the soil; the answer is, that the food of plants in the soil may be exhausted by any crop, while the soil itself cannot be exhausted. Where there is a command of manure there is no system which will so richly repay the labours of the husbandman. It was adopted here for many years on one of the best farms, without any diminution of either quantity or quality; and in order to ascertain whether soil is injured by frequent crops of Wheat, the glebe of Dunbar was properly dressed, either with seaweed, street-dung, or soot, and cropped with Wheat for five successive years. The result was an extra crop every year, and the land left in a condition that it may produce a crop or two of any kind without additional manure. The least crop in the succession was on the third year 10½ bolls (5¼ quarters) per acre; it promised to be the greatest, but it was lodged flat as the surface soon after it came into ear. All the other crops were above 12 bolls (6 quarters) per acre. One season, exactly suited to the soil, there were 8¼ quarters per acre; and the last of the five years there were 7 quarters per acre. It was ascertained that on each of three of these years there were more than 300 stones of straw per acre. The soil is a sandy loam. There is another field in the parish which has produced Oats four successive years with increasing produce and fertility. Hence it seems to follow that land, properly cultivated and manured, may produce abundantly the same kind of crop in regular succession. If the food of plants is exhausted in exact proportion to the weight of crop produced, it is worthy of investigation, whether the advantage of changing the kind of crop arises not from one kind giving off food for another, but solely from the different modes of cultivation which different kinds of crop admit of at different seasons."—*T. Sullivan.*

ON MINERAL AND INORGANIC MANURES.
No. XXIX.

By Professor Charles Sprengel.

(*Continued from page 739.*)

d. Turf Ashes.—The Grass sward of barren meadows or other waste land is cut off in thin slices, which being divided into smaller pieces, and placed against each other, are left to dry; then placed in heaps, lighted, and the obtained ashes are then strewed about, ploughed under, and the soil then farther prepared.

A soil manured with turf-ashes will always yield better crops than one manured with peat-ashes, which is caused partly by the great amount of ashes brought on the same area of land, and partly by containing a greater amount of manuring mineral substances. They are also preferable on account of always containing potash, combined at times with carbonic acid. Turf-ashes, however, like wood and peat ashes, have not always the same value. This is determined both by the nature of the sward and the quality of the earth which it covers. Grass often consists of Mosses and a felt of roots belonging to bad, barren plants; and if the earth adhering to these is also bad, the ashes which will result from the burning of such turf will have but slight manuring powers, as they will then merely contain the less powerful mineral manures—lime, potash, common salt, phosphate of lime, gypsum, &c. In this case, quantity may somewhat supply quality, the turf being cut a little thicker, for the sake of obtaining more ashes, which, however, will at times be impracticable, the stratum of humus below the Grass being very thin. For the sake of knowing before-hand what result the manuring with turf-ashes will yield, and to see what advantage may ensue from burning our turf, it is very advisable to subject the ashes of the turf to a previous chemical analysis. The following are some of the results of my analyses of turf-ashes.

1. Ashes of turf 4 inches thick, which were derived from a moor covered merely with Reed-rushes. 100,000 parts consisted of—

83,574	parts of	silica and quartz sand
5,006	,,	alumina
6,200	,,	oxide and protoxide of iron
0,920	,,	oxide of manganese
0,805	,,	lime, partly combined with silica
0,270	,,	magnesia, ditto.
0,188	,,	phosphoric acid, partly combined with lime, partly with iron
0,544	,,	sulphuric acid, combined partly with lime into gypsum, and partly with potash
0,100	,,	potash
0,015	,,	common salt
2,378	,,	carbon
100,000	parts.	

This analysis proves that these ashes will not produce any striking effect, even if 20,000 lbs. were to be used on the Magdeburg acre of land, because by this quantity the soil would merely receive 20 lbs. potash, 3 lbs. common salt, 109 lbs. sulphuric acid, 37 lbs. phosphoric acid, 54 lbs. magnesia, 161 lbs. lime, 1001 lbs. alumina, and 16,715 lbs. silica: so that the burning of the marshy soil, whence the ashes are derived, could only have a beneficial result if conjointly a manure of wood-ashes, or such mineral substances (marl) were to be added, as are rich in phosphoric acid, magnesia, potash, common salt, and lime.

2. Ashes of a turf one inch thick, derived from a sandy soil rich in humus, which were overgrown with Reeds, Rushes, much Moss, and a little peat. 100,000 parts consisted of—

97,444	parts of	silica and quartz sand
0,065	,,	alumina
1,200	,,	oxide and protoxide of iron
0,520	,,	oxide of manganese
0,360	,,	gypsum
0,203	,,	magnesia partly combined with silica
0,039	,,	potash combined with sulphuric acid and silica
0,040	,,	soda combined with silica
0,099	,,	phosphate of lime and a little phosphate of iron
0,030	,,	common salt
100,000	parts.	

If 100,000 lbs. of these ashes be placed on one acre of land (which will be the case if the Grass burnt be one inch thick), the soil will receive thereby 360 lbs. gypsum, 203 lbs. magnesia, 39 lbs. sulphate of potash, 40 lbs. soda, 99 lbs. phosphate of lime, 30 lbs. common salt, &c. From this it is seen, that if these ashes are to be beneficial, the soil must, in addition, be manured with lime, bone-dust (phosphate of lime), common salt, and potash, all which are to be found in wood-ashes, or good kinds of marl.

In England, the land off which the turf has been burnt is mostly as well manured with lime, which, certainly, in cases where the Grass-ashes are so deficient in lime, as those last mentioned, will be very beneficial, as the lime will decompose the carbonic humus and the organic remains of the soil, and thus procure more vegetable food for the plants.

3. Ashes of a turf 1½ inch thick, of a sandy loam, rich in humus, which was overgrown with Reeds, Moss, white Clover, and some good Grasses and herbs. 100,000 lbs. consisted of—

93,071	parts of	silica and quartz sand
1,352	,,	alumina
1,728	,,	oxide and protoxide of iron
0,320	,,	oxide of manganese
0,619	,,	lime
0,327	,,	magnesia
0,380	,,	potash combined with sulphuric acid
0,079	,,	common salt
1,706	,,	sulphuric acid combined with potash and lime
0,418	,,	phosphoric acid combined with lime and magnesia
100,000	parts.	

These latter ashes are evidently preferable to the two former, as they contain more potash, phosphoric and sulphuric acid, common salt, and magnesia; and as they are also not deficient in lime, it is to be supposed that if only 50,000 lbs. were used per acre, they would act beneficially. But as they do not (like the preceding sorts), possess either caustic lime or its carbonate, a simultaneous manure of burnt lime would be very beneficial.

Turf-ashes, however, do not manure only by means of the substances they contain, but also by one which is formed in them, and this is ammonia, which is generated by the protoxides of the ashes being converted into peroxide at the expense of the water. I have dilated on this process under the head of Burnt Clay, to which I refer the reader. It is obvious that the more protoxide of iron there is in the ashes the more ammonia will be formed. It is also well to be attended to during the burning of turf, that all the protoxide of iron be converted into an oxide, which will be best effected if the turf be burnt in small heaps, slowly and at a very gentle heat, hindering them from bursting into flames. And that the ammonia thus formed may not escape, but, on the contrary, be fixed by the humic acid of the soil, the ashes, after having been spread, should be ploughed under as soon as possible, but very shallow, as the access of the nitrogen of the air is indispensable for the forming of ammonia. The formation also of caustic lime in the process of burning turf will act as a solvent on the carbonic humus and the organic matters in the soil, kill the vermin, and be useful in many other respects, as I have shown in my work on Cultivation.

Home Correspondence.

Cotswold Farming.—The course of cropping upon the Cotswolds was, some years back, Wheat upon two or three years' seeds, which was generally breast-ploughed and burnt; then Oats, and Turnips, which had all the manure which was made upon the farm; the rest of the land was left in a sort of fallow, for without any manure the Turnips were very bad; the whole was in a manner folded in winter, and then laid down with Clover and Rye-grass, in either Barley or Oats. I am sorry to say many farmers still follow this course, though all now drill ashes, and most of them bones with the ashes, on the land which has no manure for Turnips. The more enlightened farmers in our district have discontinued sowing Oats after Wheat, and keep some of their land in a five years' course, and some still in a six years' course, by putting Vetches or Peas after the Wheat crop. In writing upon Cotswold farming, I must be impartial, and acknowledge that there is very little clean farming. I will allow that our land is very natural for Grass, and it is very difficult to keep it clean of couch Grass. This evil is never more visible than in the Wheat crop, and many farmers actually justify it upon the principle that it consolidates the land; and, if you attempt to clean the land for Wheat, you make it so light that the crop is destroyed by the wire-worm, forgetting that this evil is soon remedied by Crosskill's clod-crusher, or any heavy roller. The effect of breast-ploughing and burning in this neighbourhood is almost magical, not only on the Wheat crop, but in the after crops. It is the fashion to write against it, and many landlords are discontinuing it upon their estates. It appears to me the principle upon which it acts here is entirely misunderstood; Mr. Minchin has written some good things upon it in "Baxter's Agriculture;" but he has evidently mistaken the principle here, for he says it does not answer so well upon sands. Now, the down lands are the dead earthy lands I spoke of in my last letter, upon which paring and burning answers remarkably well, and this soil is almost entirely composed of sand. I believe Mr. Minchin is right as regards most countries; but not as regards our hills. It is generally believed the gypsum of the Ash is the cause of its fertility: I think otherwise. A few years ago I accidentally met Dr. Buckland and Dr. Daubeny, upon a coach going to Oxford: I was not acquainted with them, but knowing who they were, we talked much of farming. I told Dr. Daubeny paring and burning did wonders upon our land, and asked him how it acted; after some pause, he seemed to think the gypsum acted beneficially; I own I was not satisfied. Some time after I attempted to analyse some of this earthy land, expecting—why, I know not—to find a good deal of alkali in the soil, but, to my astonishment, found none. From information subsequently given by Dr. Daubeny, it struck me, that connected with this was the principle of the good effects of paring and burning. Our oolite stone will not effervesce with acids, yet, the acid being thrown off by the action of fire, it makes excellent lime; so the burning throws off the acid from the soil, and though it destroys some vegetable matter, it endows it with alkaline properties, without which the remaining vegetable matter in the soil could not be decomposed (?) I believe this is the reason why burning answers so well here: and, if I am right, burning would be injurious where there already exists sufficient alkali in the soil to decompose the vegetable matter.—*T. Bealc Browne, Sulperton.*

Hedges.—It is too often the case that we see hedges long neglected assuming such a height and breadth, that they are neither useful nor ornamental; and many being allowed to get too high, grow open at the bottom, and thus decay and die. Except for particular purposes, farm-hedges should not be allowed to get to the height they frequently are allowed to grow to; as in our north country, where we have such heavy snow-storms, that block up roads, they shelter so much drifted snow, that the hedges, by being too high, are bent down, and often broken and much damaged; whereas, if they had been kept lower, they would have been closer and more compact, and would generally escape unhurt by the snow; likewise they are more ornamental, and it is much easier to get them pruned. In a late Number of the *Chronicle*, one of your correspondents condemns the existence of hedges on farms altogether. No doubt he may be right to some extent, where the inclosures are small, and detrimental to a free circulation of air for drying the corn in harvest; but this is not the case where the fields are of considerable extent—say from 10 to 20 acres, or more. Hedges are often of much service in a tempest, or on exposed situations, as they give shelter to cattle, &c., when they would otherwise be unable to stand out to graze; besides, they add very much to the beauty of a farm or district. But to the subject of improving Thorn-hedges. Where they are got too open and straggling, I would advise, not that they should be cut in at the side-branches, almost to the main stem of the plant, as is sometimes done; but to give it the radical cure at once, by cutting the hedge completely to within 10 or 12 inches of the ground, trimming off all the side-branches close to the stem, leaving nothing but the bare stumps. This must be done in the winter season; when this is done, dress the hedge-border on both sides, if in need of it, as it will be got quite easily at to clear it of weeds; by the month of May, the plants will push a great number of fine young shoots through the bark of the old stems; and by the end of autumn the hedge will average 2 or 3 feet high or more, assuming the appearance of a young Thorn-hedge of 3 or 4 years' standing. In the autumn, give it a prune on both sides, to take off the straggling side-shoots, and give it a tapering shape to the top, making the top of an equal height: thus you will have a better hedge than ever it was before in the course of three or four years. Of course, where the hedge is not protected by a stone sunk dyke, it will require protection by palings for two or three years, as cattle would crop the young shoots, and otherwise damage it.—*A. W., Muiryfold, Banffshire.*

Campbell's Steeps.—I some time since promised to give you the results of some experiments with steeps. Last spring my bailiff tried Campbell's 6, with spring Wheat, which was a failure; attributable, as I then thought, to the continued drought. On Oats he was more successful; they came up evenly, retained a good

colour throughout their growth, and have yielded comparatively well. The experiment on Wheat has been resumed under my own eye, conforming strictly with the printed directions accompanying each box. Part of a field was sown early in October with Wheat so prepared, which has to a great extent perished in the ground; the seed for another portion of the same field, sown at the same time, and similarly prepared, was dried (by mistake) with lime—this all grew, as did that of another portion dried with gypsum. Mr. Campbell might say that the steep was too strong (though his own directions were followed): certain it is that the lime, by throwing off the ammonia, of which it is principally composed, had neutralised its effects on the second portion: but why should the part treated with gypsum vegetate better than the first? I have tried a variety of steeps, but find none to answer so well as the undiluted urine from the stable tank. This appeared at first by far too powerful a stimulant, and to test it, I soaked 20 grains of Wheat (in August) for 50 hours, which were sown at the same time and place with 20 others unprepared. The steeped seed came up some days before the other, soon outstripped it in growth, and has in every respect taken the lead since; I have, in consequence, caused all my seed Wheat, excepting that prepared with Campbell's steep, to be similarly pickled, and nothing can surpass its present appearance. Whatever the ultimate effects may be, there can be no doubt of its proving at least equally efficacious as the common saline preparation in averting smut, while it certainly promotes the early growth of the plant, causing it to tiller surprisingly.—*R.S.*

Useless Animals.—The number of these kept in this country is immense, and the sums paid for their maintenance absolutely incredible. I wish to call the attention of the public to this evil, which I believe to be a sin of the first magnitude, and an abuse of the trust conferred upon us by an all-bountiful Creator, as the food consumed by them is so much indirectly taken from the poor, by very much enhancing the price of the remaining portion of the provision of the people; let every one who keeps a useless animal reflect that it is wasting the resources of the country; and with a teeming population bordering on starvation, the money thus spent on pampered animals would cause employment, fill the mouths of thousands, greatly improve the land, ameliorate the condition of human beings, and benefit the nation.—*J.S.H.*

Dibbling Wheat.—It is surprising to see with what alacrity the labourers of our village have taken up the dibbling system; there is not a single allotment where Wheat is, but it is dibbled; men, women, and children, have been busy at the work; but the great fault is too thick planting—six inches between the rows, and four inches in the rows, and seven, eight, and even ten grains, in each hole. This is the distance, I believe, in every case but one. I saw a labourer dibbling the other day, which was the same distance in the row, but eight inches between the rows. I tried to convince him that two or three corns at the most was sufficient, and that the crops up were all too thick. He replied he should not like to have a piece set with four or five in a hole; but I hope in time to see this prejudice removed. I quite agree with Mr. Goodiffe as to distance, and I think another advantage is, that two crops in succession may be obtained off the same piece of ground, by planting between the rows of the previous year.—*Sandfordenstone.*

Grass Land.—Seeing an article in your last Number, signed "Dodman," complaining of the wet state of his meadows, and of a weed which he calls Hard-heads, a plant which I do not know by that name, but suppose it to be a species of Centaurea or Plantago; whatever the plant may be, if the roots are difficult to eradicate, I could not suggest a better remedy than he himself proposes; namely, thoroughly tile-draining, severely scarifying, and sowing with fresh clean seeds of the proper permanent pasture Grasses. To carry off the surface-water of which he complains, I should, instead of bush-drains, recommend open furrows, which if kept clear will, I have no doubt, with the aid of the tile-drains below, effect a complete reformation in the appearance of his meadows.—*W. J. Cormack.*

Agricultural Chemistry.—An extract from "The Gentleman Farmer," fifth edition, published at Edinburgh, in 1802, by Henry Home—shows that chemistry, as applicable to agriculture, is not the mania of the present day only. Page 315—"To be an expert farmer it is not necessary that a gentleman be a profound chemist. There are, however, certain chemical principles relative to agriculture that no farmer of education ought to be ignorant of. Such as appear the most necessary shall be here stated, beginning with elective attraction and repulsion, which make a capital article in the science of agriculture as well as of chemistry." Page 319—After reasoning on the subject, it says: "It is laid down above, that elective attraction is the greatest between the smallest bodies. Hence, an important lesson in agriculture, which may be justly esteemed the corner-stone of the fabric—that, the more pulverised the earth is, the more water it will hold." Page 330—Speaks of the weather a century ago: "In the rainy harvest, 1744, Oats that grew in a warm light soil sprouted in the shock 10 days earlier than Oats that grew in a cold soil."—*Semper ego auditor tantum.*

Prodigous Potatoes.—Mr. Worthington, farmer, at Hiskin, has dug up several large Potatoes, varying in weight from 4½ to 5 lbs. each. In this neighbourhood they are not only large, but rise well where they have not failed in coming up; and it appears to me that where they have failed, it is owing to the state of the ground, and the manure being too dry, and to the state of the atmosphere at the time of planting, and not so much in the Potatoes as is supposed; and as a proof of this I took from a heap of Potatoes, which had been heated and thrown away as worthless, and planted 12 of them in June in the garden, with cow-dung and guano; they all came up and produced a fair crop: and other observations of the last season fully bear out as above stated.—*M. Saul.*

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

COUNCIL Meeting, Thursday, November 7, 1844.—The following is a portion of a letter received from the Marquis of Downshire:—The intention of establishing in London a Chemistry College, has suggested to me that it might be very beneficial to the farming interest in Ireland, if the Society would elect one or more experienced chemists in the chief towns in Ireland, not with salaries, but merely appointing one or more in each town, and arranging with them a scale of charges, for analysing manures, earths, minerals, or what not, to be hung up in the shop, to be referred to on the application of the persons requiring information. Such a system would gradually bring chemistry and the necessity of more accuracy in the management of the soil, and of the suitable crops to be grown on it, into notice, and pave the way for an Irish College of Chemists, after experience has been had of that which is about to be tried in London.—The report of the sub-committee for preparing the list of premiums for the cattle-show at Ballinasloe, next year, was then submitted to the council, which suggested many important alterations from the premium-sheet of the present year, and, among the rest, that all local competition should be abolished; and that all the different breeds of stock, both males and females, should compete in separate classes; that the premiums for South Down sheep and for swine should be increased considerably; that the sum usually allocated for agricultural improvements should be increased to 100*l.*, and the prizes for butter and wool be continued, and for poultry also increased; that the sum of money usually allocated for extra stock be increased to 40*l.*; and that premiums be given for frieze, home-made linen, stockings, &c., to be confined exclusively to the class of working farmers and their families who are the objects of the Society's bounty in the local Societies, and holding under 25 acres of land in their possession. On the motion of Mr. Lyle, the premium-sheet was referred back again to the sub-committee, with instructions to the secretary to have it printed as it then stood, and circulated amongst different members of the council, to ascertain their views upon the various portions of it, previous to the next general meeting of the Society on the 29th instant.

FLAX IMPROVEMENT SOCIETY OF IRELAND.

THE fourth annual meeting of this Society took place in Belfast on Friday, the 8th inst. The competition was very extensive—there having been no less than 132 entries of Flax; and the meeting was well attended. Amongst the machinery, a very superior machine for rolling Flax, previous to scutching, was exhibited by Messrs. Mac Adam, Curell, and Co., of the Soho Foundry, which attracted general attention. This machine is entirely of cast iron, and consists of a series of fluted rollers, of different sizes. It contains all the various improvements hitherto made in Flax rollers, and differs from them all in several particulars. The Flax passes but once through the machine, and is perfectly rolled. The rollers are so contrived that the Flax, in passing through them, receives a peculiar motion towards the end of the process, which has the effect of completely loosening the woody part. They are also so made that the fibre of the Flax cannot receive any injury; and by a new arrangement of the pressing levers the entire strain is taken off the machine the moment the Flax passes through. This rolling machine is driven by about half a horse-power, and can be attached to water-wheels, horse-machinery, or even driven by men. The following certificate has been forwarded from the Messrs. Herdmans, proprietors of the Sion Flax-mills, at Strabane:—

Sion Mills, Strabane, 7th Nov., 1844.

SIRS—After a month's trial of your bruising machine, we consider it the most perfect we have yet seen, both as to quantity and manner of the work done. It is easily driven and takes up very little space. We are able to bruise with it two tons of Flax-straw per day; but we think the machine capable of doing something more.—Your obedient servants.

Messrs. Mac Adam, Curell, & Co. HERDSMAN & Co.

The Marquis of Downshire, one of the Vice-Presidents of the Society, being called to the chair, the secretary, Mr. Mac Adam, read the Report, from which we make the following extracts:—The estimated quantity of Flax seed sown in Ireland, in the spring of this year, is 40,896 hogsheads, of seven bushels each; the quantity in 1843 was 37,400. On the estimate that each hogshead would sow three statute acres, the quantity of land under the crop in 1843 was 112,200 acres; and this year (1844) is 122,688 acres. Supposing that each acre will give an average produce of 6 cwt. of scutched Flax, the entire produce of Irish Flax, last year, was 36,465 tons, and this year 39,611 tons. Estimating it at an average value of 45*l.* per ton, this additional quantity would bring 141,570*l.* The quantity of Flax grown in Ireland in 1841, the first year of the Society's labours, was about 25,000 tons; this year (1844) it is, in round numbers, 40,000 tons. There has thus been an increase, during the past three years, of 15,000 tons, which, at the same estimate of 45*l.* per ton, would amount to 675,000*l.* The improvements in quality, during this period, so evident to all the consumers of Flax, cannot have been less than was estimated last year, viz., equal to 10*l.* per ton, on one-fourth of the quantity grown. This would be 100,000*l.* more, which, added to the 675,000*l.* formerly given for the increase in quantity, makes, in all, 775,000*l.*—a sum which would formerly have been paid, in bullion, to foreigners, but is now circulated among the farmers and labourers of Ireland. In consequence of the care now bestowed, both on the growth and preparation of Irish Flax, its character is advancing; and your committee are now credibly informed that the yarns spun from Irish Flax are considered, by manufacturers, as affording a better and more durable material for their fabrics, than those spun from the generality of foreign Flax.

Saving of Flax-seed.—Your committee have been instrumental in bringing prominently before the farmers the great utility of Flax seed as food for all kinds of live stock. A prejudice had formerly prevailed against saving the seed, from an idea that it would injure the quality of the fibre. Almost everywhere through the country, this season, a large portion of the crop of seed has been saved, and the Flax fibre has not been at all deteriorated, when the operation was performed with care. Your committee have reason to believe that fully one-sixth of the Flax grown in Ireland, this season, has been rippled. The seed has either been used for feeding, or has been sold for the oil-mills; and the total value of the above-named quantity, reckoning it at 3*l.* to 4*l.* per acre, cannot be estimated at less than 60,000*l.* to 80,000*l.* Several large landed proprietors have, at great cost, erected scutch-mills on their estates, for the benefit of their tenantry, containing the most approved machinery.

The Factor System.—It has ever been the desire of your committee to introduce and foster the trade of purchasing Flax on the foot, as they conceive that this would at once obviate the objections to the trouble of managing the crop in districts of Ireland like the adjoining counties, where the agricultural population is fully employed. The gentlemen who engaged in this new branch of business, last year, from taking too much in hand, were unable to realise any profit, as much of the flax was greatly injured by their inability to have the different processes, on so large a quantity of Flax, managed by their infant establishments. This season, however, those who have purchased Flax on the foot have expressed themselves well satisfied with the result of their enterprise; and the claimants for the prizes, which your committee offered to these gentlemen, can testify that such is the case. Mr. Galbraith's establishment at Lifford, has been of the most essential service, not only in giving profitable employment to numbers of persons in that neighbourhood, but in holding out such an example to the surrounding farmers, in the neatness and care with which the Flax is handled, and the consequently vast improvement in the quality of the fibre, when ready for the market.

In the course of the evening of this day's proceedings Mr. J. Campbell made the following remarks on the Irish linen trade:—Not many years ago, in the summer days and winter evenings, the enlivening sound of the spinning-wheel gladdened the hearts of the peasantry of this country, and our linen trade flourished. The enterprising Englishman saw that this simple operation could be more economically done, upon a large scale, and by machinery. It were needless to inquire whether it would be better to have the trade as it was, or as it is now conducted. One thing, however, became certain, that if this country did not keep pace with the improvement, and adopt spinning by machinery, it would soon lose it altogether, and possibly the other branches of the linen trade along with it. In that emergency those spirited and patriotic individuals, the Murlands, of Castlewellan, and the Mulhollands, of Belfast, determined to avail themselves of the improvements, and to use them for their own and their country's benefit. They commenced, and had carried on till that day, that new branch of trade, in a manner creditable, as he hoped it had been profitable to themselves, and highly beneficial to the province of Ulster. Their example had been followed by others, and there were now a number of concerns of this description in the north of Ireland, costing, as near as he could compute, 1,160,000*l.*, and requiring, besides, about half a million of floating capital—distributing 6000*l.* per week, employing upwards of 12,000 men, women, and children, and indirectly, a vastly greater number; using 90,000 tons of coal yearly, which would employ about 30 vessels and 150 seamen to carry them from England and Scotland; and, what was still of greater importance to that Society, using about 300 tons of Flax per week, worth from 12,000*l.* to 15,000*l.*, or 15,600 tons a year, worth at least 653,200*l.*—*Abridged from the Northern Whig.*

FARMERS' CLUBS.

Maidstone.—An unusually full meeting of this club lately took place to receive the report of the deputation appointed at the previous meeting to visit the farms under the management of Mr. Hewitt Davis, near Croydon, and to inquire into his system of thin sowing of Wheat, as recommended in his pamphlet on the subject. Mr. Dickson read the following report:—Spring Park Farm consists of about 200 acres. The most striking feature observable on entering the land was the care that had been taken, by grubbing hedgerows, &c., to lay the land open to the influence of the sun and air. The soil of this farm consists of black sand and beech gravel, with a subsoil of white sand and gravel. The moor-pan formerly consisted of exceedingly hard conglomerate masses of gravel and apparently ferruginous sand, some of which were so large as to require six horses to draw them off the field. They are very similar to what is called

pudding-stone, and the soil is evidently, from its appearance, a very inferior one, requiring pressure to consolidate it. Previous to Mr. Davis's occupation, a field, termed Seave Acre, from its unproductive quality, would scarcely grow anything; but under his management it has become the best on the farm, and has produced, with thin sowing, no less than 5 qrs. of Wheat per acre. The whole of this apparently intractable land has been subsoiled, and a very large portion drained by Mr. Davis, who, although his lease has only five years to run, is now draining another portion, four feet deep, the labour alone costing him 9*d.* per rod. So convinced is Mr. Davis of the value of draining, that he believes even this expense will be fully repaid to him. His practice is to lay the land in ridges, varying from 12 to 24 feet in width. The seed having been got in, he generally runs Smith, of Deanston's, subsoil-plough down each furrow, between the ridges, even through the drained land. With reference to the system of thin sowing, the deputation had an opportunity of seeing the stubbles that were still remaining unbroken. The strength of the stubble roots were remarkable, and were found to have tillered to from eight to ten stalks each. The next criterion for judging presented to the deputation was Mr. Davis's stack-yard, consisting of five large stacks of Wheat, two of Oats, two of Buck Wheat, one of Pulse, and three of Hay. Besides these stacks, there was a barn full of Pulse and another of Wheat and Barley. The appearance of the crops was excellent. The straw was exceedingly strong, and the ear was very fine. The Pulse crops were remarkably well podded. The Wheat was the Essex rough chaff, which Mr. D. had been told could not be grown on the system of thin sowing, as it had been said that thin sowing produced mildew, a disease to which this sort was particularly liable. Mr. D. states, however, that mildew is a disease that he has scarcely ever been troubled with. As the members may not all be aware of Mr. D.'s rotation, it is as follows:—

1st Year..	Rye.....	For green meat and feeding off with sheep in April, May, June, and July, and followed by
,,	Tares.....	
,,	Mangold Wurzel	With a liberal dressing of farm-yard dung.
,,	Swedes	
,,	Cabbages	
,,	Turnips	
2nd Year..	Oats or Barley, sown with Clover	
3rd Year..	Clover twice mown for Hay	
4th Year..	Beans or Peas	The Beans have Turnips drilled betwixt the rows, which come into feed in September and October.
5th Year..	Wheat	

The quantities and periods at which he sows are the following:—

Rye.....	1½ bushel	. . . .	in August and September
Tares	1½ ,,		in 3 sowings in August Sept. and Oct.
Mangold Wurzel..	6 lbs.	. . . . .	in April
Swedes	1 quart	. . . . .	in May
Turnips	1 ,,		in July
Cabbages	1 every 3 feet,		in June
Oats	7 pecks	. . . . .	in Jan. Feb. and March
Barley	6 ,,		in Jan. Feb. March, and April
Wheat	3 ,,		in September and Oct.
Peas	8 ,,		in Dec. Jan. and Feb.
Beans	8 ,,		in September and Oct.

Mr. Davis's Rye and Tares for green feeding are sown in rows at 9 inches apart, all his white Corn at 10½ or 12 inches, his pulse at 27 inches, as are also his root crops, and Cabbages, on the ridge. The growing Tares, winter Beans, Wheat, Rye, and winter Barley, also Cabbages and Turnips, had a very healthy and flourishing appearance. The general appearance of the winter Barley and Rye, for spring feed, which is now a few inches above the ground, would lead a person passing by to the conclusion that the usual quantity of seed had been sown, till on examination he would find that it consisted of separate vigorous plants, which had each tillered out some seven or eight stems. Mr. D.'s general system of growing Turnips is that of planting double rows of Turnips and Cabbages alternately—a plan which has this advantage, that however severe may be the weather, the sheep always find food in the Cabbages, which, although they draw the ground more than Swedes, yet produce a much larger weight of food per acre. These Swedes and Cabbages, considering the soil and the season, were exceedingly good. The number of stock upon this farm was 14 cows, 1 bull, 200 pigs, about 30 colts and brood mares, 300 fatting Down sheep on green crops and oil-cake, and 200 ewes in lamb. Mr. Davis uses the Kentish turn-wrest plough, Smith's subsoil plough, and Finlayson's harrow. He has discarded the old dished wheels of his waggons and carts, and substituted for them others, nearly straight, for their lighter draught. He prefers the flail to the threshing machine. His cart-horses were all of the heavy Cleveland carriage breed, about 16 hands high, clean-legged, with strong bone, and of great activity. Mr. D. has selected them from the job carriage horses which are sold off in London at the end of the season. They cost him from 12*l.* to 20*l.* each. At Addington Farm, the deputation had the opportunity of seeing Mr. Davis's Wheat drilled, and a Kentish plough at work in an adjoining field, ploughing to the depth of 12 inches. This farm, though of nearly similar soil, in other respects is of better quality than that of Spring Park, but before Mr. D. took it, had had four tenants within seven years. Mr. D.'s system appeared to have been equally successful here as at Spring Park. Selsdon Farm, however, offered the best criterion of Mr. Davis's mode of cultivation. Eleven years ago it was offered at 10*s.* per acre, tithe-free, and no one would hire it, only 8*s.* having been offered for it. It then consisted of a thin soil of about five inches on the chalk, comprising 136 acres of arable land, with 120 of poor park land. It never had had more than three stands for stacks in its stack yard; there are now 14 stands in this yard, which were last year filled, besides the barns. Mr. Davis has turned up six inches of pure chalk, which has all become disintegrated and mixed with the soil; by this means he has been enabled to apply his system of rotation to it, entirely dispensing with fallows. On one of the fields, in which, under the old system, nobody would have thought of trying to grow Tares or Beans, is now to be seen a most luxuriant crop of Cabbages and Swedes, and the whole of the farm bears striking evidence of the great success of Mr. Davis's management, who states that he had of last year's growth 14 large stacks, and the barn full of corn, three stacks of Clover-hay, and root crops for the fattening of 200 wether sheep and 100 ewes with their lambs, besides 12 oxen. Hading Farm, which has been under Mr. Davis's management for only nine months, presents no point worthy of particular observation, beyond those that have been mentioned with reference to the other farms, except the decided inferiority of the last year's Wheat and straw, now being threshed, as compared with those upon Mr. Davis's other farms. The leading features of Mr. Davis's system are deep ploughing, early and thin sowing, and frequent cultivation between the drills; which system, as applied by him to the farms above named, appears to have been most eminently successful. The following resolution was unanimously agreed to:—"That in the opinion of this meeting it is highly desirable, in a national point of view, that Mr. Hewitt Davis's system of drilling and cultivation, as expounded in his pamphlet, and reported upon this evening, by the deputation from this Club appointed to inquire into it, should receive the serious attention of agriculturists, and should be tried as generally as possible by way of experiment."—*Maidstone Gazette.*

Stewponey.—The following are extracts from a Paper on Keeping Farm Accounts, read by Mr. Amery at the late meeting of this Society:—"An accurate system of accounts affords the only safe index by which you can ascertain the value of new and improved modes of farming. It appears to me that only two accounts are necessary, namely, a day-book or journal, and a ledger, which may be kept in different parts of the same book; but in order to have the advantage of double entry, I very strongly recommend a cash account also. The first thing to be done in commencing any system of accounts is to take as accurate a valuation as possible of all produce on the farm, live stock, implements, fallows, seeds, &c.; and Michaelmas, when harvest is ended, is, in many respects, the most convenient period to do this. This valuation represents the capital at that time actually employed in the farm, and the amount thereof should be the first entry in the ledger to the debit of the farm, and the first entry in the cash account to the credit of cash, as due from the farm. All subsequent entries will be made from the journal or day-book as they occur, the farm being debited with all items of expenditure, labour, purchase of stock, implements, repairs, rent, taxes, interest on capital at 5 per cent., &c. &c., for which the cash account would have a corresponding credit, and being in like manner credited with all sales of produce and stock, and the value of produce consumed on the farm, except the keep of horses which are required to cultivate the farm, for which also the cash account would have a corresponding debit. At the end of every year, say from Michaelmas to Michaelmas, the ledger and cash account must be cast up and balanced; and, if they are kept correctly, the result of both will appear to be the same. Then, in order to ascertain the actual profit of the year, a fresh valuation must be taken, at the times' price, similar in all respects to that at the commencement of the year, taking care to deduct a per centage for the wear and tear of implements from their former estimated value, perhaps 15 per cent., and the difference between the amount of this last valuation so taken and the sum standing to the debit of the farm as due from it, shows the real amount of profit or loss for the year. This closes the amount of the last valuation, and will form the first entry of a new account for a succeeding year; the journal, ledger, and cash account will be then worked precisely as before."

Miscellaneous.

On the Analysis of Soils.—The following directions for selecting specimens of soil, or subsoil for analyses, are extracted from a paper issued from the Museum of Economic Geology, in the department of Her Majesty's Woods and Forests:—"Soils being generally the upper decomposed portions of subjacent mineral substances, whether hard rocks of various kinds, or clays, marls, sands, &c., mingled either naturally or artificially with vegetable and animal matter, it becomes very desirable in collecting specimens of them, that they should be accompanied by others of the hard rocks, clays, marls, sands, &c., on which they rest. In selecting soils for analyses, care should be taken to obtain fair average specimens; and to insure the true subsoil, or subjacent hard rock, clay, sands, &c., specimens of the latter should be obtained as near as possible beneath the spot whence the soil may have been so selected, for it sometimes happens that the soil of a field varies in places from resting upon different kinds of subsoils. The soil above hard rocks is not unfrequently separated from them by broken angular fragments, the half decomposed portions of such hard rocks; specimens, therefore, of subsoils, or subjacent mineral substances, should, in such cases, be taken from the solid hard rocks beneath, and not from these fragments, which have commonly suffered too much decomposition to exhibit the real chemical composition of the rocks themselves. The quantity of soil taken as a specimen should weigh about a pound, which should be tied up in a canvass bag, and labelled. With respect to specimens of subsoils, if of marl, sand, or clay, portions weighing about a pound should be tied up in a canvass bag labelled to correspond with the respective soils above them. If the subjacent rocks be hard, a piece also weighing about a pound, and fresh broken from the body of the rock, as nearly as possible beneath the spot whence any specimen of soil may have been selected, would suffice, and should be wrapped in strong brown paper, labelled to correspond with the soil above it." The substances usually met with in soils, are silica, alumina, carbonate of lime, carbonate of magnesia, phosphate of lime, phosphate of magnesia, phosphate of alumina, phosphate of iron, peroxide of iron, oxide of manganese, sulphate of lime, salts of potash and soda, and organic matter. Some of these are often absent, and the determination of others may sometimes be deemed superfluous; nevertheless, it is our wish to make the process sufficiently complete to meet all ordinary cases. 1. The first step in the process is, properly to dry the specimen to be analysed over a water-bath, at 212° Fahr.; a higher temperature than this should not be used, as it might cause the decomposition of some of the organic matter. The dried specimen is to be powdered, sifted through a wire sieve, well rubbed in a mortar so as to insure the uniform admixture of all the parts, again dried over the water-bath, and put into a stoppered bottle. 2. Five hundred grains of the dried specimen are to be spread out on a sheet of writing-paper, and exposed to the air for 12 hours; then weighed, and the increase of weight, if any, noted. The absorption of moisture from the air, if it take place to the extent of seven or eight grains in the above quantity, may be considered a favourable indication. 3. One hundred grains of the dried specimen are to be introduced into a previously counterpoised bottle, containing hydrochloric acid, with the usual precautions; and when action has ceased, the amount of loss determined, which will be the carbonic acid resulting from the decomposition of the carbonates. 4. Two hundred grains of the dry specimen are to be put into a platinum crucible, and exposed to a red heat, being occasionally stirred, until on cooling it assumes a reddish appearance throughout. It is again to be weighed, and divided into two equal parts. 5. One of these parts is to be introduced into a counterpoised bottle, containing hydrochloric acid, and the disengaged carbonic acid estimated as before. If the quantity of carbonic acid thus deduced be less than that obtained before calcination, the difference must be added to the weight of the calcined product under operation, and this deducted from the weight before calcination, will indicate the amount of organic matter. 6. The other half of the residue left after calcination is now to be boiled in a flask with about an ounce of hydrochloric acid. By this means all the ingredients, excepting the silica and part of the alumina, will be dissolved, some of them being decomposed. The insoluble part is to be separated by filtration, washed until no longer acid, and dried. The solution, together with the washings of the insoluble powder, is to be marked *A*, and put aside for subsequent examination. The powder is to be finely powdered, and mixed with four times its weight of dried carbonate of soda; the mixture is then to be heated in a platinum crucible until it fuses into a glass. The crucible and its contents being placed whilst warm in a Wedgewood dish containing distilled water, about an ounce of hydrochloric acid is to be added, and heat applied. More acid and water may be added, if necessary, until nothing more is dissolved. This being done, the solution and insoluble part are to be evaporated to dryness, in order to aggregate the silica held in suspension; and care must be taken during this operation that no hard lumps be left in the solution, as the silica sometimes forms a coating over such particles through which the acid will not act. The residue, after the evaporation, is to be heated with water mixed with about half an ounce of hydrochloric acid; the solution is to be filtered, and the insoluble part washed. The latter is the silica, which must be carefully heated to redness, and weighed whilst warm. The solution from which the silica has been separated, is to have solution of ammonia added, which will throw down the alumina. This must be treated as the silica and weighed. 7. The solution *A* is now to be examined. For this purpose, add ammonia in excess, and afterwards strong acetic acid in considerable excess, and boil the mixture; phosphate of peroxide of iron, and phosphate of alumina, if present, will be precipitated, and will remain undissolved. Collect and wash this precipitate, and label the solution *c*. Treat the precipitate with solution of caustic potash, which will dissolve the phosphate of alumina, and leave the phosphate of iron; separate, wash, dry, and weigh the latter. Add ammonia to the potash solution to throw down the phosphate of alumina, which is in like manner to be collected and weighed. It must not be inferred that the phosphates of iron and alumina thus obtained, existed as such in the soil. The phosphoric acid may have been, at least in part, in combination with lime or magnesia, while the iron may have been in the state of peroxide, and the alumina uncombined; but on dissolving these ingredients in the hydrochloric acid, the phosphate of lime or magnesia would be decomposed, and phosphate of iron and alumina formed. As this decomposition would always take place under the circumstances indicated, it next becomes a question, whether the equivalent proportions of peroxide of iron and alumina, or of phosphoric acid, existed in excess. To determine this point, divide the solution *c* into two parts; to one add a few drops of solution of perchloride of iron, which, if any earthy phosphates still remain undecomposed, will occasion a precipitate of phosphate of iron, in which case

it may be concluded that the whole of the iron originally in the solution has been obtained in the state of phosphate of iron. Continue the addition of perchloride of iron as long as a precipitate is formed, and treat this precipitate the same as that first obtained from solution *A*. If, on the other hand, no precipitate be formed from the perchloride of iron, it will be necessary to try whether there be more iron or alumina in the solution. In this case, add to the other half of the solution *c* liquid ammonia, so as to render it slightly alkaline; then add hydrosulphate of ammonia, which will throw down peroxide of iron, oxide of manganese, and alumina, if present. Collect and wash this precipitate, and label the solution *d*; dissolve the precipitate in hydrochloric acid, and boil the solution; add caustic potash in excess, which will throw down peroxide of iron, oxide of manganese, and alumina, but will again dissolve the last. The oxides of iron and manganese being removed from the solution, and ammonia added, the alumina will be precipitated. These precipitates are to be washed, dried, heated to redness, and weighed. 8. The quantity of manganese contained in soils is usually so small as to render its separation from the iron unnecessary. Its presence may be indicated by the black colour which the iron precipitate assumes on being exposed to the air, or by the smell of chlorine which is afforded on adding a few drops of hydrochloric acid to the precipitate. If thought desirable to separate these two oxides, let them be dissolved in hydrochloric acid, and precipitated carbonate of lime added, which will throw down the oxide of iron. Separate the precipitate; add oxalate of ammonia to the solution previously neutralised by ammonia, to remove lime, and then precipitate the manganese with caustic soda. Collect, dry, and weigh this, which is oxide of manganese. 9. The solution *d* may still contain lime, magnesia, and salts of potash and soda. Boil this solution to drive off any sulphuretted hydrogen it may contain; add oxalate of ammonia as long as a precipitate of oxalate of lime is formed. Collect, dry, and weigh this precipitate, and label the solution *e*. If the precipitate be dried at 212° it will contain one atom of water. 10. Add hydrochloric acid to solution *e*; evaporate it to dryness, and heat it to a dull red heat. Redissolve it in a little water; add some red oxide of mercury; evaporate again to dryness, heat it to redness, and treat the residue with water. Pure magnesia, if present, will remain, which weigh. 11. The chlorides of potassium and sodium have yet to be determined as well as the sulphate of lime. Boil 200 grains of the dry specimen in 10 ounces of distilled water; filter the solution, and wash the insoluble part, divide the solution into two equal parts; to one add nitric acid and then chloride of barium as long as any precipitate occurs; collect, wash, and dry this precipitate, which will be sulphate of barytes, obtained from the decomposition of the sulphate of lime. To the other half of the solution add nitric acid, and then nitrate of silver, as long as any precipitate occurs, which treat as in the former case, This will be chloride of silver, obtained from the decomposition of the chlorides of potassium and sodium.—*Pharmaceutical Journal.*

Steeping Seed.—My object in the present communication is merely to press a *veto* on steeping Turnip-seed previous to sowing; and I trust the very numerous and repeated experiments I have made, and with uniformly decided results, will operate as a salutary caution against steeping Turnip-seeds in chemical solutions. My first experiments were made on the 21st June, and after white Stone-Turnip had been steeped for 55½ hours in solutions of carbonate of ammonia, muriate of ammonia, phosphate of ammonia, and silicate of potash, with water simply, by way of comparison, it may suffice to say, that while the entire number of the seeds steeped in water germinated, and grew very well, not one of any of the rest germinated, with the solitary exception of three or four of those steeped in silicate of potash. Other chemical solutions were tried, and the period of steeping varied, but they proved uniformly fatal to the germination and growth of Turnip-seed. This seems of importance, as Mr. Campbell's steep, which contains sulphate and muriate of ammonia, has been recommended for Turnip-seed, as well as Wheat, Barley, and Oats. From my experiments, I find much discrimination is essential in reference to chemical solutions, as steeps for various seeds. I have Blue Moscow Barley, which has tillered into 25 stems from seeds steeped in a particular chemical solution; and Mummy Wheat, which displays 16 stems, by being similarly treated. On the other hand, Kidney Beans, after being steeped 31 hours in a solution of phosphate of ammonia, entirely perished. Flax-seed was steeped for 28 hours in water, phosphate of ammonia, and sulphate of ammonia. These all germinated and advanced in growth, without the slightest difference being perceptible. Altringham Carrot and Portugal Onion were steeped for 28 hours in water, sulphate of ammonia, and phosphate of ammonia, and both Carrot and Onion seemed essentially invigorated and benefited by the solution of sulphate of ammonia.—*J. Murray, in the Mark Lane Express.*

Notices to Correspondents.

Thanks to *Mr. Dean* for his letter, which is too late for this Number.

ALLOTMENTS.—*Anon.*—See Number of the "Labourer's Friend" for August, September, October, and November, 1843. *F.*

ARTIFICIAL EGG-HATCHER.—*Sesima.*—Can any one inform us of the success of this instrument? Is there more than one kind of it?

BOOKS.—*Mr. Sproule* has applied to his bookseller for the name of the publisher of "Warnes's Suggestions for Fattening, &c.," but it is not known. Will "A Constant Reader" kindly inform him?

BURNETT'S MATERIAL FOR PRESERVING WOOD, &c.—*Anon.*—This is the chloride of zinc.

COMPOST.—*T. E. L.*—Your compost is made up of materials the mixture of which will be advantageous. Charcoal-dust is a very useful element in all composts of matters whose decomposition produces ammonia.

DIBBLING.—*Querist.*—Eight inches by four are good intervals; two seeds in each hole.

FATTENING CATTLE.—*A. W.*—As you wish to consume all your Turnips on the land by sheep, you may profitably convert your straw by cattle in the yard upon straw and oil cake, 4 lbs. each daily, or try Mr. Warnes's compound.—How many head (with no Turnips) will it require to tread down the straw of 99 acres of average bulk, between December 1st and May 1st?—This depends, of course, altogether upon the weather. If it be wet, 30 head of cattle would do it.

FOOT-ROT.—*J. M.*—The existence of foot-rot may be first detected by the heat of the foot and the lameness of the sheep. The horn should be cut away sufficiently at the lower part to permit the escape of any matter that may be confined, and the diseased part should be touched, by means of a feather, with a little hydrochloric acid, which may be repeated if any fungous flesh grows on the part; if otherwise, the sore may be dressed daily with a powder composed of equal parts of sulphate of copper, alum, fine charcoal, and armenian bole. A dry lair is essential, and dirt and moisture highly prejudicial. *W. C. S.*

FURROW-DRAINING.—*A. W.*—In 3-feet drains, to be filled with stones covered with straw, and no tiles used, fill to within 20 inches of the surface.

GRASS LAND.—*Subscriber.*—In last Paper we stated all we know of methods of extirpating Moss, viz, that caustic lime has been known to kill it. We must also say that we know cases in which it has failed to do so.

GURNEYISM.—*R. R.*—The influence of the light strawey covering which Mr. Gurney lays upon his pastures, appears, from published facts, to be singularly efficient in causing a rapid growth of Grass. We should be glad if any of our Cornwall subscribers would describe the subject to us. Your Grass will probably be somewhat earlier if you manure the land well.

LIME, &c.—*Querist.*—Apply it in autumn. The best way is to take it at once from the kiln, and divide it into heaps from the cart over the field, then cover up with a thickish coat of earth, and let it slake.

LINSEED.—*Querist.*—It must be crushed or ground some way or other; if you have not a suitable machine, and will not buy one, you must send the seed to the mill.

LIQUID MANURE.—*Quer st.*—If applied directly. Apply it *on* the young crop; the best way, however, is to carry it to the land *in* the farmyard manure.

LUCERNE.—*Delta.*—Your 10 rods of land, if they are statute measure, will require scarcely 1 lb. of seed. Sow in rows 12 inches apart, on deeply and well tilled soil, in the month of April. We know only one kind. Cut it only once the first year—it will be ready about August. It will arrive at its full growth about the third year. You will need to manure it occasionally, and hoe and dig between the rows to keep the land clean.

MANURE.—*Queri t.*—You had better mix the manure with earth *in* the field, not before carrying it thither.

POTATO SEED.—*A Farmer.*—Squeeze the ripe Potato Apples in water, strain all through a cloth, and dry the seed before the fire, and keep it in a dry place. In February, if you have the convenience of a hot-bed or hot-house, let it be sown thinly in flower-pots of rich light earth and covered very lightly; in a month or six weeks, or as soon as the young plants are an inch high, they are to be raised carefully and planted singly in small pots, and placed in a frame where they will have a very little warmth, and where they must have plenty of air and water as required until the middle of May, when they may be turned out of the pots into the open ground without breaking the ball. By this treatment the Potatoes will be so large the first year as to enable you to judge of their merits. If you cannot command artificial warmth, sow the seed in shallow drills of light rich earth, early in April, and transplant the young plants into rich earth in June, raise the Potatoes at the usual time, and treat them afterwards in the usual way: they will "prove themselves" the second year. —*Dublin Farmers' Gazette.*

POTATOES.—*Somersetshire Vicar.*—Your specimen appears similar to that figured in a Leader on the Horticultural side some weeks ago.

REARING CALVES.—*A. W.*—Give them an abundance of the milk of the cow, and give the latter such food as will tend to increase it, particularly its nitrogenised portion, *caseine*. Marigold Wurzel is one of the best roots for this purpose, and if sufficient milk cannot be obtained for the calf, Peas, made into a sort of broth, is, I believe, the best substitute. Moderate exercise is desirable both for the cow and the calf, which, however, should not be afforded, if the latter is intended for the butcher. *W. C. S.*

SEA INUNDATION.—*H. H.* is informed that I asked what would most readily restore fertility to Grass-land inundated by the sea. I also asked if it had ever been ascertained when any given quantity of salt ceases to be beneficial and becomes detrimental to vegetation, instancing the well-known fact that a thick dressing of salt on a gravel walk at the beginning of summer destroys the weeds for that season, but unless renewed every year tends to the increase of them. I also asked what would be likely to render mud taken out of a tide river useful as manure, with a view to counteract the superabundance of salt contained in it. Exposure to sun and air, in all cases of mud, is, I believe, very necessary to make it useful as manure, either in top-dressing or otherwise; but what would soonest assist the operation of the elements?—*M. D. P.*

SHEEP.—*Querist.*—It is better to divide your ground, and let your flock into successive portions, at successive periods. Sheep should not be put to ram till the second year.

*** As usual many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, NOV. 25.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s 0	to	4s 4	Best Downs & Half-breds	4s 0	to	4s 4
Best Short Horns	3 10		4 0	Best Long-wools	3 10		4 0
Second quality Beasts	3 6		3 6	Ewes and second quality	3 2		3 8
Calves	3 8		4 6	Pigs	3 4		4 6

Beasts, 3333; Sheep, 27,240; Calves, 64; Pigs, 440.

Our supply of Beasts is again rather smaller, which, added to the favourable change in the weather, has caused a brisk demand. There is a considerable advance in price even in the second rate qualities, which have so long been a drag on the Market. Several the choicest Scots have made rather over 4s 4d per 8 lbs, and some of the most selling Short Horns make 4s 2d. Everything finds buyers. There are a few less Sheep than last week, and an increased demand, consequently trade is brisk at somewhat advanced prices; the best Downs readily make 4s 4d, in some instances 4s 6d, sizeable Long-wools 4s 2d, and large Sheep 3s 10d per 8 lbs. Veal trade is brisk; it must however be a choice Calf to make 4s 6d. Pork-trade is tolerably good amongst nice small Porkers, which make about 4s 6d. Large Pigs are also more in request.

FRIDAY, NOV. 29.

We have rather more Beasts to-day, but the best qualities, with which we are not very abundantly supplied, maintain Monday's quotations. Trade is however heavy for second-rate Beasts, which cause quite a very great part of the supply and make a little less money. Best Scots 4s 4d to 4s 6d. Best Short Horns 3s 10d to 4s; second quality 3s to 3s 8d. Our supply of Sheep is also rather larger, but the demand is adequate. The best Downs, &c. are making from 4s to 4s 6d, and Long-wools 3s 10d to 4s 2d. Most fine Sheep are rather a heavy trade, but the dead market having been but moderately supplied since Monday, we have a chance of getting all sold at a trifle under Monday's quotations. Veal trade is good; a very choice Calf is worth very nearly 5s 0d; second rate about 4s. Pork-trade is steady.

Beasts, 806; Sheep, 4120; Calves, 177; Pigs, 220.

81, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, NOV. 25.

During the past week the supplies have been liberal from most of the shipping districts, and in consequence of the previous shortness of the supply, there has been a ready demand for the best samples, but the second rate samples went off heavily.

HOPS, FRIDAY, NOV. 29.

THE Hop Market continues firm at quite as much money.

FATTENDEN & SMITH, Hop-Factors.

MARK-LANE, MONDAY, NOV. 25.

WE had a moderate supply of Wheat from Essex, Kent, and Suffolk; the condition of a great part continues indifferent; best samples being scarce are saleable at fully the rates of this day se'nnight; anything below is difficult to dispose of; there is very little demand for Foreign, which is held at late quotations. Fine Malting Barley is wanted, and sells at the terms of last week; inferior continues neglected, with the exception of Foreign for grinding, which is in request. White boiling Peas are fully as dear; Maple and Grey 1s. lower. Old Beans are unaltered, but New are 1s. cheaper. Oats maintain the prices of Monday last.

FRIDAY, NOV. 29

THE arrivals of English Wheat since Monday have been good, and such as were offered on the Market met a slow heavy sale at declining prices; business in Foreign has been very limited, but we observe no alteration in its value. The best samples of malting and also grinding descriptions of Barley are taken off on late terms, but secondary qualities of the former must be written 1s. cheaper. Beans and Grey Peas are unaltered, good breakers are inquired after, and the turn dearer. There is little doing in Oats, but Monday's prices are fully supported.

ARRIVALS THIS WEEK.

COVENT GARDEN, NOV. 30.—The supply of both Fruit and Vegetables has been well kept up during the week; but the market continues to be dull, as is generally the case about this time of the year. Of Fruit, Pine-apples are plentiful and good in quality. Hothouse Grapes are somewhat dearer than they were last week, and Portugals are also rather on the rise. Among Apples, the best dessert varieties at present in the market are, the Newtown Pippin, Wenham Orange, and Ribstone; and among Pears, the principal sorts for table are the Passe Colmar, Old Colmar, Ne plus Meuris, Winter Nelis, and Chaumontelle. Melons are very scarce, and Cucumbers are nearly over for a season, as are also Quinces; but Medlars still continue plentiful. Oranges are becoming very plentiful, and Nuts of all sorts are pretty abundant. Vegetables have, generally speaking, not altered in price since our last report. Cauliflowers are, however, somewhat dearer, and Broccoli is slightly advanced in price. Turnips and Carrots are good and sufficient to meet the demand. Brussels Sprouts are likewise excellent in quality, as are also Savoys, Leeks, and Onions. Celery, Endive, and other salading are pretty plentiful. Cut Flowers chiefly consist of Euphorbia splendens, Poinsettia pulcherrima, Rondeletia speciosa, Pentas carnea, Bignonia venusta, Jasminum revolutum, Gnidia pinifolia, Heaths, Camellias, Cinerarias, Chrysanthemums, Double Primulas, Heliotropes, Tulips, Roman Narcissus, Neapolitan Violets, and Roses.

FRUITS.

Pine Apple, per lb., 3s to 7s 6d
Grapes, Hothouse, per lb., 1s 6d to 5s
— Spanish, per lb., 10d to 1s

Tarragon, Green, per bunch, 2d to 3d
Green Mint, per bunch, 2d to 3d
Marjoram, per bunch, 2d to 3d
Chervil, per punnet, 2d to 3d
Chilis, per 100, 1s to 2s

UNDER THE PATRONAGE OF HER MAJESTY.

J. G. WAITE, SEEDSMAN, &c., 1 and 4, Eyre-street Hill, Hatton Garden, London, embraces the present opportunity of returning his best thanks for the very liberal support he has hitherto received, and to assure his friends that no exertion shall be wanting on his part to merit a continuance of their favours.

J. G. W. most respectfully informs the public that Seeds of every description (with the exception of Carrot) are unusually fine this season, and he will offer them at very low prices.

Waite's Queen of Dwarf Peas, per quart . . .	7s. 6d.
A splendid new variety, growing only 1 foot high, producing a larger pod than any of the same habit; the seed is quite distinct from all others, and larger than any Dwarf Pea in cultivation. It has been grown at the Royal Gardens at Frogmore, and approved of as a new variety, and also at Her Majesty's table, for its superior flavour.	
Cuthill's Black Spine Cucumber, per packet of 100 seeds	5s. 0d.
Waite's Race Horse, do., 32 inches long, Black Spine, and wonderful bearer per packet of 20 seeds	5s. 0d.
True Beechwood Melon . . . . of 25 do.	2s. 6d.
Pimelia spectabilis, new . . . . of 5 do.	2s. 6d.
Calceolaria, from all the new spotted varieties, per packet	2s. 6d.
Anagallis Brewerii . . . . . do.	1s. 6d.
Pot roots of Dahlias of the finest varieties, including 1 of Keyne's Standard of Perfection, per doz.	10s. 6d.
Ranunculus, 100 roots in 100 fine sorts, with names, per 100	12s. 6d.

J. G. W.'s unrivalled priced Catalogues of Seeds will be ready shortly, and can be had on application at 1 and 4, Eyre-street Hill.—November 30.

DUTCH HYACINTHS for forcing, Single and Double at 4s. per dozen; also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones & Ranunculuses; priced Catalogues of which will be forwarded per post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Double Italian Tuberose roots expected the end of next month.

KNAP-HILL NURSERY, NEAR BAGSHOT, SURREY.

HOSEA WATERER (Brother and Successor to the late MICHAEL WATERER), respectfully begs to announce that the American Plants this year are remarkably well furnished with bloom; and with the other articles which are generally required for forcing, he has this season to offer very fine plants of the hardy Scarlet Rhododendrons. This Nursery has long been celebrated as containing the finest Collection of American Plants in the kingdom; independent of this, H. W. is a most extensive grower of Hardy Ornamental Trees and Shrubs, Roses, Forest and Fruit Trees; this may be inferred from the fact, that the Nursery extends over near 100 acres of land. The Knap-Hill Nursery is 2½ miles from the Woking station of the South Western Railway.

All letters intended for this Nursery must be addressed Knap-Hill, near Bagshot, Surrey.—Nov. 30.

THOMAS JACKSON, of the Priory Farm, Childwall, near Liverpool, begs to inform Nursery, Seedsmen, and others, that he has saved a fine quantity of the Incomparable Hardy Green COLEWORT, which was Advertised in the *Chronicle* of 23d March last. T. J. can refer any person to a respectable Nurseryman in this neighbourhood, as to quality and being genuine. Price 2s. per lb.—Nov. 30.

EDWARD BECK informs the Public that in consequence of the greatly increased demand for his SLATE TUBS, he is enabled to reduce the price of the following sizes about 10 per cent. He regrets the too frequent delay which has occurred in the execution of orders. This he hopes to avoid in future by keeping a supply on hand.

Present Prices for Cash or Post-office order:—

14 inches . . .	11s. 0d.	20 inches . . .	22s. 6d.
15 inches . . .	12 6	22 inches . . .	25 0
16 inches . . .	16 0	24 inches . . .	32 0
18 inches . . .	19 0		

Slate Works, Isleworth, Middlesex.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford Street. — Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

TO NURSERYMEN, SEEDSMEN, AND OTHERS.
LAVENDER HILL NURSERY, WANDSWORTH ROAD.
UNRESERVED SALE OF EXTENSIVE NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. PAMPLIN, to sell by Public Auction on the premises, Lavender Hill Nursery, Wandsworth-road, near London, on Monday, Dec. 2d, and following days, at 11 o'clock on each day, the whole of the EXTENSIVE and VALUABLE NURSERY STOCK, comprising a large quantity of the finest Hardy Evergreens of all sizes (which remove particularly well out of this ground); Fruit and Forest Trees, Shrubs and American Plants; Hardy Herbaceous Plants; large and small Camellias; a very capital collection of Ferns, some of which are of extreme rarity; Garden Frames and Lights; Shop Fixtures and general Fittings of a Seed shop and Counting house; Stock of Seeds of the present Harvest; Garden Implements, a useful Horse, Carts, Barrows, &c.; several thousand yards of Box Edging; about 200 Pollard Willows with their lop and top; Evergreen and other Hedges; also some growing Crops, as Mangold Wurzel and Turnips; together with many useful articles.

The whole will be sold without the least reserve, the premises having been disposed of for other purposes, and must be cleared before Christmas.

Catalogues will be ready one week prior to the Sale, and may be had on the premises; at most of the Seedshops in London; at No. 45, Frith-street, Soho; and of the Auctioneers, Leytonstone, Essex.

FERNS.—The Collection of FERNS (in the approaching Sale of the Stock at the Lavender Hill Nursery) will be sold on the FOURTH DAY, viz., Thursday, December 5th, at 12 o'clock. Catalogues of this part can be had separately, on application.—Lavender Hill Nursery, Wandsworth-road.

PROTHEROE AND MORRIS.

TO GENTLEMEN, NURSERYMEN, FLORISTS, & OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed to submit to public competition, on the Premises, Windmill Lane, and Camberwell Nurseries, on Monday, December 16th, 1844, and following days, at 11 o'clock, by order of the Sheriff of Surrey, Without Reserve, the whole of the Choice Collection of GREENHOUSE PLANTS, consisting of Fine Double Camellias, well furnished with bloom, Azalea Indica, Chorozema, Erica in fine varieties; also the whole of the NURSERY STOCK. Further Particulars will be given in future advertisements. Catalogues may be had, one week prior to the Sale, on the Premises; of the principal Seedsmen; of Mr. J. C. Holmes, Solicitor, 163, Fenchurch Street, London; and of the Auctioneers, Leytonstone.

TO NURSERYMEN, SEEDSMEN, and OTHERS.

TO BE DISPOSED OF, A Most Desirable NURSERY, with the remainder of the LEASE, about 7 years, situated 40 miles from the Metropolis, joining the London turnpike road, and within two minutes' walk of a railway station. The Nursery comprises from two to three acres of ground well stocked with Evergreens, Shrubs, Fruit Trees, &c., also a Greenhouse and Framing, with other Buildings convenient for the trade, with a Seed Business in the centre of one of the best market towns in England. For further particulars, application to be made to Mr. BRISTOW, Seedsman, Knightsbridge; or Mr. CHARLWOOD, Seedsman, Covent Garden; if by letter post paid.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery, they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick, also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.		Flue Door.		Damper.		Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s.	d.	s.	d.	s.	d.		
10	1 5	20	7	6	6	6	2	6	30 feet.	12 to 20
Ribbed Boiler.										
10	2 2	20	10	6	7	6	2	6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12	6	7	6	3	6	80 to 125 feet.	40 to 65
14	3 10	35	17	5	8	6	4	6	150 to 250 feet.	65 to 100
18	5 5	42	25	0	8	6	5	6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35	0	8	6	7	6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently published Pamphlet, "Practical Instructions for using Guano as a Manure Illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or conveyed within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street, Fenchurch-street, London.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Nov. 30, 1844.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIKIN late Mr. Mitchell, Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation, also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen not versed in Agricultural Chemistry, Plans and Estimates will comprehend the Elements of Analysis.—No. 5A, Pawsey's Pond, Kentish Town.

DRAINING OF LAND.—THE WORKMAN'S A LEVEL, invented by Mr. BAILEY DENTON, is made and sold, as approved by him, by Messrs JONES, Opticians, 30, Lower Holborn, London, price 30s.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING,
Saving half the Timber usually consumed.
Weight, 24 lbs. per square of 100 feet.
Cost, 8s. 4d. per square of 100 feet.
The above Material has been used and approved of by the NOBILITY, GENTRY, and AGRICULTURISTS generally, as a ROOFING & COVERING to SIDES of FARM BUILDINGS.
Its advantages are LIGHTNESS, DURABILITY & ECONOMY.
Being a non-conductor, it has been proved an efficient PROTECTIVE MATERIAL TO PLANTS, and is now in use at the ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.
It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the Trade.
THOMAS J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

DR. HALLETT'S DRY SOLUBLE FERTILIZERS are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10l. per ton, or 12s. per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1s. 6d., and in bottles, six times the size, at 7s. 6d. Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 29, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Building, Bunhill-row, London.

In post 8vo, price 10s. 6d., handsomely bound in a new kind of cloth, silver gilt; or 9s. boards,
IMAGINATION and FANCY; or, Selections from the best English Poets, Illustrative of those First Requisites of their Art: with Markings of the best Passages, Critical Notices of the Writers, and an Essay in Answer to the Question, "What is Poetry?" By LEIGH HUNT.
"This volume is handsomely printed, and beautifully bound in a new style of exquisite delicacy and richness. To institute a comparison with the contents of the Annuals would be absurd, at any degree of distance—there is no more relation between them than between a street lamp and a fixed star; but in external beauty 'Imagination and Fancy' equals any gift-books that have appeared; and it will form a more enduring memorial than any other volume that might be selected as a gift for the coming season."—*Spectator.*
II.
Just published, Sixth Edition, in 3 vols. fcap. 8vo, beautifully Illustrated, price 7s. 6d. each, in a handsome and uniform cloth binding, or 10s. 6d. handsomely bound in morocco,

The Newspaper.

SATURDAY, NOVEMBER 30, 1844.

LIFE ASSURANCE.—The following are specimens of the low Rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age.	20	30	40	50	60
An.Pr.	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid, in the hands of the assured, at interest to be deducted from the sums assured, when they become claims.

Persons assured to the amount of £500 for the whole term of life, participate in the profits of the Company. Subscribed Capital £200,000.

For Forms of Proposal and other particulars, apply at the Office, 126, Bishopsgate-street, corner of Cornhill, City.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. Boyd, 4, New Bank Buildings, or of the Actuary, 10, Pall-Mall East. JOHN KING, Actuary.

NOTICE is hereby given, that the ACHILLES LIFE ASSURANCE ASSOCIATION has been UNITED with the GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY; and the holders of Policies effected with the said Achilles Life Assurance Association are hereby requested to pay the renewal premiums on such Policies at the Office of the Great Britain Mutual Life Assurance Society, No. 14, Waterloo-place, London. E. GILBERTSON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.
The Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.
GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

PROFITS.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

CREDIT.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l*.

AGE.	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£. s. d.	£. s. d.	£. s. d.
20	1 0 9	1 1 6	1 13 11
30	1 2 9	1 3 3	2 2 1
40	1 5 6	1 7 6	2 16 4
50	1 15 9	2 1 6	4 1 11
60	3 3 5	3 17 0	6 8 3

Full particulars are detailed in the Prospectus.
A. R. IRVINE, Managing Director.

SCOTTISH (Widows' Fund) LIFE ASSURANCE: constituted by Act of Parliament; instituted A.D. 1815.
President—The EARL of ROSEBERY, K.T.

Capital accumulated and invested upwards of 1,450,000*l*.; annual revenue upwards of 220,000*l*. The Directors are now empowered to grant Assurances for fixed sums, without any claim on the part of those in right of the Policies to participate in the Surplus Fund or profit of the Society.

There is no Office in Scotland, and very few in England, which can compete with this Society in respect either of the amount of Insurances effected annually and the number of Policies issued, or of the advantages afforded to the members insured, whether participating in the profit fund or not.

The total amount of sums insured since the Society was established is nearly six millions and a half sterling.

The amount insured during the last seven years has on an average been upwards of half a million annually.

The amount offered for insurance in one year alone was upwards of 790,000*l*.

One of the leading characteristics of the Society is, the liberal, punctual, and simple manner in which the claims are settled, combined with the very great care bestowed by the Directors (with the advice and assistance of the medical officers) in the selection of lives. Instead of affording every facility to parties to join the Society, and afterwards throwing all manner of unnecessary obstacles in the way of settlement when the claim emerges, the Directors proceed upon the opposite principle of being most cautious and particular in their inquiries before admitting members to the benefits of the Society; but after being admitted they are entitled to all the advantages which the Society affords to each class of insured respectively, and when the claim emerges, no undue delay takes place, and no difficulties which can be avoided are interposed to prevent an easy and expeditious settlement.

Forms of proposals, and every necessary information, may be obtained at the head office, Edinburgh, 5, St. Andrew-square; or at any of the Society's agencies.

JOHN MACKENZIE, Manager.
HUGH M'KEAN, Agent, Office, 7, Pall Mall.
Edinburgh, November, 1844.

DISEASED AND HEALTHY LIVES ASSURED.
MEDICAL, INVALID AND GENERAL LIFE OFFICE,
25, PALL MALL, LONDON.
SUBSCRIBED CAPITAL £500,000.

THIS Office is provided with very accurately constructed Tables, by which it can ASSURE DISEASED LIVES on Equitable Terms. The EXTRA PREMIUM DISCONTINUED on restoration of the Assured to permanent health. INCREASED ANNUITIES granted on UNSOUND LIVES, the amount varying with the particular disease. MEMBERS of CONSUMPTIVE FAMILIES ASSURED at Equitable Rates. HEALTHY LIVES are Assured at LOWER RATES than at most other Offices. POLICIES of twelve months' standing are NOT AFFECTED BY SUICIDE, DUELLING, &c.; and Assigned Polices are valid from the date of the Policy, should death ensue from any of these causes. F. G. P. NEISON, Actuary.

BRITISH AMERICA.
Her Majesty's Province of New Brunswick.

TO EMIGRANTS.—THE NEW BRUNSWICK AND NOVA SCOTIA LAND COMPANY (empowered by Royal Charter and Act of Parliament) have resolved to SELL portions of their LAND on the following terms, for Lots of 100 Acres each, viz.,

3*l*. to be paid down.
[No payment required in the Second Year.]

3*l*.	to be paid on or before 1st Dec.		in the Third Year.
3*l*.	ditto	ditto	in the Fourth Year.
3*l*.	ditto	ditto	in the Fifth Year.
3*l*.	ditto	ditto	in the Sixth Year.
3*l*.	ditto	ditto	in the Seventh Year.
3*l*.	ditto	ditto	in the Eighth Year.
3*l*.	ditto	ditto	in the Ninth Year.
3*l*.	ditto	ditto	in the Tenth Year.
4*l*.	ditto	ditto	in the Eleventh Year.

Ttl. 31*l*. sterling, without any charge for interest.

The territory belonging to the Company is upwards of half-a-million acres, situate in Her Majesty's Province of New Brunswick, between the rivers St. John and Miramachi. Several other rivers run through the tract, on one of which, the Nashwauk, is situated the Company's principal Town and Settlement of Stanley. Here is a church, schoolhouse, and corn and saw-mills, and many houses belonging to resident settlers. The Chief Commissioner and the Company's Establishment are at Stanley, and there is also a resident surgeon.

The passage from the chief port in the Province (St. John) to the Company's town of Stanley may be made in 24 hours, at a very moderate expense.

For further particulars (gratis) apply (if by letter, post-paid) to the Secretary, 5, Copthall-court, London; or to Mr. I. I. Birchal, 10, St. Mary's Gate, Manchester.

London, November 30, 1844.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

HEAL AND SON'S LIST OF BEDDING:—Containing a full description of weights, sizes, and prices, by which purchasers are enabled to judge the articles that are best suited to make a good set of Bedding, sent free by post, on application to their establishment, the largest in London exclusively for the manufacture and sale of Bedding (no Bedsteads or other furniture being kept). HEAL AND SON, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham Court Road.

PROTECTION OF LIFE AND PROPERTY.

J. READ begs to inform Noblemen, Gentlemen, Agriculturists, and Horticulturists in particular, that he has recently made improvements in his double and single-action FIRE ENGINES, by reducing them to half the usual size without diminishing their power. They are well adapted for Mansions, Villages, Factories, Agricultural Buildings, or wherever there is danger of fire; being so portable they will pass through any common doorway, and may be kept in a house or Agricultural Building. They may be worked with two-thirds the labour required for any other Engines of equal power. Likewise Horticultural Engines, Machines, and Syringes, worked with *half* the labour of any other Engines for the same purpose, which the Patentee, from 31 years' experience in that science, can safely warrant. May be seen and proved at 35, Regent Circus, Piccadilly, and at the ensuing Cattle Show, Baker-street, Portman-square.

N.B. Fire Engines made to order of any power or dimensions.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s*. 9*d*. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

MISS MARTINEAU ON MESMERISM.

THE ATHENÆUM of This Day contains the SECOND OF A SERIES OF LETTERS FROM MISS HARRIET MARTINEAU, on her RECOVERY by MESMERIC TREATMENT ALONE.

FARM.—Wanted to Purchase, A FARM of 200*l*. to 400*l*. a year rental: it must be south of the river Thames.—Address, by letter, stating size, situation, rent, and price, to E., *Gardeners' Chronicle* Office, 5, Upper Wellington-street, Covent-garden, London.

GARDENER'S CHRONICLE

News of the Week.

THE election of Mr. Polk to the Presidency of the United States is the leading event of our Foreign News. The triumph of this gentleman, and the defeat of Mr. Clay, seem to have taken all parties by surprise, and the unexpected result has opened a wide field for speculation on both sides of the Atlantic. The name of Mr. Polk was unknown in Europe, and scarcely known beyond the State which he represents, until last May, when he succeeded in defeating Mr. Van Buren in the Baltimore Convention. Mr. Clay, on the other hand, has been long known, both in Europe and in America, as an able public man, esteemed by his countrymen during a long career, and respected abroad as one of the most moderate and consistent statesmen in the Union. It is evident, therefore, that Mr. Polk's success is attributable, not to personal considerations, but to political principles; and it is in this point of view that his election becomes an event of great importance to the future policy of this country. It is admitted to be a triumph of the Southern over the Northern States, and of the democratic over the Whig party; and it may also be regarded as an indication of the national feeling on three subjects of vast concern to English interests—the annexation of Texas to the Union—the definitive occupation of the Oregon territory by American forces—and a low in contradistinction to the present high tariff. Of all these schemes Mr. Polk is a decided partisan, and if the democratic party, of which he is the representative, pursue their object with as much earnestness as they displayed in making converts to their principles during the electoral contest, the relations of England with the United States must be beset with difficulties of which it is impossible to foresee the limit. The effect of the election on the Slave question, and on the repudiating States, is also doubtful:—Mr. Polk is said to be a supporter of both these questions, but the Whig party console themselves with the belief that the new President will not possess sufficient strength in Congress, as at present constituted, to carry out his views.—The affairs of Tahiti are again a prominent topic in the French papers. The recent news of a fresh collision with the natives has re-opened the whole question, and there is no doubt that it will form one of the leading points of attack in the approaching Session of the Chambers.—From Spain we learn that Gen. Prim and his companions have been found guilty. Prim has been sentenced to six years' imprisonment in a fortress, and his companions to imprisonment for two or three years, according to the presumed measure of their guilt. Zurbano's insurrection continues to give great uneasiness to the Government, but the accounts of his movements are extremely contradictory. The advices from Madrid state that he is reduced to the last extremity, while those from the frontier announce the rapid progress of the insurrection, and detail fresh risings in various important towns of Upper and Lower Arragon.

At home, the late railway accidents divide public attention with the extensive robbery of Bank notes in the City of London. The inquiry into the railway accidents is still in progress, and it would therefore be premature to notice any of the various rumours which are current on the subject. The extraordinary Bank robbery at Messrs. Rogers and Towgoods' is also unexplained, and we must therefore refer to the simple statement of the facts recorded under our Metropolitan news.

Home News.

COURT.—The Queen and Prince Albert, with their royal visitors, continue at Windsor Castle. On Saturday the Prince, accompanied by the Duke of Saxe Coburg and the Duke Ernest of Wurtemburg, hunted with His Royal Highness's harriers. On Sunday the royal party attended Divine service in the private chapel of the Castle. On Monday, the Queen and Prince, the Duke and Duchess of Saxe Coburg, and the Duke Ernest of Wurtemburg took an early walk in the pleasure grounds of the Castle, and after their return, the Prince with the Dukes of Saxe Coburg and Wurtemburg shot over the royal preserves, and afterwards rode out on horseback. On Tuesday, the Queen held a Chapter of the Order of the Bath, and afterwards gave a grand dinner to the Knights Grand Crosses who were present at the Chapter. In the course of the morning the Duke and Duchess of Saxe Coburg Gotha and the Duke of Wurtemburg came to town and inspected the new Houses of Parliament, Westminster Hall, and Westminster Abbey, and after lunching at the Duchess of Gloucester's returned to Windsor Castle to dinner. On Wednesday the royal

party took their usual walks, and the Prince shot over the royal preserves. On Thursday the Queen held a Court and Privy Council, which was attended by all the Ministers; at the Council Sir H. Pottinger, Bart., was sworn in as a Privy Councillor and took his seat at the Board. The visitors to the Queen this week have been the Earl of Aberdeen, the Marquis and Marchioness of Normanby, the Marquis of Granby, the Duke of Wellington, Earl and Countess Cowper, Earl Delawarr, Lord and Lady Willoughby d'Eresby, Sir Robert and Lady Peel, Sir H. Wheatley, and the Knights of the Bath present at the Chapter.

Parliamentary Movements. — At the Council on Thursday, Parliament was ordered to be further prorogued from the 12th December, until Tuesday the 4th February, and a proclamation was ordered to be issued summoning the Parliament to meet on that day for the despatch of business.

Cabinet Council.—A Coun il was held on Friday at the Foreign Office, which sat upwards of three hours, and was attended by all the Cabinet.

Order of the Bath.—The Queen held a Chapter of the Order on Tuesday, at which the Earl of Ellenborough and Sir Arthur Aston, the late Minister in Spain, were invested with the insignia of Knights Grand Crosses. The Knights present were — Prince Albert, the Duke of Cambridge, the Duke of Wellington, Viscount Strangford, Sir E. Paget, Sir G. Murray, Sir G. Cockburn, Sir E. Codrington, and the Earl of Clarendon.

Foreign.

France —The affairs of Tahiti are once more a prominent topic in the Paris papers. A letter from that island of the 26th of May, published by a London paper, and reflecting upon the morals of the French officers, soldiers, and seamen, is indignantly resented by several of the Opposition prints, some of which pronounce it a worthy *pendant* to the Warspite epistles. The recent news, however, quoted in our last, giving accounts of another attack made by the French upon the natives on the 30th June, and the removal of Queen Pomaré from the island by an English man-of-war, has re-opened the whole question, and affords some of the Opposition papers an opportunity of attacking the continual meddling of England. The more moderate papers, however, take a more rational view of the subject than formerly, and speak of it more to blame their own Government for concealing what is doing than to throw blame on England. Rear-Admiral Dupetit-Thouars, to whose suggestions and agency the injudicious occupation of the Marquesas, and unfortunate occurrences at the Society Islands have been originally due, appears to have been advised not to return to Europe for some time to come. "A letter from that officer," says *La Presse*, "announces that the news of his disavowal has reached him, and that being left at liberty to return to France either directly or in about two years, after accomplishing a voyage, he has determined on adopting the latter course." The Opposition papers are extremely indignant at Admiral Dupetit-Thouars for yielding to the counsel of his Government rather than to the recommendations of the press. For the present they only express regret at his not returning the moment he learned that Government had disapproved of his conduct and proceedings. His resolution to make a voyage of two years, instead of coming back to France to receive the sabre of honour purchased for him by "the eternal enemies of the English," is a serious offence, for it deprives the Opposition of a most powerful weapon, on the application of which, in the approaching session, they had reckoned with certainty.—The *Moniteur* contains a Royal ordinance issued at the recommendation of the Minister of the Interior, whereby an extraordinary credit of 240,000f. is granted for trying the electrical telegraph system on the Paris and Rouen Railway.—It is stated that the Ministry have come to the resolution of applying to the Chambers, at the commencement of the impending session, for the large sum of 80,000,000f., for the purpose of providing the fortifications of Paris with ordnance; and that the question of obtaining a "dotation" for the Duke of Nemours has of late been revived in the Cabinet, to the great anxiety of its members. The King, it is said, insisted upon its being brought forward next session, but, after much discussion, he has been persuaded that the measure will have a better chance of success with a new Chamber than with the present one. "The consequence," adds the *Commerce*, "is, that the 'dotation' will not be presented this year, but that we shall have general elections in 1845. Such is now the state of the question. It will perhaps change to-morrow, for many persons still doubt that the aforesaid determination is a final one."—The Municipal Council of Marseilles is stated to have voted a sum of 30,000 f., to be placed at the disposal of the mayor, for the expense of the *fêtes* which are to take place on the arrival in that city of the Prince de Joinville and the Duke and Duchess d'Aumale.—The papers contain a long essay, published by M. de Lamartine in a newspaper of Macon, in which, after reading a severe lecture to the Opposition upon their inconsistency and blunderings, he enters upon a formal accusation of M. Thiers, and proceeds to vindicate himself and his friends for not having cordially joined a party who recognised "the President of the Council of 1840" as their leader. He censures the outcry raised by the Opposition on the affairs of Tahiti, and says, that there are noble fields for contest on the banks of the Rhine and the Mediterranean, without struggling for a rock of which England does not even deign to dispute the possession. He approves cordially of the King's visit to England, and of the speeches in which His Majesty expressed his determination to maintain peace, declaring that "a King acting such a part raises himself to the level of a philosopher." According to a Corsican print the King is about to create another Duke in the person of Marshal Sebastiani, late Ambassador at the English court, with the title of "Duke d'Olmeta." — To the great disappointment of the Parisians, the clouded state of the atmosphere on Sunday night rendered the eclipse of the moon invisible. The weather was gradually becoming cold, but was still dry.—Marshal Bugeaud, Governor-General of Algeria, and Baron de Bourqenay, Ambassador of France at Constantinople, have arrived in Paris. The papers are filled with accounts of the dinner given at Marseilles to Marshal Bugeaud, on the occasion of his return. The speeches on the occasion were of a very ordinary character. Marshal Bugeaud, however, took occasion to give a glowing description of the progress made by the colony of Algeria within the last four years.—The election at Rheims for a deputy took place on Sunday. There were four candidates, but M. Chaix d'Est Ange, the eminent advocate, who was the ministerial candidate, was returned by a majority of 414 to 314.

Spain.—We have accounts from Madrid to the 20th ult. The Court-Martial by which General Prim and his co-accused were tried sat in deliberation until 6 o'clock in the morning of the 15th, when the judgment was delivered. Prim was sentenced to six years' imprisonment in a fortress, but was to retain his rank and decorations. The other prisoners were condemned to three and two years of the same penalty respectively. The Supreme Tribunal of War and Marine was to revise the judgment and decide where the culprits were to undergo their punishment. The Chamber of Deputies on the 18th resumed the debate on the Constitutional Reform Bill. The whole sitting was devoted to the discussion of an amendment moved by the Marquis de Montevirgen, for declaring the station of Senator hereditary. At a late hour, the amendment was rejected, with the approbation of Ministers, by a majority of 88 to 60. The proceedings of the Cortes attracted less attention than Zurbano's movements, respecting which numberless reports were daily propagated. The *Gazette* publishes a despatch from the colonel commanding the column of operations in the province of Logrono, announcing that on the 16th he came up with Zurbano, in the mountains, near the village of Montenegro, that his infantry had thrown down their arms on the approach of the Queen's troops, and fled in every direction, and that Zurbano, his two sons, his brother-in-law, and six other individuals, succeeded in effecting their escape in the direction of Yanguas, with the evident intention of crossing the Ebro, in the vicinity of his country seat. Letters from the frontier add that his troops had been beaten and dispersed, his son, brother-in-law, and servant captured, and that Zurbano himself, with only a few followers, had taken refuge in Navarre. This account, however, is contradicted by advices from Bayonne of the 21st, stating that the insurgents are making rapid progress in Upper and Lower Arragon, and that on the 18th, Zurbano and his troops entered the town of Soria, where he was well received by the inhabitants. He, however, found that previous to his arrival, the political chief of the place had issued a *bando*, ordering that Zurbano should be shot, if taken prisoner, upon his simple identity being proved. Zurbano, upon this, ordered the political chief himself to be shot, as an example to all persons in authority not to publish such mandates. These orders were at once carried into execution. A battalion of the regiment of Saragossa has *pronounced*, and gone over to Zurbano, and it is expected that the example will be followed by more of the troops. Information has also been received that a rising has taken place in the province of Guipuscoa in favour of the constitutional cause. Two towns, Ascotia and Aspetia, have *pronounced*, and General Iturbe has placed himself at the head of the movement. It is reported that a further rising has taken place in the province of Galicia, which is known to be in a state of disaffection. On the 16th Saragossa was placed by the authorities in a state of siege. The posts were doubled, and the troops, in whom their officers seem to have but little confidence, were confined to their barracks, and a battalion placed at the principal post. The authorities issued an order for the delivery of all the arms possessed by the inhabitants; but very few were delivered, the inhabitants having been disarmed some months ago, when the National Guard was abolished. The apprehensions of the Government are betrayed by various fresh rigours. Several generals, including Espinosa, Ramirez, Graces, &c., have been ordered to quit the capital. All the officers in the kingdom have been ordered to present themselves every week to the military commandants of the towns where they reside, and not more than three of them are to be permitted to meet at the same time. This severe measure has been resorted to from the apprehension of these officers joining the insurrection. There are about 4000 of them without employment, who have served in the ranks of the regular army, most of whom, says a private letter, "have no means of existence, and are disposed to join any party, whether Carlist, Constitutional, or Republican, provided they can procure bread. It is thus that almost all the bands of brigands that infest the roads and environs of Madrid are commanded by old officers. These bands, if a civil war were to break out in any part of Spain, would become factions, for they have arms and money." —On the 19th inst. the Queen's *fête* was celebrated by a grand levee in the Palace, the presentation of addresses from the Cortes, and a splendid entertainment, given by General Narvaez, at which Her Majesty, her sister, and their mother were present. The ball was opened by a quadrille, in which the Queen danced with General Narvaez, and the Queen Mother with the French Ambassador. In the second quadrille the Queen danced with the French Ambassador, in the third with Mr. Bulwer, and in the fourth with General Concha, leader of the Opposition. It was only in the fifth quadrille that the Queen favoured the first Grandee of Spain, the descendant of royalty, the Duke of Medina Celi with an invitation, a neglect which has caused much disappointment and alarm to the whole Spanish aristocracy.—According to the French papers, a new candidate has been proposed for the honour of possessing the hand of the Queen of Spain. A certain number of influential Spaniards and Portuguese have proposed to unite Queen Isabella to the Prince Royal of Portugal, Pedro d'Alcantara, the eldest son of Queen Donna Maria. This Prince is a child of 7 years of age; Queen Isabella is 14. The young couple would be merely affianced, and they would then wait the majority of the young husband!—The papers contain long biographical accounts of the celebrated Curé Merino, whose death took place a few days since. This extraordinary man figures conspicuously in the history of Spain, from the period of the French invasion in 1808, when he collected an army of 2000 men, smugglers, muleteers, and goatherds, to oppose the French. In 1833 he took the field on behalf of Don Carlos, though 68 years of age, and rendered himself terrible to the Constitutionalists by his rapidity of movement, presence of mind, and determined bravery. It is said that it would fill a volume to narrate the unexpected attacks, extraordinary escapes, and romantic exploits, which made Merino during his lifetime a real melodramatic hero.

Belgium.—The Post-office treaty between England and Belgium was signed in London on the 19th October. The ratifications were exchanged in London on the 19th inst. By this treaty letters may be pre-paid or not, at the rate of 1*s.* for every single letter; newspapers to be delivered free to the post-offices of the two countries, and to be then charged with an inland postage of 5 centimes ($\frac{1}{2}d$). The departures from Ostend to Dover to take place on Sundays, Mondays, Wednesdays, and Thursdays; the departures from Dover every Tuesday, Wednesday, Friday, and Saturday.—The eclipse of the moon was not seen in Brussels on account of the foggy weather during the whole of Sunday night.

Germany.—The German States display great activity in the execution of treaties of commerce. After the recent conventions between Prussia and Belgium, and of Hanover with England, the King of Saxony has concluded a treaty of commerce with Portugal. The Baron de Renduffe, the Envoy of the Portuguese Government, had received orders to negotiate treaties with the other German States on the basis of that lately concluded between Portugal and Prussia. The Zollverein, on the other hand, proposes to commence negotiations with the Brazils, and likewise with Mexico and the other South American States, for the conclusion of a treaty of commerce.—The Prussian Minister of Finance has returned to Berlin from Cologne, where he has been collecting all the necessary information for the speedy determination of the measures to be adopted respecting the new railway from Cologne to Minden, which is to be extended from the latter town to Berlin, Posen, and, in the sequel, to Warsaw and St. Petersburgh. A letter from Berlin says that Tscheck has been condemned in the second instance to be beheaded. The celebrated chemist Berzelius has just been seized with a violent congestion of blood, but the apprehensions felt for the result have diminished, and there is a promise that his health will be restored.—A letter from Dusseldorff states, that M. Buddæus, bookseller, is printing a work, which gives a most detailed account of the 18 coats of our Saviour, which are preserved in different places in Christendom, with engravings of the coats, and the several medals and documents relating to them, and also reports of the miracles which each of these coats, every one alleged to be genuine, has performed in its own sphere.—Archduke Charles of Austria closed on the 13th, the session of the Hungarian Diet. After the ceremony, the laws which passed in the session and received the sanction of government were read. Amongst these the most remarkable are that relative to the admission of plebeians to public functions, the law on mixed marriages, and that allowing plebeians to be possessed of lands proceeding from noble families. Letters from Presburg state, that Austria has resumed the plan of joining the Danube with the Black Sea by a canal, but the two Chambers of Hungary differ. The States propose a tax on the noblesse, to make up for the first immunity, while the Magnats consent to a general tax on all indiscriminately.

Italy.—A letter from Naples of Nov. 5, says, "The famous volcano of the Valley of Solfatara, near Puzzuoli, in the kingdom of Naples, of which the last eruption took place in 1198, but which sent up in 1807 quantities of boiling water, has been for some days exhibiting the same phenomenon. The water which it now emits is strongly charged with sulphur. It issues from the eastern crater, in jets of about 15 to 20 feet high."—The Jewish writer, Lombroso, who resides at Turin, has just embraced the Christian religion. This is described as one of the most important conversions that has occurred for many years.

Greece.—We have accounts from Athens to the 9th inst. The Chambers are still engaged with the examination of the election returns, which has already occupied two months, and is still far from being completed.

General Church, the British officer who did so much service to the cause of the liberty of Greece in its most desperate struggles, has been dismissed from his office of Inspector-General of the Army, and has been replaced by the notorious General Grivas, who entered into a conspiracy and appeared in arms against the Government when Mavrocordato was in power, and who would have been taken and shot had it not been for the protection of the French Minister, who afforded him protection on board of a French man-of-war, which carried him to Egypt, where he remained till the accession of the present Cabinet enabled him to return.

TURKEY.—Accounts from Constantinople of the 7th mention a partial change in the Turkish Ministry. Rifaat Pacha, the Minister of Foreign Affairs, has been dismissed, and is replaced by Shekib Effendi. On the 2nd inst. salvos of artillery announced the birth of another Prince, the Sultan's third son. The heir to the throne, who is called Sultan Murad, has just entered his fifth year. The Porte has apologised to some British subjects, who were imprisoned and otherwise maltreated by the police of Constantinople, in obedience to the recent order that foreigners found in the streets after sunset should be imprisoned. — From Syria we learn that Jaffa and Sidon have been the scenes of bloodshed, having been entered by the notorious Shiek Abu-Ilohoosh, who massacred the governors of both places. Dr. Wolff is still at Meshed, from which place he was unwilling to proceed till he had received an escort from Colonel Shiel at Teheran. It is remarked as singular that, after crossing the desert of Mero and escaping from the Turcoman hordes, he should shrink from encountering dangers and difficulties comparatively trifling.—The accounts from Alexandria are of the 6th inst. The only news they bring is, that Mr. Bourne is still at Alexandria, and that he has not advanced one step in effecting a post-office treaty with the Pacha.

UNITED STATES.—By the arrival of the Great Western, we have accounts from New York to the 9th inst., bringing the important intelligence of the election of Mr. Polk, as President of the United States, and of Mr. Dallas as Vice-President. The presidential elections commenced in Pennsylvania on the 9th. This State returns 26, all of them in favour of Mr. Polk, and the adjoining State of New York, which returns the largest number in the union (36) also declared in his favour. These great States, being the most densely populated, and returning the greatest number of presidential electors, were held to be decisive of the contest. Some of the remote States had not been heard from, and returns were daily pouring in, but the friends of Mr. Clay hold the return of his rival as certain; indeed, the admissions of that gentleman's organs in New York place the issue of the contest beyond a doubt. Thus a new man, whose name was unknown in Europe, and scarcely known beyond the State which he represents, until his nomination by the Baltimore Convention in May last, where his friends succeeded in defeating the popular democratic candidate, Mr. Van Buren, has been raised to the highest office in the United States, in preference to an able public man, who has been before the public, and respected by his countrymen during a long career. The result of this contest shows the hold which two questions of great importance have taken of the American mind, one of them appertaining more immediately to their own domestic policy, the annexation of Texas to the Union; and the other of considerable importance to Great Britain—a low, in contradistinction to the present high tariff. Whether Mr. Polk will possess sufficient strength in Congress, as now constituted, to carry out these two questions, remains to be seen, but that they have been the instruments by which he has defeated a much abler and otherwise more popular man is unquestionable. As regards the subject of free trade, the elections in New York show an extraordinary result; the city, which is the commercial metropolis of the country, voted in favour of the protectionist, Mr. Clay, but this was neutralised by the general vote of the State, which supported Mr. Polk by a majority exceeding 4000. In addition to the two great principles of the new President in regard to Texas and the Tariff, it appears that he is in favour of slavery and a supporter of the repudiating States. According to the *New York Herald*, the tariff may be somewhat modified next session, though it never can be essentially altered; no bank, no distribution can take place for the present; new negotiations may be opened for the annexation of Texas, but as the Senate will be Whig for two years at least, nothing can be done effectually as regards that matter for some time to come. This journal regards the Whig party as utterly and for ever disbanded, and conceives that on their ruins will spring up the American Republicans. It is said that the election was the scene of disgraceful intrigues. An immense number of foreigners, particularly Irish and Germans, were naturalised for the occasion, and, except in a very few instances, so few as scarcely to form an exception, voted for Mr. Polk. In addition to which, it is said, great and friendly aid was given by the Canadians, who crossed the line, and deposited their ballots in favour of Mr. Polk.—The first steam-vessel ever despatched from the United States for any parts beyond the Cape of Good Hope, sailed from New York on the 4th. It was the steam-propeller Midas.—Francis Quenisset, the bravo, who, as our readers will recollect, attempted to assassinate King Louis-Philippe, was arrested on the 22d ult., in New Orleans, for a similar attempt on a citizen of that city. —A new electro-magnetic light has been invented at Cincinnati, of such power that one of them at a height of 200 feet is expected to illumine the whole city.—The potato crop of the northern States and Canada has been attacked with a singular disease this year. Hogs and cattle have died from eating potatoes, and several persons have narrowly escaped with their lives.—A general convention of the Protestant Episcopal Church at Philadelphia has been busily occupied with endeavouring to agree in common resolutions against Puseyism, but it has failed as yet in coming to an agreement. Serious charges were made against Bishop Hawkes, of Mississippi, for being a bankrupt, which the bishop indignantly repelled. Severe frosts and snow are said to have been experienced in different parts of the United States at the close of the past month.—From Canada, also, we have tidings of the near approach of winter. Montreal advices of the 4th inst. give the total returns in favour of the Governor-General at 42, against 27 Radicals, with 4 doubtful, making a total of decided elections of 73; the whole number is 84, but this is considered decisive.

TAHITI.—We have intelligence from Tahiti, by way of the United States, to July 15. On the 20th June, a body of natives having assembled at Point Venus, and their proximity being considered too near for safety, Governor Bruat had marched against them at the head of 400 French. The natives, having received intelligence of their approach, placed themselves in ambush, and allowed the main body to pass; but as the rear-guard were passing in front of the English mission-house, they opened their fire upon them in a direct line with the house, and Mr. M'Kean, one of the missionaries, who was walking on his verandah, was struck by a ball, and instantly killed. His death is universally regretted. He was one of those who had lately arrived from England, well-educated, and one of the most respected men upon the group. The action was upon the north side of the Bay of Papeite. The native loss is unknown. The French loss amounted to 3 killed and 5 wounded. At the same time, on the south side, another action took place, in which the natives were routed. In this action, 5 French were killed and 7 wounded. The native loss on this occasion is also unknown; but the day following the natives again advanced upon the town, and succeeded in burning the French mission house, chapel, &c. In all these actions it has been impossible to determine, with any degree of certainty, the native loss. They have always been accustomed to remove their dead during the night, and only those are found upon the field who die at the point of the bayonet. The natives had seized 3 Frenchmen, whom they put to death with great torture. On the 17th June the English frigate Carysfort arrived at Papeiti from Valparaiso. It saluted the French frigate Uranie, which returned the salute. The Governor, Captain Bruat, received the visit of Lord William Paulet; and although he had not received any official intelligence of the French Government having refused the dominion of the Society Islands, nor any other notice of it excepting what was contained in a letter from Valparaiso, he immediately sent the chief of his staff on board the Basilisk with a letter for Queen Pomaré, informing her of the new position of affairs, and requesting her to land. This letter was translated to Queen Pomaré in the presence of the French chief, and of the commanders of the Carysfort and the Basilisk, and she replied that she would go to Barabara, there to await the settlement of these affairs. The Carysfort prepared immediately to conduct her there, where resides the Chief Tabra, the first husband of Pomaré.

CITY.

Money Market, Friday.—Consols closed at 101 for the account; Red. Three per Cents., 99¼ to 100; Three and a Quarter New, 102 ⅛ to 102½; Bank Stock, 207; India Stock, 288; Exchequer Bills, 58 to 60 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—J. BURGESS, Cratfield, Suffolk, farmer—J. TOMLIN, Cornhill, City, ship broker—B. VANDERPLANK, Love-lane, City, woollen warehouseman—R. WATT, 43, Lime street, City, merchant—C. H. HAMBLETON, late of Northampton street, Bethnal Green, victualler—P. J. MEUGENS, 33, Dunster court, Mincing lane, City, broker—J. C. WHITE, Canterbury, Kent, draper—J. O. HARRIS, Winchester-place, Borough, hat manufacturer—G. STEPHEN, 4, Skinner's-place, City, and 7, William-street, Knightsbridge, scrivener—W. COX, Crown street, Soho, general dealer—J. JOHNSON, 6, North-place, Gray's Inn lane, apothecary—J. F. FLOOR, 3, Dunster-court, Mincing lane, merchant—W. CLARKE, Sheffield, builder—J. HUMBLE, Ossett, Yorkshire, manufacturing chemist—J. HASELDEN, Bolton-le-Moors, Lancashire, cotton spinner—J. HALL, Walls-end, Northumberland, cowkeeper—E. and W. ROBINSON, Leicestershire, bankers—J. BROWN, Newcastle-under-Lyne, painter—C. S. T. WALKER, Oxford street, artificial florist—J. NORTH, Mapleton, Stepney-green, victualler—R. TUCKER, Dean street, Westminster, farrier—L. WILLIAMS, Oxford, woollen draper—J. HARMAR, Charlotte street, Bloomsbury, pianoforte manufacturer—R. MARSHALL, Pleasant-row, High-street, and Upper road, Deptford, Kent, stone mason—W. HENDERSON, Sunderland, Durham, mercer—W. OLIVER, Darlington, Durham, printer and bookseller—E. P. WORTH, Henley in Arden Warwickshire, victualler—W. REES and G. EDWARDS, Wells, gardeners, nursery and seedsmen—J. STOREY and J. GIBB, Liverpool, shipchandlers—W. CROSS, Chester, lead merchant—M. and J. INGLESON, Ecclesheed, Yorkshire, paper manufacturers.

DECLARATION OF INSOLVENCY.—J. MUSSON, Melton Mowbray, Leicestershire, out of business.

SCOTCH SEQUESTRATIONS.—R. C. LAMB, of Edinburgh, and A. TINGMAN, of Leith, commission agents—H. M'DERMID, Milton, Dumbartonshire, calico printer—Rev. R. HOGSCON, Glasgow, cattle dealer.

Metropolis and its Vicinity.

The late Forgeries on the Bank.—We gave in our last the particulars of the pursuit of Burgess and Elder by John Forrester, the Mansion-house officer, the suicide of Elder, and the escape of Burgess in the night. By an arrival this week from New York we learn that Burgess was apprehended in a most miserable condition, in a small island 15 miles from Boston, and that he is now on his return, in the custody of John Forrester, to this country. It appears that when Burgess escaped from the hotel at Nahant, he rowed in the dark for a considerable time, and at length, after having been tossed about, he landed, and made the best of his way to a small cottage in which a poor Irishman and his wife and three children resided. From thence he sent to the waiter of the hotel at Nahant his keys, with directions to take possession of the money contained in his bags, and convey it to him. John Forrester, who managed the whole business, with the ready assistance of the American officers, took care to cut off the means of retreat or escape by land, and met the bearer of the money on his way to a place of appointment. The bag, which contained 126*l.* in gold, and in dollars and notes 168*l.*, was directly sent back to the hotel, while the pursuit was continued. In the most wretched condition, with no more than a half-crown or a couple of shillings in his pocket, and half naked, Burgess, after great exertion, reached another cottage, at the distance of about eight miles across the water, and there remained under shelter for nearly a night and a day. He then sent the owner of the cottage with a note to a Mr. Grant, who had had some transactions with him in a pecuniary way, requesting money. Mr. Grant, who had been informed of the forgery and robbery of the Bank of England, immediately gave information to Forrester, and the person who knew Burgess's place of concealment was prevailed upon—but not without a great deal of persuasion, and a reward of 300 dollars—to give him up to the police. It was evident from the proceedings of Burgess and Elder, after their arrival in America, that they looked with the utmost confidence to permanent security from arrest. Burgess had been lodging about a fortnight at the hotel at Nahant, and had purchased a piece of ground, on which he was about to build a house, and it was odd enough that before the foundation was laid he purchased carpeting, bed-linen, glasses, and other articles of furniture. It was supposed that the death of Elder, who strangled himself in the gaol of Boston, would have been the cause of some delay and inconvenience, but so willing were the authorities to give every opportunity to the Bank messengers to obtain restitution of the stolen property, that there appears to be no chance of the slightest delay. The purchase made in the names of the fugitives was, it is said, all good stock, and no doubt is entertained that it will realise the prices given for it. An inquest was held upon the body of Elder, at Boston, and it was found by the jury that the deceased was found dead in the gaol by strangling himself with his silk handkerchief, fastened to the grate of the prison window.—In regard to the extensive forgeries of 100*l.* notes of the Bank of England which we have alluded to on former occasions, it is stated that the prompt measures adopted by the Bank have frightened the culprits, and that no attempt has since been made to pass them either in Paris or Brussels. The French telegraph speedily apprised the authorities that the fraudulent parties had been in Brussels and had left for Paris. They had, however, time to dispose of ten or fifteen of their notes, but they must then have gained some intelligence that the money changers were upon their guard, for they do not appear to have subsequently attempted to utter any more of the spurious instruments. The principal party engaged in passing the notes was a young Frenchman about 27 years of age, who appeared under the name of Lindor, and was accompanied, in some instances, by a German, of stout make, rather older, who adopted the name of Ortel, and both parties seemed to have gone from Rotterdam to Antwerp. At Antwerp they put up at a small inn, but having succeeded in uttering two of their notes, they proceeded to Brussels, where they took up their abode at one of the principal hotels. At Brussels they were fortunate enough to pass no less than seven of the forged notes to a money-changer of highly respectable character, M. Charles, who consequently suffers severely. Having got these seven notes changed, the conspirators proceeded to Lille, on which place it appears M. Charles gave Lindor an order in part payment of the conversion of the notes. They stayed at Lille one night, got the order cashed, and then went on to Paris, where they passed more notes. It was thought that those who were in pursuit, having procured full particulars concerning the passports of the parties, there would be no difficulty in finding them in Paris. It turned out, however, that although Lindor, in uttering the notes at Paris, in answer to the inquiries of the money-changers, stated his name to be Lindor, yet neither he nor Ortel could be traced by these names; and upon investigation it was discovered that the passports of which they had been the bearers were forged, as well as the notes they had passed.

Great Robbery at Messrs. Rogers and Towgood's.—A robbery to an unparalleled extent was committed between Saturday night and Monday morning, in the banking-house of Messrs. Rogers, Towgood, and Co., bankers, of Clement's-lane; bank-notes to the amount of from 40,000*l.* to 41,000*l.*, were stolen from out of the iron safe, which is deposited in the wall of the inner office, and securities to a very large amount were also taken by the thieves. It is a remarkable circumstance connected with this robbery, that on Monday morning, when it was first discovered, there were no external appearances from which suspicion could be entertained, upon entering the office, that any robbery or attempt at robbery had been made. Everything was in its accustomed order. The iron safe in which the cash and securities were regularly deposited was locked; and the iron chest in which it was usual to deposit the master-key of the safe, to which there were two locks, was also secure. It is said to be the practice of the partners of the firm, of which there are four, to relieve each other in the heavy cash business of the house at stated periods, and each of them keeps keys of the safe and iron chest; and it is supposed that one of the gentlemen left behind him his keys upon some occasion of hurry or forgetfulness, and

that with these keys the safe, &c. were violated. Some force had been used on a tin box in which several valuable securities were kept; but it appeared that the thieves had made some mistake with regard to the exact position of these documents, for they worked on the wrong side, and were so far disappointed. They laid hands upon enough, however, to console them for their blunder, as appears from the enormous list of Bank notes announced in a large handbill issued on Monday night, and containing particulars of the stolen notes, which amount altogether to 40,710*l.* Of these notes there are 168 for 5*l.*, 40 for 10*l.*, 37 for 20*l.*, 10 for 30*l.*, 12 for 40*l.*, 9 for 50*l.*, 10 for 100*l.*, 5 for 200*l.*, 1 for 500*l.*, 35 for 1000*l.* The hand-bill states that whoever will give such information as will lead to the apprehension of the guilty parties, and recovery of the property, shall receive 3000*l.* reward, or a part proportionate to the sum recovered. Sir James Graham has also advised Her Majesty to grant a free pardon to any accomplice who will give such information as will lead to the conviction of the robbers. The house of Rogers and Co. is situated in Clement's-lane, rather a quiet thoroughfare, and, on Sundays especially, comparatively deserted, the houses being chiefly let out as offices, having nobody in them on Sunday but the male or female housekeepers. This would so far afford facilities for the unobserved approach of the thieves, a court running also within two doors of the bank. One or two members of the swell mob were on Sunday observed in the neighbourhood of Lombard-street. The thieves may possibly have got away from one of the out-ports for the Continent on Sunday evening, or early on Monday morning; but it would have been useless to ship themselves, even if the opportunity offered, for any other part, if the object were to pass the notes. The house of Rogers and Co. has always done a good, though rather a private business; and the head of the firm, now advanced in age, is well known as the author of the "Pleasures of Memory." It is considered by those about the banking-house that the robbery was committed about mid-day on Sunday, and the reasonable inference from that conjecture is, that the thieves started by railroads to the several ports from which steamers were speedily to sail to various parts of the Continent. Messengers were sent off to France, Germany, Belgium, and other places, the several telegraphs were set to work, and the greatest exertions are being made by Mr. Hobler, whose experience and activity lead the members of the establishment to hope that detection may soon follow. On the robbery having been made known, the proper instructions were given to the police, and Mr. Harvey, and an inspector, waited on the firm to make inquiries, but the latter refused to give the slightest information to the officers, and referred them to Mr. Hobler, who has secured the able services of Daniel Forrester. No clue has yet been found to the discovery of the robbers, but it is believed that the parties, whoever they may be, as well as the property stolen, are still in the neighbourhood of London; an opinion which is borne out by the fact that Mr. Hobler has returned from Paris, and is now actively engaged with Forrester in following up their inquiries.

Evening Sittings at the Central Criminal Court.—At a committee of the Court of Aldermen on Saturday, the proposition of Alderman Wood to abolish the evening sittings of the Central Criminal Court for the trial of prisoners at the Old Bailey was taken into consideration; and it was unanimously resolved that the experiment should be tried, commencing with the sittings in December next. The consideration of the second part of Alderman Wood's proposition, for a third court for the greater despatch of business and the accommodation of the public, was reserved until the result of the experiment of abolishing the evening sittings should be ascertained.

East India Company.—We copy the following paragraph from the *Scotsman*:—"We have reason to believe that the Cabinet is meditating a complete change in the government of India, by introducing a measure next session tantamount to the extinction of the political power of the Court of Directors. The recent collision between the Government and the Directory, in the recall of Lord Ellenborough, may have quickened this bold policy; but it is well known that the abolition of the commercial monopoly of the East India Company was always intended to be followed up by ulterior changes in our government of that vast and distant empire. We believe that we are well informed when we state that the 'Merchant Princes' of Leadenhall-street will be deposed, if Ministers are strong enough to carry their design into execution."

Frauds upon Millers.—During the examination of a dealer in marine stores at the police court a few days since, for receiving a quantity of miscellaneous property, the produce of various felonies, it was stated by the police that on searching the place they found no less than 45 millers' and corn-factors' sacks, and an immense collection of other property, sufficient to fill two waggons, a good portion of which had been stolen. Mr. Chitty, a miller at Ilford, Mr. M'Whinney, a miller at Chelsea, and Mr. Day, a salesman in Spitalfields market, swore to a number of the sacks being their property. The wear and tear of his sacks cost one witness about 20*l.* per year, but from this system of robbery he had to expend from 180*l.* to 200*l.* per year to replace those stolen, and another witness lost from 50*l.* to 60*l.* per year by the same means. The losses of the whole trade were estimated at from 15,000*l.* to 20,000*l.* yearly in this manner, and they had, therefore, formed themselves into a society for their mutual protection.

Fires in London.—From the records in possession of the London Fire Brigade, it appears that no fewer than 800 fires have occurred in the present year; but that they have not been of so extensive a character as in former years. The number of lives lost, however, is much greater than the average.

Camden Chapel, Camberwell.—Last week, after the consecration of Camberwell Church, the Bishop of Winchester consecrated Camden Chapel, of which until recently, the Rev. Henry Melvill was minister. A large number of clergymen were present, and every available space in the building was occupied by the parishioners.

Suicides.—On Monday morning a double suicide was committed by two young persons in a respectable sphere of life at Mile-End. The young man was the son of Mr. Duckett, accountant, of Raven's-row, and the female, a Miss Elizabeth Williams, 20 years of age, to whom he had been paying his addresses for 9 years. They had evidently been dead some hours, and on the contents of the stomach being analysed, upwards of half an ounce of pure Prussic-acid was extracted. It appears that the young man purchased it at Battley's, the chemist in Fore-street, having procured it by representing himself to have been sent by a druggist who deals with the firm. Rumour had gained circulation that the deceased young woman was pregnant, but it was ascertained the report was without foundation. The parties had been long attached, but adverse circumstances having interfered to prevent their marriage, it is supposed that despair prompted them to this rash act. The young woman was the daughter of a surgeon in Cannon-street road, and the young man a clerk in his father's office. The Jury at the inquest returned a verdict "That the deceased persons died in consequence of having imbibed a certain quantity of prussic acid, but how administered there was not sufficient evidence before the Jury."—On Tuesday an inquest was held on the body of Lieut. E. A. May, aged 24, the son of Sir Stephen May, formerly Sovereign of Belfast, and a connection of the Marquis of Donegal. The unfortunate young gentleman had only arrived in England on the 20th from Madras, and on Monday morning he was found dead in his bedroom, at 17, Duke-street, St. James's, having cut his throat with a table-knife. It was stated in evidence, that deceased had shown symptoms of insanity during the voyage, and that he had been dismissed the Madras army by the sentence of a General Court-Martial, on account of a quarrel with a brother officer. The jury returned a verdict of Temporary Insanity.

Accidents.—On Saturday Lord Nugent met with a serious accident, whilst riding from Twickenham to town. His Lordship was cantering along the road, and riding loose at the same time, when his horse fell, and rolled completely over him. His Lordship, although much shaken by his fall, remounted his horse and rode on to town. Mr. Travers was then sent for, and at once discovered that his Lordship had sustained some internal injury, and had fractured three of his ribs. His Lordship, however, is doing well, and it is expected that he will suffer no ulterior inconvenience from the effects of his accident.

Strike of the Barking Fishermen.—No fewer than 60 fishing smacks, belonging to Barking, in Essex, are at this moment lying in the river, a little below Woolwich, their crews having brought them home from sea, and struck work for increased wages and shorter voyages. Their present rate of wages is—men 14*s.* a week, and mates 16*s.* They want this to be advanced 2*s.* in each case, and the time of absence to be limited to one month. The majority of the owners seem inclined to grant this, but others are averse to all concession. The general opinion however is, that the owners must give in, as this is the most profitable part of the year; "all hands" are in the strike, and the men of other places are not suited to the particular kind of fishery in which the inhabitants of Barking are engaged. It is certain that, if the strike continues long, the loss to large owners will be very great. Those who continue at sea will obtain high prices for such fish as they can bring to market, though it is doubtful whether this advantage will be more than overbalanced by their participation in the general loss.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Nov. 23; West Districts, 131; Northern, 159; Central, 145; Eastern, 212; Southern, 267; Total, 914. Weekly average for the last five years, 946.

Provincial News.

Banbury.—On Friday this neighbourhood was shocked by a report that Miss Jane Gulliver, daughter of Mr. Thomas Gulliver, of Bloxham, and sister to Mrs. Fisher, of Grimsbury-house, with whom she had been staying some time, had drowned herself. She was about 26 years of age, and had for a long period been in indifferent health, and latterly her spirits had been so much affected, that her medical attendant had suggested the propriety of her not being left alone. On the Friday morning she had, with one of her sisters, walked into Banbury, and soon after their return, her body was found in the stream of Grimsbury mill. It appeared that she had taken off her pattens and pinned her cloak tightly round her, and then thrown herself into the stream, which was very rapid and swollen by the previous rains that had fallen for some days. It is supposed that she must have been quickly carried to the spot where she was found, which is also about 40 or 50 yards from where she threw herself in. Her pattens were found on the bank by a man who was wandering by the river some time before the body was discovered. An inquest was held upon the body the following day. It came out in the course of the evidence that a report had prevailed that deceased was *enceinte*, but it was proved, on medical testimony, that there was not the slightest foundation for this aspersion on the character of the unhappy young lady. But to what cause the depression of spirits from which she had been suffering was attributable there was no evidence to show, and the Jury returned a verdict—"That deceased drowned herself whilst in a state of temporary insanity," at the same time expressing themselves satisfied that there was no foundation for the report alluded to, but which, for the satisfaction of her friends, the coroner had thought proper to investigate.

Jersey.—For some weeks past the case of Mr. Chas. Carus Wilson, who has been imprisoned by the authorities of Jersey for some offence connected, we believe, with contempt of court, has been prominently before the English public. Application was lately made on his behalf to Mr. Justice Patteson, for a writ of *habeas corpus* to bring up before the Court of Queen's Bench, in order that the reason of his imprisonment might be examined into, and decided upon. The writ was granted and addressed to the gaoler. This functionary, instead of complying with the writ, referred it to the Royal Court of Jersey, and that Court, after hearing the Attorney-General upon the subject, and after due deliberation, decided that the gaoler "should take no notice whatever of the said writ, their opinion being that the Court of Queen's Bench has not jurisdiction in Jersey, and that the writ of *habeas corpus* doth not run in that island." The question is considered one of great importance to the liberty of the subject, and it is supposed that it will be brought before Parliament next session. It is generally admitted, that if the judgment of the Royal Court of Jersey be correct, it is in some points of view rather a serious matter that there is a part of Her Majesty's dominions, within a few hours' access from the English shore, in which the writ of *habeas corpus* does not run.

Loughton.—On Wednesday week, a gentleman named Scott hung himself from a tree in that part of Epping Forest which is known by the name of Phillipson's Warren, High Beach; and this circumstance, together with the discovery of the skeleton of an old man, named John Harris, who was supposed to have been murdered near the same spot, has created an unusual degree of excitement in the neighbourhood. It appeared that on Wednesday Mr. Scott had arrived from his residence in the neighbourhood of Staines at the asylum of Dr. Allen. About 3 o'clock, a man in the employment of Mr. Phillipson, of the King's Oak Tavern, High Beach, having occasion to go into a small thicket adjoining the rabbit-warren, found the deceased gentleman suspended from the forked branch of an oak by a white silk handkerchief. He with much promptness cut him down, but he was quite dead. It was proved at the inquest that deceased was subject to fits of insanity, and had expressed his fear that he might lay violent hands upon himself. Dr. Darling, in consequence, recommended him to go back to Dr. Allen's Asylum, where he had been a patient before, and keep himself quiet there, and he would soon recover from such a feeling. The Coroner expressed his regret, that after what fell from the deceased gentleman about his intention to commit suicide, he was not put under some restraint or surveillance. Had such been done, his life might have been spared; and he considered that the conduct of Dr. Allen was not altogether free from blame in the unfortunate affair. The jury expressed a similar opinion, and returned a verdict that deceased had committed the act of suicide while labouring under temporary insanity.—The body of John Harris was found on Tuesday by a young lad named Henry Bacon, who was strolling through an unfrequented part of the forest, near Loughton, and discovered the body lying on the ground with a rope, much decayed, round the neck. The body was a mere skeleton, all the flesh having been devoured or decayed away. Another piece of rope, corresponding with that around the neck of the skeleton, was seen suspended from a tree above the body, leading to the conclusion that deceased had hung himself. He was last seen at the inn at High Beach, where he changed a sovereign and spent a shilling only, but the remaining money was not found upon him. The jury, under these circumstances, thought it best to return an open verdict, that he was "found dead," but by what means there was no evidence to show.

Nottingham.—The local papers observe that the extent to which child-poisoning is carried may be surmised from the fact stated before the Parliamentary committee on the health of towns, that one single druggist in Nottingham made up 13 cwt. of treacle into Godfrey's cordial in the course of one year.

Portsmouth.—The St. Vincent, 120, Captain the Earl of Hardwicke, arrived on Tuesday at Spithead from the experimental cruise. The St. Vincent beat her competitors, the Queen and Caledonia, in the cruise, which lasted 34 days. The squadron did not fall in with the Albion, 90, until two or three days after touching at Lisbon, when the four ships sailed in company to within about 80 miles of Madeira. They experienced very heavy gales during the early part of this month, but latterly the weather was fine. The trial, it is said, has fully proved the efficiency of our W. Symonds's ship Queen, which has been beaten by long odds upon every tack. The St. Vincent weathered upon the Albion, but the latter, carrying more canvass, carried off the palm. The Albion parted company with the rest of the squadron, and made for Lisbon on the 20th inst.—The submarine operations at Spithead on the wreck of the Edgar have finally ceased, and the moorings of the Success hulk were taken up on Friday. The anchorage

a Spithead is now entirely free from any obstruction from this wreck. It is said that an attempt will be made to remove the wreck of the Boyne, 98, which took fire on the 1st May, 1795, and sank when about a mile off Southsea Castle.—The royal yacht has been dismasted, and had her funnel unshipped, and her alterations will be proceeded with immediately, among which she will have a false keel of six inches added, and her rudder widened. It is reported, notwithstanding, that she will never be used again by the Queen, who has ordered another vessel to be built. A small iron screw-propeller is now building at Blackwall as a tender to the royal yacht. This little steamer is to draw only four feet six inches, so that she may be able to run close in shore, and enable Her Majesty to land and embark without the aid of any intermediate boat.

Peterborough.—The *Lincoln Mercury* states that not a hundred miles from Peterborough, at a late quarter sessions held in an ancient town-hall, a remarkable circumstance occurred. On the trial of a prisoner charged with robbing his master of various articles, the business had proceeded so far as to leave the matter in the hands of the jury; and that body not being able to come to a satisfactory determination whether the prisoner was guilty or not, and being locked up, the foreman proposed, in order to shorten the question, that the poker from the fireplace should be placed exactly upright, and that if it fell to the right the prisoner was guilty, and if it fell to the left he was not guilty! The poker so placed fell to the right, and the prisoner obtained three months' imprisonment in consequence.

Rochdale.—In accordance with a resolution passed in this town on the 21st inst., Mr. Sharman Crawford, M.P. for the borough, and Mr. Livesey, chairman of the Board of Guardians, proceeded to London, and had on Saturday an audience with Sir J. Graham at the Home-office. They presented to him the memorial committed to their charge, signed by 11,415 ratepayers, and detailed various matters connected with the present administration of the relief of the poor in the locality under the Select Vestries Act. Sir J. Graham stated that so strong a manifestation of the feelings of the people of Rochdale, together with the statements made by the deputation, should receive due consideration. Sir J. Graham, in answer to a memorial of the Board of Guardians, which had been forwarded previous to the memorial of the ratepayers, replied that he had no power to suspend or alter the operation of a general law.

Rochester.—A few days since a singular case came before the county magistrates sitting at this place:—Three men, named Meager, Oliver, and Prentis, were charged by the Rev. E. Shepherd, of Luddesdown, with having, on the 29th August, stolen a large quantity of peaches and nectarines from his garden. It appeared in the course of a long examination, that the prisoner Meager, at the time of the robbery, was gardener to the reverend gentleman, but had received notice to quit his situation; and in order to revenge himself upon his master he went to the two other prisoners and another man named Colman, who were at work close by, and said that he was going to leave his service on the following Monday, and wished that they would come and strip the garden, as the peaches and nectarines were getting nicely ripe. Colman, however, refused to have anything to do with it, and now appeared as a witness. The same evening Meager again saw them, and said, if they would come he would shut the dog up in the stable, and added that it was no new thing, for the garden was stripped almost every year. On the night of the 29th August the garden was accordingly stripped of its wall fruit, but not without disturbing Mr. and Mrs. Shepherd, who opened their bed-room window, and Mr. Shepherd threatened to fire, when Meager came up the walk, and said that if Mrs. Shepherd had not made a noise he should have caught the thieves. His manner excited suspicion, and subsequently the facts coming to the knowledge of the prosecutor, the prisoners were taken into custody. The two men admitted the truth of the witness's account, and said that the first night they went the dog interfered with them, and they told Meager, who said they ought to have let him know, and the next night the dog was fastened up. The bench thought Meager most to blame, and let off Prentis and Oliver on paying a fine of 6*d.*, 5*s.* for the fruit, and 13*s.* 6*d.* costs, but sent Meager to the House of Correction with hard labour for four calendar months.

Stapleford.—Several examinations of parties concerned in the riots consequent upon the attempt of the railway surveyors to get upon Lord Harborough's property have taken place before the county magistrates. In some cases the parties have been held to bail for assaults; in others the magistrates have refused to grant warrants. On Monday upwards of 200 special constables were sworn in for 21 days, and placed in various parts of Stapleford-park, and there are also several in the neighbouring villages, headed by some of the Leicestershire county police; they keep watch in parties of about 20, and are relieved every eight hours. It is stated that the surveys have recommenced on the Oakham-canal towing-path, and as there appears to be a right of way reserved to the public by the Act of Parliament, it is not thought that Lord Harborough or his advisers will venture again upon ejecting the railway agents from it.

Stourbridge.—This town for some weeks has been in a state of great excitement, in consequence of a report that Mr. S. C. Hassall, surgeon, had caused the death of his wife by ill treatment. The Jury at the inquest returned a verdict that death had been caused by deceased's habitual intemperance, but the interference of the police having produced an inquiry before the magistrates, Mr. Hassall has been committed to take his trial at the ensuing assizes on the charge of manslaughter, but has since been liberated on bail.

Sleaford.—The Lincolnshire *Chronicle* states that it is currently reported at Sleaford that a well-known millwright (a working man) of that place, by a recent decision in the Court of Chancery, immediately comes into the possession of a large estate near London of the annual value of 13,000*l.*, as well as arrears of rent for the same for the last 20 years, amounting to the sum of 260,000*l.*

Uxbridge.—In the *Maidstone Gazette* of the 9th inst. was inserted an advertisement expressing a desire to become acquainted with a lady, with a view to matrimony, the lady to be possessed of a small competency, and willing to take as a husband a man between 45 and 50 years of age, in independent circumstances, and not unprepossessing in appearance, and requesting any lady who might wish for an interview to address a letter to Mr. Stone, 99, Old-street, St. Luke's. The advertisement attracted the attention of a shopman of a cheesemonger of Uxbridge, who wrote a letter to the above address, signing it as "Frances Gower," expressing an earnest desire to have an interview with the advertiser, and requesting him on the following Sunday to come down to Uxbridge by the Wycombe coach, and to wear a flower in the button-hole of his coat, have a white-pocket handkerchief in his right hand, and be reading a book as the coach passed towards the inn. On Sunday the shopman was at the spot appointed, while numbers of his companions, to whom he had mentioned the hoax, were secreted at short distances. When the coach drew up, they saw on the box a respectably dressed individual, exhibiting the desired flower, book, and handkerchief. The shopman accosted Mr. Stone, and representing himself to be Miss Gower's brother, expressed on the part of his sister the regret she felt at having been prevented from keeping the appointment; but her papa not having gone to church that morning she was unable to leave the house, but she would meet him at ½ past 2 o'clock. Mr. Stone appeared disappointed, but agreed to accompany the young man in a walk about the town. The latter, however, led his victim in the direction of Uxbridge-moor, whither his companions had gone before, and on their coming up with them, Mr. Stone was hustled and thrown into a pond, and pelted with mud. Charles Henwood, gardener to Mr. R. Fell, and another of that gentleman's servants, were accidentally present, and used their utmost endeavours to rescue Mr. Stone from his assailants, in which they eventually succeeded, and conducted him to the cottage on the moor. Mr. Fell, on being made acquainted with the particulars of the outrage, conveyed Mr. Stone, who is stated to have formerly been clerk to one of the coroners for Middlesex, in his carriage to the West Drayton station of the Great Western Railway, on his way to town. On Monday 17 young men were brought before the magistrates charged with being concerned in this outrage; the ringleaders were fined 20*s.* each, and the rest dismissed with a reprimand.

Wigan.—On Monday week, an eruption of water and foul air, followed by an explosion, occurred in the coal-pit belonging to the trustees of Mrs. Williams, situated at Pemberton, about a mile and a half from this town. Two boys were killed on the spot, and two others so severely injured that they only survived a few hours. Several others were much bruised and burnt. The jury, at the inquest, after examining many practical men, who could give no explanation of the cause of the explosion, returned a verdict of "Accidental death."

Wolverhampton.—An investigation has for some days been going on in this town, in which a lady of hitherto respectable character, together with a married sister and a young surgeon, have been charged as being implicated in a case of infanticide. On the 28th ult. the body of a female child was found dead in Queen-street, at the back of the house of Mr. Quinton, surgeon. It appears that for some time previous to the finding of the body, Mr. Hildreth, printer, residing in the town, had paid daily visits to Mr. Quinton's surgery, always inquiring very particularly for Mr. Sheriff, Mr. Quinton's assistant. Mr. Quinton interrogated his assistant as to the cause of these frequent visits, and was informed that Mr. Hildreth wished him to procure abortion "for a person of great respectability, secrecy being guaranteed, and money no object." Mr. Sheriff asked Mr. Quinton if he would attend? but that gentleman refused to do so. Mr. Sheriff informed Mr. Quinton that the party was Miss Railton, of the Post-office; and subsequently applied to Mr. Doubler, surgeon, of the same place, but omitting the name. Mr. Doubler also declined to attend. Since the finding of the body, the suspicion attached to Miss Railton that the child was hers, and she was eventually apprehended by Colonel Hogg, of the county constabulary. She at first denied having had a child, but since her apprehension she made disclosures seriously affecting Mrs. Hildreth (her sister) and Mr. Sheriff, Mr. Quinton's assistant. From her statement it appears that on Sunday three weeks, at Mr. Hildreth's house, at noon, Mr. Sheriff went and performed an operation, and she was in dreadful agony from the time he had done this until she was delivered of a child. The body was taken away three or four nights afterwards, and the material question in the investigation is, whether the body found is that of the same infant. From the *post mortem* examination, there appears no doubt that the child was born alive. Mr. Sheriff, Miss Railton, and Mrs. Hildreth were then taken into custody, and after several examinations before the coroner's jury, were committed to take their trial at the ensuing assizes, Miss Railton for concealing the birth of her child, and the others as accessories.

York.—At the Yorkshire Assizes last year, a person named Joseph Mason, who resided at Clifton, near this city, was tried for having burglariously entered a house at Hall Moor, and was sentenced to 20 years' transportation. Many persons at the time believed that he was innocent, but he was sent to Norfolk Island. This week, however, two men who have been committed to York Castle for felony have confessed that they, together with two other persons now at large, committed the burglary at Hall Moor for which Mason has been transported. The two prisoners have also confessed that four other persons have been unjustly transported for offences which were perpetrated by the Hall Moor burglars. These extraordinary statements have been communicated to the Secretary of State.—The Derby papers mention that Earl De Grey has purchased the Duke of Devonshire's Burton Moor estate in this county.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2160*l.*; Bristol and Gloucester, 675*l.*; Eastern Counties, 3676*l.*; **Edinburgh and Glasgow, 2214*l.*; Great Western,** 12,976*l.*; Grand Junction, 7264*l.*; Glasgow, Paisley, and Ayr, 1464*l.*; Great North of England, 1664*l.*; London and Birmingham, 14,376*l.*; South Western, 3013*l.*; Blackwall, 648*l.*; Greenwich, 711*l.*; Brighton, 3702*l.*; Croydon, 367*l.*; Liverpool and Manchester, 1450*l.*; Manchester, Leeds, and Hull associated, 6016*l.*; **Midland, 8523*l.*; Manchester and Birmingham, 2922*l.*; Newcastle and Carlisle, 1655*l.*;** Newcastle and Darlington, 1054*l.*; Preston and Wyre, 338*l.*; South-Eastern and Dover, 40.5*l.*; Sheffield and Manchester, 692*l.* York and North Midland, with Leeds and Selby, 2189*l.*—We gave in our last a brief account of the fatal accident on the Midland Counties Line, of which the first intimation reached town on Friday night. It appears, from the detailed accounts which have since been published, that a tender belonging to an engine attached to a train of coal-waggons having got off the up line, about 150 yards above the station, passed the road crossing to Wilford, so as to impede the passage; and the out Derby train, which should have left Nottingham at 10 minutes to 3, was unable to proceed along the proper line, and some delay in starting consequently took place. At length, after waiting ten minutes or a quarter of an hour beyond its proper time, Mr. Lightfoot, chief clerk at the Nottingham station (having dispatched a messenger on foot up the line, to stop an expected down-train at the Beeston station, about three miles up the line), determined that the train should go along the down line at a slow pace, and accompanied it himself, calculating that the train would either reach the Beeston station before the arrival of the down-train, or that the messenger would stop the arriving train, so as to prevent collision. The messenger either did not arrive at Beeston in time for the train, or he did not deliver his message properly, for the train to Nottingham had left the Beeston station before the train from Nottingham had arrived, and the engineer, either not knowing or not regarding the message that had been forwarded, drove the train at its usual rapid pace; and as it had attained considerable impetus, in consequence of having proceeded about three-quarters of a mile towards Nottingham, he then came into contact with the up-train, on which was Mr. Lightfoot, with the engineer and stoker. In consequence of the dense fog which prevailed at the time, and had continued for a great part of the day, the collision was quite unavoidable, and the destruction tremendous. In consequence of the down-train being driven at so much more rapid a pace than the train from Nottingham, and being a much heavier train, and having a powerful and very heavy engine, the up-train from Nottingham sustained the principal part of the damage. The up-train consisted of an engine and tender, a second-class carriage, containing parcels, but no passengers; then two second-class carriages, with passengers, followed by a first-class carriage with passengers, and then a third-class carriage. So great was the force with which the down-train met the up-train that the engine of the latter was actually driven from its position downwards, and the boiler was elevated to the height of many feet above it; the tender of the engine was driven through the parcel carriage, and the two passenger second-class conveyances were as completely smashed to pieces as if they had been egg-shells. The unfortunate passengers in these two carriages were dreadfully crushed and mutilated, although, upon assistance being rendered, none were found actually dead. Mr. G. Baker, who had taken a second-class ticket, but had, by some accident, along with Mr. Tutin, butcher, been put in the first-class carriage, escaped without much injury. As soon as he was able to collect himself and alight, he assisted Mr. Wildey, who had been riding in the third-class, to release their more unfortunate fellow-travellers, and proceeded as rapidly as he could across some ploughed fields, to procure assistance; and about an hour after the accident, two carts, containing straw, and some other conveyances were procured, and some of the sufferers were conveyed to Beeston, some to Lenton, and others by a train sent up for the purpose, to Nottingham, when those who were able reached home, and others were taken to the infirmary. Twelve or fourteen were thus conveyed away seriously hurt. The following is a list of the sufferers, from the *Nottingham Journal*:—Mr. Dean, Hounds-gate, dead. Mr. Neep, of Retford, seriously injured, but hopes are entertained of his recovery. G. Burley, stoker, seriously scalded and burnt, the fire and boiling water having fallen upon him from the engine, when forced upwards by the collision. Mr. Bowlestridge, landlord of the Three Horseshoes, and Miss Ann Gretton, of Dove Cliff, Staf-

Yorkshire, who had been on a visit to Mr. Bowbridge's, and was returning with her father, who is manager of some iron works at Stoke cliff; all three were much bruised. At *Lenton*—the following persons are lying ill and wounded. Mr. Greeton, Burton-upon-Trent, severely crushed; Mr. Bradley, Southwell, farmer, leg broken; Mr. Varnalls, formerly butler at Colwick-hall, since dead. At *Beeston*—the following are lying ill: Mr. Arnold, medical instrument maker, severely bruised; Mr. Garratt, surgeon, of London, extensively injured. Mr. Robert Thornhill, lace manufacturer, slightly crushed. D. Fox, employed at Mr. Gill's silk mill, arm broken. Misses Ann and Maria Lewis, of Sneinton, owing to the violence of the concussion, were thrown out of the carriage, and their dresses becoming entangled, they were nearly stripped. One of them had actually the sole of her shoe torn off. Mr. Roberts, traveller, obliged to have his leg amputated. Mr. Thistlewood, of Lincoln, much injured; Mr. Nixon, Hounds-gate, do., Mr. G. Baker, slightly bruised; Mr. J. Wildey, Pelham-street, bruised; Mr. Tutin, sen., butcher, Nottingham, bruised. Miss Surplice, of Beeston, escaped by leaping out of the carriage; Mrs. Dean, sister-in-law to the deceased, and landlady of the Castle and Falcon, Nottingham, with her daughter, was also severely bruised and crushed. Inquests have been held at Nottingham and Beeston on the bodies of the two unfortunate persons who were killed. The evidence ran to so great a length, that it is impossible to give more than an abstract of those portions which affect the public at large. It appears that the Midland Counties Company have a book of regulations for the direction of their engineers, and that one of those regulations applies to cases in which an engine goes on the wrong line. *The precautions prescribed in this regulation were not taken* by the engine-driver of the second train—the one which caused the collision; there is no doubt that the man omitted them because he thought that another engine having gone to Beeston on the wrong line before him, those precautions were unnecessary, but it is, at all events, worthy of remark that these precautions were omitted; another regulation is, that in cases of fogs, the fog signals should be put in use, and from what appeared at the inquest it would seem that they are ingeniously contrived, being calculated to cause a loud explosion when the engine to be warned passes over them. These fog signals were not used on this unfortunate day, although the fog was so dense that the average distance which could be seen on the line, at all the parts in question, was about 150 yards. The engine-drivers of both the engines which came into collision, complained earnestly of the arrangement which had led to the occurrence, and the overseer of two engines, and an engine-driver, said, in answer to a question from the coroner, that if a man had been sent before the second train on the wrong line, and if, in obedience to the regulation, it had gone at four miles an hour, instead of 15 or 20, as it was going when the collision took place, the accident could not have happened. It was also stated that the signal which the engine driver made, was by constantly blowing his whistle from the time he left Nottingham; but that signal, he stated, would not tell that he was on the wrong line—it would merely tell that he was advancing; and in fact it was no signal at all as regarded the important matter of the wrong line. It was stated by the witnesses that one of the new regulations, if adopted, would have prevented the accident, and yet though one driver had these regulations many days before the accident, the man who drove the engine on the wrong line did not receive them until the day after the collision, having up to that time been in possession of another set of regulations, which differ in some points from the new ones. Inquests have been held on the bodies of the deceased persons, but although the jury have sat for several days, they have not yet been able to bring their inquiries to a conclusion.—On Thursday week another accident occurred on the Midland Counties Railway, at Knighton, near Leicester. A coal train started from the Leicester station for Rugby, a little before 7, P.M., and stopped just after passing the tunnel in consequence of the breaking of a coupling chain. During the delay thus caused, Jowett, the breaksman, got off the tender, and it is supposed, went to the other side of the railroad to gather some sand to strew before the engine, the rails being so slippery that the wheels did not bite, and from being in a stooping position, together with the noise of his own engine in his ears, he was not aware of the approach of the second goods train, by the engine of which he was struck on the forehead, and killed on the spot. The Jury at the inquest returned a verdict of Accidental Death. On Wednesday, another accident occurred on the same line, a guard named Woodward having been killed by his head coming in contact with a bridge, near the Syston Station, while arranging the luggage on the top of the carriage. The jury, at the inquest, returned a verdict of Accidental Death.—On Wednesday, as the train which left Greenock at half-past 10 was proceeding from Paisley to Glasgow, and about half-way between these towns, the hind axle of the locomotive suddenly gave way, and the train was almost immediately brought to a stand. As the accident was instantly discovered, no farther damage was sustained. Many of the passengers walked to Glasgow, and the remainder were taken by a locomotive sent to receive them.—On Thursday week a young man named William Murrowood, a stoker in the employ of the Birmingham and Gloucester Company, lost his life at the railway bridge, near Kingsnorton, under the following circumstances:—The train which leaves Birmingham about 7 P.M., in its progress westward, passed through one of the densest fogs which has been known to occur for many years. The train proceeded at a rapid rate up to the bridge, which is considered too narrow in its construction, and is supported by upright iron pillars, between which and the train there is scarcely more space than will admit the carriage steps. Before arriving at the bridge, deceased, who was expecting the coming up of another engine to assist, leaned over to look back, when his head caught one of the upright pillars, and he was killed on the spot. An inquest was held, when the driver of the engine was asked whether he considered the pillars dangerous? He replied that he did so, and that he frequently had occasion to caution passengers not to look out of the carriages when passing under the bridge. There were marks upon several of the pillars where luggage upon the trains had struck against them. In consequence of this evidence, the coroner adjourned the inquest until Wednesday, when the jury returned a verdict of Accidental Death, with a deodand of 1s. on the engine. One of the directors stated, that they had not previously been aware of the danger of the bridge, but it should be immediately altered.—On Thursday week a fatal accident took place on the line of the Great Western, near the station at West Drayton, by which two men lost their lives. About ½-past 8 A.M. six men, including the two killed, were engaged in repairing a portion of the railway westward of the station, when the sound of an approaching up-train was heard in the distance. Four of the men immediately got off the line, but the two deceased, instead of following their example, moved only from the up to the down line. At the time there was a very dense fog so that objects could not be seen beyond a short distance, in consequence of which the men were not aware of the approach also of the down train, until it was so close that all chance of escape was hopeless, and they were instantly knocked down and killed. The persons having charge of the train were not aware of the accident until their arrival at Slough, when some of the railway officers observing blood on the tender of the engine, communicated the fact to the guard, when persons were immediately sent along the line to ascertain the cause, who found the bodies of the two men lying in a frightfully mutilated state on the down line between the Slough and West Drayton stations. An inquest was held on Saturday, when a verdict of Accidental Death was returned.—A special meeting of the Leeds and Bradford Company was held last week, at which it was unanimously resolved to undertake the formation of an extension line from the Leeds and Bradford Railway at Shipley to Colne, and a branch railway from Keighley to Hawarth, and the directors were authorised to apply to Parliament next session for an Act, and to raise an additional capital of 500,000*l.* by the creation of 8000 shares of 50*l.* each, and 8000 shares of 12*l.* 10*s.* each.—A meeting of the Midland Company was held on Tuesday at Derby, at which it was resolved to agree to a lease in conjunction with the Manchester and Birmingham Company of the Sheffield, Ashton-under-Line, and Manchester Railway, the lease to be for 30 years, and the weekly payment to commence at 2800*l.* The Chairman said that this step had been caused by the course which the Manchester and Leeds Company had taken with reference to the London and York Railway, and it was in self-defence that the Midland Company had determined on entering upon their lease, in order that they might have an independent terminus in Manchester.

IRELAND.

Dublin.—The Lord Lieutenant has nominated four of the five Roman Catholic Commissioners under the Charitable Bequests Act. These are Dr. Croly, Archbishop of Armagh; Dr. Murray, Archbishop of Dublin; Dr. Kennedy, Bishop of Killaloe; and the Right Hon. A. R. Blake, late Chief Remembrancer of the Exchequer; all of whom, it is stated, have consented to act. The fifth Roman Catholic Commissioner has not yet been appointed; but it is understood that either the Earl of Fingal or Sir Patrick Bellew, Lord Lieutenant of Louth, will complete the number. It is stated that the Government have intimated their willingness to amend the act next session, in such a manner as to do away with the objections as to interference with the usages and discipline of the Roman Catholic Church in Ireland.—The Irish representative prelates for the parliamentary session of 1845 are the Archbishop of Dublin, the Bishops of Meath, Kildare, and Cashel. Five Roman Catholic Clergymen in Ireland, Messrs. Frost, Burke, O'Brien, Brisbie, and Macnamara, have lately renounced Catholicism, and are now preparing for the ministry of the Church of England.—The Duke of Devonshire has contributed 100*l.* to the fund for Father Mathew, and has written a very handsome letter expressing much sympathy for that gentleman, whom his Grace describes as "the deservedly esteemed and universally respected, the good and benevolent Father Mathew."—The Repeal Association met on Tuesday, Mr. M. O'Connell in the chair. After several remittances from America and other places had been handed in, and a letter read from Dr. Blake, Roman Catholic Bishop of Dromore, in favour of Repeal, Mr. O'Connell, who wore a new cap richly decorated with gold lace, delivered the speech of the day.

He commenced by proposing an "Hurrah for the Repeal!" and then said that they had entered on a new campaign, and then recounted a long list of Irish grievances, apologising for being compelled so often to repeat himself. He attacked both Whigs and Tories, preferring, however, the Tories, not because he thought they could ever be right even by accident, but because they were open enemies, and he knew better how to deal with them. He attacked the press both of England and France, and indulged in violent invectives against the King of the French. As to Federalism, he said he never had agreed to give up one particle of the [illegible] no day to pass without doing something to forward the Repeal of the Union. The people were as animated on the subject as ever. They are too manly and too good to be used in the cause of any party. Ireland must be for the Irish. He would maintain the Queen, the Throne of the Crown, but Ireland must be Irish for herself. Hurrah for the Repeal! He concluded a very long speech by moving "That it be referred to a committee, to inquire into the best means of establishing a Parliamentary inquiry into the late state prosecutions," and "That Mr. Crawford's letters on Parliamentary privilege in a criminal matter, who were to treat them with the utmost contempt." He postponed his motion relative to the Privy Council System, having found more difficulties, he said, in the way of its formation than he had anticipated.

At the close of the meeting, Lord Ffrench was called to the chair, and the rent was announced to be 541*l.* 2*s.* 8*d.*

Limerick.—The Munster banquet and procession to celebrate the liberation of Mr. O'Connell and his fellow traversers, took place in this city on Wednesday the 20th inst. For some miles out of Limerick the roads were thronged with people, who welcomed Mr. O'Connell's approach with vociferous cheering. On entering the city Mr. O'Connell, who looked all the better for his visit to his native mountains, addressed the people from the window of his hotel, and entered at great length into the various topics of Repeal.

"I have seen," he said, "many an exhibition of popular strength and determination, but I never saw any to equal—oh, certainly never one to exceed the demonstration of this day. I have physical force enough to accomplish the worst of purposes, if I had any such desire. No Monarch in Europe has a larger army about him than my volunteer army to-day. But how glorious to the people of Ireland; they do not meet to do mischief—they have no inclination to do it, but, confining themselves within the paths of law and propriety, they commit no crime against the laws of man—they commit no offence against the laws of God. The trial has had one useful effect, it is now decided by the House of Lords, on solemn decision, that numbers constitute no crime—that no matter how great the numbers of the persons assembled, if their conduct be peaceable, they are perfectly free from stain or reproach, or the traps or chicanery of virulent prosecution. I am quite content that the English should have England—is not that fair?—(Cries of 'Yes')—that the Scotch should have Scotland, but a little bird told me in a whisper, some time ago, that another thing is also equally fair, Ireland for the Irish. It is vain to suppose that we will not carry the Repeal. If any one fact had occurred that would tarnish the conduct of the people I might despair of Repeal; but they have preserved—their conduct has been peaceable, and all we want now to insure success is perseverance. Organise yourselves then—have Repeal wardens in every district—Repeal rooms—Repeal libraries. Let every man who has a vote register. Let every man who can sign a petition join with me in petitioning for an inquiry into the recent state trial. Let us agitate—agitate—agitate—peaceably but determinedly, and we shall have the Repeal. Is there a man amongst you that will bear to have it said that the English must govern him—that he is not fit to govern his own country? I thank Heaven the people have not been driven to madness by the nonsense of the English newspapers in saying that England must govern us. I say it must not. The Queen is the Queen of Ireland, as well as of England. We recognise her title, and submit to her rule. We are attached to the Crown, as far as she is concerned. But we will not allow that any other part of the Empire nation shall govern us. We are ready to be good neighbours, but will never consent to be their servants or slaves. They will have their reporters here to-day—let them inform the English people, in my name, and I will answer for it that it is your sentiments also, that we are determined peaceably and tranquilly, but with the most fixed resolve, to have a Parliament in College-green. No nation of nine millions is miserable enough to be dragged at the tail of any other nation on the face of the earth. There are seventeen independent states of Europe which are not the equal in population, in physical resources, in strength, or even in bravery, to the Irish people. Aye, which are not their equals in intellect or in religious feeling. We will make the eighteenth—not by separating from England—not by violating our allegiance, but by a strict perseverance for independence until we have a Parliament in College-green—until we have the Irish Queen, the Irish Lords, and the Irish Commons, making laws in Ireland for Ireland. Hurrah for the Repeal!"

The dinner took place in the evening, and about 700 or 800 gentlemen were present. Mr. W. S. O'Brien, M.P., presided. On his right sat Mr. O'Connell, Dr. M'Hale, "the Lion of the fold of Judah;" Dr. Brown, the titular Bishop of Elphin; Mr. O'Brien, M.P.; Mr. Roche, M.P.; Mr. Kelly, M.P.; Mr. Powell, M.P.; Sir V. Blake, M.P.; Mr. Bridgeman, M.P.; Mr. Maher, M.P.; Mr. M. J. O'Connell, M.P.; Mr. Fitzgerald, of Muckridge. On his left, Dr. Geary, Mayor of Limerick; Mr. Fegan, Mayor of Cork; Dr. Phelan, Mayor of Clonmel; Alderman T. Lyons, Sir B. Morris, Sir R. Musgrave, Mr. Lynch, ex-Justice of Peace, Galway; Mr. Steele, Mr. Barrett, Dr. Gray, &c. Mr. O'Connell's speech was of course the event of the evening; it dwelt at great length on the well-known topics of Repeal—the resources of Ireland, and the grievances she has endured from British ministers of all parties. He concluded by saying:—

"I have been so much abused, that I am resolved to mind it no more, but to press for the restoration of national independence alone, and to look for nothing, think of nothing, but our own Parliament in College-green. I have detained you long. (Cries of 'No, no, go on!') There's no use in saying 'No, no!' You can't put back the clock. (Cheers and laughter.) Well, I have but a few words more to say to you. They are these:—The period of my life cannot now, in the course of nature, be long. Yes, I have fallen on the sear and yellow leaf, and the span of my life is measured by a few declining years, in all human probability, by far less; but [illegible] you, be the time long or short, I am determined, for the sake of Ireland, that not a week, not a day, not an hour, shall pass, without my thinking how I may do good to Ireland, and, acting for her independence, no matter what disappointment or treachery I may meet with, I shall work on. Will you work with me? (Loud cries of 'We will.') Aye, well I know it. The loyal, the religious, the moral people of Ireland will work on with me. Even if we fail, is it not delightful to be engaged in a struggle for one's country? What do I feel coursing through my veins at the thought, which he who never

has been in that struggle can never feel, as he goes crawling along calculating on which side lies the profit! Poor paltry wretch—if such there be—I tell him to reckon the throbbings of my heart as it beats with all its pulse for old Ireland, and to know what the pleasure is which I feel in struggling for her liberty. That is my duty and my happiness, and recollecting that loved land—the fairest, sweetest spot on earth—more fertile, more populous than 10 states of Europe—more powerful, I will say too, than almost any state, for her tremendous physical force is concentrated in a narrow compass—can I doubt that such a country was fitted for one day of prosperity and happiness? Aye, that day is near at hand. The morning star of independence has shone forth. I think the sun of liberty will soon appear over our horizon, and rise into the ascendant, giving light to all, and infusing the life, heat, and animation of liberty into old Ireland."

The meeting was subsequently addressed by Mr. S. O'Brien, Mr. Steele, Mr. Barrett, and Dr. Gray.

Archbishop M'HALE returned thanks for the Roman Catholic hierarchy, and justified his order in supporting and furthering Mr. O'Connell's agitation, on the ground that by doing so they showed their sympathy for the people, and their desire to alleviate their distress. He maintained too that the Roman Catholic clergy, when they mixed in secular assemblies, evinced an anxiety to soothe and not irritate, and endeavoured to lay into repose the mutinous elements of society. They had been accused of co-operating with conspirators, but the decision of the House of Lords had shown that the charge of conspiracy was unfounded. If it were otherwise, neither bishops nor clergy would be there that evening, for neither the Roman Catholic priesthood nor episcopacy held any sympathy with sedition. No, it was well known that they had a holier and wiser discrimination, and that their chief object and incessant endeavour was to discharge the respective duties which they owed to the temporal powers on the one sine, and their spiritual authority on the other. The spiritual allegiance of the Roman Catholic priesthood was upon every page of their melancholy history, and was attested by the monuments of every city in Europe—these monuments which served as beacon-lights to guide them in the path of their duties, and they loved to walk in the old beaten path which their pious ancestors had trodden. From those duties they would not shrink, for it was the discharge of such duties that had enabled them, with their illustrious guest at their head, to strike off some of the chains that bound the energies of Ireland. The same course would, he trusted, enable them to get rid of the odious remnant of these chains, and resist their reformation in a more hideous form. The reverend prelate concluded a very fluent speech, by condemning the Charitable Bequests Bill, and with it the framers of it, as the offspring of a most insidious policy, and of an unworthy effort to injure the Roman Catholic Church in Ireland.

Dr. Browne also returned thanks, concurring in what had fallen from the Archbishop of Tuam, whom he took as his polar star in religion, while Mr. O'Connell was his political guide. Several other toasts of local interest followed.—An important cause which has been pending between the Poor-law Commissioners and the Limerick Board of Guardians was decided last week in the Court of Queen's Bench. After the legal argument had been concluded, the Court delivered a judgment which is, in effect, a decision against the Commissioners, inasmuch as they refused the *mandamus*, at the same time intimating that it was not in the power of the Guardians to resign, and that it was optional with the Commissioners to receive their resignation, and cause another board to be elected.

SCOTLAND.

Edinburgh.—A public meeting was held last week to consider the scheme for supplying public baths for the working classes. The meeting, which was crowded by a numerous assemblage of all classes, was called at the instigation of the committee for erecting the baths. The Duke of Buccleuch took the chair, and was supported by Lord Dunfermline, the Lord Justice-General, Lord Cunninghame, Lord Murray, Sir J. M'Neill, Mr. Rutherford, M.P., Bishops Terrot and Gillis, Sheriff Spiers, Mr. R. Chambers, &c. Votes suitable to the occasion were proposed by Lord Murray and others, and carried unanimously. Thanks were voted to the Duke of Buccleuch, who, before leaving the room, put down his name for 100*l*., and that of the Duchess for 25*l*.—A large meeting of the Chamber of Commerce was held on Friday, when resolutions were passed condemnatory of any change in the currency of Scotland. It was announced by one speaker that the merchants of Manchester were willing to assist the Scotch in petitioning Parliament against any change.

Theatricals.

HAYMARKET THEATRE. — A new five-act comedy by Mr. Bourcicault, entitled "Old Heads and Young Hearts," was produced last week at this theatre, and with complete success, in spite of much obscurity of plot in the three last acts, which marred what would otherwise have been one of the best of our modern comedies. The play opens well. At the rising of the curtain we are at the chambers of *Littleton Coke* (Mr. C. Madeas), a younger brother and a briefless barrister, whom his mother thrust into the bar because she had dreamt he would become Lord Chancellor. He has run through his fortune at College, and mortgaged his paternal acres to his brother *Tom Coke* (Mr. Webster), a Yorkshire squire. He is holding a consultation with his factotum, *Bob* (Mr. Buckstone), who informs him that a loan he had anticipated from a friend had resolved itself into the singular fact of his friend's reply that "he is in Florence." His last hopes are fixed upon a letter he has written to his brother *Tom*; the answer arrives—the money is refused. *Coke* vows irrevocable alienation from his brother, and is plunged in utter despair. A knock is heard, when *Lord Charles Roebuck* (Mr. Holl) enters: he is the prodigal son of the pompous Home Minister of the day, the *Earl of Pompion* (Mr. Pilbury). *Lord Charles*, who has been for nine years, at Eton and Cambridge, the chum of *Littleton*, relates his rencontre with *Miss Rocket* (Miss Julia Bennett). He found her overturned in her carriage on the road, with an old East India Colonel, her father (Mr. Strickland), and fell in love with her. In his communicative spirit, he further informs his friend that his father destines him to two unwelcome offices—to wed a gay, rich, and fashionable widow, his cousin, *Lady A. Hawthorn* (Madame Vestris), and to become M.P. for a borough. *Coke* undertakes to thwart the old nobleman's designs, by relieving his son from the Lady and the borough. But hardly is the plan arranged, when *Bob* announces two suspicious visitors, whom, by their description, *Littleton* takes for the moneylender and the attorney. The friends escape, whilst *Bob* receives, with a broadside of indignant epithets, the new comers—who are, however, *Littleton's* elder brother, *Tom Coke* (Mr. Webster), just returned an M.P., and an aged clergyman, *Jesse Rural* (Mr. W. Farren), who has been as a father to both, but who especially doats upon *Littleton*. They have both come to relieve *Littleton* from his necessities; but brother *Tom*, when insulted by *Bob*, is highly incensed, while *Rural* is lost in amazement. In the meantime, *Littleton* is introduced by his aristocratic friend at his mother's, the *Countess of Pompion* (Mrs. W. Clifford), whose only thoughts are concentrated upon fashion, her lap-dog, and herself. Here *Littleton* meets *Lady Alice Hawthorn*, and they fall, at first sight, into mutual love. The gay widow has discovered the object of her cousin's passion, and *Charles Roebuck* is gladdened with the sight of *Miss Rocket* and her father, whom the scheming *Earl of Pompion* has been induced to invite to his house, under the false notion, insinuated by *Lady Alice*, that he disposes of two seats in Parliament. Once united in the drawing-room of Pompion House, a succession of plots and counterplots, of mistakes and cross purposes, succeed each other, too innumerable and intricate to enumerate—the innocent clergyman becoming the confidant of all parties, and the Marplot of the intrigue. *Tom Coke* falls in love with *Lady Alice*, who encourages him to elucidate the feelings of his brother; but the mistake is soon cleared up, and ultimately the young lord and the young barrister, disguised as postboys, gallop away with their lady-loves to Closeborough, for which *Littleton* is at last returned as member. Unfortunately they each discover, on arriving at the end of their journey, that they have arrived with the wrong one. Whilst the gentlemen quarrel on this subject, the *Colonel*, the *Earl*, and the *Countess* arrive in hot pursuit, and all parties attack the poor clergyman, who, by his gentle-hearted bluntness, has been the origin of all the mischances. But, as comedies must terminate at the fifth act, the dramatist here interposes his magic rod, and at once the *Old Heads* are conciliated, and the *Young Hearts* made happy. Long as may appear this account of the argument, it is far too short to guide the reader through the labyrinth of the intrigue. The scenery was most gorgeous. Seldom indeed has anything been seen on the stage more perfect than the laying out of the drawing-room of *Lord Pompion*. At the fall of the curtain there was a perfect storm of applause, mingled with calls for the author and Mr. Webster, in the midst of which Mr. Farren came forward to announce the comedy for repetition. The calls for the author and manager were, however, continued incessantly, upon which Mr. Bourcicault made his bow from a private box, and Mr. C. Mathews and Miss Julia Bennett made their appearance on the stage. The demand for Mr. Webster, so far from diminishing, increased in force, and at last the curtain drew up and discovered nearly everybody concerned in the play drawn up upon the stage to divide the compliment with their manager.

Miscellaneous.

The Eclipse of the Moon.—The commencement of the eclipse on Sunday night was not seen in the metropolis, owing to the hazy weather. About midnight the darkness was intense. A little before one o'clock, however, the moon appeared tolerably clear, and for nearly half an hour before the last contact with the shadow was distinctly visible. It is worthy of remark that in consequence of the hazy state of the atmosphere, the eclipse was not seen in Edinburgh, and our foreign news informs us that the fog rendered it equally invisible in Brussels and Paris. It was seen, however, in Dublin, and at various places on both sides of St. George's Channel.

Miss Martineau and Mesmerism.—The *Athenæum* of Saturday contains a long communication from Miss Martineau, detailing the particulars of her wonderful cure, which has been effected by mesmerism, after a serious illness of five years and a half. Of the character of the disease under which she suffered she thus speaks:—"This is not the place in which to give any details of disease. It will be sufficient to explain briefly, in order to render my story intelligible, that the internal disease under which I suffered appears to have been coming on for many years; that, after warnings of failing health, which I carelessly overlooked, I broke down, while travelling abroad, in June, 1839, that I sank lower and lower for three years after my return, and remained nearly stationary for two more preceding last June. During these five years I never felt wholly at ease for one single hour. I seldom had severe pain, but never entire comfort. A besetting sickness, almost disabling me from taking food for two years, brought me very low, and, together with other evils, it confined me to a condition of almost entire stillness—to a life passed between my bed and my sofa. It was not till after many attempts at gentle exercise that my friends agreed with me that the cost was too great for any advantage gained: and at length it was clear that even going down one flight of stairs was imprudent. From that time I lay still, and by means of this undisturbed quiet, and such an absence of emotion as kept down my most urgent distresses, I passed the last two years with less suffering than the three preceding. There was, however, no favourable change in the disease. Everything was done for me that the best medical skill and science could suggest, and the most watchful humanity and family affection devise, but nothing could avail beyond mere alleviation. My dependence on opiates was desperate. My [illegible] was the most singular man I know, and the most self-deceiving, kept assuring his patient friend—as we said to one another Christmas, and new year's, that he found himself compelled to give up all hope of effecting the disease—of doing more than keeping me up, in collateral respects, to the highest practicable point. This was no surprise to me, for when any specific medicine is taken for above two years without affecting the disease, there is no more ground for hope in reason than in feeling. In June last I suffered more than usual, and new measures of alleviation were resorted to. As to all the essential points of the disease I was never lower than immediately before I made trial of mesmerism." Miss Martineau then gives the following narrative:—"On Saturday, June 22, Mr. Spencer Hall and my medical friend came, as arranged, at my worst hour of the day, between the expiration of one opiate and the taking of another. By an accident the gentlemen were rather in a hurry—a circumstance unfavourable to a first experiment. But result enough was obtained to encourage a further trial, though it was of a nature entirely unanticipated by me. I had no other idea than that I should either drop asleep or feel nothing. I did not drop asleep, and I did feel something very strange. Various passes were tried by Mr. Hall; the first that appeared effectual, and the most so for some time after, were passes over the head made from behind, passes from the forehead to the back of the head, and a little way down the spine. A very short time after these were tried, and 20 minutes from the beginning of the *séance*, I became sensible of an extraordinary appearance, most unexpected, and wholly unlike anything I had ever conceived of. Something seemed to diffuse itself through the atmosphere—not like smoke, nor steam, nor haze—but most like a clear twilight, closing in from the windows and down from the ceiling, and in which one object after another melted away till scarcely anything was left visible before my wide-open eyes. First the outline of all objects was blurred; then a bust, standing on a pedestal in a strong light, melted quite away; then the opposite bust; then the table with its gay cover; then the floor, and the ceiling, till one small picture, high up on the opposite wall, only remained visible, like a patch of phosphoric light. I feared to move my eyes, lest the singular appearance should vanish; and I cried out, 'O! deepen it! deepen it!' supposing this the precursor of the sleep. It could not be deepened, however; and when I glanced aside from the luminous point I found that I need not fear the return of objects to their ordinary appearance while the passes were continued. The busts re-appeared, ghost-like, in the dim atmosphere, like faint shadows, except that their outlines, and the parts in the highest relief, burned with the same phosphoric light. The features of one, an Isis with bent head, seemed to be illumined by a fire on the floor, though this last has its back to the windows. Wherever I glanced all outlines were dressed in this beautiful light; and so they have been at every *séance*, without exception, to this day; though the appearance has rather given way to drowsiness since I left off opiates entirely. This appearance continued during the remaining 20 minutes before the gentlemen were obliged to leave me. The other effects produced were, first, heat, oppression, and sickness, and, for a few hours after, disordered stomach, followed, in the course of the evening, by a feeling of lightness and relief in which I thought I could hardly be mistaken." The second application was made by Miss Martineau's maid. "Mr. Hall," says Miss Martineau, "was prevented by illness from coming over, too late to let me know. Unwilling to take my opiate while in expectation of his arrival, and too wretched to do without some resource, I rang for my maid, and asked whether she had any objection to attempt what she saw Mr. Hall do the day before. With the greatest alacrity she complied. Within one minute the twilight and phosphoric lights appeared; and in two or three more a delicious sensation of ease spread through me—a cool comfort, before which all pain and distress gave way, oozing out, as it were, at the soles of my feet. During that hour, and almost the whole evening, I could no more help exclaiming with pleasure than a person in torture crying out with pain. I became hungry, and ate with relish, for the first time for five years. There was no heat, oppression, or sickness during the *séance*, nor any disorder afterwards. During the whole evening, instead of the lazy hot ease of opiates, under which pain is felt to lie in wait, I experienced something of the indescribable sensation of health, which I had quite lost and forgotten. I walked about my rooms, and was gay and talkative. Something of this relief remained till the next morning; and then there was no reaction. I was no worse than usual; and perhaps rather better. Nothing is to me more unquestionable and more striking about this influence than the absence of all reaction. Its highest exhilaration is followed, not by depression or exhaustion, but by a further renovation. From the first hour to the present, I have never fallen back a single step. Every point gained has been steadily held. Improved composure of nerve and spirits has followed upon every mesmeric exhilaration. I have been spared all the weaknesses of convalescence, and carried through all the usually formidable enterprises of return from deep disease to health with a steadiness and tranquillity astonishing to all witnesses. At this time, before venturing to speak of my health as established, I believe myself more firm in nerve, more calm and steady in mind and spirits, than at any time of my life before. So much, in consideration of the natural and common fear of the mesmeric influence as pernicious excitement—as a kind of intoxication." Miss Martineau mentions several incidents. — "Another striking incident occurred in one of the earliest of my walks. My mesmerist and I had reached a headland nearly half a mile from home, and were resting there, when she proposed to mesmerize me a little—partly to refresh me for our return, and partly to see whether any effect would be produced in a new place and while a fresh breeze was blowing. She merely laid her hand on my forehead, and in a minute or two the usual appearances came, assuming a strange air of novelty from the scene in which I was. After the blurring of the outlines, which made all objects more dim than the dull gray day had already made them, the phosphoric lights appeared, glorifying every rock and headland, the horizon, and all the vessels in sight. One of the dirtiest and meanest of the steam tugs in the port was passing at the time, and it was all dressed in heavenly radiance—the last object that any imagination would select as an element of a vision. Then, and often before and since, did it occur to me that if I had been a pious and very ignorant Catholic, I could not have escaped the persuasion that I had seen heavenly visions. Every glorified object before my open eyes would have been a revelation, and my mesmerist, with the white halo round her head, and the illuminated profile, would have been a saint or an angel."

Law.

COURT OF CHANCERY.—*The Duke of Leeds* v. *Lord Amherst*.—This appeal was argued at great length on Saturday, the 17th, and Monday, the 18th, and involved the right of possession to an equestrian painting of Marshal the Duke of Schomberg.—The LORD CHANCELLOR now gave judgment, and stated, that the facts were very simple in themselves. The late Duke of Leeds, by his will, bequeathed *inter alia*, all his portraits, including those of his mother, of his grandfather and grandmother, Lord and Lady Holdernesse, of his son, and of the Duke of Schomberg, to trustees, to allow his son-in-law, Mr. Sackville Lane Fox, to have the use of them for life, with remainder over as specified in the will; and in another part of his will the Duke gave all the articles of furniture, ornaments, &c., at Hornby Castle not before specifically bequeathed to his trustees to sell, with the right of pre-emption, however, to his son, then the Marquis of Carmarthen. Upon the decease of the late Duke three paintings of the Duke of Schomberg were found, one in crayons, one a half-length portrait, and the grand equestrian painting by Sir Godfrey Kneller, which was the subject-matter in dispute. A suit was instituted before the Vice-Chancellor of England, and it was referred to the Master to inquire what portraits of the Duke of Schomberg the testator was pos-

sessed of at the time of his decease. The Master reported that the equestrian painting was a portrait, and passed under the bequest to Mr. Sackville Lane Fox. Exceptions were taken to such report and argued before the Vice Chancellor, who in a most elaborate judgment confirmed the view taken of the matter by the Master. Such being the position of the case, the sole question was, whether this equestrian painting could properly be denominated a portrait of the Duke of Schomberg. A great deal had been said during the progress of the argument upon the derivation and strict meaning of the word "portrait," but it was not his Lordship's intention to attempt *tantas componere lites*, being himself of opinion with a learned German author, that *etymologia ei nomina vera promittit*. On the one side it had been argued that *portractus* implied discussion and consideration, and on the other hand it had been insisted that it only meant a slight carrying over. He, however, was inclined to think that the article *per* was one of intensity, even at the risk of going in opposition to the whole learning of the university. Was this painting, then, a portrait in the ordinary signification of the word? Did it possess the proper characteristics of one, in delineating the face of the person represented, while the other parts of the picture were subordinate to that object? He must say that he never had much doubt upon the point, and looked upon the horse and the battle in the background as by no means constituting the chief ingredients of the picture. A judicious painter always introduced such objects as merely accessary to the main design, namely, the portrait. A judge was painted in his ermine, a bishop in his lawn sleeves, and a warrior in his armour. Could it be said that the equestrian paintings of Charles I., of Lord Ligonier, of General Amherst, and the beautiful picture of the Duke of Wellington, by Sir Thomas Lawrence, in the possession of Sir Robert Peel, were not portraits? Would the last-mentioned one be ever called a picture of the Battle of Waterloo? Then why, in this instance, should this picture be taken out of the class of portraits because the Duke of Schomberg happened to be on horseback, and there was a battle in the perspective? Surely no one would call it a painting of the Battle of the Boyne, even if that battle were meant, for the largest division of troops was not larger than the horse's hoof. It was quite consistent, therefore, to represent the Duke of Schomberg in armour on horseback, with a person holding his helmet, for armour was worn at that time; and the picture itself, taken altogether, was full of fire, character, and spirit, and was painted with great judgment by the artist, being one of his finest productions. With respect to the question whether the picture was intended to represent the Battle of the Boyne, he was inclined to lean to the opposite opinion, inasmuch as some prints of it had been produced by Houbraken, Vandergucht, and Smith, which were all anterior to the Battle of the Boyne; and, therefore, looking at the matter in every point of view, he was of opinion with the Vice-Chancellor of England, that the equestrian painting was a portrait of the Marshal Duke of Schomberg, and passed under the bequest to Mr. S. L. Fox, and the appeal must be dismissed.—In answer to an application for the costs, the LORD CHANCELLOR said, he never had entertained much doubt upon the subject; but had deemed it necessary so far to enter into the question, as in all probability he should hear of it in a higher tribunal, and was therefore desirous that his judgment might be as clear as possible.

ARCHES' COURT.—*The Office of the Judge promoted by Titchmarsh against Chapman.*—Sir H. Jenner Fust gave sentence in this case, which was a proceeding under the 68th canon against the Rev. William Herbert Chapman, vicar of Basingbourne, Cambridge, for refusing to read the burial service over the corpse of an infant, the child of a parishioner. The defensive allegation pleaded that the baptism of the infant, which had been performed by a minister of the class of dissenters called Independents (to which the parents belonged), was heretical, and consequently the child was unbaptised or excommunicated, within the meaning of the rubric of the Book of Common Prayer prefixed to the order for the burial of the dead. This allegation was rejected by the Court, which held that the child had been "sufficiently" baptised, notwithstanding the person performing the rite might be a heretic. The case consequently came now to be decided upon the evidence adduced, to show that the canon had been violated. The canon declares that no minister shall refuse or delay to bury any corpse that is brought to the church or churchyard, "convenient warning being given him thereof before," unless the party deceased was denounced excommunicated *majori excommunicatione*, on pain of suspension for three months. The learned judge was of opinion, that it had been proved that Mr. Chapman did refuse to bury the child, and that the child was not unbaptised within the meaning of the rubric; the only question was, whether he had had sufficient notice, which was essential to the proof of a canonical offence. There was no evidence, however, that Mr. Chapman had had notice until the corpse was brought into the porch of the church. Each of the witnesses, J. Rumbold, the father of the child, Mr. Morse, the independent minister, who had directed the proceedings, and Hopkins the only other witness, had expressly denied having given him notice before that time, and the learned judge was of opinion that this was not the "convenient warning" to be given "before," within the intent of the canon, which meant "before the corpse was brought to the churchyard." It might be extremely inconvenient to the minister, who might be absent from home or engaged in other clerical duties, to be called upon to perform the services *instanter*; and it was a part of his office to meet the corpse. Preparations were moreover necessary for decent interment, and the warning contemplated by the canon must be one convenient to all parties. The articles expressly pleaded that "convenient warning" had been given; the promoter, upon whom the *onus* lay, had not therefore been taken by surprise, and as this was a criminal proceeding, the Court was bound to require strict proof. Unless proper notice had been given no canonical offence had been committed; no such notice had been proved, and Sir H. Jenner Fust therefore pronounced that the promoter had failed in his proof, and dismissed Mr. Chapman with costs.

COURT OF QUEEN'S BENCH.—(Sittings in Banco.)—*The Queen v. Barnard Gregory* ("The Satirist").—Monday having been appointed for bringing up Mr. Barnard Gregory, proprietor of the *Satirist*, to receive judgment for a libel on the Duke of Brunswick, the Court was much crowded. On their Lordships taking their seats, Mr. Wordsworth prayed the judgment of the Court upon the defendant, he having pleaded guilty to an indictment charging him with publishing false and scandalous libels on his Royal Highness the Duke of Brunswick.—Mr. Platt said he had to apply on behalf of Mr. Gregory for a rule to show cause why the indictment against him should not be quashed, or that the judgment of the Court should not be respited. He made this application on the ground that the indictment preferred against defendant at the Central Criminal Court had been found without jurisdiction. The objection to the jurisdiction of the court was, that by the Central Criminal Court Act, it was provided that no indictment should be found therefor any misdemeanour, except where the prosecutor had previously entered into a recognizance to prosecute the same. Here the caption of the indictment was dated on the 14th November, and the recognizances required by the act had not been entered into till the 20th December, the indictment having been found in the meantime.—Mr. Sergeant Talfourd was not prepared at that moment to show cause, because it was necessary for him to produce an affidavit, which would afford an answer in fact to this objection. The recognizances had in fact been entered into in due time, but had not been filed and dated till after the indictment had been found. It was necessary to establish this fact by affidavit, and therefore he could not show cause now.—Lord Denman said that cause not having been shown against the motion, the rule asked for must be granted, and cause can be shown against it next term. The effect of this decision is, that Mr. Barnard Gregory, whose term of imprisonment in Newgate expired on Tuesday, has been set at liberty. The defendant seemed in a very weak state of health, and much agitated; at times he appeared to require support to enable him to stand.

Lake v. *the Duke of Argyll.*—This was an action by a printer for work done for the British and North American Emigration Association, in the formation and proceedings of which the noble defendant had for some time publicly co-operated, having taken shares in the stock of the Association, contributed 500*l.* to its funds, and consented to accept the office of president; in which capacity he took the chair at a meeting at which the work in question was ordered to be done. The case having come on for trial at Guildhall, it was submitted to Lord Denman, who presided at the trial, that the plaintiff ought to be nonsuited, upon the ground that the circumstances disclosed by the evidence did not show any implied order by the defendant for the performance of the work in question, and that there was no evidence whatever of any express promise to pay. Lord Denman was, however, of opinion that there was some evidence upon the subject for the consideration of the jury, to whom he left the decision of the question, and who found a verdict for the plaintiff for the amount of his demand. Upon a former occasion a rule was obtained on the part of defendant calling upon the plaintiff to show cause why a nonsuit should not be entered, or a new trial had, upon the ground that the judge ought not to have left the case to the jury, and that the verdict was contrary to the evidence, which was alleged to have shown that the employment of the plaintiff upon the occasion in question was only a continuation of a previous employment by one of the original concoctors of the Association. Cause was subsequently shown against the rule, but judgment was reserved. Lord Denman now delivered the judgment of the Court upon the case, and having gone through the circumstances as we have stated them above, went on to say, that the Court was of opinion that the judge who presided at the trial was right in not directing a nonsuit, but leaving the case to the jury. His Lordship compared the case to another against the same defendant for a similar cause of action, which had been tried in the Court of Common Pleas, and in which the jury found a verdict for the defendant. Every such case depends upon its own facts, and the result of one case afforded no rule for the decision of the other. In the present instance the Court was of opinion that the direction to the jury was right, and, as the question had been properly left to them upon the evidence, the Court saw no reason to disturb the verdict. The rule, therefore, was discharged.

BIRTHS.—On the 13th inst., at Torquay, the lady of Sir J. E. HONYWOOD, Bart., of Evington, of a daughter—14th inst., at Maperton House, the lady of H. J. FITZGERALD, Esq., of a daughter—20th inst., at the Rectory, Himley, Staffordshire, the lady of the Rev. W. H. PILLANS, of a daughter—21st inst., at Cresswell, the lady of O. A. B. CRESSWELL, Esq., of a son—23d inst., at Brooklands, Wandsworth-road, Mrs. F. W. BRAMSTON, of a son—23d inst., at 8, York-street, Portman-square, the lady of S. WALCOTT, Esq., of a daughter—24th inst., at Nalliford, Middlesex, the lady of Lieut.-Col. L. COOPER, of a son.

MARRIAGES.—On the 11th inst., at Aberdeen, S. E. JACSON, Esq, 54th Regiment, second son of G. Jacson, Esq., of Barton, Lancashire, to GEORGINA WINCHESTER, youngest daughter of C. Winchester, Esq., Advocate, Aberdeen—21st inst., at Bishop Wearmouth Church, the Rev. R. MOORSON, Vicar of Seaham, to CHARLOTTE GREGSON, youngest daughter of the late John Gregson, Esq., of Durham—21st inst., at Llangathen Church, J. P. PRYSE, Esq., youngest son of P. Pryse, Esq., of Gogerddan, M.P. for Cardigan, to MARY ANNE PHILIPPS, second daughter of J. W. Philipps, Esq., of Aberglasney, Carmarthenshire—26th inst., at St. Margaret's, Westminster, CAPTAIN DRAPER, 64th Regiment, to ANNE C. GRUBB, fourth daughter of J. Grubb, Esq., late of Horsendon House, Bucks.

DEATHS.—On the 19th inst., at his residence, Chailey, near Lewes, General the Hon. F. ST. JOHN, aged 82—22d inst., J. GUILLEMARD, Esq., F.R.S., aged 81—23d inst., at Loftus, near Gisborough, Yorkshire, Lieutenant-General the Hon. Sir R. L DUNDAS, K.C.B., Colonel of the 59th Regiment—24th inst., at Bridge-cottages, Kentish Town, MARGARET E. BROWNE, eldest daughter of the late Rev. T. Browne, of St. Vincent's, aged 25—24th inst., W. HOLLOWAY, Esq., late of Singapore, and son of the late C. Holloway, Esq., of the Hon. East India Company's Service, at Fort Mariborough, in Sumatra—25th inst., at Kensington Gravel Pits, Sir A. W. CALLCOTT, R.A., aged 65—25th inst., MISS PARKER, of Church-row, Newington—25th inst., at Gloucester-place, Portman-square, Mrs. S. COOPE, aged 78—25th inst., KATE A. MURRAY, only surviving daughter of J. A. Murray, Esq., of Porchester-terrace, aged 9 years—25th inst., R. LOWDEN, Esq., Twyford, near Reading, Berks, aged 38—25th inst., at Cirencester, MARIA BOWLY, wife of Christopher Bowly, Esq., aged 62—23d inst., at his residence, Guernsey, Lieut.-General SIR J. CAMERON, K.C.B., aged 71, formerly Lieut.-Gov. of Plymouth, one of the most distinguished officers of the Peninsular war—On Wednesday week, at Norwich, DAVID IRWIN, Esq., Assistant Editor, on Sunday, JONATHAN MATCHETT, Esq., senior proprietor and Editor of the *Norfolk Chronicle*; and on Wednesday last, R. M. BACON, Esq., proprietor and Editor of the *Norwich Mercury*, all suddenly.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

70, STRAND, LONDON.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH-STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch-street, London.

STOOPING of the SHOULDERS and CONTRACTION of the CHEST are entirely prevented, and gently and effectually removed in Youth, and Ladies and Gentlemen, by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily employed outwardly or invisibly, without bands beneath the arms, uncomfortable constraint, or impediment to exercise. Sent per post, by Mr. A. BINYON, 40, Tavistock-street, Strand, London, or full particulars on receiving a postage stamp.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN"

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

SILVER TEA-SERVICES.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, London, opposite the Bank of England, submit the price of the following Silver Tea and Coffee Services. The Cottage Pattern is plain, standing on shell feet, the tea and coffee-pot with a flower ornament on the lids. The King's Pattern is richly embossed with flowers and scrolls. The shape of either is new and elegant.

Cottage Pattern.			*King's Pattern.*		
Strong Silver Tea-pot	£12	0s.	Strong Silver Tea-pot	£12	0s.
Ditto Sugar-basin	6	16	Ditto Sugar-basin	7	10
Ditto Milk Ewer	4	10	Ditto Cream Ewer	5	10
Ditto Coffee-pot	15	0	Ditto Coffee-pot	15	0
Complete...	£38	6	Complete...	£40	0

A variety of upwards of 50 tea and coffee services may be seen in the show-rooms, where may be selected every article of silver requisite for the side-board or plate-chest. Pamphlets of prices, illustrated with sketches of the various articles, gratis, and forwarded, postage-free, to any part of the kingdom.—A. B. SAVORY and SONS, 14, Cornhill, London, opposite the Bank of England.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers, as follow:—Cottage Pattern—1 Cover of 20 inches, 3*l.* 19*s.*; 1 do. of 18 inches, 3*l.* 3*s.*; 2 do. of 14 inches, 4*l.* 8*s.*; the set of 4, complete, 11*l.* 10*s.* ONLY. Double Dome Pattern—1 Cover of 20 inches, 4*l.* 16*s.*; 1 do. of 18 inches, 3*l.* 19*s.*; 2 do. of 14 inches, 5*l.* 5*s.*; the set of 4, complete, 14*l.* ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7*s.* 2*d.* per oz. Queen's Pattern, 7*s.* 4*d.* per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 Engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their establishments, 22, Regent-street (corner of Jermyn-street); or 45, Moorgate-street, City. New Goods plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the Kingdom and abroad free.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON AND CO, West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own Manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co.," under a crown. Old articles replated and gilt.

WANTED.—In a small family where a lad is kept as assistant, a Clever Man, who thoroughly understands the culture of a Kitchen Garden, Border Flowers, and Greenhouse Plants, and who is competent to undertake the care of a horse and chaise. One accustomed to the occasional use of carpenter's tools, paint-pots, &c., and who will attend to general neatness in and out of the house will be preferred.—Apply by letter, stating terms, age, and particular qualifications, to Q., at Mr. Hawke's No. 25, King William-street, London-bridge.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS STEWARD.—A young Man who has a thorough knowledge of the present improved mode of Farming, is also conversant with Architecture and Building generally, and has lived the last four years on a large estate where considerable improvements have been made in under-draining both light sandy, and strong clay land. Satisfactory recommendations and security can be given.—Direct to M. D., Post-office, Walham-green.

AS GARDENER.—A single Man, aged 28, who has had extensive practice in England and Scotland in the cultivation of Pines, Vines, and forcing generally, together with the routine of Kitchen and Flower Garden; can give 4 years' reference as to character and abilities.—Direct to A. O., Messrs. Marnock and Manley, Nurserymen, Hackney.

AS GARDENER.—A married Man, aged 32, who perfectly understands his business, and can have a good character from his last situation, where he was three years. His wife would have no objection to take charge of the family Washing, or attend to a small Dairy, if required.—Direct to Mr. JEVES, Nurseryman, Northampton.

AS GARDENER, or UNDER-GARDENER, where two or more Men are kept.—A single Man, aged 24, who thoroughly understands his business, and is a first-rate Grape-grower. Can have a good character from the gentleman he has just left.—Direct to F. S, at Mr. Crastin's Nursery, Seven Sister road, Holloway, near London.

AS GARDENER. — A Nobleman's Gardener is desirous to recommend his Foreman to any one in want of a thorough practical Gardener. He has served him upwards of two years, and he can with confidence recommend him. Nine years' previous character can be had if required.—Direct to M. D., Office of this Paper.

AS GARDENER. — A single Man, aged 34, who understands his business in Greenhouse, Hothouse, Frames, Vines, and Flower Garden. Can have six years' good character, and has no objection to a single handed place.—Direct to A. B., Warner and Warner, Seedsmen, 25 Cornhill.

AS GARDENER, OR COACHMAN AND GARDENER.—A respectable Man aged 40, without incumbrance, who thoroughly understands either capacity, as well as the management of Stock, and has no objection to make himself useful; can have a good Character from the family of a Nobleman. His Wife is a thorough Cook and Dairywoman.—Direct to C. E., Tivoli Gardens, Battersea, Surrey.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

NOTICE IS HEREBY GIVEN that in future the MEETINGS of the GARDENERS' BENEVOLENT INSTITUTION will be held at the LONDON COFFEE-HOUSE, Ludgate-hill.—By order, Edw. R. Cutler, Secretary, 97, Farringdon street.

THE ARBORETUMS QUEEN'S-ELMS, BROMPTON, NEAR LONDON, AND EAST COWES, ISLE OF WIGHT.

RAMSAY BROTHERS, Landscape Gardeners, Contract Planters, Ground Workmen, &c.

Plans and Estimates submitted, and works contracted for in any part of the kingdom.

J. B. SMITH, having purchased the rare and valuable STOCK-IN-TRADE of the executors of his late father, begs leave to inform the Nobility, Gentry, and Amateurs, that he intends carrying on the Business as hitherto, and shall be glad to be favoured by their kind commands, which shall ever meet his best attention. A choice collection of Rhododendrons, Azalea Indicas, Hardy Azaleas and Ghent Azaleas, Camellias, Roses, Pelargoniums, Liliums, &c., including the most novel and approved varieties; a priced list of which may be had on application. A liberal discount for cash. A remittance or reference from unknown correspondents is solicited.

Norbiton Nursery, Kingston, Surrey, Dec. 7.

KNAP-HILL NURSERY, NEAR BAGSHOT, SURREY.

HOSEA WATERER (Brother and Successor to the late Michael Waterer), respectfully begs to announce that the American Plants this year are remarkably well furnished with bloom; and with the other articles which are generally required for forcing, he has this season to offer very fine plants of the hardy Scarlet Rhododendrons. This Nursery has long been celebrated as containing the finest Collection of American Plants in the kingdom; independent of this, H. W. is a most extensive grower of Hardy Ornamental Trees and Shrubs, Roses, Forest and Fruit Trees; this may be inferred from the fact, that the Nursery extends over near 100 acres of land. The Knap-Hill Nursery is 2½ miles from the Woking station of the South Western Railway.

All letters intended for this Nursery must be addressed Knap-Hill, near Bagshot, Surrey.—Dec. 7.

ROSES.

MESSRS. LANE and SON, Great Berkhampstead, Herts, have an extensive and well-grown Stock of Standard and Dwarf Roses, which they are enabled to offer at the following prices, the selection being left entirely to themselves, viz.:—

DWARFS, good old sorts without names, on own roots	30*s.* per 100
Ditto ditto with names, in pairs, on own roots	50*s.* per 100
Ditto superior ditto	12*s.* to 30*s.* per doz.
STANDARDS, first rate	10*l.* per 100
Ditto ditto	24*s.* to 30*s.* per doz.

They have also an immense Stock of Roses in pots for greenhouse culture, at from 18*s.* to 30*s.* per doz. Likewise numerous others at a much lower rate, but which they could not confidently recommend.

Rose Catalogues for 1844-5 may be had on application to the Nurseries, inclosing a 2*d.* postage stamp.

Great Berkhampstead, Dec. 7, 1844.

THOMAS JACKSON, of the Priory Farm, Childwall, near Liverpool, begs to inform Nursery, Seedsmen, and others, that he has saved a fine quantity of the Incomparable Hardy Green COLEWORT, which was Advertised in the *Chronicle* of 2nd March last. T. J. can refer any person to a respectable Nurseryman in this neighbourhood, as to quality and being genuine. Price 2*s.* per lb.—Dec. 7.

J. WHYTE begs to inform the Public that he has now ready for Sale some fine new SEED of his well-known dark and delicious BEET. Price, per lb., 5*s.*; or 1*s.* 6*d.* per oz.; to be had of the grower, Isleworth.

TO THE SEED TRADE.

J. G. WAITE, Wholesale Seedsman, begs to inform the Trade, that his PRICED CATALOGUE is now ready, and can be had on application.

3 and 4, Eyre-street-hill, Hatton Garden, December 7.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and CO. beg to announce they are again able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing	100	Canes	£2	0 0
Ditto	,,	50 ,,	1	1 0
Ditto	,,	25 ,,	0	12 0

For particulars of the above, see Y. & Co.'s Advertisement of Nov. 9th.

YOUELL and CO. take the present opportunity to state that the above unequalled RASPBERRY is to be obtained only at their Nursery or of their Agents (as follows): and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title, has been substituted by certain parties as the "true variety." They also publicly deny the truth of Mr. Rivers' statement, "that the fruit upon which Dr. Lindley pronounced his opinion was gathered in what he terms the 'Filby Garden.'"

LIST OF AGENTS.

Bury St. Edmunds—Mr. R. Pettit; Canterbury—Mr. W. Masters; Carlisle—Messrs. Little and Ballantyne; Chichester—Messrs. Newman and Co.; Cliff Vale, near Leek, Staffordshire—Mr. F. Fox; Cork—Messrs. Haycroft; Doncaster—Mrs. Milan, Seed-shop; Dublin—Mr. John White, 32, Mary's Abbey; Dundee—Messrs. Urquhart and Son; Durham—Messrs. Hancock and Sons; Edinburgh—Messrs. Peter Lawson and Son; Fulham—Messrs. Whitley and Orsborn; Glasgow—Messrs. Drysdale and Co.; Leicester—Mr. James Stone; Lincoln—Mr. W. Palethorpe; Halifax—Mr. W. Throp; Jersey—Mr. B. Saunders; Leeds—Messrs. Ely and Son, Rothwell Haigh; London—Messrs. Flanagan and Son, No. 9, Mansion House-street, and Messrs. Noble, 152, Fleet-street; Liverpool—Mr. James Cuthbert, 12, Clayton-square; Manchester—Mr. H. D. Cormack; Nottingham—Mr. J. F. Wood, The Coppice; Peterborough—Mr. John White; Penzance—Mr. J. Fox; Plymouth—Mr. W. E. Rendle; Sheffield—Messrs. Fisher, Holmes, and Co.; Southampton—Mr. James Ingram; Stafford—Mr. J. Sandy; Torquay—Mr. J. Morgan; Wakefield—Mr. W. Barratt; Waterford—Messrs. Fennessey and Son; Westerham, Kent—Mr. I. Cattell; Wexford—Mr. James Harpur; York—Messrs. T. and I. Backhouse.

YOUELL'S CELEBRATED TOBOLSK RHUBARB, the earliest sort known; fine roots, fit for forcing, 12*s.* per dozen. For Particulars see their Advertisement of Nov. 2.

Finest Imported DUTCH HYACINTHS, 6*s.*, 12*s.* and 18*s.* per doz.; for Particulars of which, together with the Extensive and Select Collection of CARNATIONS, PICOTEES, and PINKS, see their Advertisement of Nov. 9.

Great Yarmouth Nursery, Dec. 7, 1844.

THE FILBY, or FASTOLFF RASPBERRY.—At the request of some gentlemen living in the neighbourhood of Yarmouth, T. RIVERS begs to submit the history of this really excellent Raspberry to the public. In the year 1814 Colonel Lucas, of Filby, a place lying between Norwich and Yarmouth, discovered a Raspberry plant growing under an old Laurel hedge in his garden. His attention was drawn to it, and he soon found it to be a superior and delicious variety, so that in a short time every other sort was ejected from his garden, and this alone cultivated. It was not, however, till 1824 that he allowed his gardener to part with it, who then gave canes to his neighbours, and by this means it got to be cultivated in Caistor, Ormsby, and, in fact, in all the neighbourhood, under the name of the Filby Raspberry, to the exclusion of all other sorts. It has latterly often been called the Caistor Raspberry, from the Market Gardeners growing it in that parish. In Caistor is an old castle in ruins, that formerly belonged to the Fastolff family: the latter name was given to the variety by Youell and Co., when they first began to sell the canes. The fruit upon which Dr. Lindley pronounced his opinion was gathered in the Filby garden, now the property of the Rev. G. Lucas, who authorises and permits the publication of the above facts; and has also permitted his Gardener to supply the Canes after this date to T. RIVERS only.

Canes are sold at 30*s.* per 100, or 6*s.* per score, carriage paid to London. Charge for package, for small parcels, 6*d.*, for large do., 1*s.* to 1*s.* 6*d.* Orders to any amount can be executed. The Trade price will be given on application.

Sawbridgeworth, Herts, Dec. 7, 1844.

DUTCH HYACINTHS for forcing, Single and Double at 4*s.* per dozen; also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones & Ranunculuses; priced Catalogues of which will be forwarded per post, from Arthur Corbett's Italian and Foreign Warehouse, 18, Pall Mall.

Double Italian Tuberose roots expected the end of this month.

THUNBERGIA CHRYSOPS.—Plants of this new and beautiful Creeper, dark rich purple with a golden eye, 5*s.* and 7*s.* 6*d.* each. Also strong bushy Plants of Superb Seedling Cinerarias well trussed and forward for flower, containing every shade of dark and light-blue tints, furnishing to the Greenhouse, Conservatory, or Drawing-room, an ornamental and splendid continuance of elegant bloom throughout the winter months, 6*s.*, 9*s.*, and 12*s.* per dozen.

Packets of the best mixed seed of do.	*s.* 6*d.*
Do. that large Anagallis Brewerii	2 6

Application, including Post-office order or stamps, will be carefully executed.—Direct to Michael Brewer, Senior, Cambridge Nursery, Cambridge.

TO MELON GROWERS.

FISH'S EARLY CANTALOUPE and HARDY GREEN FLESH MELONS. The above are recommended to all Melon-growers, as, independent of the good quality of the Fruit, they are so hardy as to require comparatively little attention; a fact of considerable importance where fuel is expensive, and fermenting material a scarce commodity. Both sorts were awarded Certificates of Merit at Regent-street, London; the Cantaloupe on the 7th of May, described as "good early fruit;" and the Green-fleshed on the 4th of June, described as "capital green Melon, highly fragrant, and weighing nearly 5 lbs." The Cantaloupe grows from 4 to 6 lbs. in weight. Fruit was exhibited in July at Chiswick, weighing 4 lbs. 14 oz., and the fifth crop is maturing in November, from the same plants cut from in May. Specimens of the Green-fleshed, from the same plants cut from in June, were exhibited at Regent-street, on the 1st Oct., weighing 3 lbs. each. These have been grown on dung beds, as described in the *Chronicle* of the 7th May and 1st October.

Youell and Co. having purchased of Mr. Fish the entire stock of Seed of the above most desirable Melons, for the first time offer it to growers, being fully confident of its realising all the merits ascribed to it. Sealed packets, containing three seeds of each, 6*s.*, sent per post, free.

Great Yarmouth Nursery, Dec. 7, 1844.

CEDRUS DEODARA, PINUS, HYBRID RHODODENDRONS, &c.

CEDRUS DEODARA,	1½ feet	each—3*s.*	6*d.*

Ditto	Ditto 3 ,,	21	0
Ditto Hybrid between Arborea and Campanulatum		per doz. 24*s.* to 30	0
Ditto Barbatum		each—42	0
Ditto Caucasicum, p. doz., 18*s.*, 24*s.*, 30*s.*, & 36			0

FRANCIS and JAMES DICKSON, Nurserymen, Chester, have much pleasure in submitting the above List of VALUABLE EVERGREENS, &c., of which they at present possess a considerable stock of exceedingly healthy and well-grown plants. *** Orders will command every attention.

Newton and Upton Nurseries, Dec. 7.

TO THE CULTIVATORS OF ROSES.

R. B. BIRCHAM, Hedenham Rosery, Bungay, Suffolk, begs to offer the following Select ROSES, which he can with confidence recommend, as possessing superior quality. A purchaser selecting 12 different kinds from this list, R. B. B. will be happy to supply at 20*s.* The plants are strong and healthy, and varying in height of stem from 1½ feet to 3 feet.

Agnes Sorel	Aurelie Lamare	Las Casas
Donna Sol	Briseis	Idalize
Duchess of Kent	Buffoon	Jambart
Duchesse d'Orleans	Crivalis	Julie
Emerance	Duc de Trevise	La Splendeur
Illustre Beauté	Egle	Nelly
La Ville de Londres	Fleur d'Amour	Becquet
Mrs. Rivers	Gil Blas	Blairii, No. 2
Nicolate	Gurin's Gift	Charles Louis
Petite Beauté	Gurin's Desdanes	De Candolle

La Ville de Bruxelles	Madame Dubarry	Eclatante (Moss)
Volumineuse	Reine ne me Surpasse	Princess Royal
Aglae Dusart	Triomphe de Laguenle	Prolifere
Agnodier		Pompone
Antouine d'Ormoise		

Also strong plants of Climbing Roses (Evergreens), at 6*s.* per dozen. These Roses will make shoots upwards of 6 feet long in one season, and are very suitable to cover unsightly fences, walls, stems of trees, &c.

Descriptive Catalogues forwarded upon prepaid application. Plants gratis, to compensate for distant carriage.

Hedenham, Dec. 7.

CHEAP AND GOOD PELARGONIUMS.

W. MILLER has several thousands of good Plants of the very best PELARGONIUMS, selected from those exhibited by the most successful raisers:—as, Foster, Garth, Beck, Lyne, Gaines, Wilson, Thurtell, Catleugh, and others; they can be well recommended as good additions to small or large collections, and will be sold, at low prices, by the dozen. A select List may be had on application,

W. M. has also a few more sets of those splendid new seedling Pelargoniums raised by G. M. Hoyle, Esq., Guernsey; also some packets of Mr. Hoyle's choice Seed—50, 7*s.*; 100, 12*s.*—Providence Nursery, Ramsgate.

IMPORTANT TO PLANTERS.
ILEX OR EVERGREEN OAK.

W. E. RENDLE has a large Stock of this most valuable hardy tree, and can supply fine two-year old Seedlings, from seed-pans, at 20*s.* per 1000. package and carriage free to the Exeter terminus of the Great Western Railway.

Union Road Nurseries, Plymouth, Dec. 7, 1844.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—ANNUAL COUNTRY MEETING of 1845, to be held at SHREWSBURY, in the North Wales District, comprising the Counties of Anglesey, Carnarvon, Merioneth, Montgomery, Denbigh, Flint, Chester, Salop, and Stafford. The Prizes are open to general competition. Forms of Certificate to be procured on application to the Secretary, 12, Hanover-square, London. All Certificates for Implements must be returned, filled up, to the Secretary, on or before the 1st of May, and all other Certificates by the 1st of June; the Council having decided that in no case whatever shall any Certificate be received after those dates respectively.

PRIZES FOR IMPROVING THE BREED OF CATTLE.—1845.

Short-horns.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In case of the Cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Herefords.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In the case of the cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.) 4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Devons.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In the case of the Cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Cattle of any Breed (not qualified to compete in the foregoing classes).—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 20*l.*; to the owner of the second-best ditto, 10*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 15*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In the case of the cow being in calf, and not in milk, the prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 10*l.*—5. To the owner of the best Yearling Heifer, 10*l.*

HORSES.

CLASS 1. To the owner of the best Stallion for Agricultural Purposes, of any age, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best three years old do., 15*l.*—3. To the owner of the best two years old do., 15*l.*—4. To the owner of the best Mare and Foal for Agricultural Purposes, 20*l.*; to the owner of the second-best do., 10*l.*—5. To the owner of the best two years old Filly, 10*l.*—6. To the owner of the best Thorough bred Stallion, which shall have served mares at a price not exceeding 3 guineas (and with a groom's fee of not more than 5*s.*) in the season of 1845, 30*l.*

SHEEP.

PRIZES FOR IMPROVING THE BREED OF SHEEP.—1845.

Leicesters.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do., 5*l.*

South-down Sheep.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do., 5*l.*

Long Woolled Sheep. (Not qualified to compete as Leicesters.)—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second best do. do., 5*l.*

Sheep best adapted to a Mountain District.—CLASS 1. To the owner of the best Ram of any age, 15*l.*; to the owner of the second-best do., 10*l.*; to the owner of the third-best do., 5*l.*—2. To the owner of the best pen of Ewes of any age, 10*l.*; to the owner of the second-best do., 5*l.*

PIGS.

CLASS 1. To the owner of the best Boar of a large breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—2. To the owner of the best Boar of a small breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—3. To the owner of the best breeding Sow, of a large breed, 10*l.*—4. To the owner of the best breeding Sow, of a small breed, 10*l.*—5. To the owner of the best pen of three breeding Sow-pigs, of the same litter, above four and under ten months old, 10*l.*

AGRICULTURAL IMPLEMENTS.

A sum not exceeding 300*l.*

Cheese.—To the exhibitor of the best cwt. of Cheese (of any kind) made within the district, 10*l.* To the exhibitor of the second-best do., 5*l.*

Extra Stock, Roots, and Seeds.—For Extra Stock, of any kind, not shown for any of the above Prizes, and for Roots, Seeds, &c., Prizes may be awarded and apportioned, by the Committee and Judges, to an amount not exceeding in the whole 50*l.*

Any New Implement.—For the invention of any new Agricultural Implement, such sum as the Council may think proper to award.

Seed Wheat, Barley, and Oats.—I. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of white Wheat, of the harvest of 1844, and grown by himself.

II. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of red Wheat, of the harvest of 1844, and grown by himself.

III. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of spring Wheat, of the harvest of 1844, and grown by himself.

IV. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Barley for malting, of the harvest of 1844, and grown by himself.

V. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Oats, of the harvest of 1844, and grown by himself.

Competitors are requested to send with their Wheat, Barley, or Oats, specimens, fairly taken, of the same in the ear, with the whole of the Straw, in a sheaf not less than one foot in diameter, and with the roots attached.

[12 bushels of the Wheat, Barley, or Oats, will be sealed up by the Director or Stewards, and one of the remaining bushels of each variety will be exhibited as a sample to the public; the other being kept for comparison with the produce of the next year. At the General Meeting in December, 1846, the Prizes will be awarded.]

The two best samples of each of these classes of Wheat, Barley, or Oats, without at that time distinguishing in any of the cases, between the comparative merits of either sample, will be selected by the Judges appointed for the Meeting at Shrewsbury; and will be sown, under the direction of the Council (the winter Wheats in the autumn of 1845, and the spring Wheat not earlier than the 1st of March, 1846), by four farmers, who will make their report, upon which the Prizes will be awarded, provided there be sufficient merit in any of the samples. 10*l.* will be given at the Meeting at Shrewsbury to each exhibitor whose Wheat has been selected for trial, and 6*l.* for the Barley or Oats.

*** No variety which has been selected for trial at any previous Show shall be qualified to compete in the same class.

ESSAYS AND REPORTS ON VARIOUS SUBJECTS.

Prizes for 1845.—PRIZE ESSAYS.

1. *Farming of Nottinghamshire.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Nottingham. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Nottinghamshire since the Report of Mr. Robert Lowe in the year 1798; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

2. *Farming of Cornwall.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Cornwall. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Cornwall since the Report of Mr. G. B. Worgan, in the year 1811; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

3. *Farming of Kent.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Kent. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Kent since the Report of Mr. John Boys, in 1805; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

4. *Heath Land.*—Twenty sovereigns, or a piece of plate of that value, will be given for an account of the best method of reclaiming heath-land. Competitors will be required to describe methods which have been successfully adopted in the reclaiming of heath-land, reference being had especially to the following points:—1. The mode of breaking up, whether by paring and burning, or by simple ploughing. 2. The application of lime. 3. The course of cropping. 4. The conversion of heath-land into pasture, where either the steepness of the land, or its elevation above the sea, does not allow the culture of corn.

5. *One-Horse Carts.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on the advantages of One-horse Carts. Competitors will be required to point out the saving in horse-labour, and other advantages which undoubtedly arise from substituting 1-horse carts for waggons.

6. *Catch-Meadows.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Catch-Meadows. Competitors will be required to describe the best and cheapest method of forming water-meadows on the sides of natural slopes, as practised in Somersetshire and Devonshire; the mode of managing them, and of applying their produce; the increase of value thereby given to unproductive hill-sides; and to state how far this mode of improvement might be applied to the mountainous districts of Wales and the North of England.

7. *Fences.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Fences. Competitors will be required to describe the best and neatest methods of maintaining hedges, whether for arable or for grazing ground; and to point out how far the present fences in various parts of England are injurious to the farmer, whether by their size, their excess in number, or the over-abundance of timber which they contain.

8. *Fattening Cattle.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for an account of the best method of fattening cattle; as to the places in which they are kept, large or small yards or stalls; as well as the food, roots, hay, &c. on which they are fed during the time of fatting.

9. *Tile yards.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the cheapest and best method of establishing a Tile-yard. Competitors will be required to attend to the following points:—1. Mode of working the clay, according to its quality. 2. Machine for making the tiles. 3. Sheds for drying the tiles. 4. Construction of the kiln. 5. Cost of forming the establishment. 6. Cost of the tiles when ready for sale.

10. *Curing Butter.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best description of the Dutch method of salting butter; pointing out the causes of its superiority to other salted butters.

11. *Experiment in Agriculture.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for an account of the best Experiment in Agriculture.

These Essays must be sent to the Secretary, at 12, Hanover-square, London, on or before March 1st, 1845.

Twenty Sovereigns, or a Piece of Plate of that value, offered by the Right Hon. Lord Kenyon, will be given at the Annual Country Meeting of the Royal Agricultural Society, to be held at Shrewsbury in 1845, for the best Account of the Use of Gorse for the Food of Cattle, Horses, or Sheep, founded on actual experiment. Competitors will be required to state the following points: 1. The quality of land on which the Gorse is grown. 2. The age of the plant when cut. 3. The mode and expense of cutting. 4. The mode and expense of preparing for food. 5. The mode of feeding with Gorse, and the quantity of other food given therewith.

Essays competing for this Prize must be sent to the Secretary, at 12, Hanover-square, on or before May 1, 1845.

Rules of Competition for Prize Essays.—1. All information contained in Prize Essays shall be founded on experience or observation, and not on simple reference to books, or other sources. 2. Drawings, specimens, or models drawn or constructed to a stated scale, shall accompany writings requiring them. 3. All competitors shall inclose their names and addresses in a cover, on which only their motto, and the subject of their Essay, and the number of that subject in the Prize List of the Society, shall be written. 4. The President or Chairman of the Council for the time being, shall open the cover on which the motto designating the Essay to which the Prize has been awarded is written, and shall declare the name of the author. 5. The Chairman of the Journal Committee shall alone be empowered to open the motto paper of such Essays, not obtaining the Prize, as he may think likely to be useful for the Society's objects, with a view of consulting the writer confidentially as to his willingness to place such paper at the disposal of the Journal Committee. 6. The copyright of all Essays gaining prizes, shall belong to the Society, who shall accordingly have the power to publish the whole or any part of such Essays; and the other Essays will be returned on the application of the writers; but the Society do not make themselves responsible for their loss. 7. The Society are not bound to award a prize unless they consider one of the Essays deserving of it. 8. In all reports of experiments the expenses shall be accurately detailed. 9. The imperial weights and measures only are those by which calculations are to be made. 10. No prize shall be given for any Essay which has been already in print. 11. Prizes may be taken in money or plate, at the option of the successful candidate. 12. All Essays must be addressed to the Secretary, at the house of the Society.

(By Order of the Council) JAMES HUDSON, Secretary.

ADDRESS TO THE PLANTERS OF ENGLAND.

TRUE HIGHLAND PINE-TREE.—MY LORDS, LADIES, AND GENTLEMEN,—The time has come when all those who have waste lands at their disposal should plant them. Of this I am fully persuaded, and I beg you will allow me to explain on what grounds this opinion is founded. England, generally, is a thickly-wooded country, yet, strange though it may appear, it has not been planted with any view to meet its most urgent wants. If the poor farmer require an outhouse built for his cattle, he cannot have it because there is no deal-wood in the neighbourhood: he builds it therefore of whins, or of any other rubbish he can lay hold of. Instead of having plenty of fir-wood on all hands to fence young hedges, planted like other things on the common surface of the ground, military-like fortifications have been raised to divide fields, occupying as much good land as is contained in three of the largest counties of Britain: it is on those banks ineffectual attempts have been made to grow hedges. After the 1st of March, when the Royal Agricultural Society's Prize on fences shall have been awarded, a great proportion of the hedges throughout England will be reconstructed by planting them on the plain surface; and the question will then arise, "Where is the wood to protect them in their young state to come from?" Turning to the railways which are now being formed in every county in England, another and greater question arises as to the supply of wood which will be required in *their* construction. Go up, I am told, to the Lebanons of our island—those immense forests in the north of Scotland—and there hew down as many trees as will be required. From those, however, I find we must expect but a limited supply. Like the famous Mount of old, they are already overrun with the axe, and a continuance of the present rate of demand for a few years more will reduce the trees upon them to a mere remnant. It is not the original numbers required for sleepers which will effect this change, but it is the incessant demand, *ad infinitum*, for timber to replace that which is already laid down, or may be for the future laid down in additional lines. Look at it how we may, the state of our country at the present crisis proves that our immense and almost measureless tracts of what is generally called waste land were not created to be a scene merely of unproductive solitude. The rains with which they are refreshed, and the fostering sunshine that rests upon them, might have taught us that Providence had designed them to contribute in some way or other to the wants of man; and though Nature has been unable to lead us to comprehend her lesson, so simply brought before us, necessity has at length compelled us to look to these districts where only a sufficient quantity of timber can be raised to meet our increasing wants. Now, then, is the time to plant: wherever there is a waste piece of ground, moor, or mountain, let it be forthwith invested with trees, for every year, for many years to come, will unquestionably bring with it an additional demand for timber. Thus far on the necessity of planting. Allow me next to bring under notice the sort of tree I would recommend to be planted, which is the chief aim of this Address. That tree is the TRUE HIGHLAND PINE, for introducing which, I had the honour, along with my brother, of receiving the Highland Society's prize. It is admirably fitted, in every respect, to take possession of all the uplands throughout England. It will grow freely on all soils suitable for the common Pine; its wood is very durable; and for railway sleepers it is unrivalled. Brindley, the celebrated engineer, considered its durability equal to that of the Oak; and Dr. Smith states, in the *Transactions of the Highland Society of Scotland*, that he has seen some of it taken down after it had been 300 years in the roof of an old castle, as fresh and full of resin, as newly imported timber from Memel, and that it was actually worked up into new furniture. "Such," says Loudon, "is the durability of this wood, that while the bog timber of the Birch is often found reduced to a pulp, and the Oak cracks into splinters as it dries, the heart of this Pine remains fresh, embalmed in its own turpentine."

MY LORDS, LADIES, AND GENTLEMEN,—Allow me to add a word or two on the merits of this tree as a landscape ornament. In this respect it rivals, if not excels, the Cedar of Lebanon. It has, at any rate, a much better ramification than the Cedar; for, as Sir Walter Scott observes, it assumes in a great measure the bold and contorted figure of the Oak. In illustrating the Seats of Norfolk (and the remark is applicable to all England), it frequently occurred to me that advantage had not been taken of prominent situations by investing them with grand evergreen trees; for so soon as November comes, our parks lose almost all that weight of grandeur for which they are so celebrated in summer-time. Their solemnity ceases with the fall of the leaf; but were they ornamented with this Pine, its broad umbrageous canopy remaining green during winter, the change consequent upon the approach of winter would be much less observed, and our country residences would at all times be surrounded with the dignified accompaniments so consistent with their character.

The importance of this subject will, I doubt not, be accepted as an apology for my thus venturing to express my opinions so plainly on matters of English practice. My suggestion as to the improvement of park and pleasure-ground scenery by introducing the Pine in question is offered with the greatest deference, being fully persuaded that in matters of this description England has been always distinguished for its refined taste. I am ready to dispose of the Highland Pines at the following prices:—

Single Plants, strong and well rooted	6*d.* each.
Strong Plants, 18 to 20 inches high	5*s.* per 100.
Strong Plants, 15 to 18 inches	30*s.* p. 1000.
Smaller-sized Plants for exposed situations	10*s.* to 20*s.* p. 1000.

I have the honour to be, My Lords, Ladies, and Gentlemen,

Your most humble Servant,

JAMES GRIGOR, NURSERYMAN, Norwich.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford Street.—Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

FIRST-RATE PANSIES.—To be Sold, a Bargain, a first-rate Stock of PANSIES, comprising all the best Flowers in cultivation, including some valuable Seedlings not in other hands, together with all Seedlings not yet bloomed, and Show-boxes of four different sizes; the entire stock of a most successful Amateur declining their further culture. The Pansies are all in small pots, and the Seedlings pricked out in boxes. For further particulars apply to Mr. W. CLARK, Seedsman, 25, Bishopsgate-street Within, who has on Sale, Cuthill's Lisianthus, 2s. per paper; Cuthill's true Black Spine Cucumber, 2s; true Cabul Melon, 2s. 6d.; Hoosainee, 2s.; fine mixed Geranium, 1s.; Calceolaria, 1s.; Cineraria, 1s.; Tropæolum tricolorum, 2s; Tropæolum brachyseras, 2s.; warranted Pansy, 2s. 6d.; Joseph Cox, Esq.'s superb Picotee Seed, 5s. May be had on receipt of a Post-office Order.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 7, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY	Dec. 11	Microscopical	8 P.M.
WEDNESDAY	Dec. 11	Society of Arts	8 P.M.
SATURDAY,	Dec. 14	Royal Botanic	4 P.M.
TUESDAY,	Dec. 17	Linnean	8 P.M.

THE probable importance of AUTUMN-PLANTING THE POTATO has been confirmed by an experiment which we had overlooked when speaking of Mr. GREY's. We find that Mr. TROTTER, a gentleman well known in the neighbourhood of Stockton, has been trying the comparative effects of autumn and spring planting on strong clay land, cropped with Beans the previous year. The field was ploughed in November, with a view to its lying in that state through the winter. Mr. Trotter had on former occasions attempted to grow Potatoes on this land; but, from the very strong nature of the soil, it often yielded him little more than the seed he planted. This led him to try the effect of planting a piece of ground in the autumn; and accordingly, about a quarter of an acre was re-ploughed about the end of November, manured with stable-yard dung, and planted in the usual way with Yorkshire Red Potatoes, no protection whatever being given them during the winter; a portion of the sets was cut, and another portion planted whole. The plants from the cut sets were much the strongest, and kept a-head of the others until the whole of the ground was nearly covered. Indeed, Mr. Trotter says that the plants from the cut sets were so much stronger than those from the whole Potatoes, that they could be distinguished with ease at a good distance.

A ridge of land close by the side of that planted in autumn was prepared and planted in spring, and manured in the same way. It is scarcely possible to imagine the difference that existed between the autumn and spring-planted crops. When our informant, Mr. G. Watson, gardener at Norton Vicarage, saw them, which was in the second week of October, those which had been planted in autumn were still strong, healthy, and green; while the haulm of those planted in spring was brown, and much withered.

When the crop was taken up, the quarter of an acre planted in autumn yielded 80 bushels of Potatoes; while those planted in spring produced little more than the seed. Mr. Trotter is, we understand, of opinion that on the land planted in autumn there was four times as many Potatoes as on that planted in spring, and that the former were larger and better in quality; and this gentleman has arrived at the conclusion, that for stiff clayey soils it is of the greatest importance to plant in autumn. He was, at the date of our correspondent's letter (Nov. 25), preparing to plant for next year.

At the time of harvesting there was little or no difference between the produce of the cut and uncut sets. The Potatoes planted in autumn were only protected by the regular covering of soil; and Mr. Watson finds, upon reference to his journal of the weather, which he keeps in his employer's garden, that the thermometer stood at 16° on the 5th of February, and at 15° on the 6th; this being the greatest amount of frost experienced about Stockton-on-Tees last winter.

Although this experiment was not conducted with the minute exactness characteristic of Mr. Grey's, yet it is valuable as affording additional evidence as to the apparent importance of autumn planting. It also possesses some points of interest of its own.

In the first place, it shows that heavy land is as well suited to autumn planting as light land. We do not mean to say that clay suits Potatoes as well as sandy loam; but that, if heavy land is to be cropped with this plant at all, autumn is the more advantageous season to do it in. It is true that 320 bushels an acre, which was Mr. Trotter's crop, is no great amount of produce; but it is to be borne in mind that the spring-planted crop yielded almost nothing.

Another, and very important fact, elicited by this communication is, that it confirms the correctness of the opinion we last week ventured to express, that it is immaterial at what time before winter the Potato-crop is got into the ground. Mr. Trotter's was planted *on heavy clay, at the end of November*. We shall, however, ascertain by another season how far this plan can be followed safely; for we have ourselves planted, at the time when these remarks are published, a piece of heavy land, to which no stable manure whatever has been applied.

The last fact that Mr. Trotter's experiment seems to have elicited is, that Potato sets are better than whole tubers. For this we were not prepared; because we should have thought that in heavy land the Potato would have had a better chance of standing the winter when protected by its natural skin, than if cut into pieces. It would, however, appear that even on clay land, in autumn, sets are better than whole Potatoes, as has been so generally found to be the case in the spring, and as was shown by Mr. Grey's experiment on light land.

We wish that those who have the means would now try the experiment of planting Potato sets through every week from the 1st of December till the winter finally sets in. The question would thus be set finally at rest; and we think a more important question can hardly occupy the attention of the cultivators of the soil.

Since the above was in type another correspondent has favoured us with his experience of planting Potatoes in the autumn, near Birmingham. It appears that in this case the crop was very satisfactory; but no details or comparative statements are given. One thing, however, was observed which deserves mention. "The Potatoes, growing at 20 inches deep, and obliged to be got up with the draining-spade, were so large that some weighed (many) 4 lbs. within a few ounces; they decreased in size as they grew nearer the surface, and those at the top, only sufficiently large for the pigs, &c., were very few in proportion."

AN amateur at Nottingham (Mr. Thomas Gibson) has been the grower of the heaviest GOOSEBERRY ever recorded as having been exhibited. But it appears that some people are endeavouring to deprive him of the credit he deserves, and publicly assert that heavier berries have been raised. They do not, however, favour us with either the name of the grower, the weight of the fruit they refer to, nor the time or place where it was exhibited. For ourselves, we have no idea of allowing even a Gooseberry grower to be talked out of his rights; and therefore we have taken some pains to ascertain what the facts are, by searching the records of Gooseberry-growing for the last 27 years.

The result of this investigation we here produce, with the name, colour, weight, grower's name, and place of exhibition in each case, except for 1829, of which we have no record; and, if we are not mistaken, no lists were published in that year. It will now be found that from 1817 to 1825 no fruit reached 30 dwts.; and so also from 1825 to 1830, all were below that standard, until Teazer, a yellow berry, (all the other 26 being reds) reached 32 dwts. Nobody again produced a fruit of 30 dwts. till 1838; but it will be seen that from 1840 to 1844, for five consecutive years, the heaviest berries have in all cases been above 31 dwts., and the last, that grown by our friend Mr. Gibson, reached the extraordinary weight of 35 dwts. 12 grains. It was exhibited at the Carnation Show of the Nottingham Floral and Horticultural Society of the present year, and we are informed that the members of that Society intend presenting Mr. Gibson with a piece of plate, as the grower of "The Champion Berry of England."

A return of the heaviest GOOSEBERRIES that have been publicly exhibited between the years 1817 and 1844, both inclusive:—

Year.	Variety.	Wght.	Grower's Name.	Where Exhibited.

HINTS ON RENOVATING OLD AND LONG NEGLECTED COPPICES.

THE chief object to be attained in improving old neglected coppices is, of course, that the ground should be uniformly covered with stools or stems, as even in size and strength as possible, so as to produce a regular and even crop of wood; this applies more particularly to coppices in Hop districts, where the production of Hop-poles is the primary consideration.

About five years ago I undertook the management, among others, of a large coppice, consisting principally of Alder, Ash, and Red Withy. The stools were of large size, many of them measuring 3 ft. from the ground to the crown, and had been so long neglected, that the wood from the large stools had killed the lesser and weaker ones by over-topping them. The coppice had evidently been originally planted alternately with Alder, Ash, and Withy; but the two former had nearly overpowered their weaker neighbour, the Withy, and appropriated to themselves the whole locality; and at the time I took it in hand, there was evidently a struggling for the mastery between the Alder and Ash, and from the weakened appearance of many of the Ash-stools, I have no doubt but that the former (the least deserving), would eventually have been left the sole occupier. I commenced by layering all that I could possibly get from the Ash, and from the few Withy-stems which were found here and there, rejecting the Alder, unless there was no other sort in the vicinity, and in many places I planted very strong plants of Withy, about 6 ft. high, which I trust will ultimately supersede the Alder. The strong high stems of Alder I caused to be lowered a foot, thereby weakening them for a time; but they soon rallied, and progressed at such a rapid rate, that it was evident they would very soon have outstriped the Withy layers and plants, and have regained their former position. In going over the coppice the second season after cutting, I found the Withy layers doing remarkably well; I then had two or three of the large leading shoots of both Ash and Alder taken from the old stools, thus producing a greater uniformity of growth, and giving the weaker-growing sorts a chance of competing with their more powerful neighbours.

In forming coppices I should certainly abstain from planting fast and slow-growing sorts indiscriminately. In many situations the Ash and Alder might be planted together with success; but the latter is of little use except for burning into charcoal for the powder-mill. The Ash will flourish in both wet and dry soils, and when properly managed will produce a vast quantity of marketable produce; and if we take into consideration their rapid growth and the durability of the converted wood, I think we may safely pronounce it to be the most profitable sort we can plant for underwood. The Water Withy (Salix aquatica), will oftentimes successfully compete with the Ash, and even the Alder in growth, if planted in moist situations; but the wood is little, if at all, superior to the Alder for durability. The Red Withy (Salix rubra), is a slow grower, but amply repays any trouble and expense incurred in bringing it to maturity. —*Quercus II.*

ROSE GARDEN.—No. XXI.

(*Continued from page 732.*)

IT must be observed, that directions in horticulture must depend more or less upon the state of the weather. The climate in England is so changeable as to make it impossible to mark, with anything like precision, the most advantageous time for out-of-door operations; and a hard frost succeeding fine weather, which has induced the operator to commence his work, will delay if not defeat his hopes, without a remedy, even where great care has been bestowed to secure success.

In grafting, the question seems to be how forward the tree is to be permitted to advance before the scions are inserted. It would seem to be difficult to hit the nice point between putting in the scions before the tree has sap enough to effect a junction and prevent them from suffering, and inserting them so late as to cause a material check in the action of the tree. But the fact is, that the sap is on the rise long before any great exhibition of its effect appears, and if a shoot of the wild Rose be deprived of its head in November, the rise of the sap may be seen in March, by the swelling of the stock before the side shoots, or rather their precursors, the buds, appear to feel it. Stocks which have carried the same heads through the winter show the rise of the sap by the swelling and starting of the buds upon them, while others which have been decapitated in spring, and appear comparatively at rest, will be found, on examination, to be in the same state. The main stem is better to graft upon than the shoots; first, because it makes a handsome tree; secondly, because the bark of the shoot not being so thick as that of the stem, is more likely to get dry and hard: thirdly, because dormant and almost imperceptible buds on the shoots, frequently break out in the clay, absorb the sap, and injure the scion; whereas in the stem the bud that appears may be cleft through, and the scion put in its place; perhaps also the vessels in the stem are larger, and the plant required to come in contact can be made to do so with greater facility; and lastly, the sap, rising in a grafted stock, is spread over a larger surface (and the effect of it consequently diminished) when shoots are used, than when the stem is cleft for that purpose. The united circumference of three shoots, or even two if they are vigorous, being more than that of the stem. The difference in labour is also greatly in favour of using the stem which will receive three or four scions, requiring but one operation in cementing and claying, whereas the use of the shoot involved three times the attention.

From the 1st of March until the stocks get so forward

as to be injured materially by taking off their heads, the stem of the wild Rose may be successfully grafted, provided the wound be carefully kept from the air; and although (when grafted early in the season) the scion will remain in the stock for months without bursting, as long as the bark and buds remain plump no fear need be entertained. The junction between the scion and stock is so slow that the growth of the buds appears quite imperceptible, but where once a single well expanded leaf is found upon the bud, the scion incorporates with the stem, and the tree, being then in a natural state, vegetates with vigour.

Those who object to use clay may defend their graft with the mixture, swathing the head of the stock and scion in Moss, which must be occasionally wetted with a watering-pot. The success of this method is not quite equal to claying, which moistens the head of the stock, softens the bark, and by facilitating the passage of the sap to the base of the scion, effects a speedy junction. Moss is, however, admirably adapted to preserve scions in vigour until they are connected with the tree; and such buds as are hidden in it will frequently break out with vigour, while that part of the scion which is exposed to the air dies off entirely. To enable the operator to keep his scions moist, it is necessary that all wild buds beneath the ligature be so confined as to render them unable to receive or use the sap which rises in the stock; and if the bast bandage be carefully and closely twisted round the stocks and scion, it will admit of the passage of moisture to the bark of such scion, while at the same time it prevents the swelling of the buds of the subject. When an overplus of any valuable sort of scions remain, they may be advantageously used by cutting down the shoots of any stools of Roses about the garden, near to the ground, and cleft-grafting them in the same manner as the wild stock. Their vicinity to the ground, which renders them so little liable to be blown about and injured by the wind, will do away with the necessity of claying, a common sailor's knot being slipped over the heads of each, and tied in front; the mixture No. 3 is applied to the graft, which (as only one scion is entered in a shoot, and but one bud left to break) can be done with the greatest facility, and the shoot produced may be laid down the same season, and be cut off from the stool a perfect and independent plant, upon its own bottom, the same autumn; while the operator is enabled to avail himself of the assistance of a handglass, if required, to advance his layers. Two or three buds of the new shoot should be left upon each graft of the stock for flowering in the ensuing spring.

The inserted scions are greatly helped, until supplied with nourishment from the stock, by the moisture of the clay; if therefore the lowest bud be only a quarter of an inch above the head of the stock, it will remain alive though concealed in the clay, and lie dormant (having no power of breaking out before that time), till the midsummer shoot, when, if the clay be removed, it will grow rapidly. This is a desirable method of finding vent for excess of sap at midsummer, as well as of limiting the demand upon trees in the spring. If this mode be adopted, the clay should be removed and the ligature loosened, when the spring shoot is over; the mixture being then applied in the same manner as to other wounds, the point of the bud only being left free. If there be not vigour enough in the tree to start the bud during the autumn, it will lie dormant, and break out with increased strength the next spring. In many cases, however, the spring shoots alone will increase the size of the scions and head of the stock so much, that it may be necessary to loosen the bandage, which may be done during the month of June, when the tree is usually in a state of comparative rest, between the spring and midsummer shoots. The most favourable time for removing the clay is after rain, when, having become soft, there will be less risk of injuring the scions. If the stem be large and but one scion take, a quantity of dead wood at the head of the stock will be the result; the whole of this must either at this period, or eventually, be cut away and the place defended with the mixture, or the operation of grafting must (as to the Rose) be abandoned.

OPERATIONS IN DIFFERENT MONTHS.

January.—Procure wild stocks, if delayed before.

February.—Wild stocks may still be planted with advantage, but the season is getting forward; cut and put by some scions for grafting; beat up clay for that purpose, and attend to the buds in the wild stocks.

March.—This is the last month to plant wild stocks; prune all trees which were grafted last or budded the year before, and restake those that have got blown about; graft fresh stocks; pinch off wild buds where not wanted, and from those trees which have been budded 18 months cut off the remaining parts of the old stem and that part of the budded shoot which is beyond the bud inserted—the first to the base of the shoot, the second close to the bud; they are then expected nearly to heal over the same year: cover them with cement for that purpose.

April.—Attend to cleft grafts by keeping down the buds below them, eradicating suckers, and cutting off the heads of failing grafts to bud upon in autumn; attend to the shoots budded upon last year; nip off the point of the sap-bud where required, and put on guards; kill snails and caterpillars this month, and whensoever afterwards they can be found; leave some flower-pots inverted to catch slugs in, which will infallibly harbour them; stop newly-starting buds when they have formed three or four eyes, that a head may be formed at once.

May.—Attend to the buds and suckers of wild stocks, and tie the new shoots to the guards, where necessary, without delay.

June, as in May.

July.—If the season be early, bud at the end of the month.

August.—Bud all this month, and if any buds start, they may be treated as pushing eyes; but, under such circumstances, the whole of the shoots upon the same tree must be shortened, or the curtailing of one shoot would be a mere transfer of its sap to another, to the great detriment, if not eventual death of the inserted bud; attend to ligatures.

September.—Continue to watch all newly inserted buds, and for the first fortnight replace any that fail; loosen the ligatures if necessary, but not without, except to examine where there may be reason to think they require it.

October.—Transplant in the last week; cutting off the ends of the wild branches, as directed.

November.—Take up any trees (carefully examining their roots) it may be desirable to remove, and replant them immediately; procure fresh wild stocks to plant, and set them out in line, or if delayed, lay them by the heels.

December.—The same as last month.

THE ORIGINAL RIBSTONE PIPPIN APPLE-TREE.

The accompanying is a representation of what remains of this renowned tree, with a few observations on its present condition.

The Original Ribstone Pippin Apple-tree.
April 20, 1844.

A small portion of the old trunk, as represented in the above engraving, still exists, and stands about 9 inches from the ground; and out of this, about 4 inches below the surface, springs a branch, which with proper care may yet become a tree. It is about 4 feet in height, and appears to be of about 10 years' growth. It stands in an exposed part of the park, and is merely fenced round with Scotch fencing. The soil in which it grows is of a tolerably free, open texture, on a sandy and gravelly subsoil.

When the tree first came under my care (scarcely two years ago) it was nearly devoured with the woolly aphis and canker, and almost overgrown with Nettles. I had the inclosed area (which is about 6 yards in diameter) thoroughly cleaned, part of the earth removed, a quantity of fresh earth brought in, and some of the roots raised into the fresh soil. I have not been able to accomplish the extirpation of the aphis. I believe their stronghold to be in the old stool under the ground; for in spite of all I could do, they still continue to make their appearance on the young branches. I have much satisfaction in observing that the young branches [illegible] a decided improvement in health and vigour, having now a good broad foliage, and showing no signs of canker. The roots are pushing freely into the fresh earth, and many young roots have sprung from the base of the principal branch or sucker. By encouraging these young roots, keeping them near the surface, and otherwise nursing the shoot, I have no doubt that the old tree may be revived, and as there are already several terminal blossom-buds on the heretofore sickly branches, probably the year 1846 may be remarkable for the reproduction of fruit on the original Ribstone Pippin.

I am informed that the old tree was broken down in the year 1815, after which only one large branch remained, which was supported by stakes in a horizontal position, as shown in the engraving figured below. In this state it bore fruit for many years, and while in this position many layers were taken from it. It lingered until 1835, when it died, and was removed and burnt. The remainder of the trunk, excepting the small portion which now stands, was removed in 1839, and is carefully preserved by Joseph Dent, Esq., the present proprietor of Ribstone.

Although I have hitherto spoken of the old Ribstone Pippin-tree as the original, yet I am of opinion that it had been grafted; and if so, of course it is not the original. My suspicions on this point were first raised by the appearance of a sucker which is growing in the garden at Ribstone, and which was taken from the old tree sixteen or eighteen years ago. This tree has not yet borne fruit: it has thriven badly, being greatly affected by canker: it is now in a more healthy state, and forming many blossom-buds. I could not reconcile the habit of this tree with that of the true Ribstone Pippin, and consequently took considerable pains to ascertain if any and what measures had been taken to prove whether the old tree had been grafted or not. In pursuit of this object various and contradictory was the evidence that I met with. The strongest evidence that I obtained of its being a grafted tree, was from a person whose voluntary testimony I have no reason to doubt, and who positively asserts that he took a root-sucker from the old Ribstone Pippin-tree, and planted it against a wall, where it remained until it bore fruit, which proved to be a bad Crab. The sucker was then destroyed. On the other side, Mr. Thompson, of the Horticultural Society's Garden at Chiswick, informs me that there is growing in that garden a tree which was raised from a sucker that was taken from the original tree at Ribstone with a piece of the old root attached, eighteen years ago, and that this tree has borne fruit identical with the true Ribstone Pippin. However contradictory these accounts may appear, they may nevertheless be both correct; if the old tree has been grafted (admitting this) we must suppose that the tree in the Chiswick Gardens has been raised from an underground branch, which branches frequently put out roots at their bases, and that the old tree has been grafted very low, having the earth about its stem considerably raised; or it may have sprung from the roots of some of the layers, of which there were many before that time.

It is much to be regretted that this point has not been settled beyond dispute, as it ought to have been long ago. This neglect is scarcely to be accounted for, unless we suppose it to be consequent on the many changes which have taken place, or, if it has been proved, the unwillingness to publish the fact. It therefore remains enveloped in mystery, and will probably rest so (unless some of the existing suckers prove the old tree to have been grafted) until a root-sucker is raised from the old stool, which I think is practicable, and which I purposed attempting had I remained at Ribstone.—*James Craig, late Gardener at Ribstone Park.*

Home Correspondence.

Tank-heating.—I have observed, on two or three occasions, that an opinion has been expressed in the *Chronicle* unfavourable to the use of pottery for the construction of tanks and gutters as channels for hot water. On one occasion there was a specific objection, viz., the alleged impossibility of avoiding leakage. I am inclined to think that such objections must have resulted from imperfection in the materials from which the pottery was prepared, in the arrangement of it when made, or in the material used in connecting and cementing the parts together. My houses and pits, of which plans and particulars are given at p. 428, 1841, are heated exclusively by gutters of pottery and tanks of the same mate-

rial, the latter having a brick foundation; they answer entirely to the satisfaction of my gardener and myself. They have now been in constant use for full 12 months, without any alteration, and we discover no leakage in any part. I apprehend that the atmosphere of the houses is somewhat more moist than in those in which iron is employed. The luxuriance and beauty of the foliage and flowers, particularly of Roses in pots, during the whole of last winter, was remarkable. The plants expressed their enjoyment very unequivocally. The Pine plants in the pits have afforded similar evidence of enjoyment throughout the season, bearing a fine dark-green foliage, without a tinted leaf to be seen. My experience, therefore, induces me strongly to recommend the article, as by far the most economical and congenial to healthy vegetation.—*Chas. Lawrence, Cirencester.* [Upon receiving this letter we applied to our kind correspondent for information as to the cement with which the pipes are jointed; it having been found near London impracticable to prevent the joints of pipes set in cement from cracking and leaking. The following is his obliging reply:]—I should suppose that the pottery you have used and mine may be very different in quality and construction. Earthen pipes, such as I have seen, are very porous, and not above half an inch in thickness; whereas, my gutters are made of very tough clay, well ground, and are from 1½ inch thick and upwards; the surface is very smooth and compact for such an article. The man who set my work informs me that the lime used in making the cement in which they were set is "Haberworth lime." Of the name I know nothing; but I believe the article is prepared from burning a sort of pebble found near the sea instead of the ordinary limestone. At all events I understand this to be a lime well known, and commonly employed in works under water; it is said to set better under water than above. The lime I used was obtained from Gloucester. While the work was in hand, I thought the man extremely careless in not grinding the cement in a pug-mill or something of the sort, as I observed indications after the trowel of considerable particles of grit, which I thought would be a source of leakage; but he was so confident as to his material, that I was obliged to let him take his own course, merely telling him I did not believe the work would hold water, and that I would not pay him till it did. The result was a considerable leakage in particular places; he put these to rights, and then, at my desire, put a thin coat of Roman cement over the whole of the interior. (?) The houses were set to work in November, 1843, and have gone on to this time without any leakage. Whether this be due to the Roman cement, or the cement by which the work was first put together, I cannot say. At the points, where I have moveable tops to steam the house, I cannot perceive any disturbance whatever of the internal coating of Roman cement, which would, of course, have cracked with any expansion or contraction of the gutters. I should, however, put my faith rather in the original cement, if I were to go to work again, taking care to have it thoroughly reduced by grinding. My expectation is that my work will stand for ever, barring chance accidents, against which it is pretty effectually protected. Any one can see my apparatus who is disposed to take the trouble of a jaunt by the Great Western.—*Charles Lawrence.*

The Bignonia Venusta.—In reply to Mr. Beaton, I beg to give my mode of prolonging the blooming of this useful plant. The situation in which it most delights is a bark-bed, where the roots can run at liberty among the tan. The plant here was first potted in a 16-sized pot, and then placed in a corner of a bark-bed, where Pines are grown; it has occupied that place now for 10 years, and although the bark-bed is regularly turned every year, yet the disturbing of the roots does not injure the plant; the roots being found to run along by the wall that forms one side of the pit, and the end, the heat of the tan preventing them from progressing towards the centre. The plant is trained upright until it reaches the top-lights; it is then trained along the house, which is 35 feet in length and 3 feet in width, till it reaches the other end, covering the pathway at the back of the bark-bed. Towards the end of December, I cut the plant in to 6 or 10 feet, when it remains dormant through the winter, without a leaf upon it, although occupying a warm situation in a fruiting Pine-stove. In the beginning of March, young shoots in abundance break from the apparently dead wood; a sufficient number of these are selected to be trained along the house, and these again produce laterals, about a foot or 2 feet in length; and at the end of each, a cluster of blossom-buds is formed. On the production of those lateral shoots depends the free blooming of the plant, to encourage which, a damp atmosphere is kept by pouring water over the pathways, and by frequently syringing the plant. All superfluous shoots are stopped; and it is necessary to pay a good deal of attention to this, for an over-abundance of shoots would soon be produced that would form a complete thicket. The plant here commences flowering about the beginning of September; it is now in full flower from one end of the house to the other, and has an exceedingly gay appearance.—*James Brown, Gardener to Lord Southampton, Whitlebury Lodge.*

The Golden Pippin.—I am glad to revert to this favourite fruit again, because I consider it too important to be disposed of so lightly as "Quatfordensis" would have us. Mr. Knight preferred the Cornish Gilliflower to all other Apples; I prefer the Golden Pippin, and so do many others; on this account its degeneracy is surely worth investigating. I am willing to defer largely to so great an authority as Mr. Knight, but with such proofs as are now recorded, his doctrine may at least be considered questionable, if not entirely fallacious. It is all very well to talk about originating similar or better kinds; but with the hundred and one attempts to accomplish this, what is the result? Who in our time has succeeded in producing an Apple equal to the Golden Pippin? I am inclined to think it wiser to bear the ills we have, and see whether it is possible to retain this valuable Apple during, at least, our time. That it grows vigorously and produces fine crops of fruit, at Hewel in Worcestershire, is beyond all doubt; the selfsame kind of Apple also, under the eye of Mr. Falconer, has for 20 years done the same thing, and in neither of these instances has the least sign of constitutional debility shown itself. Mr. Knight, in a paper read before the Horticultural Society of London, May 3d, 1831, hinted at the probability of retarding the deterioration of valuable varieties of fruits. If, without Divine intervention, a man could stop the sun in his course for one hour, why not for a thousand? Mr. Falconer has at least shown that he has successfully done it with the Golden Pippin; so has Mr. Markham, and I dare say many others; and with such authority I leave the subject for the present. —*R. G.*

Birch Coppices.—I have planted Birch rather extensively, and in various soils, but more for cover than from any hope of its ever growing into anything better than bavin wood. I cut generally six or seven years after planting, and I invariably find that a great number of the stools die in consequence. I have cut the tree partly through and layered it, and I generally find the same effect produced. If some of your correspondents will have the kindness to point out the cause, they will confer a favour upon—*Romseyoniensis.*

Hybrid Melons.—In answer to "Querist" (p. 782,) I beg to state that I am well acquainted with the Melon called Pitt's Improved Egyptian Greenfleshed; but in my opinion it is wrong named: instead of being called the Improved Egyptian Greenfleshed, it should be named the Unimproved, or the Egyptian Greenfleshed Melon Ruined. The true old Egyptian Greenfleshed, when well grown, is far better than this is in flavour, but not in size; but of what use is size without flavour? Pitt's improved might certainly be useful for decorating the dessert table, but it must not be tasted, or it will at once be condemned. About four years ago six plants of this hybrid Melon were given to me by a friend. I planted them in a three-light box, two plants under each light, where they grew rapidly, producing fruit almost at each joint; they set, swelled, and ripened a fair crop of fruit much larger than those of the old Egyptian Greenfleshed Melons. Some of them weighed as much as 4 and 5 lbs., although my frames were far too narrow for the rambling growth of the plant. I sent one into the house for dessert, which was used, and the remainder were sent as presents, as they ripened, to the different branches of the family. To my great disappointment, however, not one single fruit was approved of by any one who tasted them. My own opinion is, that this hybrid is tasteless; the flesh is neither green nor white. Some gardener may perhaps say that I did not give it a fair trial or good treatment; but such is not the case; for in the same season in which I grew this hybrid I grew 18 lights of a good Persian variety on the same Melon ground, and with the same treatment, the same soil, &c.: the latter produced a heavy crop of fruit, of a most excellent flavour, and highly approved of by all who tasted them. It could not, therefore, be in cultivation that this hybrid lost its flavour. Last season I was determined to give it another trial. I grew six plants in a three-light box, two plants under each light as before; and in this instance I had an opportunity of giving it another fair trial, as the frames (newly made) were 7 feet in breadth, 2½ feet in depth in the back, and 2 feet in depth in front. This I considered ample space for the rambling habits of the Melon. They grew with rapidity, bearing fruit much larger than before. I sent one to table, which was not approved of; others were sent as presents, as they ripened; but none of them gave satisfaction. All other true sorts which were grown on the same ground, and with the same treatment, gave great satisfaction; therefore I consider this quite sufficient to convince any person that this hybrid, as well as many others, is quite useless.—*Wm. M'Donald, King's Road, Chelsea.*—[This is but an unprofitable dispute. No doubt many hybrid Melons are worthless; but how can we say that they are all bad when, for anything we know to the contrary, half the best sorts in cultivation are cross-bred? No doubt bad crosses will produce bad Melons, and good crosses good ones. Would a cross between the sweet Melon of Ispahan and the Beechwood be worthless? We suspect that it would be very much the contrary.]

Colour of Leaves affected by Soil.—Most manures seem to deepen the green of the leaf. But there are some Picotees and Carnations that generally have a sickly hue, and however well and carefully they may be layered, they are apt to rot, very often not until the following year, when they are in bloom; they will then die suddenly. Piping seems the only sure way of propagating them. It is said that salt and nitrate of soda have the effect of hardening plants. Would it answer to apply them in this instance, and if so, in what manner? Humphreys's Compound is said to harden. Nitrate of soda must be applied in much smaller quantities than Humphreys's Compound, but how much may be safely given I do not know; perhaps a teaspoonful to a gallon of water.—*G.*

Potatoes.—I observe, with some surprise, your remarks on Mr. Grey's experiments on the planting of Potatoes in autumn. You appear to think it quite necessary that the sets should be covered so deep that they cannot be reached by the frost; this is a very unnecessary precaution. Provided Potatoes are in dry soil, and completely covered by it, they will not be injured by the most severe frost—that is, supposing they are allowed to remain in the soil until they are completely thawed again. Hundreds of Potatoes are left in the ground all the winter, many of them not more than an inch deep, and yet, when they are turned up in the spring, they are as sound as if they had been kept in a cellar. If you doubt this, it is easy to test its truth, by covering up Potatoes now in the soil of a dry garden, to the depth of an inch or two, taking care that the light is thoroughly excluded, and take them up in the spring, when the frosts are over, and you will see that what I have stated is correct. On reading the article again, I observe you suggest the probability of Potatoes bearing frost when covered. As you solicit information about Potatoes, I beg to say that I have saved sets from the Lemon Kidneys grown in my own garden for the last dozen years, and they neither curl nor rot, which I attribute to their being left on the ground exposed to the sun until they become quite green, which appears to give so much excitability to them as not only to prevent rotting, but also to make the crop earlier the succeeding year.—*T. G.* [Since our correspondent's *experience* tells him that Potatoes are not affected by frost, if in the dark, we can only express our satisfaction at finding it agree with our qualified *expectations.* We should be sorry, however, to risk a crop buried but an inch deep in any land that we know of.]

Collecting Leaves.—In the Calendar of Operations for last week "W. P. A." recommends leaves to be drawn into ridges in the back part of the shrubberies, and there to lay and rot, if they are not wanted for other purposes. This I look at as being a very disorderly plan. Where do we see the shrubberies so thick as to hide those leaves for the twelvemonth round from the eye of our employers? If my master were to pass by leaves behind his shrubberies without noticing them, I should begin to think that, in the course of another year, he would also pass them by in front of the shrubberies without notice. It is well known that leaves, when rotted in a proper place, and dug into the ground before planting shrubs, are of very great assistance to the shrubs; but to scatter them on the surface of the ground is of no use; the spring months would dry them to a powder, and they would, comparatively speaking, be driven like chaff before the wind. I regard the advice of putting them in a fresh state into holes intended for American plants, as more likely to mislead than to advance any inexperienced person. What would have been the result of plants put in in such a way, after a summer like the past? Water would have been of no use in a hole filled with leaves at the bottom. And, in the case of snow with strong wind coming soon after the plants were planted, I should expect to see their roots turned up to the weather, particularly if they were large plants. Until such time as "W. P. A." can prove the good resulting from such a practice, the advice can be of no use to any one, except to those who wish to try it as an experiment.—*M. D.* [We insert this letter at the express request of the writer; but in doing so, we must add, that we entirely disagree with some of his opinions.]

The Peregrine Falcon.—I have a living specimen of this noble bird of prey, which came into my possession about six days ago; he is quite docile; takes food from the fingers; and apparently might be trained to fly at other birds with very little trouble. He was taken on the 27th of last month, in the neighbourhood of Wormwood Scrubs, by a London bird-catcher. He is a male in two years' plumage; and I can only add, that all I have read concerning the habits of this noted bird is verified in this one, as far as I have had the means of judging.—*John Milton.*

Wilmot's Black Hamburgh Grape.—With reference to this Grape I am enabled, from my experience at Welbeck, to state that it is not, as Mr. Mearns suspects, identical with the Welbeck Black Tripoli. Judging from appearance I for a long time after it was exhibited at Chiswick considered it the Tripoli, but on tasting it I was soon convinced of my error. Wilmot's Black Hamburgh, in point of flavour, is inferior to the common Hamburgh, while the Welbeck Black Tripoli is infinitely superior to that variety. Wilmot's Black Hamburgh is a very desirable variety, and worthy of a place in every late Vinery in the country, as it keeps better than most varieties; but the Welbeck Black Tripoli has no equal among black Grapes that I am aware of. This variety is not known in the London trade.—*W. P. Ayres, Brooklands, Blackheath Park.*

Shanking of Grapes.—At p. 749, an "Amateur" complains that his Vines grew the first year with great vigour, and in the second year produced a considerable quantity of fruit, most of which shanked off. I am not surprised at this. I am confident that the late venerable President of the Horticultural Society would not have sanctioned the cropping of the Vines in the second year after planting, when he approved of the plan for the borders. Surely the considerable quantity of fruit which was left on those Vines to ripen, would demand more secreted matter for their maturation than the leaves were able to store up in the system of the plants, under the most favourable influences that possibly could be. An "Amateur" observes further, that in the previous summer many of the largest Vine-leaves damped off and fell, having rotted near the base of the footstalks. To this I should say, that the larger the leaf, the greater the surface exposed to light and heat; consequently, it would perspire more than a leaf of less size, and part

with a greater quantity of fluid than the roots could transmit to it, on account of the leaves being in a warmer medium than the roots. See Dr. Lindley's "Theory of Horticulture," pages 50 and 85. But the disease originates from more causes than one, viz.:—The principal cause is the roots of Vines being in a medium much colder than that of the leaves and branches, produced either by an excess of water in the soil occupied by the roots, which prevents its being heated by solar influence until this water is evaporated—the effect of which is to lower the amount of warmth in the soil; or from the border being shaded, by plants or otherwise. From the plants not being preserved in a sufficiently healthy state to decompose, or assimilate, the whole of the aqueous matter taken up by the roots, to mature their wood perfectly, and to be able to store up in the interior of the plants a sufficient amount of secreted matter to be able to meet the demand of the quantity of fruit left on them to ripen. Over excitement. By this is meant a too high night temperature; and also a high temperature in dull weather, when the leaves are unable to perform their functions in the absence of solar light, at the same time being exposed to a too high degree of fire-heat; and at no time does this treatment act more deleteriously than when Grapes are undergoing the ripening process. One of the first gardeners in England says, that notwithstanding the many conjectures and conflicting opinions respecting shanking, its undoubted cause is at the roots, originating from a cold or retentive soil, or from imperfect drainage, or from the Vines having been planted too deep. To one or other of the above faults, every case of shanking I have experienced was attributable. I have a large house having a thoroughly drained and shallow border, in which there is no shanking; while Vines planted in an old border, and having their roots deep, are shanked at the extremities of the branches. The whole of the Vines are exposed to the same temperature, and the same internal treatment.—*G. G. Watson, Vicarage, Norton.*

Gardeners' Benevolent Society.—I am afraid the remarks of Mr. Whiting, relative to this Society, are too true; and there is another item in the management which appears to be wrong, and one which I know is doing the Society considerable injury. I allude to the extravagant charge of *fifteen shillings* each for the Annual Dinner, a sum considerably higher than the majority of gardeners can afford for one night's entertainment. Last January I had engaged to meet several friends at the dinner, five of which would have joined the Society, but when the price of the Tickets was announced, they declined the invitation. I wrote to the Chairman (Mr. Noble), stating the fact, and giving my reasons for not attending, and solicited him to read the letter to the company, but he declined to do so. A few days afterwards I received a note from him stating that he did not conceive my letter related to the meeting, and that "he did not see how a dinner, with an unlimited quantity of wine, could be got up for less than 15*s*." An unlimited quantity of wine! What, in the name of conscience, do gardeners want with an unlimited quantity of wine? If wine-bibbers like to drink their half-dozen bottles, let them pay for it; but do not tax the man who would be satisfied with one pint, because his neighbour likes to drink ten pints. A member of the Committee told me if the dinner-tickets were lower, gentlemen would not attend, and therefore the Society would lose their donations. This may be all very true, but I do not believe it. Am I to suppose a gentleman disposed to contribute to the funds of the Society would absent himself from the dinner, merely because the price was not such as to exclude gardeners? No: that benevolent spirit which prompts them to contribute towards the support of the poor and indigent of our class would forbid that they should refuse to meet the hale and hearty for so noble a purpose. If, however, the Committee think otherwise, let them provide two tables, one for the patrons, and the other for the patronised; but, at any rate, let the "poor gardener" have a chance of dining without expending the whole of his week's earnings. I throw these hints out for the consideration of the Committee, believing that they are more likely to be influenced by a public notice than by any private recommendation. — *William P. Ayres, Brooklands.*

[Why have a dinner at all? It would be much wiser in those who can afford to throw away their money upon a bad tavern dinner to give that money to the charity. Nothing can possibly be more absurd than the English practice of persuading people to pay a guinea for a dinner, in order to obtain another guinea for the charity after dinner.]

Brewing.—I cannot agree with "Sandfordenstone," that good beer can be made without boiling the wort; it may answer for present use, but it is far from being wholesome or clear. In order to make good pellucid beer, take one barrel and a quarter of liquid from six bushels of malt; steep the Hops in boiling water for three hours, then throw it into the boiler with the whole of the wort, and boil gently for two hours (with the cover on, or it will waste and lose its strength); then take it off the fire, and put it into coolers; when cold enough add yeast; in 16 or 18 hours afterwards turn it into casks, and keep filling them up well for a few days. I often brewed the above quantity three times a week during summer, and occasionally omitted boiling it properly, and consequently I had it thick and poor.—*A Farmer's Daughter.*

Hints for Nurserymen.—I wish to call the attention of nurserymen to the following suggestion, because I think that some plan resembling that which I am now about to propose might, if adopted, be profitable alike to both buyer and seller. What I would recommend then is, that some of our nurserymen would now and then publish a short list of ornamental plants, with prices, subjoining an enticing little P.S. to this effect,—that all purchasers (say) to the amount of 21*s*., selecting their plants from the above list, and paying ready money for the same, should be entitled, as a *bonus*, to additional plants to the value of —— to be selected either from the same, or from a second list of plants, which might fairly consist of such articles only as the owner had a superfluity of.—*Screw.*

Chrysanthemums.—The cause of these flowering so late in the season is owing to their growth not being accelerated early enough. Let firm cuttings be put in, in October or November; this will cause the plants to develop flower-buds a month earlier in the succeeding autumn. Put cuttings singly into small pots, and keep them in these until March; then shift them into pots, larger and larger as they advance in growth. Place them in a moderate hotbed, and keep them growing in the frame until May; when about 1 foot high, stop them, which will cause every bud to push. Retain five or six shoots, and rub all the others off as they appear. Place them on a sunny border, about a foot apart every way, and never allow them to want water in the hot weather. Keep on shifting, using loam and dung, until they are in 24-sized pots. When they begin to show flower-buds, stimulate them by using guano or other liquid manure, which will make them produce flowers early. This is of great consequence, if they are wanted to bloom out of doors. To have them in perfection, when in flower, remove them to an airy greenhouse, as no plant suffers so much from confinement, where they speedily lose the leaves, and run up to naked, unsightly stems, destitute of foliage. By attending to these directions, fine dwarf-plants will be produced, clothed with rich dark-green leaves and large flowers.—*J. R.*

Chrysanthemums.—With respect to "C. P.'s" Chrysanthemums (p. 752). I think he will find that his border is too rich for such varieties. All the light kinds are obtained by getting rid of colour, to which the plants, when grown too luxuriantly, have a tendency to return.—*Corylus.*

Miscellaneous.—*Caledonia*, in reference to the paragraph by "J. R.," p. 765, observes that the Almond (Amygdalus communis) bears profusely, and ripens its fruit at the distance of 700 miles north from London. The Mulberry, too, he says, matures good crops of fine fruit at the same distance from the metropolis.

Societies.

HORTICULTURAL SOCIETY.

Dec. 3.—R. W. Barchard, Esq. in the Chair. At this Meeting, among Plants, perhaps the greatest novelty was a small specimen of a stove plant from Messrs. Henderson, of Pine-apple-place, named Hesemasandra aurantiaca, but appearing to be an Aphelandra of some sort, with most beautiful orange and yellow blossoms. It was said to have been received from the Continent about two years ago, from Mr. Makoy; this was probably the first time of its flowering in this country. If, as is probable, it can be grown to the same size, and brought to the same state of perfection to which A. cristata often is, it will prove an exceedingly valuable addition to our autumn-flowering stove plants. A large Silver Medal was awarded for it.—From Mr. Plant, gr. to J. H. Schroder, Esq., was a handsome plant of the old Phaius grandifolius, in fine bloom; also Zygopetalum rostratum, Brassia Wrayæ, and a good plant of Dendrobium Pierardii. A Banksian Medal was awarded for the two last-named plants.—Messrs Veitch and Son, of Exeter, sent two new sorts of Tropæolum; one, a yellow flowering variety, was not named; the other, a scarlet, was named Lobbianum, in honour of their collector, Mr. Lobb, who sent it from Peru; it had on it one fully-expanded bloom, of a very brilliant scarlet, and, judging from its numerous flower-buds, it has every appearance of being a free bloomer. A Banksian Medal was awarded for it.—From Mr. Gaines, of Battersea, was a plant of Cynoglossum cœlestinum, and two seedling Corræas, one with rose-coloured blossoms, the other with pale-green flowers.—From Mrs. Wray, of Oakfield, was a cut specimen of the scarce Epidendrum rhizophorum, a species resembling E. elongatum, and remarkable for its gay bright orange blossoms.—Mr. Stanley, gr. to H. Berens, Esq., sent a good specimen of the old Cymbidium sinense, which, being very fragrant, is exceedingly suitable for placing in sitting-rooms.—From Mr. Tant, gr. to E. Johnston, Esq., was a box containing 14 beautiful cut blooms of Chrysanthemums.—Mr. Hamp, gr. to J. Thorne, Esq., sent a cut specimen of Habrothamnus elegans, or purpureus, with pale violet blossoms.—Of Fruit, there were two Pine-apples from Mr. Sheeres, gr. at Bohun Lodge, East Barnet; one, an Enville, weighed 6 lbs., and measured 18½ inches in circumference, and 1 foot in length; the number of pips in height was 15. The other was a Queen, weighing 4 lbs. 1oz. and measuring 16 inches in circumference and 8½ inches in length; the number of pips in height was 9. These were both handsome fruit.—G. Crawshay, Esq., of Colney Hatch, showed fine bunches of Black Hamburgh Grapes in excellent condition, the berries being quite plump, with a firm juicy flesh. They had been grown, as has been formerly mentioned, without the aid of fire-heat, except about this time of the year, when slight fires are put on through the day, solely for the purpose of drying up damp, which it is well known would soon destroy ripe Grapes at this season. Air is, however, given both at back and front of the house while the fire is in operation, and when the house is shut up at night the fire is withdrawn. Mr Crawshay stated that he has now 400 bunches in a vinery of the ordinary size, in equally good condition with those exhibited.—From J. Moorman, Esq., was a collection of Pears, consisting of fine specimens of Marie Louise, in excellent condition; Eyewood; Van Mons Leon Le Clerc, a Flemish variety of modern introduction; and Beurré Diel, the latter very fine.—Good specimens of Apples and Pears were also shown by Mr. Errington, gr. to Sir P. G. Egerton, Bart., M.P.—Mr. Cockburn, gr. to the Earl of Mansfield, Kenwood, sent fine large roots of Oxalis Deppei. This, although not equal to the Potato, is a very useful variety of vegetable, ranking with Jerusalem Artichokes, Scorzonera, and such like plants. Notwithstanding the unfavourable season we have had for tap-roots, such as this is, those exhibited were excellent specimens, and showed to what perfection the root may be brought when properly cultivated.—Among miscellaneous objects were two Slate Pots, from Mr. Beck, of Isleworth, who has in this instance improved these excellent contrivances, by putting a rim similar to that of the common garden-pot, round the top, by which they not only look neater, but may be lifted with much greater ease.—From the garden of the Society was a collection of Chrysanthemums which, although well-grown plants, were not in fine bloom, owing to their having been placed in the conservatory too early; and not having been sufficiently exposed to light there, the plants grew rapidly after they were introduced into the house, became drawn, and were consequently unable to fully expand their flowers. Four of the plants exhibited, had been watered with Potter's concentrated liquid guano, which was given to them at three different times, viz. on the 1st of August, on the 27th of the same month, and on the 10th of September: it was applied to them in the water with which they were watered, at the rate of 4 table-spoonfuls to 3 gallons of water. Other four plants in the same group were watered with guano-water at the period above mentioned; the liquid was mixed at the rate of 2 oz. of guano to 3 gallons of water; and, finally, seven other plants received manure-water once a week, from the 1st of August until the middle of October. In other respects, the whole received exactly the same treatment as regards soil, &c.; they all grew very much alike; indeed, so little difference existed among the plants in general, that it was almost impossible to have said which was the best among them.—Of fruit from the gardens there were, among Apples, Tower of Glammis—a sound keeping, excellent kitchen Apple; Padley's Pippin, resembling the Golden Harvey, very hardy and exceedingly useful for all purposes of the table; Beachamwell; Dutch Mignonne; Reinette du Canada; and Pomme Royale: the latter being a sort of Russet, is a good keeper.—Among Pears were Broom Park, a hardy variety, raised by Mr. Knight, which has proved to be good when grown as a standard; Passe Colmar; Glout Morceau; Beurré d'Aremberg; Knight's Monarch, which maintains its good character; and Winter Nelis, a variety which should have a place in every collection, on account of its excellence. Many Pears, generally good, are not always so in all seasons, but this variety is invariably excellent. Fluctuations of the season do not affect its quality, which is a consideration worth attention by Pear-growers.

LINNEAN SOCIETY.

Dec. 3.—Edward Forster, Esq., in the Chair. A species of Triton caught at Putney was exhibited.—Mr. Hogg presented to the museum a new form of a Chenopodiaceous plant.—A Paper was read from Mr. Main, A.L.S., on Vegetable Physiology, in which the author endeavoured to state his own views in opposition to those generally received by vegetable physiologists. He maintained that there was no proof of the ordinarily received notion of the descent of the sap; that the tissues were nourished by, but not formed or developed out of the elements of the sap; that the tissues of the tree were indefinitely extensible, and formed by a vital process out of the cambium, which he called the indusium or vital membrane, and which was the only true source of all vegetable tissue. The cambium is not formed by the leaves, or any other agent, but by itself. The true function of the leaves is to draw up the sap into the tree, which they effect by the transpiration of the fluid part of the sap through their tissues.

ENTOMOLOGICAL SOCIETY.

Dec. 2.—Geo. Newport, Esq., President, in the chair.—Mr. Des Vignes exhibited a specimen of the Coccinella lineata, of Fabricius, now known as a variety of C. ocellata, which was taken in Great Britain.—Mr. Pelerin exhibited the larvæ, supposed to be of a species of Hepialus, from New Zealand, from which protruded a fungus 5 or 6 inches in length.—Mr. Bond also exhibited a specimen of the larvæ of the Drinker Moth, which was covered with a plant of fungoid character, and closely resembling the Muscardine, which attacks the Silkworm.—Mr. Weaver exhibited the cases of the Porrectaria vibicipinella, which were of a horny consistence, and in form resembled the shell of a dentalium.—Mr. Westerman exhibited a new species of Carabus, from Guinea.—Mr. Westwood also exhibited drawings of two new species of the same genus.—Mr. Evans exhibited a collection of insects from New Holland, consisting principally of Hymenoptera and Neuroptera.—Mr. Milton brought down to the Society some larvæ which he had taken from the crop of a pheasant, and which belonged to a species of Tipula. The larvæ were alive when the bird was opened; and, on being counted, numbered 852. Mr. Spence pointed out the importance of this fact, as the larvæ of the species of Tipula were very destructive

to the roots of various Grasses.—Mr. Saunders exhibited a Dragon-fly, which had been caught at sea, off the coast of Africa, 600 miles from land. The question of the possibility of the insect flying so far from land was discussed by the President, Messrs. Spence, Marshall, and Yarrell, and the conclusion arrived at was, that this insect had driven from the shore by the winds.—Mr. Saunders stated he had often seen Dragon-flies at sea, above 100 miles from the land.—Mr. Westwood exhibited two rare insects from the collection at the British Museum, the one a Grasshopper (Megalonyx ensifer), from Sumatra, remarkable for the length of its ovipositor; the other a species of Moth, belonging to the genus Coronis, remarkable for its gay plumage and the form of its wings, and forming a link between the two great families of Lepidoptera.—Drawings were exhibited from Captain Boys, of India, of a species of Cimex, with its larva, which was covered with spines. It was found on the leaves of the Ocymum gratissimum. A species of Coleoptera, approaching the form of Ips, was exhibited also from Captain Boys.—A paper was read from W. Stephenson, Esq., Surgeon, on the Entomology of New Zealand. The Coleoptera are exceedingly abundant, and their larvæ assist much in the destruction of the hard wood of the numerous forest trees. No Buprestidæ had been observed. The larva of a Hepialus was found exceedingly destructive in gardens. An account was given of a formidable insect, allied to Gryllus, which lived chiefly in decayed trees, and was carnivorous, and which inflicted severe wounds upon those who interfered with it.

COUNTRY SHOWS.

Norfolk and Norwich Horticultural Society, Nov. 27.—This was the annual Show, which was better attended than we remember to have seen it upon any former occasion. The Chrysanthemums were very creditable, and presented many beautiful varieties, including Grand Napoleon, Vesta, Empress, Defiance, Unique, Queen, and several others. Mr. Bell exhibited the following:—*Chrysanthemums, 32 varieties:* Maréchal de Crequi, sanguineum, Itobate, Malvina, mirabile, Bijou, insigne, Louis-Philippe, Marie Antoinette, Conqueror, Madame Pompadour, Theresa, Luxurie, Hero, Unique, Vesta, sulphurea, Incurved Pink, Memnon, Casimir Perrier, Ivanhoe, Empress, Adventurer, Defiance, Grand Napoleon, Phillis, Colonel Combes, perspicuum, Marchioness de Montebello, Achmet Bey, Surprise, and Phidias. *Ericas:* Linnæoides, hyemalis, caffra, arbuscula, and pyramidalis. *Miscellaneous Plants:* Epacris grandiflora, Ardisia crenulata, Gesnera longiflora, Leschenaultia formosa, Cactus truncatus, Cypripedium insigne, and Ipomopsis picta. MEMBERS' FLOWERS—*Chrysanthemums, best* 24: Rev. J. Burroughes—Marshal Maison, Beauty, Vesta, Golden Lotus, pulcherrimum, Empress, Defiance, Tasselled Yellow, Princess Marie, Chancellor, formosum, Marie, Duke, Cluster Yellow, Minerva, Malvina, sulphureum, Luxurie, perspicuum, Tasselled Lilac, lucidum, elegans, and Starry Purple. *Best* 18: Mr. Short, gr. to H. N. Burroughes, Esq.—Luxurie, Campestroni, Chancellor, Peter, Duke, Minerva, Achmet Bey, Beauty, formosum, Duc de Calineau, Memnon, Tasselled Yellow, Louis-Philippe, Marshal Maison, Two-coloured incurved, Defiance, Hero, and Cluster Yellow. *Best* 12: Rev. J. Burroughes—Duchess de Montebello, Vesta, Duke, Tasselled Yellow, pulcherrimum, Cluster Yellow, Defiance, Flechier, Golden Lotus, Marie, formosum, and Sultana. *Primula sinensis, best collection.* Mr. Spence, gr. to Sir W. B. Proctor, Bart. *Gesnera zebrina, collection of:* Mr. Emms. *Lemon tree, &c., in fruit:* Mr. Emms. *Combretum purpureum:* Colonel Petre. FRUITS.—*Grapes:* 1, Muscat, W. Gale, gr. to H. N. Burroughes, Esq., M.P.: 2, Hamburgh, Mr. Rippingale, gr. to G. Morse, Esq.; 3, Muscat, Rev. G. Lucas. *Extra,* Hamburgh, Mr. Aldborough, gr. to Mrs. Kett. *Grapes, out door:* 1, Muscadine, Mr. Spence; 2, Mr. Colman. *Plums:* Imperatrice, Mr. Short, gr. to J. Stracey, Esq. *White Currants:* Mr. Short. *Red Currants:* Mr. Short. *Cranberries:* Mr. Short. *Apples:* Golden Harvey, Mr. Short. *Pears, dessert:* 1, Marie Louise, Mr. J. Cann; 2, Crassane, Mr. Warner, gr. to W. Robinson, Esq; 3, Black Worcester, Mr. J. Wighton, gr. to Lord Staffd. *Medlars:* Nottingham, Mr. Gale. *Pears, baking:* 1, Uvedale St. Germain, Rev. G. Lucas; 2, Catillac, Mr. Short. *Walnuts, thin-shelled:* Mr. Scarlett. VEGETABLES.—*Celery:* 1, Crawshay's Solid Red, C. K. Tompson, Esq.; 2, White, Mr. Short. *Carrots:* Attringham, Mr. Gale. *Parsnips.* Hollow Crown, Mr. Gale. *Lettuces:* 1, Brown Cos, Mr. Jacobs, gr. to Mrs. Scott; 2, Texter Cabbage, J. Kitson, Esq. *Peas:* Shilling's Early Grotto, Rev. J. Burroughes. *Potatoes:* Cambridge Kidney, H. S. Patteson, Esq. *Red Cabbage:* Colonel Petre. *Sea-kale:* Mr. Short. *Horse Radish:* Mr. J. Potter. *Broccoli:* White Cape, Mr. Short.—*Norwich Mercury.*

Reviews.

Sowerby's Supplement to English Botany. Second Series.

WE wish to call the attention of the readers of the *Gardeners' Chronicle* to this very beautiful work, which is now publishing at intervals of two months, as it seems highly probable that many of them, who take an interest in botanical pursuits,—and what possessor of a garden ought not to do so?—are ignorant of its existence. Of the present series *six* Numbers have now been published, each containing *four* plates of new or recently discovered native plants, executed in the very highest style of art, and also most accurate in the delineation of the several parts requisite for scientific study. Each plate is accompanied by one, two, or more pages of letter-press, giving the generic and specific characters, synonyms, and a detailed description of the plant; together with, when requisite, observations on its peculiarities, and critical remarks concerning it. The literary part of the work is in all cases prepared by some botanist of note who has turned his attention to that part of the subject to which the respective plants belong, and his initials are appended to each article.

From the large number of copies of the original English Botany, which have been sold, it is manifest that very many persons must possess that work who have not as yet rendered it complete by obtaining the Supplement; for if such had not been the case it would not now have to be stated that the sale of that Supplement is so small (considerably under 100 copies) as not to pay its expenses, even when (as is the case) the artist, engraver, colourer, publisher, and proprietor, are the same person. We trust that the lovers of botany will not allow a work which does so much credit to our country to fall to the ground for want of support; and would also recommend it to the ladies as an elegant appendage to the greenhouse and drawing-room. It should be remembered that no country possesses a collection of figures of its native plants, making even nearly the same approach to perfection as is done for Britain by the English Botany and its Supplement. The Supplement was advertised in the early Numbers of this Journal for 1844.—*C. C. B.*

A History of British Crustacea. By Thomas Bell, F.R.S., &c. Part I. Van Voorst.

THIS is the first part of another work of the series on British Zoology, published by Mr. Van Voorst. We had feared that the interest in natural history was too little to allow of the publication of any works in this series upon the invertebrate animals of Great Britain. We are, however, glad to find that Mr. Van Voorst is disposed to extend his design to the whole animal kingdom. The present work embraces the Crustacea, by Professor Bell, whose knowledge of this subject is well known to naturalists, and will be a guarantee for the successful issue of the work. The description of each species is accompanied with a wood engraving, and an account is given of its habits, uses, and other interesting information. In the present Part also, there are several vignettes, the subjects of which are selected with much good taste. We hope these works will meet with such encouragement as will induce the publisher to give the remainder of the British Fauna in the same manner, as we believe one great reason why zoology is not pursued with equal interest to its sister science, botany, is the want of works giving accurate descriptions of our native animals. In the point of "getting up" the work promises to be worthy the series of which it forms a part.

The Naturalists' Pocket Almanac (Van Voorst), is a poor affair, and unworthy its publisher. The idea of it is good; the execution bad. The plan of the book is to combine with a common Almanac monthly notices, Zoological and Botanical, to which the observer may add memoranda of his own upon interleaved paper. If these notes were copious and well selected, they would be interesting and useful; but their value depends essentially upon their copiousness. A few petty details are productive of no advantage to the reader. In the trifle before us they are meagre in the extreme. For example, the writer has not a word to say about the plants that flower in March, April, and June—the three months of the year most interesting to the accurate observer; and in May the most important fact that he announces is that the Lily of the Valley is in flower. Near the end is a meagre list of the periods at which a few common plants have been observed to flower for *four* years; but the list is far too short, and not all contrasted with the remarks of other observers elsewhere. In short, the Almanac seems intended for the special information of those who live in Epping Forest or its neighbourhood. The Entomological information is more copious and useful, as far as it goes; but it has the great fault of admitting a nomenclature so unusual in this country, that our best Entomologists are sometimes puzzled to know what the insects are to which the names belong. Almanacs are for popular purposes, and, to have any sort of utility, must be written in common language. Neither can we compliment the author upon his accuracy. There is no such Secretary of the Horticultural Society as Dr. Anderson; there is no such English plant as Whitehorn.

Miscellaneous.

Shanghae Trefoil (Medicago denticulata).—A fine broad-leaved variety of this plant was found by Mr. Fortune to be much used by the Chinese in the winter months as a vegetable. Afterwards they manure the rice-grounds with it—indeed it is often sown expressly for that purpose. It is, however, hardly to be expected that it should answer that purpose in England. We understand that the Horticultural Society have received a few seeds of the variety.

Defence of Speculation.—One would think that in thinking there were something wicked or else unwise; everybody feels or fancies a necessity of disclaiming it. "I am not given to speculation"—"I am no friend to theories." Speculation—theory—what is it but thinking? Can a man disclaim speculation—can he disclaim theory, without disclaiming thought? If they do not mean thought, they mean nothing; for unless it be a little more thought than ordinary, theory, speculation, mean nothing.—*Benthamiana.*

New Zealand.—We have just heard of a valuable case of plants received by a gentleman in this settlement, by the Theresa, which were packed in wet Moss without any soil at the roots, and soldered in tin. This mode of packing answers remarkably well, as every tree appears to be alive and healthy. Fruit trees may be thus obtained from England at considerably less cost than we have been accustomed to pay for them from the surrounding Colonies, besides the advantage of insuring the best descriptions.—*Nelson Examiner, April* 27, 1844.——A Meeting of the Agricultural and Horticultural Society was held, C. B. Brewer, Esq., the Provincial Judge, in the Chair. It was moved by Mr. F. D. Bell, seconded by Mr. J. S. Tytler—That the cordial thanks of the Society be presented to James Robert Gowen, Esq., for the interest he has manifested in its proceedings, and for his kind exertions in procuring donations of plants and seeds for this settlement. The following gentlemen were elected officers for the ensuing year:—Patron, J. R. Gowen, Esq. At Nelson; President, W. Fox, Esq.; Vice-President, G. Duppa, Esq.; Treasurer, A. MacDonald, Esq.; Committee, Messrs. J. S. Tytler, Kerr, Redwood, Dillan, Elliott, Cautley, Domett, Macshane, A. Saunders, Brewer, Bell; Secretary, Mr. Cautley.—*Id., May* 4.——I have paid every attention in my power to your recommendations. Trotter, the gardener, has ample employment in private gardens; he told me to-day, that he had seven days' work to perform in six working days in the week. My garden has progressed very much lately. We had nearly 100 fine ripe Peaches, and are now eating some tolerable Grapes. I believe I have four hives of Bees, but some have been deserted. I think the bees see no occasion for laying up a store for the winter, as there are flowers all the winter; but they swarm too often, sometimes four or five times in a season.—*Col. Wakefield.* (*Private Letter, July* 5, 1844.)

Botanic Garden, Calcutta.—Dr. Wallich has been directed to carry out all the changes in this establishment advocated by Mr. Griffith, who has quitted his charge of the garden and returned to Malacca; but I regret to say, that little has been done since Dr. W.'s return. Indeed, the last time I was in the garden all the new ground arranged by Mr. Griffith was overrun with weeds! The Agricultural Society of Calcutta has determined to attempt the introduction of all the valuable fruits of all tropical countries, for dispersion in India, and Sir L. Peel gives a prize gratuitously for fruit and flower exhibitions.

The Black Indigo.—We learn, by a letter from Mr. Griffith, that this substance, mentioned at p. 879, 1843, is procured from some species of Diospyrus, a plant of the order of Ebonies, and known for the blackness and hardness of the wood, and acerbity and astringency of the immature fruit. Mr. A. Robertson is said to be engaged on an analysis of the fruit, and in the meantime agrees that, in consequence of the general character for astringency of the family, it is probable that the black dye is not in itself a black dye. This is likewise suggested by the published analysis of the dye stuffs, in which iron was found. This species of Diospyrus Mr. Griffith suspects to be unpublished.

Florists' Flowers.—We understand that the North Country growers intend holding several Exhibitions at Mr. Wood's, of the Coppice, near Nottingham, during the coming summer, which are to be open to the growers of the United Kingdom, and of which advertisements will appear early in January next. The first will be of Tulips and Pansies; the former of which will be exhibited in stands of 6s or 12s; and the latter in stands of 12s or 24s. There will also be prizes for the best pans of Breeder Tulips. The second Show will consist of Carnations and Picotees, and from the impetus given to the cultivation of these beautiful flowers (by the Exhibition of last season), in the immediate neighbourhood of Nottingham, a spirited competition is expected.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

THE highest night temperature in the stove for this month should not exceed 60°, which may be maintained as long as the weather keeps open; should the weather, however, suddenly change to hard frost, do not strive to keep up this temperature by strong fires: 50° is high enough in very severe weather, and strong fires will be needed even to keep up that heat, so that in many cases water must be sprinkled over the paths, pipes, &c., to prevent the highly-dried air from injuring the plants. Strong stove climbers that do not blossom freely should now be root-pruned by cutting off some of their largest roots near the surface, or if they are to be taken up next spring and tried in boxes, this is a good time to begin to prepare them, not however, by cutting their roots, but by tracing one half of them to their extremities, and then placing them near the surface with some light compost thrown in amongst them; by the end of January these roots will have formed a fresh set of young fibres, and then the other half of the roots may be served after the same manner, but leaving the plant in the same place till later in the spring; this is a safe mode of treating plants that are to be removed from the borders of any of the houses, or for checking their luxuriance.

Conservatory.—Euphorbia jacquiniflora is an excellent conservatory plant while it is in blossom, but at other times it must have the stove treatment. Last season, about this time, I pruned some large plants of it, to see if by a little forcing in spring I could get them to flower early this winter, but the experiment failed in some measure; as soon as these plants began growing in spring, they also flowered on the young growth, but not satisfactorily, and now they are not more forward than others that flowered last Christmas, and that were pruned in January; these are now just beginning to flower, and by the middle of the month will be fully out: in another season or two this treatment, with the same plants, will bring them into blossom by the first week in December, and thus one of the best winter-flowering plants we possess may be had for the rooms or the conservatory for four months. The older the plants are, if they are kept in health, the earlier they can be brought into blossom, as they do not grow so freely; to get plants in this state, pieces of the oldest roots should be made into cuttings at potting time, as Mr. Threlkeld has shown in a former Number.

Greenhouse, Pits, &c.—Such a season as this proves how useful temporary structures are for protecting greenhouse plants late in the autumn; the general plan is to cram all the pits and houses on the first appearance of frost in October, whereas almost all the plants of this division might yet be partially in the open air, and be much benefited by the treatment. For some families of plants—Pelargoniums, for instance—that are worked much out of season, contrivances of this sort are particularly useful. To have fine specimens of Pelargoniums in blossom in August and September, October is the best time to cut down the plants, and from that time till after Christmas they should be as much exposed in the open air as rain and frost will permit them; they will only be coming into leaf again, and after two months' protection in the greenhouse, &c. they may again be turned out into temporary pits to keep them back, and as the warm weather comes they may be placed under a north wall, &c.—*D. B.*

III.—FLORISTS' FLOWERS.

The Florist may now take breath. His Tulips are all safely in the ground and in a growing state, and comparatively speaking out of harm's way. He may now occasionally "overhaul" his collection by looking through his book, when his favourite flowers will recur with all their beauties to his fervent imagination; we need not enlarge on his feelings, for those only who

have experienced them can appreciate how pleasurable they are. The Carnation-grower's chief care must now be to prepare his compost for next season (for most assuredly it will be a busy one). His turf must be turned often, very often, during the next three months, carefully picking out of it the Florist's plague "the wire-worm." His leaf soil also must be shaken up and sweetened, and a proper quantity of thoroughly decomposed stable manure must be made sure of, let whatever other crop will, go without. If he means to have large and fine flowers, he must not be too fastidious about manure, but it must be well rotten. Picotees are not so apt to become foul, or as we call it, "run," as Carnations, and they will, consequently, bear a richer compost. Still, where Carnations and Picotees are grown for exhibition, one hundred pots might easily be cultivated at "high pressure," in order to win some of the prizes, which will be "thick as Bilberries" in the country next season, for those deservedly popular flowers. *Pinks.*—We have heard of many new sorts of these scented favourites, both from north and south. We are told that Simmonite's Coronation, dark lace, and Burguis' Miss Jessop, black and white, are splendid flowers; the former having won several Cups in succession at Sheffield, till Bradshaw's Greensides carried off the palm this season. Still we know that the Sheffield judgment and that of London are as yet as wide apart as the Antipodes. Queen of Roses is not now to be obtained for "love or money." Headly's Duke of Northumberland is a "clipper," and we are persuaded will become a general favourite, and the florist who has not yet got it had better make inquiry. These, as well as Carnations and Picotees, must be attended to now regularly. The attention they want is comparatively trifling, but that little must not be neglected. For other florists' flowers consult the Calendars of the last four weeks.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—The weather of the last fortnight, having been dry, has been much in favour of Pines grown in pits heated by dung linings—not protected. Have plenty of leaves and litter always in readiness to renew these linings, as one heavy shower will destroy the heat in those which have been long unturned. The best plan is to make a rule of turning a portion of the linings every week. On fine days dew the plants in the fruiting and succession pits heated by fire, with the syringe. The atmosphere of dung pits will probably be sufficiently moist from the steam of the dung.

Vineries.—If the Vines started three weeks back are beginning to swell their buds, be more careful to keep the temperature uniform—about 50° by night and 60° by day, must be maintained, allowing the house to rise to 70° with sun-heat. Long shoots should be bent down, so as to place the lowest buds uppermost, to cause them to break first, after which the rod may be gradually restored to its proper position. You cannot keep too moist an atmosphere from this time till the Vines are in blossom. Keep the soil of the outside borders at a temperature of about 70°, by covering it with leaves and litter as far as the roots extend. Examine the inside borders occasionally, and if dry, let them have a good soaking with liquid manure.

Peach-houses.—Whenever you perceive the buds to be advancing, pay the strictest attention to the state of the atmosphere. Give air when the sun raises the thermometer to 60°, and sprinkle the trees three times a day till nearly in bloom.

Plants in Pots, now in bloom, should be assisted in setting, by means of a camel hair brush. Keep a temperature of 55° by night, and 65° by day. If they are plunged, the bottom-heat should not exceed 70°.

Strawberries.—If Strawberries are required early, a few may now be brought into a cool Vinery or a pit, the decayed leaves being first trimmed off, and a little of the top soil removed, and replaced with some fresh rich loam. Wherever they are placed they should have gentle treatment at first, and air should be admitted freely every fine day.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Root pruning of Fruit trees now, in connection with Top-pruning in Summer.—In cases where several branches of a tree have become so luxuriant as to prevent a fair distribution of sap, or where altogether the growth has been so rampant as to prevent the formation of blossom buds, the cutting of the stronger roots, so as to check the too luxuriant branches, or the general pruning of the roots in cases of too vigorous though uniform growth, will be attended with advantage, inasmuch as vigorous growth and productive fruitfulness are severally effected by means directly the opposite of each other. Though root-pruning is now frequently referred to as something new, it must be 15 or 16 years ago since I saw it resorted to by the late Mr. Beattie, at Scone gardens, and he did not seem to think then that there was anything in it remarkable for novelty. The practice frequently recommended, of cutting the roots every year or so, and then surrounding them with a trench of rich manure—though, I doubt not, attended with good results—possesses this anomalous feature, that the system owes the whole of its success to a perpetual doing and undoing; producing fertility by rendering the tree deficient in nourishment at one time, and supplying it with too much at another. When trees are deficient in fertility from over-luxuriance, the raising of the roots nearer the surface, giving no manure but as mulching, and attending to early and judicious summer-pruning, we should prefer to a yearly mutilation of the roots, unless in circumstances where it was desirable to have as many fruit-bearing trees upon as small a space of ground as possible. Where the roots of Apples, Pears, &c., are within from 9 to 18 inches of the surface, the trees may soon be deprived of extra luxuriance by judicious summer-pruning, merely preserving as many leaves on the shoots as will insure a healthy action between the roots and the branches, and not so many as will shade those buds at the base of the shoots, and on small short spurs, that can only be rendered fruitful by a free exposure to light and air. In extreme cases, such as in old fine-looking Pear-trees, that have become barren in the centre, the raising of the roots, and the supplying the tree with young wood, as previously recommended in the Calendar, or as recently advised by Mr. Errington, would doubtless be attended with good results; but with trees of moderate age and equality of growth it will seldom be necessary, unless in the case of trees of peculiar habits. Did I want anything to convince me of the utility of judicious shortening and thinning out the shoots of Pear trees for example) in summer, it would be the sight of the fertile, healthy appearance of the Pear trees on the walls at the Horticultural Gardens, where, without having recourse either to root-pruning, or an annual laying in of young wood, the branches are studded all over with fruit buds close up to the stem.

Celery.—The present dry weather should be embraced for giving this useful vegetable its final earthing up. As we grow our crops chiefly in beds, and as our soil is apt to rust the Celery, I do not put on a great thickness of earth, but I bank the late beds up with tree leaves and any loose litter, putting them together when dry, and as lightly as possible, to keep them from fermenting. The surface soon gets caked over, so as to exclude the most of the rain, and the frost is kept out and the Celery blanched by the same operation.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—As the weather still continues favourable for all operations of the season, every opportunity should be embraced for forwarding them.

Coppice.—Now that the leaves have fallen, attend to the clearing of ditches, drains, and water-courses; repair fences, cut and plash the hedges where it is necessary, and forward all other work whenever the weather is favourable.

Young Plantations.—The planting of new ones, and making good failures in recently planted ones, should be proceeded with as expeditiously as possible, when the weather is mild and the ground dry. It is best to keep the different sorts of forest-trees in masses or groups by themselves as much as possible; but this must be regulated according to the soil, situation, &c. Plant the kinds intended for permanent wood by themselves, intermixed with other suitable kinds as nurses, to be headed off, and kept low as undergrowth.

Nursery Work.—The work to be done in this department, pointed out in previous Calendars, may still be proceeded with whenever the weather is favourable.—*W. B.*

VII.—COTTAGERS' GARDENS.

This being about the best time for procuring a few Roses for the cottage garden, I would recommend those who are desirous of collecting a small group of good sorts to get the following, which are mostly Perpetuals, or which flower from June until late in autumn, when frost puts an end to their beauty: viz., Bourbon, Acidalie, Bouquet de Flore, Duchess of Sutherland, P.; Madame Laffay, P.; Aubernon, Fulgore, P.; Duc d'Aumale, Damask, Bernard, Crimson perpetual, Prince Charles, Bougère, Goubault, Eliza Sauvage, Comte de Paris, Triomphe du Luxembourg, Sylvain, Lady Fordwich, P.; Lamarque, P., and Jaune Desprez, P. The above are all good, and are not expensive to buy. Those marked P are well adapted for covering walls, or for training up pillars, &c. If planted in a bed they had better be placed in the centre, or wherever it is wished that the bed should be highest. China, Tea, and Noisette Roses, should be kept in pots until spring. Other kinds may be planted with advantage about this season, when the weather is dry and not frosty. The pruning of the Vine and other fruit-trees may now be proceeded with. In pruning the Vine, cut out a portion of the old wood, especially where such can be replaced by well-ripened shoots of last season. All the young shoots should be more or less shortened according to their strength and maturity. It is of no use to leave soft, unripe, or weak wood. If left so thick as that the whole of the wall would be covered with foliage, the rays of the sun would be thereby prevented from heating the wall, and thus the latter would afford little assistance in ripening the crop. It is, therefore, advisable to train thinly; for by so doing the bunches will be larger and better ripened than could be obtained from crowded wood.—*J. McH.*

State of the Weather near London for the week ending Dec. 5, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

American Blight.—*M. C. F.*—Your tree is devoured by this insect. Wash it all over in the spring, as soon as the blight appears, with spirits of tar, applied with a stiff brush. After a few weeks more will appear; repeat the application. A little perseverance will soon rid you of this pest, which in the long-run would kill your trees.

Apples.—*Malum.*—The following table and dessert Apples will probably be found suitable for walls in Cornwall, at a considerable elevation above the level of the sea, viz., Court Pendu Plat, Dutch Mignonne, Herefordshire Pearmain, Adams's Pearmain, Reinette du Canada, Ribston Pippin, Stormer Pippin, Dumelow's Seedling, Blenheim Pippin, Bedfordshire Foundling, Mère de Ménage. The Early Harvest may be planted as an early sort against a north wall; but this situation is more proper for kitchen fruit.¶

Bees.—*Apiarius.*—We are endeavouring to organise an Apiarian department of our Paper, in which all matters relating to Bees shall be sufficiently treated of. You shall have an answer to your inquiry next week.

Books.—*Georgic.*—"The Modern Gardener," by T. Price. It may be purchased for 1*s.* 6*d.*——*T. Nadin.*—We are not booksellers. You must apply to the publishers.

Carnations.—*Rus in Urbe.*—Potter's liquid guano has been tried on Carnations in the spring, when in a growing state, with great success. After the layers have become established in their blooming-pots is the proper time to apply it; we should decidedly object to manure in *any shape* being mixed with the soil in which the layers are wintered.—*W.*

Chicory.—*O. T.*—When used in coffee this is not deleterious, quite the contrary; it certainly imparts, when used in moderation, a fine flavour.

Cucumber Pits.—*C. J.*—We have given so many directions already for all sorts of structures of this kind, that we can find little to add. By all means let your sashes be of wood. If you have iron ones you will never be able to use them. Certainly use the tank system, and hot-water gutters, not close pipes, for bottom-heating.

Diseases.—*K.*—The production on leaves of Hardenbergia consists of a mass of elongated cells perpendicular to the plane of the leaf. It is accompanied by a very minute Acarus, to which probably it owes its origin. There is also an obscure mould on the surface of the little patches. If produced by the Acarus, which is most likely, it is very probable that it may extend to neighbouring plants; but if the little mould be the cause, this is not likely to be the case. *M. J. B.*

Gooseberries.—*Corylus.*—The varieties of Gooseberries can be obtained generally correct from the Lancashire growers. Amongst several hundred varieties which were obtained from various authorities by the Horticultural Society, there was less confusion as regards synonyms and false sorts than amongst any other class of fruits.

Insects.—*Querist.*—Our advice would not be so serviceable to you as a perusal of the article on the Wireworm, in the last Number of the Royal Agricultural Journal.*R*——*A Subscriber.*—It is an acarus, nearly related to the red spider and also to the A. telarius. The best remedies you will find connected with their natural histories in vol. i, p. 164, and vol. iii, p. 356, of this Journal.*R*——*A Beginner.*—The worms you sent may be bred in the decomposing parts of the plants, but it is the wood-lice that eat off your seedling Auriculas.*R*

Laurel Leaves.—*S. V.*—We presume that dilute prussic acid would answer the same purpose as Laurel leaves in destroying the red spider; but there is a difficulty in knowing what the degree of solution should be, and an objection in the expense. Laurel leaves cost nothing, and are very easily applied. We shall be anxious to hear the result of your experiment. Your explanation of the supposed fact, if it be a fact, is doubtless correct. We would, however, suggest that the soil of Spain is much warmer in winter than that of England.

Mildew.—*C. W.*, and *Alricksey.*—It is by no means uncommon for Chrysanthemums, &c., to be affected with mildew at this season. The best way to prevent it is to syringe the plants well with nitre dissolved in water at the rate of 1 oz. to a gallon. This should be done as soon as the mildew makes its appearance. §

Names of Fruits.—*S. R. P. Shilton.*—1, Probably Minchal Crab; 5, Bedfordshire Foundling; 6, Hollandbury; 9, Loan's Pearmain; 11, Hall Door; 13, Hughes's Golden Pippin; 14, Beurré Diel; 17, now past its season, but very probably the Gravenstein, 18, Cordwall is the Rymer; 19, Eve Apple (of some), not the Red Margaret; 20, Pike's Pearmain is King of the Pippins; 23, probably Keswick Codlin; 26, Dutch Mignonne; 27, Dumelow's Seedling; 28, 29, Beurré de Capiaumont; 33, Franklin's Golden Pippin; 34, Glout Morceau; 37, Barcelona Pearmain; 7, 30, 31, 32, correct. Of the Seedlings, No. 4 is the best, and seems worthy of further trial; 18 deserves further notice.‖——*W. D. F.*—The Pear cultivated in your neighbourhood under the name of Forme de Marie Louise, is the Marie Louise; the other is the Black Achan.‖——*B. D., Greys.*—A fine specimen of the Bishop's Thumb.‖——*M. L.*—1, White Doyenné; 2, Brown Beurré; 3, decayed. 1, Stagg's Nonpareil; 4, Hollandbury; 5, Gloria Mundi; 7, Downton; 8, Beauty of Kent; 10, 11, Famagusta; 12, Golden Noble.‖—*Subscriber.*

Names of Plants.—*C. M'I.*—Epiphyllum violaceum. 3, Zygopetalum crinitum; 2, Maxillaria picta; 3, M. punctata. 4, Bifrenaria racemosa; 5, Oncidium sanguineum, a small variety. We do not recognise the shrub.——*A Subscriber.*—Some kind of Eugenia, and a stove plant.——*F.*—The plant is *probably* Læha flava; but we will not speak positively without seeing its flowers. We never fix values on plants. ——*Anon.*—Polypodium vulgare, and some Commelina, perhaps Angustifolia.——*H. B.*—Peziza coccinea.

Nursery-ground. Auction Duty.—*F. V. A.*—The products of a nursery-ground sold, as stated, are not, we think, liable to auction duty.—*W.*

Pears.—*J. E.*—For Perry the Barland, Holmore, Oldfield, Huffcap, and Teinton Squash, are amongst the most approved varieties.‖——*W.*—If you can send a specimen of the Pear called in your neighbourhood the "Slippery," it will be attended to.‖

Pear-trees.—*W.*—In planting, it would have been better if the holes which were filled with good soil had not been dug so deep as to penetrate the stiff clay. The roots have been, in consequence, led into the very substance which has doubtless occasioned canker in the shoots. The sorts, Swan's Egg, and Autumn Bergamot, are, however, more liable to canker, when old, than many others. All you can do is to supply the roots with fresh rich compost, and graft with Marie Louise, Knight's Monarch, or Althorp Crassane.‖

Pelargoniums.—*An Anxious Inquirer* keeps her Pelargoniums too wet at this time of the year. They should have water *very seldom.*

Planting Forest-trees.—*R. F.*—In preparing ground on the side of a hill for planting, where the soil is composed in many places of 8 inches in depth of good earth on a bed of chalk, and strong earth mixed with flints, only trench the ground to the depth of the good soil, mixing a small quantity of the chalk or strong earth from the bottom with it during the operation. The best trees for such a bleak situation as the side of a high hill in Dorsetshire, are Evergreen Oaks, Weymouth and Cluster Pines, Silver and Spruce Firs, Scarlet and other Thorns, common and other Maples, Catalpa, Yew, Chichester Elm, and common and Manna Ash.¶

Potatoes.—*J. G.*—What it is in soil that determines the quality of Potatoes is unascertained. Opinion seems to turn in favour of saline manure, or guano, and against farm-yard dung, unless very fresh and strawy. Some lands never bring Potatoes of good quality.

Sap.—*A Youth of the Soil.*—The sap of trees rises from the soil till it reaches the leaves; then, under the influence of light, it is very much changed; a great deal of the watery part flies off; the remainder is converted into organisable matter, which is returned downwards, and lodged among the tissue, where it becomes wood, or is employed in the formation of new leaves and flowers, or is stored up in the form of starch, sugar, resin, and other secretions. A small part is perhaps given off by the roots, under particular circumstances; but this is probably a deranged function.

Sulphate of Ammonia.—*G.*—The person who sold you this salt for nitrate of ammonia was either a cheat or a blockhead. It may be used with advantage for Potatoes. But is it, after all, sulphate of ammonia? A dealer who blunders one way may blunder in another. We never heard of its being applied to florists' flowers; the danger will be in its making them too rank. It would be a great convenience if you would be so obliging as write *on one side only* of your paper. We can find no such statement about guano on 26th Oct. as you refer to.

The Sloe.—*A. Z.*—This may be propagated freely by suckers or by seeds; the latter should be gathered in October, when the fruit is dead ripe, mixed with sand, and turned over two or three times in the course of the winter; and, if sown in February, they will probably come up in May.‡

Transmutation of Corn.—We observe in a French Journal that Mr. Thomas Biggs has shown in Cork specimens of Wheat from each side of which perfect Oats have grown. These specimens are said to have grown on the estate of Shippoul, belonging to Captain Herrick. Could any of our Irish friends inform us whether this story is true, and if it is, procure us a sight of these ears of corn? We should be infinitely obliged, and would return them carefully. If they were addressed to Dr. Lindley, 21, Regent-street, *unpaid*, they would be promptly attended to.

Miscellaneous.—*E. O. L.*—Your Carnation from Naples is the common Dianthus plumarius. We apprehend that in this case no change has taken place, but that your friend has been deceived by the Neapolitan who sold him his roots.——*Querist.*—Early sorts of Potatoes are best adapted for late planting. The Beurré de Capiaumont is in perfection in October. It is a great bearer, but has not so rich a flavour as many others of the same season. Oaks are best grown from the Acorn, without having been transplanted.‡——*E. M. W.*—The Cotoneaster microphylla may be grafted with success on the common Hawthorn. If grafted, it should be done in the spring; but if budded, the operation should be performed after midsummer.¶——*R. J. H.*—The Royal George and Noblesse are suitable Peaches for forcing in pots. If the wood of your Vines is well ripened, it is not necessary to cover the branches with hay ropes after the Vines are turned out of the house.‡——*A Lady.*—Rhubarb is a vegetable.‡——*Alricksey.*—The vols. for 1843 and 1844 are the third and fourth.——*H. S., &c.*—The manner of applying spirits of tar for the purpose of killing American Blight on wall trees, is to unfasten the trees from the wall, and with a painter's brush, or one made of matting, to paint over every part of the tree affected, taking care to rub the material well into all crevices and cracks.‡——*A New Reader.*—If glass is too expensive for you, calico, which may be bought for about 2*d.* a yard, done over with linseed oil, is better than the old plan of preparing paper with the same material for the purpose of covering lights, as the latter is very liable to be torn. Calico, prepared with the composition above described, has been found to answer as well. With regard to Melons, the Beechwood is one of the most valuable sorts.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—Dr. Lyon Playfair, Consulting Chemist to the Society, having kindly consented to deliver Two Lectures before the Members on the occasion of their ensuing General Meeting, all Members will have the privilege of free admission on presenting tickets, to be obtained at the Office of the Society. By Order of the Council,
12, Hanover-square, Dec. 4. James Hudson, Sec.

BURRIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus; and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet street.

The Agricultural Gazette.

SATURDAY, DECEMBER 7, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
Wednesday, Dec. 11—Agricultural Society of England.
— — Smithfield Club Exhibition.
Thursday, Dec. 12—Agricultural Imp Soc. of Ireland.
Wednesday, Dec. 18—Agricultural Society of England.
Thursday, Dec. 19—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Dec. 10—Abergavenny.
Dec. 19—Richmondshire.
Grove Ferry.
Dec. 20—Wrentham.
Stoke Ferry.
Dec. 21—Rayleigh.
Dec. 21—Winchcomb.

We have as yet received but few communications on the subject of our late remarks on Farmers' Clubs. We should feel exceedingly obliged if any of our readers living near the place of meeting of any such Society, would be kind enough to inquire of the Secretary if he has noticed our request, that information might be forwarded to our office of its name and place—of the days of its meetings for the ensuing year—of the subjects to be discussed on those days, if they have been determined on—of the subjects discussed during the past year, and of the resolutions arrived at on those subjects.

Of course, if any Society has determined on refusing the publication of these matters, we can have nothing further to say; only we are anxious that our request should at least be brought under the notice of all, and it can then be dealt with as may be thought proper. We believe, with many, that an attempt to centralise and connect or compare the now disjointed *dicta* of Farmers' Clubs would be beneficial. See page 769.

Among the many questions of interest which have been partially discussed at the agricultural meetings of the present year, is THE POLICY OF BREAKING UP INFERIOR PASTURE-LANDS.

The chief argument urged by the advocates of the proposal is, that such a change would give much additional employment at a time when it is much needed. With such a claim upon our notice, the question is certainly entitled to the fullest investigation. We are the more anxious, however, to enter into the merits of the case, because, up to the present period, the tenant farmer has universally been jealously restricted from adopting the system in *any* degree, or under any circumstances. Now, we are no friends to restrictions upon the good farmer, who is "up to the age," and who, endeavouring to get as much as he can from the soil, *gives* to it in the same proportion that he *takes* from it; at the same time, however, it must be conceded, that with the tenant-at-will they are, in some degree, *necessary* evils. The restriction alluded to, therefore, though in many cases it may be essential, in others is decidedly injurious; for, whether or not arable land be superior to pasture in creating profit and labour, there are unquestionably cases—many, too—in which lands that will not produce a *natural* crop, should be made to produce an *artificial* one.

The restriction we allude to is so universal, that the tenant farmer in but few cases ventures to question its propriety; and, indeed—so soon doth use breed habit, and habit mould the mind—many of our landowners also are convinced that it is *essential* to their interests, and ought, in all cases, to be preserved inviolate. No matter what the soil may be, whether it grows bad Grass or good, the tenant who should venture to suggest that he could pay his rent better, if allowed to cultivate and improve the whole of his naturally poor soils, instead of allowing one portion to remain in its originally unproductive condition, would often be looked upon with an eye of suspicion, and sometimes even be considered an agricultural pirate, whose design was to plunder the soil at the expense of its owner. A restriction like this, then, so general as to be applied to every description of soil, and under every sort of circumstance—a rule which ought to have so many exceptions, but which has been generally carried out with so few—cannot but have operated against the interests of agriculture. We therefore hail with pleasure the movement which has called for investigation into the principle upon which this restriction is founded; for whatever may be the merits of the practice proposed, it will doubtless be able to show sufficient to convince many that there are cases where that which they have hitherto denounced may be advantageously adopted by both landowner and occupier.

Upon these grounds—*i. e.*, in the hope of modifying a restriction which, when carried out without due discrimination, seriously retards the progress of agricultural improvements—we hold, that the general merits of the proposed system are worthy of special investigation.

To this inquiry we now proceed. In estimating the merits of any system of husbandry, it is essential to ascertain:—1st. The amount of *profit* arising from it—*i. e.* the balance left in the hands of the cultivator after the expenses of cultivation have been paid; 2d. The gross amount or value of the produce raised from the soil—*i. e.* its quantity and value without reference to its cost; 3d. The amount of employment it has given—*i. e.* the *proportion* of the expenses of cultivation absorbed in cost of labour—the gross sum which it has invested in employment. On the first blush of the question, it may appear that the *first* is the only important consideration, as upon the profits of cultivation depend the landowner's rent and the interest of the farmer's skill and capital. No matter, therefore, according to this view, what may be the *quantity* produced, or what may be the expense of labour; so long as the balance is sufficient, the system is a good one. It is true that the *profit* of cultivation, whether it arises from a large gross produce, or a small cost of production, is the first matter to be considered—upon this both the owner and cultivator depend—and if there were no other interests vested in the soil, it would justly engage our whole attention. The time, however, has gone by when a man can say that he has an *exclusive* right in landed property. He has the first claim upon it, because his capital is sunk in it; and, similarly, the tenant, according to his proportion of capital; but no further. Property has, it is acknowledged, its duties as well as its rights. "No man," said a late and lamented nobleman, "has a right to do wrong with his own." So in the cultivation of land we must not consider any system worthy of our acceptation, solely because it is a profitable one to the cultivator, and through him to the owner. Though the owner have the main interest in the soil, the country at large has also a claim upon it. If the owner have capital buried in it, the country affords that capital the protection of the law, secures it against all foreign or domestic interference, and in fact gives it a *convertible* and *actual* value. Capital would be useless lumber were it not that the wants of an industrious population afford a ready exchange for its produce. And, lastly, the soil is one portion of what constitutes "England," and it is incumbent upon each *part* of any body, to act so as to aid and benefit the *whole*. It cannot, however, require argument to show that *English soil* ought to minister as far as possible to the wants of *Englishmen*, or that a *duty* devolves on property, which cannot be shaken off or commuted—a duty to produce as *much* as possible for the benefit of those whose demand confers a value upon what would otherwise be valueless, and by whose constitutional union the proceeds are secured to their owner. Allowing, therefore, that the country has some right in the soil, and that its claim for as full a supply as possible of the necessaries of life is a valid one, it will be evident that the second question must be answered satisfactorily—and the quantity of produce as well as the net profit arising from any system of management, must be taken into consideration in estimating its value.

The next question—that of labour—depends on the grounds urged in the above case. If a country has a claim in the soil, every individual has also an interest in it. Individuals constitute a nation, and in its interests they have individually a share. "This, however," it will be said, "does not prevent us from producing *cheaply*. If we give you *quantity*, we do our duty to the country at large and to individuals; after that we surely have a right to make as good a balance for ourselves as possible." Undoubtedly; but before we balance our accounts we should pay all our liabilities; and one of these is to provide labour for the labourer: he has a right to demand this on the clearest grounds. If the nation has an *acquired* claim upon property from the fact of the benefits it has conferred on that property, the labourer has a stronger *natural* one, the title to which is patent to every well-informed conscience. This claim—the right to labour—is his inheritance,—it is, in fact, his *capital*, a profitable field for the investment of which he may rightly claim as his due. When, therefore, the rich man invests *his* capital in the soil, he does it with the knowledge that there is a mortgage upon it, and it is his duty in the first instance to satisfy the original creditor.* No system of cultivation, therefore, can be a good one, which neglects to provide employment for the labourer, but which obtains its profits from the interest which is due to him.*

But it is not merely on moral and equitable grounds that we are bound to look at the labour required by a method of cultivation before we can estimate its value—on *national grounds* the amount of employment we can give is of the utmost importance; the exigencies of a vast and increasing population can only be supplied by allowing the healthy and the able labourer to invest the only capital of which he is possessed—his physical energy. Of what avail will be the produce of a *great quantity* of food if we do not provide an *equal quantity* of employment to enable the labourer to obtain that food? For these reasons, therefore, we maintain that the merits of any system of cultivation depend not merely on *the profit to the cultivator and the quantity of food* which it produces, but also on *the quantity of employment it provides for the labourer.*

We shall next week test the merits of the arable and pasture system by these principles.—*H.*

* We need not here rest our case merely on moral grounds; the poor man has a legal right to maintenance by the land, as any one will soon find who, by refusing him permission to work for it, makes him a pauper.

THE PLOUGH.

(*Continued from page 802.*)

The frame-work of the plough must be regulated by the work to be done, so far as strength to sustain the tear and wear and the shocks of the roughest work is considered: but its dimensions, the length of the beam and the length of the stilts or handles, as they only affect or regulate the power which the man or the horse has over the implement, need not vary with the work to be performed. These are wholly independent of the consistence of the land to be ploughed, or of the form of the furrow-slice, which both vary, and their dimension may therefore be fixed; and amidst the immense variety of forms of the plough, it is satisfactory to know that this point, one so much affecting the appearance of the implement, need not vary. The length of the beam in some degree affects the power of the horse over the implement. If it be long, the straightness of the furrow evidently will be less affected by any oscillating deviations of the horse from the straight path, and the motion of the implement will be more regular. This, however, is as well insured by lengthening the draught-chain as by lengthening the beam. The longer the handles of the plough, and the shorter the beam in proportion, the more power will the man have over his implement. There are, however, limits to both of these points, which convenience in the length of the implement impose. Very excellent dimensions are those of the Scotch ploughs of Clarke and Fergusson, plough-makers of Stirlingshire (see woodcut). The length of the beam is in these ploughs 3 feet, and that of the handles is 5½ feet; that of the whole plough is 10¼ feet, which leaves 21 inches for that part of the frame-work to which the body of the plough is attached.

The following is a sketch of the mere frame-work of their plough, on a scale of 1-36th:—

[Frame-work of Clarke's Plough. Scale 1-36th.]

The cutting parts of the plough are the share, which cuts horizontally the bottom of the slice, and the coulter, which cuts it vertically from the fast land, of which it forms part. It is evident that these should cut it perfectly. There should be no tearing when the mould-board begins to work. Any tearing must require an otherwise unnecessary exertion of power, and will increase the draught. In some districts an invention has been tried which does away altogether with the attachment of the coulter to the beam of the plough, and provides in its place a projecting edge, standing up from the sock on the vertical plane of the side of the plough, but inclining backwards towards the plough, at a considerable angle. This, of course, insured the perfect cutting of the sod; but it was found in practice that it encountered more obstruction, and was more liable to bend, or, if made of cast-metal, to break, than the common arrangement for the purpose: it was, therefore, abandoned. The relative position of the share and the coulter must, as we have already said, be such that they may cut a square-cornered sod. With regard to their actual position in the plough, it is obvious that the more inclined they are to their work, the more easily will it be accomplished. The cut will be more gradual—less abrupt. They should, therefore, be as much inclined to their work as is consistent with a convenient form of the plough.

Now, it is evident that, though it may be necessary, when altering the dimensions of your furrow-slice, making the plough go deeper or shallower, or when going from one description of soil to another, as from a clayey to a strong soil, to alter the position of the share or of the coulter; yet there can, under no circumstances, be any necessity for an alteration in the form of those parts of the plough. Here, then, is another part of the

* See Professor Henslow's admirable letters on this subject, in the Suffolk papers of last month.

plough which may be constant. We shall find that of all the parts of the plough the mould-board alone will require to vary with the work to be done. There should, however, be a means of altering the position of the coulter; and this is one of the reasons of the failure of that which, as I have said, has been tried instead of it. Besides the common excellent method of effecting this by means of wedges, the subjoined are figures of three methods of doing this, adopted by various agricultural implement-makers in England :—

Ransome.

Hensman.

Sanders & Co.

There are other means of regulating the position of the plough, according to the nature of its work, which should, perhaps, have been mentioned when the frame-work of the plough was described. It is evident that the line drawn from the horses' shoulders, through the point of attachment of the draught-chains to the plough, must, if lengthened, pass through the centre of the resistance met with by the plough at work. Should it be otherwise—should the line so lengthened strike the mould-board at a point higher, for instance, than the centre of resistance, then the effect of the draught will be to pull the plough over, and sink the point of the share, till the implement, by increasing the depth of the land ploughed, has raised the centre of resistance higher up the mould-board. Should it strike the mould-board to the right or left of this centre, then the plough in the same manner, in order that this centre may be brought into the line of draught, will be forced to take a greater or less width of land. This is the way in which the means act which are adopted for altering the dimensions of the furrow-slice.

Lee

The bridle of the plough admits of the attachment of the draught chain to the plough being shifted to the right or left; and so it enables the ploughman to increase or diminish the width of his furrow; and the bridle, by means of a screw or otherwise (see annexed figures), may be elevated or depressed, and so the depth of the furrow may be increased or diminished. There is another and very simple way of altering the depth to which the plough runs; and this is by changing the position of the back-band. It has been before seen that by the action of this part of the harness a portion of the draught is thrown on the back of the horse, and only a portion of it remains on its shoulders. By shifting the back-band nearer to the plough, we increase the ascent of the line of draught, and of course tend to raise the point of the plough, make it work shallower; and by placing it nearer the shoulders of the animal, the plough is allowed to go deeper.

From what has been said it is evident that the object of the beam of the plough is merely to furnish a rigid attachment of the draught chain to the implement. The centre of resistance on the surface of the mould-board is a given point—so also is the attachment of the draught chain to the hames at the horse's shoulder—the straight line between these is the line of draught, and the beam of the plough must be extended in front at such a height and to such a length as may be necessary to afford an attachment of the draught chains, in this line, to a rigid part of the implement above ground and out of the way of the coulter. This beam may be made, if such be the will of the farmer, as high and complicated an affair as he pleases, provided only some rigid part of it be found in the line of draught before alluded to as a place of attachment for the draught chains. Of course the simplest form of beam, which will answer this purpose, is the best. All this is well illustrated in the subjoined figure, for which we have again to acknowledge the kindness of Mr. Allen Ransome.

Any remarks on wheel or swing ploughs should be made here; but the subject is, as I believe, comparatively of little importance. The wheel was, doubtless, added by those who thought it an improvement, and it probably compensated for their unskilfulness in its management, making, in fact, the implement manageable by boys instead of men. And this is a fair and influential consideration in favour of the wheel, but it is not likely to induce its adoption in districts where the swing plough is already in use, and where the skill necessary for its management already exists.—*M. S.*

EXPERIMENTS ON NUTRITION.

I do not venture to express an opinion on the rival theories of eminent chemists; on the question, for instance—Is the fat of animals derived from the non-azotised constituents of their food, or from fat previously existing in such food? I only hope that they will very soon lay their heads together and tell us, from repeated experiments, what really is the fact, and whether fat already formed does actually exist in the food in the large proportion which the French chemists assert. The experiments of Boussingault, given in this Journal, Nov. 23, are certainly of the kind calculated to bear strongly on the point; and it is, indeed, such as these that we should rejoice to see performed and repeated in every possible way, by the chemist of the Royal Agricultural Society of England, with the assistance of one or more practical feeders, and under the sanction, and by the assistance of our National Society. What intelligent member would begrudge one or two hundred pounds so expended? We could readily suggest a mode by which this amount could be saved or obtained, if the present income of the Society should not be sufficient. But, with regard to the experiments in question, though we hail them as important additions to our magazine of facts, and agree with one of the inferences drawn by the experimenter, that Mangold Wurzel and Potatoes alone are an insufficient diet for milch cows—which, by the bye, we should have anticipated—and also that a diet may be insufficient from the absence or deficiency of either of the three constituents mentioned by Boussingault (provided his facts are correct), yet we are constrained to observe, that his experiments fail to establish what they are intended to prove. We find that two cows are taken from a hay diet, and put entirely on Mangold Wurzel, a diet not only entirely different from that to which the digestive organs of the cows had previously been accustomed, but one consisting of 80 per cent of water, and deficient in woody fibre, which is essential for the proper performance of the digestive functions, and more particularly required to give firmness to the morsel, in order to fit it for rumination. Such a diet, we hesitate not to assert, is calculated to derange the digestive organs and interrupt the proper performance of their functions; and when this is the case, we may look in vain for the results which would otherwise occur. That this was the case the result proved, for the cows, we are told, were greatly emaciated—a result, putting chemistry out of the question, which no one can feel surprised at. And as this debilitated state was gradually induced, the digestive organs must have been gradually weakened, and must have failed in extracting the same amount of nourishment as before. The experimenter appears to have regarded animals as mere machines, and to have looked to chemistry alone, forgetting altogether that there was such a science as physiology in existence. Suppose that, in order to test the nutritious qualities of grain, we were to keep a horse entirely on Beans, what would be the result? Why, the animal would soon become emaciated and diseased; or if Oatmeal alone constituted the food, purging and debility would quickly supervene. Even if Oats alone were given whole, in which case the husk would, to a certain extent, counteract the laxative qualities of the meal, the horse would still lose flesh though an unlimited quantity of grain were afforded. To these facts the chemist will, perhaps, reply: "Oh! they only show that these different articles of food are deficient in some constituent necessary for the support of the animal." This may be true to a certain extent, but to a certain extent alone; for it is by no means sufficient that the food should contain the elements required for nourishing the body, but they must also be arranged in that peculiar manner and proportion which the structure and economy of the animal requires. If this were not the case, the excrements of the body would be proper for food, seeing that they contain the necessary elements of nutrition. The natural pasturage of the field either in its crude or prepared state, appears to be almost the only food that can be taken by animals with advantage, unmixed with any other diet. But then we must bear in mind that it consists of a variety of plants; and it is not only chemically sufficient for nutrition, but it contains that amount of woody fibre essential for the function of digestion, though not entering into the system itself. Thus herbivorous animals, having very capacious digestive organs, require their food to be of a bulky form, and of such a consistence that it will stay long enough in the body for the elements of nutrition to be properly extracted from it. Now it appears to us that M. Boussingault would have accomplished the purpose he sought to obtain by his experiment—*i. e.* the discovery of truth—far better if he had, instead of confining his cows entirely to roots, given a certain amount, or as much as they pleased to eat, of hay or good sweet straw at the same time. The health of the cows would thus have been preserved, and as the quantity of dry food could have been readily ascertained, its analysis being known, not only would the facts sought for by M. Boussingault have been discovered, but the relative value of Mangold Wurzel as food for milch cows would have been ascertained, which assuredly has not been done by the experiments referred to. We must, as we have before observed, leave the conflicting theories, as to whether the fat of animals is derived from any other elements than the fatty matters already formed in vegetables, to Messrs. Boussingault, Dumas, Liebig, and Playfair, simply observing that we shall not at all be surprised to find that the truth will be found to lie somewhere between the two conflicting opinions. One fact, however, we must mention, and it is somewhat opposed to the theories of the two former chemists. We are all acquainted with the fattening qualities of Barleymeal, particularly for pigs; we know that it is greatly superior to Oatmeal, and, indeed, any other food. Now if we turn to the analytical tables of Mr. Johnston we find that Oats contain 5·6 per cent. of fatty matter, whilst Barley only possesses 2·5 per cent. Now this certainly militates strongly against the opinions of the French chemists; and although we are at once ready to concede that the fatty matter in the vegetable becomes fatty matter in the animal, yet we are disposed to ask, Whence can the superior fattening properties of Barley be derived, unless it be the starch, gum, and sugar, of which there are 10 per cent. more in Barley than in Oats; the former having 60 per cent. and the latter only 50 per cent.? With these observations we leave the subject for the present, observing in conclusion, that we do hope that under the sanction and by the assistance of the Royal Agricultural Society of England, a number of experiments will be instituted in order to decide the many difficult questions relating to the feeding and fattening of animals, and the nutritive qualities of various articles of food. Private experiments entail more trouble and expense than private individuals are able to devote to the subject, and when they are published they do not appear with the sanction of authority.—*W. C. Spooner, Southampton.*

TREATMENT OF FARM HORSES AND LIVE STOCK.

Ask a farmer if he prefers for his own use a clean dry bed to a wet and rotten dung-heap? Ask him if cleanliness in place and person, with proper ventilation, is not conducive to his health? Ask him if his food, nicely cooked and prepared, is not more agreeable to him than if raw and dirty? Ask him if he likes a cool residence in summer and a warm one in winter? He will say certainly, and laugh at you in the bargain, and yet he will not consider that what is good and profitable

for himself, is quite as much so for his cattle. What would farmers say, if, after a hard day's work, they were obliged to walk ten miles for a supper, and the same next morning for breakfast—losing six hours' rest, and adding 40 per cent. to their labour! and yet this is how they treat their horses daily. It seems too ridiculous to be tolerated. I object entirely to turning horses out, or to having pasture at all; in our midland and southern districts, the waste of food and manure is enormous. If a horse is turned out 20 days on an acre, it is equal to 20 horses one day, or 40 horses half a day. Imagine what they must destroy—their weight crushes and injures an amazing quantity of food. It may be said, "Oh, the blades rise again next morning." Yes, but with this constant treading do they grow as fast and as luxuriant as if a lowed to remain undisturbed and erect?—a foot-path or rabbit-run in a Grass-field will convince you. Then, where the droppings are, the food is lost; supposing the droppings and urine to cover and taint four square yards per day, that is 130 per month, or 3 per cent. per month. It is, in fact, 36*l.* lost in every 100*l.* per annum. The only excuse for depasturing is the imperfect state of the farm-yard, which allows the best part of the manure to be wasted.

Again, as to manure, there it lies in hot sunshine and bleaching winds, till it almost becomes its original straw-colour, losing its ammonia and other gases; and what, perhaps, is of more consequence than all, deprived of the benefits of fermentation which it would receive in a well-arranged tank. Supposing a horse's liquid and solid manure to be 1 cwt. per day, or 18 tons per annum, we lose one-third that quantity. In fact, it is not too much to say, that in the amount of labour the horse performs, his keep and manure, we can, by manger-feeding on my principle, save 30*l.* or 40*l.* out of every 100*l.* This is enormous!

Well may our great manufacturers, who consider a difference of 1 per cent. a good profit, exclaim against the want of calculation and management in farmers. Sincere friend as I am to the agriculturists, I admit, with shame, they deserve the censure bestowed on them in this respect. I call upon them to make at once honourable amends, by adopting my plan, and so save their money and their reputation. The idea of a man having 40 horses, costing him 1500*l.* per annum, and refusing to save 400*l.* or 500*l.* per annum in their keep, manure, and labour, is absurd; it is paying preposterously for the maintenance of prejudice or obstinacy, and yet, I am afraid there are some who will do so rather than act on my suggestions. There are other inconveniences and dangers attending depasturing horses—frequent kicks and accidents, loss of time in catching them, broken knees in driving home, and injury to constitution by sudden atmospheric changes. Besides, no horses fed entirely on green food can undergo the labour of those manger-fed on mixed food. Green food does not afford sufficient material for muscle and bone. It is too washy. I object *in toto* to permanent pasture, as a positive individual and national loss. Clovers are useful—but you cannot thoroughly hoe and clean the land when they are sown with a Corn-crop. Lucerne (and Sainfoin) is my favourite, and you can grow it anywhere * if you keep it clean, supply it amply with lime and its constituent parts, drain very deep (not less than 5 or 6 feet), and protect it from frost in the winter by a strong coating of manure, with a dust of guano in summer. Tares on heavy land, and Rye on light land, are both profitable; and plenty of Potatoes, Swedes, Carrots, &c., which can be grown on any land, however heavy, boggy, sandy, or gravelly, if thoroughly drained, properly manured, and deeply cultivated. By these means you may keep more than twice as much stock as by permanent Grass.

Were we to treat our bullocks and our sheep as we do ourselves and our riding-horses—keep them clean, warm, dry, and well fed—we should strangely increase the quantity and quality of our animal food.

Let us imagine ourselves standing or lying day and night for months in the moisture and effluvia of our own accumulated excrements, uncleaned and ill fed; it won't bear thinking of, and yet this is how most farmers treat their cattle: their food is presented to them in large unmanageable masses, with abundance of dirt (a corrector of acid it is called) uncooked and unprepared. We need not wonder at having to stab our bullocks to let out the accumulation of windy flatulence, or forcing strange-looking machines down their throats to remove solid lumps of unmasticated roots; we need not wonder at foot-rot, fevered feet, or other complaints. I will lay it down as an indisputable fact, as proved by our greatest breeders of animals, that we must apply to them the same treatment as we would to ourselves, if we wish to render them profitable. It is high time we amended our absurdities in this respect, or we shall have Spain, Portugal, and other warm and genial climes stocking us with what we ought to produce ourselves. Let us keep them warm in winter and cool in summer—free from tormenting flies. In fact, I shall never consider we are perfect till we can keep up a given warmth in winter—whilst we have in summer cool and shaded paved yards.
—*I. J. Mechi*, 4, *Leadenhall-street.*

(To be continued.)

ON MINERAL AND INORGANIC MANURES.

No. XXX.

By Professor Charles Sprengel.

(Continued from page 803.)

e. Ashes of Corn Stubbles.—If fields on which grain has been grown be ploughed shallow, and then harrowed, the stubbles, roots of weeds, &c., are brought to the surface; they are then raked together, and burnt in heaps, and the ashes strewed about. These ashes do not possess any particular value, as may be seen from analyses of straw, previously stated; their quantity also is so inconsiderable, that they are not worth attention. In the south, where they want less straw, the stubbles are left several feet high, and afterwards burnt on the spot. In this case the advantage is derived from the heating of the soil, and the destruction of vermin, as the value of those ashes as a manure is very trifling; 100 lbs. straw yield, at an average, only 4 lbs. of ashes, the half of which (as we have seen before) consists of silica.

f. Ashes of Brown Coal.—Pure brown coal yields ashes, which, according to all experience, are but poor manure. The reason is, that they consist merely of silica, alumina, and oxides of iron, and that most soils contain of these substances as much as crops ever require. As the ashes of pure brown coal contain neither potash, soda, chlorine, nor lime, magnesia, sulphuric and phosphoric acid, this may serve us as a proof that the fertilising properties of inorganic substances chiefly depend on the just-named seven substances. At times, however, brown coals contain sulphuret of iron, and whenever this is the case, they will yield ashes, which (if applied in proper quantity) are a very superior manure; because the sulphuret of iron will soon be changed into sulphate of iron, which, as we shall see presently, acts like gypsum. How many pounds are to be used per acre, experience only or chemical analysis can tell, as this depends upon their quantity of sulphate of iron, which varies. In Belgium, and other countries, 1000 lbs. to 1200 lbs. are strewed on one acre, which would indicate that it cannot contain much of the last, as 50 lbs. to 60 lbs. of that substance are an abundant manure for one acre of land. It is possible, however, that these ashes contain, besides sulphate already formed, also a considerable amount of sulphuret of iron, which would improve the soil for several years, as the changing of the latter substance into the sulphate takes place gradually. In the above countries, ashes of brown coal are used for manuring Rape, Clover, &c., the results being always most satisfactory.

g. Ashes of Coal.—Although the ashes of coal consist generally only of silica, alumina, and oxide of iron, still some are found which contain a little carbonate of lime, sulphate of potash, gypsum, and sulphate of iron. In the latter case, they are always a powerful manure; whilst, if merely composed of the three former substances, they are quite valueless, unless the protoxide of iron were to form ammonia, which, however, is yet to be ascertained by experiment. In the duchy of Luxembourg and on the Rhine, ashes of coal are used, with the very best result, for the rearing of Flax, Peas, Clovers, Beans, and Rape; they bear 1000 to 1200 lbs. on the acre, whence it may appear that these ashes contain gypsum or sulphate of iron. Both the ashes of coal and brown coal will also yield a superior manure for meadows, if they contain these salts. In Belgium, the ashes of coal and brown coal are often mixed with pig manure, and the compound is strewed over Clover, &c., which, as a matter of course, succeeds admirably. By using considerable quantities of coal, or brown coal ashes, though they contain neither sulphuret nor sulphate of iron, stiff clayey soils may be improved physically in a considerable degree: they are thereby loosened. It is still more important, that by a great amount of ashes, which contain much of these salts, the deep-rooted weeds may be destroyed, if the ashes be ploughed under to the depth of 16 or 18 inches. After the use of coal, or brown coal ashes, containing sulphate of iron, many sorts of vermin, especially snails, will disappear.

* Some regard, however, must be had to climate; I apprehend our northern districts and hills are hardly mild enough for such productions.

Home Correspondence.

Tottenham Garden Allotment Society.—I send you a copy of the second half-yearly Report of the Committee of this Society, to deal with as you may think proper. In a late Number of your Paper is an article on the Allotment system, by "E. G. H.," referring more particularly to the Bill of the Honourable William Cowper, laid before Parliament towards the close of the last session, copies of which are now on sale at Hansard's, Great Turnstile, at 2*d.* each. I mention this circumstance, imagining that many who read your Paper may be anxious to procure a copy. "E. G. H.," after several common-place, ill-natured observations, such as "hoping the Bill may remain on the table of the House for ever"—"subject not adapted for legislation"—"proposition, if carried, will strike a death-blow at the system"—"labourers have their full share of mother-wit and suspicion"—"whatever we propose for bettering their condition must, on its very surface, display the absence of self-interested motives, or the labourers will attempt to defeat us"—then gives his own not very charitable interpretation of the Bill: "Now it appears to me, that this Bill of Mr. Cowper's, on the face of it, provides a very fertile source of such suspicion, for it proposes to enact, that any surplus arising after the discharge of all expenses shall be paid over to the overseer, in aid of the poor-rates," and refers to sec. 25, for proof of his assertion. Now "E. G. H." ought to have known, that it proposes that the field-garden wardens shall have power to take land belonging to any parish, or to the churchwardens and overseer, or guardians of the poor, or to the poor of each such parish (sec. 9), *the rent* of which land when let to the labouring poor (the Bill provides) shall, after payment of expenses, be paid over to the overseers, in aid of the poor-rates; and if there should at any time be a surplus from the other sources of rent specified in the Bill, which is not probable, the same also is to go in aid of the poor-rates. Now, if such surplus rents are not to be paid over to the overseers, to whom does "E. G. H." think they ought to be paid? or would he have the land let to a few poor persons free of rent, to the prejudice of the many? Then "E. G. H." has an illiberal fling at societies and committees, sub-committees, treasurers, secretaries, and collectors in general, just as if Mr. Cowper's Bill proposed to have one or all of these officials. Mr. Cowper's Bill does not provide for the services of either the one or the other of them. And now for "E. G. H.'s" grand panacea:—"The best method of getting the system into general action, is to leave it as free and unfettered as possible; let it spring from the spontaneous desire on the part of the owners of property, whether lay or clerical, to benefit their poorer neighbours according to their own knowledge of their wants and the best means of applying it, without the interference of rate-payers or any officials whatever." Now, let me ask, does Mr. Cowper's Bill interfere with that freedom? Mr. Cowper's Bill is an enabling measure, and not compulsory in any case, leaving to the majority of landowners and occupiers, in each parish or place, the power of adopting the measure or not as they may think proper; and when adopted, the landowners and occupiers rated above 10*l.* a-year to the poor are to choose two of the wardens; and the owners and occupiers of houses rated below 10*l.* a-year are to choose the other two, the resident minister being ex-officio the fifth warden, than which a more equitable mode of appointment it is impossible to imagine. At last we do get a bit of common sense, and "E. G. H." shall have the full benefit of it:—"The best method for insuring good cultivation, is affixing a rent which, *primâ facie*, may appear rather a high one, but which (when it is borne in mind that allotments are small, and all good land, generally near to the occupier's residence; and that there is no averaging of good and bad land, of long and short distances, for expense of cultivation; and that, as is well known, under the spade, land will throw out an enormously increased produce) will only appear to be a fair remuneration for expenses incurred, and accommodation afforded, while it tends to insure active exertion in their cultivation." So far so good; but alas! our differences are not all over. "E. G. H." would give none of the advantages of the system to any but persons of known good character and conduct; I, on the contrary, would not exclude any, good or bad; and the Society formed in this parish act on that principle, and with the best results, as the following illustration will show:—A gentleman at the head of the Temperance movement in this parish, and who is also a member of the Garden Allotment Society, at the last half-yearly meeting of the Society in the gardens said, he had tried every method to induce a certain person (naming him) to give up his drunken habits, but in vain; he had not seen him lately—indeed, for several months he had lost sight of him altogether. I observed—"Do you see that man carrying a watering-pot?" at the same time pointing towards him. "Oh yes," said he; "that is the man." I replied, "That man is earlier and later, and more constantly at work on his allotment than any tenant we have; and I have never once seen him, since he has been here, the worse for liquor." The gentleman, reflecting for a moment, exclaimed, "Yes, yes, that is the true cure; it is clear the man wanted employment for his leisure hours;" and then, in his usual good-natured manner, smilingly added, "Henceforth let us work together: I will continue to give them good advice, and do you find them pleasureable and profitable employment, and a great moral improvement is sure to follow." Before I conclude I will just remind "E. G. H." that he might have given Mr. Cowper credit for important matters which his Bill contains, besides those referred to, viz., that of enabling trustees and others who have or who may hereafter let land in small allotments to the labouring poor, to recover the rent and also regain the possession of the land by a summary process, instead of by the round-about expensive way in which either could now be obtained, especially since the passing of Lord Brougham's non-imprisonment Bill for small sums. In illustration, I will just state shortly a case, in which I was some time since engaged as surveyor, to show what allotment tenants may do, if disposed to set their landlords at defiance. A close of land of eleven acres was, some years since, divided into 88 gardens, the rent 1*s.* per pole, or 8*l.* per acre; three acres of this land were lately required for the site of a church, for which 500*l.* per acre was to have been paid; the owner was about to give the usual notice to the tenants to quit their gardens; they combined and resisted; their claims for compensation were so enormously high that it became necessary to abandon the treaty, nor could the Archbishop of York nor the church-building Commissioners assist us, and to this day have the tenants retained the possession of the land. To oust them would cost nearly the fee-simple of the close, as 88 actions of ejectment would have to be brought, with the certainty of the landlord's having to pay the costs on both sides, on account of the poverty of the tenants, and hence the unwillingness of many landowners to let their land in garden allotments. This evil Mr. Cowper's Bill will remedy, by providing a summary process in both cases to meet the evils complained of. I have now had twenty years' experience extensively in the management of allotment gardens, and, notwithstanding the difficulties which I have had to encounter, I have found the good preponderate so much over the evil, that I have never for a moment regretted the money and time I have spent in assisting my excellent neighbours to extend the system. In this parish we have now more than 130

gardens, under the management partly of trustees and partly a committee, consisting of some of the wealthiest and most worthy of our parishioners, headed by the Rev. the Vicar, and the amount of good that has resulted from the adoption of the system no language can adequately describe.—*J. D., Tottenham, Nov.* 18. The following are extracts from the Report referred to:—"Your committee have not been unmindful of events connected with the allotment system that have taken place in and out of Parliament since the formation of this Society, confirming as they do in the fullest manner that which your committee never doubted, viz., that larger allotments than the labourer and his family can cultivate, without trespassing upon his paid labour, was an evil, and ought to be discouraged; and hence, in no case, ought any allotment to exceed one-fourth part of an acre. But your committee cannot agree with the declaration of a noble earl, lately published in the *Economist Journal*, that the allotment system, by giving partial employment to surplus labour at home, prevents emigration to the manufacturing districts, and therefore ought to be discouraged; because it is against reason and humanity that emigration should be forced upon the labouring poor whilst beneficial employment can be obtained at home, and only requires the assistance which an allotment garden will furnish to make them contented and happy."—"Your committee have seen with great pleasure a bill prepared by the Hon. Wm. Cowper and Wm. Miles, Esq., M.P., intituled 'A Bill to promote the letting of Field Gardens to the Labouring Poor,' the provisions of which appear admirably calculated to secure the object contemplated, viz., an extension of the garden allotment system upon just principles; to promote which your committee trust they shall have your approval, and the approbation of all the parishioners, to petitions proposed to be presented to both houses of Parliament in the next session, which the hon. secretary will prepare in favour of this Bill, under the superintendence of your committee."—*Jas. Dean, Hon. Sec.*

Irrigation.—Having read many of your articles on draining, and perceiving that great progress has been made and is still making in this process, I have been led to think it a pity that the opposite operation of irrigation could not receive some attention. It has occurred to me that these very drains might be turned to account in an attempt at introducing irrigation. I am no agriculturist, and have therefore to inquire if there is not sufficient water drawn off the field by these channels, which, if allowed to accumulate in a subterranean tank, might again, by simple and inexpensive machinery, be redistributed to the land during the droughts of summer. You could have the underground reservoir of any size; but, as I have already hinted, I fear the water collected during winter will be insufficient to counteract, to any great extent, the bad effects of dry weather.—*Anonymous.* [Probably, less water, under the same circumstances, runs off a field after being drained than before it was drained. The tendency of the operation is to cause all water that falls on it to pass *through* it, instead of running away *over* it. Drainage tends in various ways to the pulverisation of the soil, and thus makes it more retentive of moisture: well-drained land is rarely injured by drought; undrained land in dry weather cracks, and lets the dry air and heat into the very heart of the soil. Well-pulverised land, though of course, under the influence of heat, has the same tendency to contract and crack; but, the soil being loose, no cracks can appear; and thus the drought, acting only on the surface, is less injurious.]

Clover Dodder.—Absence from home having prevented me from reading some of the Numbers of the *Agricultural Gazette* until now, the Leader concerning Clover Dodder (p. 625) has only just met my eye. In it I find a statement that the seed of this destructive weed was probably introduced from Cabul with seed of Trefoil; and, as this observation is likely to mislead the readers of the *Gazette*, I think it right to state that the Dodder obtained from Cabul is a totally different species, the structure of its flowers being very different from that now destroying Clover in England. From rather extensive inquiries, I have every reason to believe that the Clover Dodder (*Cuscuta trifolii*, Bab.) is imported from the continent of Europe with the seed of Clover; but I have not been able to get such exact information as to prove it. I wish that the farmer would note down the day on which he buys his Clover-seed, and the name of the wholesale dealer from whom it is obtained; also its British or Foreign origin; and, in the latter case, learn, if he can, the country from which it is imported. If then the Dodder occurs in the field, we shall know to what country to look for its origin, and may guard against it in future. In the spring I asked for similar information, but have obtained none. The Cabul Dodder is the *Cuscuta approximata* (Bab.), and both it and C. trifolii are quite different from the C. europæa, C. epithymum, and the Flax Dodder, C. epilinum.—*Charles C. Babington, St. John's College, Cambridge, Nov.* 30).

Linseed—Seeing several communications on this subject in your Paper for the last five or six weeks, and not finding it anywhere stated that the Linseed can be ground by a common miller without any other than the usual stones employed by millers, if the miller adds an equal quantity of bran to the Linseed, I beg to apprise your readers of this fact, as some parties may be deterred from using this useful compound, by the supposition that they require a mill on purpose to crush the Linseed. I have fatted three bullocks on compound made of Bean-meal and Linseed ground with bran at the mill, and found it answer very well, and the bullocks eat it with avidity; the proportions I used were three measures of Bean-meal to two of the Linseed-meal and bran when mixed, with water sufficient to make it into the consistence of stiff dough. I am now trying the compound made of Barley-straw chaff and cut Beet leaves in the way mentioned by your correspondent in last Saturday's Paper, with my ponies and cows, and hope to send you the result of this kind of feeding with such stock. If it answers, it will tend to increase the manure heap, as the leaves of Turnips and Beet are very often left to rot in the fields, which is not the best way of making the most of them as a manure. If you think this worthy of insertion I shall have had pleasure in sending you it.—*T. E. W.*

Pigs.—I have a sow which had eight pigs; six of these I penned up by themselves in half of a cowshed to fatten, and they are doing very well. Two sow-pigs I kept with the mother for the purpose of breeding from: besides having a small piece of the cowhouse to themselves, they had a small square piece in the open air in front. As this open part was very damp, I tried to make asphalte of boiled tar and gravel, but the tar not having been boiled long enough remained soft, and over it some litter was spread. Having been away from home I was vexed to learn that one of my little sows had died in my absence, and on the morning after my arrival home I heard the other had been ailing some days—in fact the butcher put it out of its troubles before the day was over. Upon being opened the livers of both were found much inflamed, and the meat soon began to turn green. I ought to say that from the great rain we have had lately, the outside space of litter, tar, &c., was quite in a swamp, though their house was dry. Will you be so good as to tell me how to account for their deaths? Could it be the damp, or had the tar anything to do with it? as I purposed flooring a pig-stye with asphalte. I should say my brother tells me that he has lately lost three pigs of inflammation of the liver, and that his styes are dry; mine have been fed on oatmeal and wash. What is the best medicine for them?—*Northwood.* [We believe the disease in your pigs is to be attributed to the swampy place they were allowed to remain in. The tar could have had nothing to do with the matter. We do not think you have any reason to fear using asphalte for the floor of your pigstye, if properly prepared and allowed to get firm before it is made use of. With regard to a remedy for the disease of the liver, the following will be most likely to prove effectual:—Proto-chloride of mercury, 2 grains; powdered opium, 2 grains for a porker, and double the dose for a large pig. To be mixed in thick gruel and given once a day.—*W. C. S.*

Waste and Destruction of Fences.—Although a tenant from year to year is not bound to put premises in repair, he is not, on the other hand, at liberty to do anything which amounts to waste, or to a breach of the rules of good husbandry; he is not, therefore, entitled to cut and sell hedge-rows, or at least not without making up the hedges and fences according to the course of good husbandry. If there be a quickset fence of Whitethorn, if the tenant stub it up or suffer it to be destroyed, this is destruction; but cutting up quicksets is not waste, if it preserves the spring.—So decided in Gage *v.* Smith.—*A. Quiet Observer.*

Irrigation.—In this neighbourhood the usual method of irrigating meadows is to stop up every drain and to flood the land with water. Would it not be better to let every drain be open, so that the water might, as rapidly as possible, percolate through the soil? [Certainly]. Here also it is customary to let it remain on for some days; would it not be the best to allow it to remain on only for a short time, say 24 hours, and then let it get well drained before another application?—*A Leicestershire Farmer.* [The proper period depends upon the weather and time of the year].

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square, on Wednesday last, the 4th of December; present—His Grace the Duke of Richmond, President, in the chair; the Rt. Hon. Earl Spencer, Hon. Capt. Spencer; T. R. Barker, Esq.; S. Bennett, Esq.; J. F. Burke, Esq.; Col. Challoner; F. C. Cherry, Esq.; H. Gibbs, Esq.; B. T. B. Gibbs, Esq.; W. F. Hobbs, Esq.; W. H. Hyett, Esq.; J. Kinder, Esq.; H. Price, Esq.; P. Pusey, Esq., M.P.; F. Pym, Esq.; J. A. Ransome, Esq.; Prof. Sewell; W. Shaw, Esq., and J. V. Shelley, Esq.

The following new Members were elected:—
Alexander, Caledon, Rothampsted Park, St. Alban's, Herts.
Mathews, Richard, Esgir, Machynlleth, Aberystwith, S. W.
Ruck, Lawrence, Pantlludw, Machynlleth, Aberystwith, S.W.
Widdicombe, John, Hay-Ugborough, Totness, Devon.
Jolliffe, Colonel John Twyford, Amnerdown Park, Bath.
Donaldson, Thomas, Longlands, Eltham, Kent.
Lee, James Noah, 1, Little Charlotte-street, Blackfriars-road.
Rutley, Samuel, Wrotham, Kent.
Cox, Thomas, Parkfields, Derby.
Fountain, Henry, Leake, Boston, Linc.
Westcote, John Baker, Coate, Martock, Somerset.
Peers, Joseph, Ruthin, Denbighshire.
Lucas, Lieut., Richard, 2d Life Guards.
Anderson, Walter, Oakley, Bedford.
Harding, T. Goldie, Monkleigh, Torrington, Devon.
Turner, John Beresford, Brockmanton, Leominster, Her.
Ramsay, George Heppell, Derwent Villa, Newcastle-on-Tyne.
Le Blanc, Arthur, Maresfield, Uckfield, Sussex.
Norris, John, Hughendon House, High Wycombe, Bucks.

The names of 15 candidates for election at the next meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, read the Report of the Committee on the state of the funds of the Society at the end of the month last ended, from which it appeared, that the invested capital amounted to 7700*l.*, and the current cash balance in the hands of the bankers to 531*l.* He also laid before the Council the balance-sheet of the Southampton meeting, showing in detail the various items of receipt and expenditure connected with that account, the total amount of receipts (including the subscription from Southampton) being 1924*l.* 5*s.* 1*d.*, and the total payments 5736*l.* 5*s.* 2*d.*, leaving an excess of the payments over the receipts, on that occasion, of 806*l.* 19*s.* 4*d.* chargeable on the funds of the Society, in addition to the sum of 1355*l.* as the amount of Prizes only, awarded by the Society at that meeting.

Local Collectors.—The Council resolved, on the motion of Mr. Pym, seconded by Mr. Gibbs, that it was desirable that paid collectors should be appointed in counties or districts; and that the details of the system should be referred to a committee consisting of Mr. Pym, Mr. Shaw, Mr. Gibbs, and the Members of the Finance Committee; three of whom should form a quorum, with a request from the Council that in their report they would state the rate of remuneration recommended by them to be paid to the proposed collectors.

Lectures.—Mr. Pusey reported to the Council the arrangements already made for the delivery of lectures before the members at their ensuing Christmas meeting by Dr. Playfair, the consulting-chemist of the Society; when it was resolved that the lectures should take place on Wednesday, the 11th, and Thursday the 12th inst., at 9 o'clock in the evening; and that Professor Sewell, Mr. Gibbs, and Mr. Shaw, should be requested to act as a committee for engaging a suitable theatre for the delivery of the lectures, and the exhibition of the chemical experiments with which they were to be illustrated.

General Meeting.—The President announced his intention of directing a Special Council to be summoned for Saturday the 14th instant, at ten o'clock in the forenoon, for the purpose of taking into final consideration the Report of the Council to the General Meeting to be held at one o'clock on that day.

Lists of Members, Models, &c.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Shaw, it was resolved that a list of the Members of the Society should be printed in a cheap form, and appended to the first half volume of the Journal for 1845, to appear about midsummer in that year. On the motion of Mr. Fisher Hobbs, it was resolved, that an Inventory, with an Index, should be prepared, of all Implements, Models, &c. in possession of the Society. On the motion of Mr. Fisher Hobbs, seconded by Earl Spencer, it was resolved, that a catalogue of the books in the Library should be made by a professional person to be engaged for that purpose, under the direction of the House Committee.

Judges of Stock.—On the motion of Mr. Fisher Hobbs, it was also resolved, that in future the Judges of Stock shall be appointed by the Council, from a list of nominations made by the members at large at a general meeting, and on the report of a committee to whom such list shall have been referred. On the motion of the Hon. Captain Spencer, seconded by Mr. Bennett, it was resolved, that, in the appointment of Judges of Stock, those names only shall be given to the Stewards of the yard determined by the Council for each breed; that in case one or more of those named shall not appear, a supplementary list of Judges shall also be given to the Stewards, who shall from such list fill up the vacancy.

Exhibition of Stock.—On the motion of the Hon. Captain Spencer, it was resolved, that after the awards of the Judges of cattle shall have been delivered to the Director of the yard by the several Stewards, such Members of the Council (not being exhibitors) whose duties for the Society prevent them from seeing the cattle when the public are admitted, who shall be named by the Council the month prior to the meeting, shall be admitted to view the cattle from 5 o'clock till 7 of the Wednesday, (provided the awards shall have been delivered;) but that the awards shall not be declared before the usual time, namely, after the Council dinner.—Mr. Bennett gave notice that he should move, at the next monthly Council, that herdsmen and shepherds, not being exhibitors themselves, or relatives of exhibitors, should be allowed to be in attendance on their stock, but on no account to remain in the show-yard when the Judges enter.

Trial of Implements.—Mr. Shaw having withdrawn his motion on Trials of Implements, distinct from those made at the time of the Annual Country Meeting, Mr. Shelley laid before the Council the joint report of Mr. Miles and himself, as Stewards of the Implement Department, on the communications of Mr. Clayton, Mr. Comins, and Mr. Smart; and letters were received from Mr. Jaques and Mr. Graburn, on the trials respectively referred to them of Cultivators and Hand Corn Mills.

The Council having appointed the standing committee for the ensuing year, and agreed to the preliminary draft of Regulations for the Shrewsbury Meeting, submitted to them by Mr. Brandreth Gibbs, postponed the consideration of Mr. Gordon's offer of a Prize, and the communication from the British Association on the Analysis of Ashes of Plants, till the next Monthly Meeting. Communications were received from Mr. Jerdan, Secretary of the Border Agricultural Society; Mr. Mechi, Mrs. Welford, Mr. Dean, Mr. Evans, Mr. Moffat, Rev. S. Lysons, and Mr. Garnett.

The Council then adjourned to Wednesday next, the 11th of December.

FARMERS' CLUBS.

Chepstow.—[The following is an abridgment of a Report on the Farms competing in Monmouthshire for a Premium offered by John Buckle, Esq.] We wish to convince landlords that in no way can they do more towards improving their estates than by giving premiums for good cultivation. A tenant, occupying 200 or 300 acres of land, would be sure to lay out many times the value of the prize in preparing his farm for exhibition, with the hopes of obtaining such an honorary testimonial of agricultural skill; and, at the same time, this expense would benefit the candidate himself, inasmuch as good cultivation, provided the outlay be judicious, is always more profitable than slovenly farming. We would also wish to draw the attention of both landlords and tenants to the mutual advantages of leases, though we are decidedly of opinion that the only eligible form of lease must be founded on a corn-rent, and then it should be of such duration as would enable a good farmer to improve his farm to the utmost. No tenant, without a lease, can feel secure in investing capital in the permanent improvement of his farm. To commence with the cropping:—The quantity of Swedes and Turnips was more than one-fourth of the arable land on all the farms we visited, except two; and in these exceptions very little less than one-fourth was planted with these roots. In the case of the successful candidate, the proportion was much larger: he had nearly half his arable land under Swedes and Turnips. We found the general plan was to sow one-year-old Clover with Wheat at one ploughing. We saw some fallows, but the quantity was comparatively small. Where the Clover has been sown on foul land, which should never be the case, the only remedy is to fallow for Wheat. Part of the Turnip land is generally sown with Wheat; and the quantity of land under Barley was, in consequence, small. We found the Swedes and Turnips for the year very good, without exception, though of course superior on some farms to others; but we noticed a much greater difference in the cultivation than the weight of crop. We were sorry to see some good Swedes and Turnips that we could not consider clean, many acres not properly horse or hand-hoed, and nearly all those broadcast were far too thick; and we wish to lay particular stress upon the necessity of remedying this defect, as, on the four-field system, the only chance of cleaning the land is when under a root crop. We have this year seen land intended for Swedes made as clean as a garden by means of the Uley cultivator, first using the broad shares to pare off all the stubble; then the grubbers, till all the weeds were brought to the surface; and, lastly, all the rubbish was gathered together with a horse-rake, and carted into a heap to rot. The average proportion of land in Clover and Grass-seeds is about one-fourth, part of which is sown with the Wheat after a root crop. We were surprised and delighted to see many fields with a capital plant of Clover; and, in other instances, we had the mortification to witness a complete failure, which is to be attributed to the dryness of the spring and summer. We think that, by some alteration in the rotation, the quantity of Clover might be lessened, and the extent of root crops augmented, without reducing the proportion of Corn; thus avoiding so frequent a repetition of Clover. We do not at all mean to lay down an arbitrary course, to be followed for years without any deviation. In fact, we have known this done, and the plan materially altered in a few years. Still, we would suggest, on the light lands of this district, something like the following rotation:—

List of Crops for 200 acres of arable land.

First Year.		Second Year.	
5 acres	tankard Turnips		
10 ,,	Mangold Wurzel		
10 ,,	Carrots	30 acres	Wheat
2 ,,	Potatoes		
3 ,,	Cabbages		
20 ,,	Swedes	35 ,,	Barley, seeded.
15 ,,	Turnips, after vetches		
65 ,,	green crops, all after Wheat.		
65 ,,	Wheat	65 ,,	roots, &c.
35 ,,	Barley	35 ,,	Clover.
35 ,,	Clover	35 ,,	ley Wheat.
200 acres.		200 acres.	

Without pursuing this course any further, it will be evident to every farmer that the crops may be varied so as not to repeat Clover, Swedes, and Turnips, so often as in the usual rotation. As regards the implements, with some few exceptions which we intend to mention, we only observed those in general use: viz., ploughs, old-fashioned drags, harrows, rollers, horse-hoes for Turnips, &c. Some of the land we noticed was too stony for scufflers or cultivators to be used profitably; but we saw much land where one of Lord Ducie's implements would be most valuable. Wherever the Uley cultivator can be used, the manner in which it will pare off the foul surface and bring all the couch-roots to the face of the ground is far superior to ploughing the weeds in. We observed that admirable implement for reducing rough land for Barley, Turnips, &c., Crosskill's clod-crusher, at Mr. John Dowle's, of Claypit; a horse gripping-plough, a hand ditto, and a mole-plough, at Mr. Thos. Perkins's of Matherne. We also noticed one of Finlayson's harrows, and a horse-hoe of simple construction, for hoeing Turnips when drilled on the flat; the latter was made to fix on to a part of light cart-wheels, and consisted of three shares, to take three rows at a time. The width between the shares could be altered, and narrower shares might be substituted, to fit it for hoeing Wheat. This hoe was made by a country blacksmith, at a very moderate price. These two last implements we saw at the house of Mr. S. Matthews, of Ifton Hill, who was not a candidate for Mr. Buckle's cup. The carts and waggons we saw were all of the heavier description, which certainly require to be replaced by others of a less cumbersome character; but, whenever this takes place, we are aware that the change must be gradual. The largest quantity of stock was rather less than two sheep to an acre, and one head of cattle to every five acres, taking the whole farm for both. On one farm we saw three sheep to each acre of arable land, but the proportion of meadow and pasture to the arable was as three to four, which reduces their number to our standard. In every instance the number of cart-horses was greater than we considered requisite, in all cases exceeding one pair to every 50 acres of arable land, which we should say was quite sufficient. The breed of horses for farm purposes in this district is generally bad. We found great cause to complain of the management of some of the hedges and headlands. In many places a belt of two or three feet wide was left uncultivated round the fields, full of Couch, Nettles, and other weeds. In but one instance did we perceive any attention paid to the land adjoining the fences, to prevent the weeds from seeding over the farm. We should like to see every inch of ground kept clean round the hedges, and all the weeds in them cut out two or three times in the course of the summer, to prevent them ripening their seeds. Many farmers may complain of the expense of this, but it would pay enormous interest in the saving of future labour. We recollect once seeing a fallow for Wheat which was very clean except a few roots of knotted Couch, all of which laid on the surface and were ploughed in. For 6*d.* an acre they might all have been picked off; and surely by its not being done a much larger expense was incurred in cleaning the land for Turnips. We sincerely wish the management of farm-yard manure were better attended to. We did not see a single tank to collect the drainings of the yards, stables, pigsties, &c. In some places the liquid manure escaped into the road and ditches: in others it was led into the nearest field, and when there, suffered to soak into the ground, only benefiting a very small spot; and, worst of all, some of the yards and buildings were allowed to drain into the pool where all the horses and cattle were taken to drink. The ammonia and other salts contained in this liquid are strong stimulants, and therefore liable to cause violent inflammatory disorders. We observed that lime is not used at all as a manure on the light lands we inspected, but we think a moderate quantity, applied once in a rotation, would pay well for the outlay. Chemical analysis teaches us that lime is contained in both the straw and grain of Wheat; in short, that there is only one plant yet discovered in which no trace of lime can be detected. We recommend all those who are opposed to the use of lime, to read some of the many scientific and practical articles on the subject that have been published lately in the agricultural periodicals, and can be obtained at our library by every member. The only complete set of farm buildings we met with was on the farm of Mr. Thos. Dowle, of Ifton (who for the cultivation of his Turnip land deserves unqualified praise), and they only require tanks to be everything a farmer could wish. The drains are all laid in readiness, and the tanks are to be added shortly. The buildings are mostly new, but not being quite completed, we consider they would be seen to much better advantage another year. The roofs are all covered with reed (combed straw) under the tiles, which keeps the buildings warmer in winter and cooler in summer than tiles alone. In giving our decision, we have no hesitation in awarding the prize to Mr. Thomas Perkins, of Matherne. He has a great breadth of his arable land under Swedes and Turnips, all clean, and the rest of his arable land in a better state of cultivation than the other competitors, though we think there is still room for improvement; and we wish all who read this paper to observe that we cannot consider a farm to be well cultivated because the tillage of some of the fields is good, but expect them to be all clean and in a high state of cultivation. It is in the management of his Grass land that Mr. Perkins so much excels, he having been at great expense in cleaning his fields from bushes, and laying down some miles of drains; besides which, he has cleared away all the banks formed by cleaning out the ditches. The soil he procures in this manner he mixes with farmyard manure or lime, and annually dresses a considerable portion of his Grass land. We will merely hint that we should like to see some cattle soiled all the year, with every particle of their manure preserved and taken out upon the land; and we think that any gentleman who wished to encourage improvement in farming, could not do better than to offer a premium for the largest number of cattle kept in houses and yards all the year round. R. W. Purchas, Hon. Sec. Mon. Farm. Club, and Arthur Hall, Hon. Sec. Chep. Farm. Club—*Judges.*

Debenham.—The fifth Annual Meeting of this Club was held on Friday last (Nov. 22, 1844), at the Cherry-tree Inn, in Debenham. Much interest was excited by the display of fruit and vegetables for the Cottagers' Prizes. Upwards of 200 different productions were exhibited by about 50 cottagers; market or working gardeners, persons whose rent exceeded £*l.* per annum were excluded. The Prizes were awarded as follows:—

Three Silver Tea-spoons, given by the Rev. James and the Hon. Mrs. Bedingfeld, for the best cultivated Cottage-garden or Allotment in Debenham, were awarded to Robert List, on account of the great variety of his crops, proper rotation, and the extreme cleanliness of his allotment; this is the second prize of spoons obtained by List. *Best Dessert Apples*, 3*s.* to T. Smith, of Debenham; second do., 2*s.* to J Jacobs, Debenham. *Best Kitchen Apples*, 3*s.* to W. Tydeman, Debenham; second do., 2*s.* to A. Brown, Debenham. *Best Dessert Pears*, 3*s.* to W. Rumsey, Debenham. *Best Baking Pears*, 3*s.* to J. Pallant, Debenham; second do., 2*s.* to J. Barritt, Debenham. *Best* 12 *Carrots*, 3*s.* to R Aldous, Debenham; second do., 2*s.* to R. List, Debenham. *Best* 12 *Parsnips*, 3*s.* to R. Aldous, Debenham; second do., 2*s.* to J. Moyse, Winston. *Best* ¼ peck of *Onions*, 3*s.* to R. Moore, Thorndon; second do., 2*s.* 6*d.* to R. Aldous, Debenham; third do., 2*s.* to J. Marjoram, Debenham. *Best* ¼ peck of *Potato Onions*, 2*s.* 6*d.* to R. List, Debenham; second do., 1*s.* 6*d.* to W. Smith, Debenham. *Best* 3 *Savoy Cabbages*, 3*s.* to D. Blomfield, Little Stonham; second do., 2*s.* to R. List, Debenham. *Best Brussels Sprouts*, 2*s.* to G. Clarke, Earl Soham. *Best* 6 *Roots of Celery*, 3*s.* to D. Blomfield, Little Stonham; second do., 2*s.* to J. West, Stonham Aspal. *Best* 2 *Pumpkins*, 3*s.* to G. Skipping, Debenham; second do., 2*s.* to A. Read, Thorndon. *Best* ½ peck of *Early Potatoes*, 5*s.* to D. Blomfield, Little Stonham; second do., 4*s.* to J. Moyse, Winston; third do., 3*s* to J. Keeble, Debenham; fourth do., 2*s.* 6*d.* to J. Wade, Debenham. *Best* ½ peck of *Late Potatoes*, 5*s.* to H. Sawyer, Debenham; second do., 4*s* to R List, Debenham; third do., 3*s.* to A. Read, Thorndon; fourth do., 2*s.* 6*d.* to R. Aldous, Debenham. *Best* ½ peck of *Kidney Potatoes*, 4*s.* to D. Blomfield, Little Stonham; second do., 2*s.* 6*d.* to R. List, Debenham. *Best* ½ peck of *Red Potatoes*, 4*s.* to R List, Debenham; second do., 2*s.* 6*d.* to G. Smith, Debenham. EXTRA PRIZES: *Red Potatoes*, 2*s.* to J. Taylor, Debenham. *Onions*, 2*s.* 6*d.* to W. Smith, Debenham. *Late Potatoes*, 2*s.* 6*d* to R. Aldous, Debenham. *Early Potatoes*, 2*s.* 6*d.* to R. List, Debenham. *Red Cabbages*, 2*s.* 6*d.* to J. West, Stonham Aspal.—*W. G., Hon. Sec.*

Reviews.

On Landed Property and the Economy of Estates: comprehending the relation of Landlord and Tenant, and the Principles and Forms of Leases, Farm Buildings, Enclosures, Drains, Embankments, Roads, and other Rural Works, Minerals, and Woods. By David Low, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c. Longman & Co.

THE last chapters of this valuable work are devoted to the explanation and illustration of practical details. Those connected with the erection of farm buildings, with drainage, roadmaking, plantations, &c., are all fully entered into, and admirably illustrated by woodcuts. These chapters render the volume especially useful to landlords, agents, and all who are engaged in the permanent improvement of estates.

But it is to the first chapters of Professor Low's work that we wish particularly to direct the attention of the reader. They contain an excellent exposition of the importance of the lease as an instrument of good or evil. The permanency which it gives to the tenants' interest in his farm is of course as injurious to the estate and community when it binds to the practice of bad farming, as it is beneficial to all parties when it is framed so as to insure the introduction and establishment of good husbandry. Much of the slowness of agricultural improvement is justly attributed to the want of confidence on the part of the farmer which is inseparable from the tenant-at-will system, which prevails in England to so large an extent:—

"To what are we to attribute this tardiness to adopt what is new and useful in an art which it would seem to be the interest of every one to improve to the uttermost? A part at least of the effect must be ascribed to the conditions under which the capital of the farm as compared with that invested in other branches of industry, can be employed. The manufacturer of cotton, of wool, of iron, has the assurance that the machine which he constructs and improves for the purposes of his trade is his own, and that the more perfect he can render it, the more profitable will the use of it become to him. The farmer who lays out capital on the great machine on which his all depends, the earth which he tills, has often no such assurance. It is the property of another, who in the end will profit by all the improvements which the skill of a temporary possessor can make upon it. The manufacturer receives, directly, the profits of his stock in trade; the farmer must share those profits with another, who undergoes no part of the labour and risk; his industry is fettered by conditions imposed upon no other class of traders; and the inconveniences of obtaining returns for a present expenditure more slowly than in any other profession, are frequently aggravated by the uncertainty whether he will ever have the power of recovering the capital advanced."

The following are the conditions required to establish fitting relations between the owners and occupiers of land:—

"1st, Security of possession; 2d, Equitable rents; 3d, Suitable conditions with respect to the methods of culture and general management; and 4th, an adequate provision by the landlord for the fixed capital invested in buildings, enclosures, and other necessary appendages of the farm."

On the second of these subjects Professor Low says:—

"The actual profit to be derived by the farmer should in every case bear a ratio to the capital employed by him. The lowest calculation that can be fairly made is 15 per cent. on the capital employed, out of which the farmer must support himself and bear the risks of his trade. The farmer, therefore, who takes land should calculate, in the first place, the fixed capital which he must advance. Allowing 15 per cent. for interest, the profits of stock, his own maintenance, and the risks of his trade, the remainder of the produce is left for expenses and the landlord's rent."

After remarks in which the difficulty of finding employment for capital, and the limited number of farms at any time in the market, are alluded to, in order to show that the tendency of rents is always to rise above the just level, the author observes:—

"It is difficult for a proprietor of land to take a perfectly impartial view of the value of that which he has so great an interest in rendering available as a source of income; but it should never be forgotten that every tenant must have such a profit as will enable him to maintain himself and cultivate his land, and insure him

against the contingencies of his trade. To take away the tenant's profit is to produce the hazard of trenching upon his capital, and to trench upon his capital is to lessen or cut off the source from which the landlord's rent must be derived."

The following passages just express the simple truth: they are worthy of serious attention:—

"It is common to hear of reductions of rent, as 10, 15, or 20 per cent. made by proprietors at their audit-days, and announced in newspapers and otherwise as acts of great liberality. But bounties in this form are nearly useless to the tenant. The necessity, where it exists, of making little abatements of this kind, should lead us to the conclusion that an estate is under bad management. The rent at which land is let should be such that no temporary bounties of this kind can be needed. The tenant who takes land, and the landlord who lets it, should so adjust the rent that the tenant shall be able to bear the pressure of deficient crops, or of low prices arising from favourable ones; and no prudent man ought to contract for a rent which will not allow him to meet that contingency of his trade which arises from a fluctuation in the amount and price of his commodities."

"*The landlord who would secure a prosperous tenantry, and improve his estate, must not trust to his percentage of bounty on an audit-day, but must place his tenants in the condition which will enable them to fulfil the obligations under which they engage in virtue of a fair and well-considered covenant.*"

Besides these general remarks Professor Low enters in another chapter into that practical detail on the subject of "the lease" on which his long experience in these matters renders his statements worthy of our entire confidence, and his opinions worthy of much deference. The following is his opinion on the subject of rent:—

"Of rents of land, the most satisfactory, it is conceived, is a fixed payment in money. To rents payable in grain, or in money determined by the prices of grain, there is this objection, that the tenant may be required to pay the highest rent when he is least able to do so, that is when prices rise from deficient crops. In such a case if a tenant has not a good capital to support him, he may be injured in a single year beyond recovery. It thus becomes necessary for the tenant's security, to fix a maximum beyond which the rent shall not rise. But if it be necessary, for the tenant's security, to fix a maximum beyond which the rent shall not rise, it is equally necessary, for the landlord's security, to fix a minimum below which it shall not fall. In every transaction of this kind, therefore, there are two points to be determined, a maximum of rent and a minimum, and there is just as much difficulty and chance of error in fixing these two points as extremes as in fixing one point as a medium; or, in other words, as in fixing a certain rent in money."

We have not space to refer at present to the other subjects which the author broaches connected with the lease, but we shall very often have occasion to refer our readers to this work, which is not more distinguished by the sound and impartial views it takes of relations between landlord and tenant, than by the fullness of practical detail into which its experienced author enters, on the several sections of the general management of estates which the former has to superintend.

This work is especially one for the perusal and guidance of landowners and land agents, and we are very sure that amongst such it will be extensively read.

Miscellaneous.

Chepstow Farmers' Club.—It is proposed to present Mr. Arthur Hall, Hon. Sec. to the Chepstow Farmers' Club, with a token of gratitude for the important services he has rendered to that Society, and as a mark of the esteem and admiration in which his talents and courteous conduct are held by its members; to which all parties desirous of testifying their approbation are respectfully solicited to subscribe.—Subscriptions will be received by Messrs. Bromage, Snead, and Snead, until the 20th December next.—*Monmouthshire Beacon.*

Mangold-Wurzel.—A French newspaper tells the following story of the introduction of this root into cultivation in Flanders. When Napoleon was endeavouring to protect himself against the inconveniences felt from the impossibility of obtaining Colonial produce, in consequence of the activity of the English cruisers, an order was given that measures should be taken to induce the Flemings to grow Beet, for sugar-making. The Prefect of the department of Jemappes accordingly invited all the farmers of his district to set about the cultivation of the root, and distributed seed among them. The Flemish farmers hit upon its management immediately, and the first season gave them a large crop. But when the roots were ready nobody knew what to do with them; so the farmers resolved to cart them to the Prefecture. And accordingly, one fine morning, the Prefect was surprised by the arrival of heavy carts, bringing him some hundred thousand kilogrammes of Beet. Having no means of taking it in, for the buildings in which it was to be manufactured had not been thought of, he had no resource but to pay for the crop, and get the country people to cart it away again. This led them to consider whether cattle could not be fed upon it—and the result we all know.

Rolling Wheat.—Rolling Wheat on all soils is universally considered most beneficial, particularly after the frosts have rendered the land frothy. It gives a solidity to the soil, makes the Wheat straw more staple, and has been generally found to render the crop more productive. Carrying out the system of proof adopted in all cases where it can be obtained, the following experiment is corroborated by several trials, and by leaving one portion unrolled of every field on one farm. It was always performed, not when the land was quite dry, but when it was sufficiently so to work the roll with scrapers. When the soil was quite dry it has not succeeded; perhaps from the want of adhesion of the particles of soil without moisture:—

	C*.	B.	P.
1836—Rolled	7	2	3
Not rolled	7	0	0
	0	2	3
1838—Rolled	6	2	1
Not rolled	6	1	0
	0	1	1

Besides one hundred weight of straw in addition.—*Bacon's Agriculture of Norfolk.*

* C stands for coomb, which in Norfolk means a sack of 4 bushels.

Notices to Correspondents.

Rural Chemistry.—By E. Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Honorary Member of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, may be had of all booksellers, price 4*s.* 6*d.*

Bencraft's Patent Hames.—*Anon* says he finds the price in London is 8*l.* a pair, "but they are not recommended." Particulars can be learnt of Messrs. Brace and Box, of Wallsall, Staffordshire.

Dibbling Machine.—*Spectator.*—The implement you name is not suited for allotments and such small plots. No implement worked by horses would be suitable there. Dr. Yelloly's fork is highly praised.

Disease in Pigs.—*M. B.*—There must be something radically wrong either in the locality of the pigstye or the mode of feeding. Is the former sufficiently warm and comfortable, and free from dampness? If not, correct these matters. Do you give your pigs many roots of a watery nature? If so, make an alteration in the diet. We can do no more than throw out these suggestions. The disease appears to be hydatids on the liver, &c. *W. C. S.*

Fence.—*Que ist.*—Let the ditch be on the upper side of the hedge.—For every ton of hay or straw taken into the yards to cattle, how many tons of dung should come out? and for every 20 tons of roots in addition, how much additional dung? Perhaps our readers will help us. Last year we consumed in yard and house about 1500 tons of roots and 240 tons of straw; and we probably carried out to the field 2400 tons of manure, composed of 3 of farm-yard dung and 1 of earth.

How must I Grind Flax seed?—*M. P. S. J.*—See "Home Correspondence" of this day.

Irrigation.—*C. B.*—The best work on the subject, containing practical details, is "The Practical Irrigator and Drainer," by G. Stephens. We must, till next week, refer you to it.

Moss.—*Vicarius.*—Try harrowing it in various directions with a heavy many-tined harrow. You may tear out most of it in this way.——Apply 16 to 20 bushels of bone-dust to the acre *now.*

Mr. Reade, *of Stone, Aylesbury,* would oblige me much by informing me what he means by a "thin layer of gypsum?" Whether the heap should be more than 4 feet in height? Whether the gypsum should be strewed on the top of the second 2 feet, as well as the sulphuric acid? Whether, if these two substances be used, there is any advantage in covering the mix over with earth? (the only method I have hitherto used in preventing the escape of ammonia). Whether he removes his manure to the compost immediately from the stalls, or allows it to be trodden about the yard till half decomposed? Whether he means by a single horse cart-load, one filled with the raw litter, or with half decomposed? At what he estimates the cost of the gypsum and sulphuric acid, for say ten cart-loads of manure? *W. C.*

Spring Wheat.—*T. H.*—We have sown it so late as the first week in April, with good result. It all depends on the season; had we done so this season we shou'd have failed.

Thorn Fence.—*Buthkollidar.*—By the word "removal" we understand you to mean the shifting it to another place. Cut it down to within a foot of the ground, and remove the plants individually to their new position, which should be dug over for the purpose, and manured with farm-yard dung. The roots should be injured as little as possible, and they should be taken up with as much earth as will cling to them.

Treatment of Milch Cows.—*An Old Farmer.*—If you refer to the case of your own cow, we can only say that it is of a singular and peculiar kind; but as this periodical failing appears to be natural to the animal, we cannot suggest a remedy further than advising you to try some experiments with regard to her feeding. Food of the most nutritious kind should be given at the period when her milk falls off, or previous to it. Try oil-cake. *W. C. S.*

Winchcomb Farmers' Club.—*J. F. Peacey.*—Many thanks for your paper and information. We hope that many other Clubs will follow your example.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Dec. 2.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s	0	to 4s	4	Best Downs & Half-breds	4s 0	to 4s 6
Best Short Horns	3	10	4	0	Best Long-wools	3 10	4 2
Second quality Beasts	3	0	3	6	Ewes and second quality	3 4	3 8
Calves	3	4	4	4	Pigs	3 8	4 4

Beasts, 3420; Sheep, 27,780; Calves, 102; Pigs, 430.

There are a few more Beasts to day, but all are in request at fully last week's prices. The very best Scots, &c. have in some instances exceeded our top quotations, and some of the best Short Horns have made 4*s* 2*d*. The weather being favourable almost everything is readily disposed of. There is a small increase in the number of Sheep, but no improvement in the quality of the supply. Good Sheep are not very plentiful, and command a ready sale with prices having an upward tendency. The best old Downs more freely make 4*s* 6*d*, and some of the most sizeable Long-wools nearly 4*s* 4*d*. There is a dulness in the trade for second rate qualities, but they do not make any less money. Veal trade is dull at a small reduction from Friday; scarcely anything makes over 4*s* 4*d*. Pork trade is very heavy.

Friday, Dec. 6.

We have a large increase in the supply of Beasts. We notice a few Dutch, a great many Irish Heifers, several Scotch Beasts, and a large quantity of Cows; but the best qualities do not appear to be very plentiful, for which Monday's quotations are maintained, namely, best Scots, &c. 4*s* to 4*s* 4*d*, best Short Horns 3*s* 10*d* to 4*s*. In second-rate, however, the proportion being large, we notice a reduction of about 4*d* per 8 lbs.; prices range from 2*s* 8*d* to 3*s* 4*d*. The supply of Sheep is rather plentiful for the time of year; trade is not quite so good. Best Downs, &c. make from 4*s* to 4*s* 4*d*, the latter being an extreme price; Longwools, 3*s* 8*d* to 4*s* and Ewes, &c. 3*s* to 3*s* 6*d*. The Veal-trade is brisk at an advance on Monday's quotations, yet not quite so good as last Friday, 4*s* 6*d* being the outside price of the choicest qualities; second-rate 3*s* 4*d* to 4*s*. Pork-trade continues very heavy; we cannot quote nice Porkers at more than 4*s* 4*d*; many very good ones are sold much under.

Beasts, 1096; Sheep, 4510; Calves, 132; Pigs, 379.

41, West Smithfield.

HOPS, Friday, Dec. 6.

The Hop Market remains in the same state as last week; the demand though limited (as is usual at this season of the year) is gradual, and fine Hops in pockets are very scarce.

Pattenden & Smith, Hop-Factors.

WOOL.—British, Friday, Dec. 6.

There has been rather more demand for English Wool since our last; a good deal has changed hands; but we cannot quote any improvement in price, except in new skin country Wools, on some sorts of which an advance has been obtained.

James Perain, Wool Broker.

COVENT GARDEN, Dec. 7.—There has been scarcely any change in the Market during this week. The supplies have been generally plentiful, and the prices have differed but little. Pine-apples continue to be sufficient for the demand; among them are some fine specimens of Black Jamaica; Queens are rather inferior both in size and quality. Good hothouse Grapes are scarce; but foreign sorts are tolerably abundant. Apples of good quality are sufficient for the demand; Pears are also pretty plentiful. Among the latter we noticed good samples of Glout Morceau, Winter Nelis, Beurré Diel, and Passe Colmar. A few fine specimens of Marie Louise have also been in the Market during the week. Melons are now over for a season, and Cucumbers are very scarce. Oranges are plentiful; Nuts of all kinds are scarcer. Of Vegetables the supplies of most articles are quite sufficient for the demand. Cauliflowers are scarce, and Broccoli is not quite so plentiful. Savoys, Brussels Sprouts and other Winter Greens are abundant. Carrots and Turnips are also good, and sufficient for the demand. Seakale in small quantities has been brought during the week; it is offered at from 1*s.* 6*d.* to 2*s.* 6*d.* per punnet. Small quantities of Asparagus have likewise been offered at from 4*s.* to 12*s.* per bundle. Lettuces of good quality may be obtained at last week's prices. Endive and other kinds of Salading are generally excellent. Celery, both white and red, is abundant and good. Among Cut Flowers we noticed Cypripedium insigne, Bignonia venusta, Luculia gratissima, Poinsettia pulcherrima, Gnidia simplex, Pentas carnea, Camellias, Epacrises, Heaths, Heliotropes, Cinerarias, Amaryllises, Azaleas, Narcissus, Chrysanthemums, Tulips, and Roses.

FRUITS.

MARK-LANE, Monday, Dec. 2.

We had a fair supply of Wheat at our Market this morning, which met with a tolerably free sale at our last week's prices; the condition has also improved; there was some inquiry for Foreign Wheat in retail. Canada Flour is dull at from 25*s.* to 26*s.* per barrel. A good supply of Barley, which is 1*s.* cheaper for all descriptions. White Peas are unaltered in value; Maple and Grey are 1*s.* lower. Beans, both old and new, have declined 1*s.* per quarter. Oats are a very dull sale, but prices are fully maintained.

British, per imperial quarter.	*s.*	*s.*		*s.*	*s.*

Friday, Dec. 6

The arrivals of English Wheat have been moderate, and the trade is exceedingly dull at Monday's prices; Foreign is inquired after, but business is very slow. Fine Barley is rather more in demand, but secondary sorts are very unsaleable. Beans and Peas remain as on Monday. Oats are a dull sale at our late quotations.

PLANTS FOR COVER OR UNDERWOOD.

Rhododendron ponticum, 1 to 2 inches, 2*s.* to 30*s.* per 1000.

Ditto, 2 to 4 inches, 40*s.* to 50*s.* per 1000; 4 to 6 inches, 60*s.* to 80*s.* per 1000; 1 foot, 20*s.* per 100.

Mahonia aquifolia, 40*s.* per 1000. Game are remarkably fond of the fruit of this plant, which is also a handsome flowering Evergreen.

Common Laurel, 20*s.* to 40*s.* per 1000.

Come-well Willow, 40*s.* per 1000. (Best for Underwood.)

Furze, 10*s.* per 1000. Broom, 10*s.* per 1000.

Elder, common black, 8*s.* per 100. Excellent for sea embankments. Tamarisk 8*s.* per 100.

MISCELLANEOUS.

A great Stock of Forest and Ornamental Trees of large growth, from 6 to 10 feet, adapted for immediate effect.

Single Camellias, from pots, well rooted, 50*s.* to 75*s.* per 100.

Rose stocks, 8*s.* per 100, from cuttings of the Bourbon De Lisle, on which all kinds take freely by buds and grafts, and may be grown in the smallest sized pots.

Double Furze, 25*s.* per 100. Forms a beautiful flowering hedge.

Double Red Thorn; Double White do.; Single new crimson, 50*s.* per 100. Sea Pine, from pots, 40*s.* per 100.

Ribes sanguineum, 12*s.* 6*d.* per 100. Kalmia latifolia, 40*s.* per 100.

Printed Catalogues and Prices of their general stock may be had. Gardeners of experience and ability recommended.

TO GENTLEMEN, NURSERYMEN, SEEDSMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed to Sell by Auction, on the Premises, Windmill Lane, and Camberwell Nurseries, on Monday, December 16th, 1844, and following days, at 11 o'clock, by order of the Sheriff of Surrey, without Reserve, the whole of the choice GREENHOUSE PLANTS, consisting of Fine Double and Single Camellias, well furnished with bloom buds: Erica in fine varieties; Epacris, Azalea indica, Chorizema correa, Tropæolum; choice Geraniums, Petunias, Fuchsias, &c.; also the remaining Nursery stock, consisting of choice Pinus, Cupressus Juniperus, Vines, &c.: Iris in pots, Evergreen Oaks, Double Blossom Furze, Garrya elliptica; choice Standard and Dwarf Roses: American Plants, including Ghent and other Azaleas; hardy Scarlet Rhododendrons; Magnolias, Kalmias, Herdy Heaths, &c. One and Two-light Boxes, Hand Glasses, Four Tram Carriages complete, Garden Pots, Utensils in Trade, &c.—May be viewed prior to the Sale. Catalogues may be had of Mr. C. J. Holmes, Solicitor, 163, Fenchurch-street; of the principal Seedsmen; and of the Auctioneers, Leytonstone.

To MARKET-GARDENERS and Others.—GROVE-STREET, HACKNEY.

MR. WARREN respectfully announces that he will SELL, on TUESDAY, Dec. 10, at Twelve, on the Premises, held by Mr. John Manders (who is quitting them in consequence of their being required by Her Majesty's Commissioners of Woods, Forests, &c., for the Victoria Park), FORTY BOXES and LIGHTS, 200 boxes of healthy Cauliflower plants, seven large beds of red and 20 of early York Cabbage plants; one acre of Red Cabbages, 60 rods of Horseradish; a large quantity of Onion, Cauliflower, White Coss, Colewort, Seakale, white and red Turnip Radish, long Scarlet Radish, Celery, Curled Endive, and Parsley seeds of the very best quality. Radford's early and Giant Rhubarb, Seakale and Asparagus plants, a Waggon and Market Cart, two Horses, Harness, 100 Loads of excellent Spit Dung, Barrows, Ladders, Tools, Watering-pots, and a variety of useful effects.

May be viewed and catalogues obtained, five days prior to the sale, on the premises; of Messrs. BATT and RATLEY, Seedsmen, 412, Strand; Messrs. FLANAGAN and SON, Seedsmen, opposite the Mansion House; at the Rainbow and Unicorn Taverns, Covent-garden, and of the Auctioneer, Isleworth.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HUNT'S IMPROVED HYACINTH POT and SUPPORT, from 1*s.* 6*d.* each. The largest stock in London of Patent and other Garden-pots and Stands, from 15*s.* to 150*s.* per dozen, in Wedgewood's and other wares, for Drawing-rooms, &c.—29, Queen's-row, Pimlico.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Dec. 7, 1844.

DR. HALLETT'S DRY SOLUBLE FERTILIZERS are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.* 6*d.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Building, Bunhill-row, London.

AGRICULTURAL TRAINING SCHOOL, Hoddesdon, Herts, Established for General and Scientific Education, including every branch of Agriculture.

Resident Head Master—Mr. Haselwood.

Agriculture—Professors Austin, Gough, &c. &c.

Botany—Professor Cooper, F.L.S., Author of "Botany of Sussex," &c.

Chemistry—Professor Holmes, five years Lecturer at St. Edmund's College.

Mineralogy, &c.—Professor Richardson, F.G.S., of the British Museum, Author of "Geology for Beginners," &c.

Management and Diseases of Cattle—Professor Youatt; M.A.S., Author of "The Horse, Sheep, Cattle," &c. &c.

Practical Surveying and Levelling—Mr. Haselwood.

The course embraces the Classics, Mathematics, Mechanics, Physics, Chemistry, Botany, Mineralogy, Geology, Land Surveying, Drawing, the French Language, Practical Agriculture, and Lectures on the Breeds, Management, and Diseases of Cattle.

The School Session is divided into two terms, viz., from the 14th January to Midsummer, and from 30th July to Christmas. A library, museum, and laboratory are attached to the school, and the charge for board, lodging, washing, lectures, &c. is so arranged by the committee of management as to include every expense, except for books, at Twenty Guineas the half-year.

A Separate Class will be formed of those pupils who are not sufficiently advanced to attend the lectures, the charge for which will be Sixteen Guineas the half-year.

The Introductory Lectures of the several Professors will be public, of which due notice will be given.

Prospectuses in detail are ready, and applications for admission to be addressed to "The Head Master, Agricultural Training School, Hoddesdon, Herts," of whom every information may be obtained.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT

Is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non-conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Ropewalks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail holes.

TESTIMONIAL.

London, Nov. 1 1844.

H. C. BOWDEN, Esq., Agent for McKIBBIN'S Roofing Felt.

It is with much pleasure I add my humble testimony to the superiority of your Felt over any other preparation of the kind with which I am acquainted. This Testimony I give with the greater cheerfulness from the many reports I have heard in its favour, and from the likelihood of its being used extensively in Agricultural purposes. I shall not fail to notice it in my Lectures when on the subject.

(Signed) JOHN ROBINSON, M.B., Senior Lecturer on Chemistry, &c., as applied to Agriculture and Rural Economy in this Kingdom.

Sold in Sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet).

Apply to H. C. BOWDEN,
Agent to the Manufacturers,
No. 18, East India Chambers, Leadenhall-street, London.

AGRICULTURAL DRAINING. — THE DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker, J. DAVIS, Optician, Derby.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING,
Saving half the Timber usually consumed.
Weight, 24 lbs. per square of 100 feet.
Cost, 8*s.* 4*d.* per square of 100 feet.
The above Material has been used and approved of by the NOBILITY, GENTRY, and AGRICULTURISTS generally, as a
ROOFING & COVERING to SIDES of FARM BUILDINGS.
Its advantages are
LIGHTNESS, DURABILITY & ECONOMY.
Being a non-conductor, it has been proved an efficient
PROTECTIVE MATERIAL TO PLANTS,
and is now in use at the ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.
It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the Trade.
THOMAS J. CROGGON
8, Ingram-court, Fenchurch-st., London.

In 4to, with large Chart, and Steel-plate, Coloured Maps of England, Wales, and Scotland, price 1l., or without Maps, 3s.

CHAPMAN AND HALL'S MONTHLY SERIES.

A COLLECTION of ORIGINAL WORKS of FICTION and BIOGRAPHY.

I. The Series will be found to differ in some very important respects from every other hitherto presented to the public. It will consist exclusively of new and original works, chiefly of the Class of Novels and Romances.

II. The price of each work will be less than one-half the sum charged for an equal amount of matter in the ordinary forms of publication.

III. The means by which the saving of cost will be effected will not involve the sacrifice of literary or typographical excellence.

IV. The quantity of matter given in each Part will be found to remove a very general objection made to Serial Works, on the ground of a too frequent suspension of the interest.

The Novel will be published in Four Monthly Parts, of the post octavo form. Each Part will contain 160 handsomely-printed pages, and be sold for Three Shillings. Unless special exceptions are made, and it is expedient to issue a story in a single volume, it is intended that while every Novel in the Series shall contain the ordinary amount at present included in Three Volumes, it shall be comprised in Two, and sold for Twelve Shillings.

The Engravings will never exceed Two Parts, or One Volume.

The first Novel will be MOUNT SOREL; or, THE HEIRESS OF THE DE VERES. By the Author of the "TWO OLD MEN'S TALES."

The First Part will be published on the First of January.

London: Chapman and Hall, 186, Strand.

JUST PUBLISHED,

I.

IMAGINATION AND FANCY.

Post 8vo. price 9s. boards; 10s. 6d., in a new kind of cloth, Silver Gilt, for Presents.

II.

PICTURES OF PRIVATE LIFE. By Mrs. Ellis, Author of "The Women of England," &c., 3 vols., fcap. 8vo, price 7s. 6d. each; or 6l. morocco.

In a few days,

CHRISTMAS FESTIVITIES. By J. Poole, Esq., Author of "Paul Pry," &c. Post 8vo, cloth, with a Portrait of the Author, price 10s. 6d.

London: Smith, Elder, and Co., Cornhill.

On Thursday, Dec. 12th, will be published, by Mr. Wm. Smith, 113, Fleet-street,

A SYSTEM of CULTIVATING CUCUMBERS in MILLS'S IMPROVED PIT, so arranged as to be heated with hot water by Rushton and Healy's Boiler and Tanks. With a Descriptive Plate. It will be a Supplement to the Second Edition of Mr. Mills's Work on the Culture of Cucumbers and Melons.

On the 1st of February will be published,

A TREATISE on the IMPROVED CULTIVATION of PINE-APPLES. By G. Mills. With Diagrams of a Hothouse and a Pit for that purpose; with Plan of Apparatus for Heating them with Hot Water on the Tank System.

KNIGHT'S WEEKLY VOLUME FOR ALL READERS.

Price One Shilling.

The Publication of this Series commenced on Saturday, the 29th of June, and will be continued every succeeding Saturday. The following works will appear in the course of December:—

Dec. 7th. History of British Commerce. By G. L. Craik, A.M. Vol. II.
" 14th. British Manufactures—Chemical. By G. Dodd.
" 21st. History of British Commerce. By G. L. Craik, A.M. Vol. III.
" 28th. Civil Wars of Rome — Select Lives from Plutarch. Translated, with Notes. By Professor Long. Series I.

London: Charles Knight & Co., 22, Ludgate-street.

Price Sixpence, free by post.

Metropolitan Mortality Table.

Price 5d.; Stamped, 6d.; or 1l. 5s. per annum in advance. Order of any Bookseller or Newsman.

J. A. Carprae, 49, Essex-street, Strand.

HEATING BUILDINGS BY HOT WATER.

Now ready, Second Edition, greatly enlarged and improved, with Woodcuts, &c., 8vo, price 12s. cloth,

A PRACTICAL TREATISE on WARMING BUILDINGS by HOT WATER, and its various Methods of Distributing Artificial Heat; and the Effects on Animal and Vegetable Physiology. To which are added Inquiry into the Laws of Radiant and Conducted Caloric, and the Construction of Coal and the Economical Consumption of Smoke.

By CHARLES HOOD, F.R.S., F.R.A.S., &c.

Whittaker and Co., Ave Maria-lane, London.

THE HORTICULTURAL MAGAZINE.—Mr. Houlston, 154, Strand, will publish, on the 1st of January, 1845, Price One Shilling, PART I. of the "HORTICULTURAL MAGAZINE," a New Periodical on Flowers and Fruits.

Contents:—Cultivation of Hardy Fruit-trees—Pruning Fruit-trees—Ornamental Timber—Application of Manures—Landscape Gardening—Management of Greenhouses—Flower Shows—Grafting—Hybridising—Horticultural Societies—Description of New Flowers—Wonders of the Vegetable World—Designs for Rock Gardens—Irrigatory Labours—Select Fuchsias—Hardy Annuals—Reviews—Practical Management of Hothouses, Greenhouses, and Flower-garden—Horticultural Notes, &c.

Advertisements must be sent on or before the 15th of the month.

The Introductory Number, containing a Variety of Original Essays, and a Plan of the Work may be had, price 1s. of Thos. Houlston, 154, Strand, London, and all Booksellers.

BLACK ON BREWING.—THIRD EDITION.

Just published, Third Edition, 8vo, 10s. 6d. cloth,

A PRACTICAL TREATISE ON BREWING, based on Chemical and Economical Principles; with Formulæ for Public Brewers, and Instructions for Private Families. By William Black. Third Edition, carefully revised, with considerable additions. The Additions are recommended by Professor Graham, of the London University.

"We can recommend this book to such of our readers as practice brewing, either privately or professionally."—*Library of Domestic Economy.*

"Invaluable to the practical brewer and private family."—*Chemist.*

"I take occasion, in concluding this article, to refer my readers to the 'Practical Treatise on Brewing,' by Mr. William Black, a gentleman experienced in the business. His work contains much useful information."—*Dr. Ure's Supplement to his "Dictionary."*

London: Longman, Brown, Green, and Longmans.

SMITHFIELD CATTLE SHOW.—The Widow of the late Thomas Wrdiake, Implement Maker, begs to inform her friends her stand at the Show is No. 8, yard, and solicits a continuance of the favours so long bestowed on her late husband. She will have several useful and well furnished Assortment of Implements, an inspection of which she respectfully solicits. Please notice the Number, 33.—London Warehouse, No. 118, Fenchurch-street, opposite Mark Lane.

TO LADIES.

ROWLAND'S KALYDOR.—Patronised by the several Sovereigns and Courts of Europe.—An Oriental Botanical Discovery, and perfectly free from all mineral admixture. It exerts the most soothing, gentle, cooling, and purifying action on the skin; and by its agency on the pores and minute secretory vessels, most effectually dissipates all Redness, Tan, Pimples, Blotches, Spots, Freckles, Chaps, Chaps, and other Cutaneous Visitations. The radiant bloom it imparts to the Cheek, and the delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet. For Ladies, during the period of nursing, and as a wash for Infants, it cannot be too strongly recommended. Gentlemen, after shaving, will find it allay all irritation and tenderness of the Skin, and render it soft, smooth, and pleasant. Price 4s. 6d. and 8s. 6d. per bottle, duty included.

CAUTION.—Beware of Imitations of the most deleterious character, containing mineral astringents utterly ruinous to the complexion, and by their repellent action endangering health. See that the words "ROWLAND'S KALYDOR" are on the Wrapper; and A. ROWLAND & SON, 20, Hatton-Garden, engraved (by authority of the Hon. Commissioners of Stamps) on the Government Stamp affixed on each bottle. Sold by the Proprietors, and by Chemists and Perfumers.—**** All other Kalydors are FRAUDULENT IMITATIONS!

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Wortons Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

Edward Beck will be happy to answer any inquiries, either personally or by post.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price 6d. per yard, 7-8ths of a yard wide, thin, 2s. 6d. per yard.; stout, 3s. 1 yard wide, 3s. 6d. Price of Fluid (for renewing the cloth after lengthened service), 4s. 6d. and 2s. 6d. per bottle. Manufactured only by N. W. Tanner, Chemist, Exeter; and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

PATENT GALVANISED IRON (SORELL'S PROCESS) HOT-WATER PIPES, VAPOUR GUTTER, TANKS, &c.—J. PORTER begs to announce that, in addition to the many other and valuable purposes for which Galvanised Iron is peculiarly applicable, he is now manufacturing Tanks and Gutter for Vaporising, and Pipes for heating by hot water, bottom-heat, Hothouses, Pineries, Conservatories, &c. J. P. has also to state that, having secured the assistance of a person of the greatest skill and experience, he is prepared to furnish Plans and Estimates for Heating and Ventilating Horticultural Buildings, Public Edifices, Private Houses, Churches, Warehouses, Manufactories, &c., accompanied by references to executed works. J. P. does not profess to offer any one particular form of Boiler as the best, to the exclusion of every other, but adopts those which will insure the greatest share of efficacy and economy, in each particular case.—Grove Patent Galvanised Iron Roof and Fence Work, Southwark, second carriage turning to the right from Southwark Bridge.

Printed by William Bradbury, of No. 6, York-place, Stoke Newington, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 7, 1844.

NOTICE IS HEREBY GIVEN, that in future the MEETINGS of the GARDENERS' BENEVOLENT INSTITUTION will be held at the LONDON COFFEE-HOUSE, Ludgate-hill.—By order, Edw. R. Cutler, Secretary, 97, Farringdon street.

GARDENERS' BENEVOLENT INSTITUTION.—A GENERAL MEETING of the Subscribers to this Charity will be held at the LONDON COFFEE HOUSE, Ludgate hill, on the 22d Jan. next, for the purpose of receiving the Accounts of the Institution for the past year, and Electing Officers for the ensuing year; after which an ELECTION will take place from among the following persons, whose Testimonials, &c. have been examined and approved of by the Committee, viz.:—

JOHN BLAYLOCK,	aged	72.	3d Application.
ROBERT CRACKNELL	,,	72.	2d do.
GEORGE MARTIN	,,	61.	2d do.
JOHN ADAMSON	,,	67.	1st do.
WILLIAM EDWARDS	,,	66.	1st do.
THOMAS FARMER	,,	63.	1st do.
BARNEY FARRELLY	,,	67.	1st do.
JOHN FISHER	,,	69.	1st do.
JOHN GARNELL	,,	77.	1st do.
CHARLES GIBBONS	,,	58.	1st do.
CHARLES GRAY	,,	89.	1st do.
JAMES STEDMAN	,,	75.	[illegible] do.
ANN SUTTLE	,,	67.	[illegible] do.
RICHARD STOYLES	,,	77.	1st do.

No person will be allowed to vote whose Subscription for 1844 is unpaid on the day of Election.

Edward R. Cutler, Secretary, 97, Farringdon-street.

THE ARBORETUMS, QUEEN'S ELMS, BROMPTON, NEAR LONDON, AND EAST COWES PARK, ISLE OF WIGHT.

RAMSAY BROTHERS, Landscape Gardeners, Contractors for Planting, Earthwork, Road-making, Forming Ornamental Waters, and Improvers in general of Landed Property.

Plans and Estimates submitted, and works contracted for in any part of the kingdom.

Messrs. R. invite Noblemen and Gentlemen to an inspection of their choice stock of Ornamental Plants, which have been selected from the Lawn of the Parterre and the Shrubbery, and now growing at Queen's-Elms, one mile from Hyde Park Corner.

HERTFORD NURSERIES.

E. P. FRANCIS having received various Testimonials from Gentlemen, &c., as to the excellence and superiority of SNOW'S WINTER WHITE BROCOLI, advertised in the *Chronicle* last season, begs now to inform the Nobility, Gentry, and Public, that it may be obtained at the Hertford Nurseries, Messrs. Noble, 152 Fleet-street, Messrs. Wrench, London-bridge, and Messrs. Flanagan, Mansion House-street, at 2*s*. 6*d*. per oz.

E. P. F. begs further to recommend to those persons who have not yet obtained it, SNOW'S HYBRID GREEN-FLESH MELON, which was awarded a Knightian Medal at the Chiswick Show in May last, and which cannot be surpassed for hardy habit, most abundant bearer, and superiority of flavour over 30 other Melons that were exhibited at the same time. To be obtained at the Hertford Nurseries only, in sealed Packets containing eight seeds, 3*s*. 6*d*. each.

Also, E. P. F. begs to introduce to Public notice, SNOW'S HARDY HYBRID BROWN COS LETTUCE, which has been proved by several growers to be superior in flavour and sweetness to any other Lettuce grown, very crisp, very hardy, requires no tying up, and is fit for use three weeks earlier than the common Brown Cos, in sealed Packets, 1*s*. 6*d*. each. E. P. F. has also received from Mr. Snow a small quantity of this very fine Chinese Primula Seed, of the white and purple kinds, and all saved from beautiful fringed varieties, in Packets, 2*s*. each.—Dec. 14, 1844.

JOHN BELL begs to inform the Public that he has a large Stock of strong VINES in POTS, two and three years old, from Eyes, at the following prices:—

Strong two-year-old Plants, in pots, 5*s*. each
Ditto three years ditto, 7*s*. 6*d*. each.

Scarlet Hybrid RHODODENDRONS, 6 inches high, in pots, 12*s*. per doz.

Ditto ditto, 12 in., do., 18*s*. per doz.

Also a few hundred fine strong plants of choice SEEDLING CALCEOLARIAS, raised from Magician, Sir Robert Sale, Barnes' King, Miss Antrobus, Lady Constable, and other first-rate sorts, 12*s*. per dozen plants.—Bracondale Horticultural Establishment. Seed Warehouse 3, Exchange-street, Norwich.

KNAP-HILL NURSERY, NEAR BAGSHOT, SURREY.

HOSEA WATERER (Brother and Successor to the late Michael Waterer), respectfully begs to announce that the American Plants this year are remarkably well furnished with bloom; and with the other articles which are generally required for forcing, he has this season to offer very fine plants of the hardy Scarlet Rhododendrons. This Nursery has long been celebrated as containing the finest Collection of American Plants in the kingdom: independent of this, H. W. is a most extensive grower of Hardy Ornamental Trees and Shrubs, Roses, Forest and Fruit Trees; this may be inferred from the fact, that the Nursery extends over near 100 acres of land. The Knap-Hill Nursery is 2½ miles from the Woking station of the South Western Railway.

All letters intended for this Nursery must be addressed Knap-Hill, near Bagshot, Surrey.—Dec. 14.

TO THE CULTIVATORS OF ROSES.

R. B. BIRCHAM, Hedenham Rosery, Bungay, Suffolk, begs to offer the following Select ROSES, which he can with confidence recommend, as possessing superior quality. A purchaser selecting 12 different kinds from this list, R. B. B. will be happy to supply at 20*s*. The plants are strong and healthy, and varying in height of stem from 1½ feet to 3 feet.

Agnes Sorel	Aurelie Lamare	Las Casas
Donna Sol	Brisees	Idalize
Duchess of Kent	Buffoon	Jambart
Duchesse d'Orleans	Crivelli	Julie
Emerance	Duc de Trevise	La Splendeur
Illustre Beauté	Egle	Nelly
La Ville de Londres	Fleur d'Amour	Becquet
Mrs. Rivers	Gil Blas	Blairii, No. 2
Nicolate	Gurin's Gift	Charles Louis
Petite Beauté	Gurin's Desdames	De Candolle
Semilasso	Leo the Tenth	Fulgens
Theodora	Lionel Dumourtier	George the Fourth
La Ville de Bruxelles	Madame Dubarry	Eclatante (Moss)
Voluminеuse	Reine ne me Surpasse	Princess Royal
Aglae Dusart	Triomphe de Laguеule	Prolifere
Agnodier		Pompone
Antoinne d'Ormoise		

Also strong plants of Climbing Roses (Evergreens), at 6*s*. per dozen. These Roses will make shoots upwards of 6 feet long in one season, and are very suitable to cover unsightly fences, walls, stems of trees, &c.

Descriptive Catalogues forwarded upon prepaid application. Plants gratis, to compensate for distant carriage.

Hedenham, Dec. 14.

THE FILBY, or FASTOLFF RASPBERRY.—At the request of some gentlemen living in the neighbourhood of Yarmouth, T. RIVERS begs to submit the history of this really excellent Raspberry to the public. In the year 1814 Colonel Lucas, of Filby, a place lying between Norwich and Yarmouth, discovered a Raspberry plant growing under an old Laurel hedge in his garden. His attention was drawn to it, and he soon found it to be a superior and delicious variety, so that in a short time every other sort was ejected from his garden, and this alone cultivated. It was not, however, till 1824 that he allowed his gardener to part with it, who then gave canes to his neighbours, and by this means it got to be cultivated in Caistor, Ormsby, and, in fact, in all the neighbourhood, under the name of the Filby Raspberry, to the exclusion of all other sorts. It has latterly often been called the Caistor Raspberry, from the Market Gardeners growing it in that parish. In Caistor is an old castle in ruins, that formerly belonged to the Fastolff family: the latter name was given to the variety by Youell and Co., when they first began to sell the canes. The fruit upon which Dr. Lindley pronounced his opinion was gathered in the Filby garden, now the property of the Rev. G. Lucas, who authorises and permits the publication of the above facts; and has also permitted his Gardener to supply the Canes after this date to T. RIVERS only.

Canes are sold at 30*s*. per 100, or 6*s*. per score, carriage paid to London. Charge for package, for small parcels, 6*d*., for large do., 1*s*. to 1*s*. 6*d*. Orders to any amount can be executed. The Trade price will be given on application.

Sawbridgeworth, Herts, Dec. 14, 1844.

NURSERY LARCH.

COWAN and Co., Nurserymen, Glasgow, have on hand a large quantity of well grown transplanted [illegible]H, 2 and 3 feet high, which they will sell at a low price [illegible]es must be removed this season. All sorts of Forest-trees [illegible]edling and transplanted, grown extensively, and offered [illegible]ery moderate prices.

EDWARD BECK informs the Public the consequence of the greatly increased demand for his SLATE TUBS, he is enabled to reduce the price of the following sizes about 10 per cent. He regrets the too frequent delay which has occurred in the execution of orders. This he hopes to avoid in future by keeping a supply on hand.

Present Prices for Cash or Post-office order:—

14 inches	. . .	11*s*.	0*d*.	20 inches . . .	2[illegible]*s*. 0*d*.
15 inches	. . .	12	6	22 inches . . .	25 0
16 inches	. . .	16	0	24 inches . . .	[illegible] 0
18 inches	. . .	19	0		

Slate Works, Isleworth, Middlesex.

WANTED, 1,000 or 2,000 TWO-YEAR OLD SEEDLING HOLLY PLANTS, deliverable in Liverpool. Apply, with price, Box G 20, Post-office, Liverpool.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c., as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and CO. beg to announce they are able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing 100 Canes			.	£2	0 0
Ditto	,,	50	,,	.	1 1 0
Ditto	,,	25	,,	.	0 12 0

For particulars of the above, see Y. & Co.'s Advertisement of Nov. 9th.

YOUELL and CO. take the present opportunity to state that the above unequalled RASPBERRY is to be obtained only at their Nursery or of their Agents for the list of whom see their Advertisement of last week: and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title, has been substituted by certain parties as the "true variety." They also publicly deny the truth of Mr. Rivers's statement, "that the fruit upon which Dr. Lindley pronounced his opinion was gathered in what he terms the 'Filby Garden.'"

Also FISH'S EARLY CANTALOUPE HARDY GREEN-FLESHED MELON; for Particulars of which see their Advertisement of last week.

Great Yarmouth Nursery, Dec. 14, 1844.

ROSES, HARDY HERBACEOUS PLANTS, AND HOLLYHOCKS.

WM. JACKSON and Co. beg to offer Collections of the above from their select Stock on the following very reasonable terms:—

100	Dwarf Roses in 50 named sorts, for 20*s*.
100	do. do. 100 do., fine sorts, 35*s*.
100	do. do. 100 do., very fine sorts, 50*s*.
20	Beautiful Scotch Roses, with names, 10*s*.
25	Standard Roses, including the fine Moss and Hybrid Perpetuals, 40*s*.
50	Do. do. do. do., 75*s*.
100	Showy Herbaceous Plants, in 50 named sorts, for 25*s*.
100	Do. Do. 100 do., 35*s*. and 40*s*.
50	Very fine showy do. do., in 50 do., 20*s*.; including several new and beautiful species and varieties.
100	Fine proved Hollyhocks for 35*s*.

The above are well grown; the Dwarf Roses on their own roots, and from the same stock as those which gave such general satisfaction last season. Plants given to compensate for long carriage. Catalogues will be forwarded on receipt of two postage stamps.

A remittance or reference respectfully solicited from unknown correspondents.—Cross Lanes Nursery, Bedale, Yorks., Dec. 14.

CALCEOLARIAS.

S. STAFFORD, Nurseryman, Seedsman, and Florist, Hyde, near Manchester, begs to observe that his List of Seedling and other CALCEOLARIAS is now ready, and may be had on application. For description of Seedlings see *Gardeners' Chronicle* July 6th, signed "S. S."; *Gardeners' Gazette*, July 20th and 27th; "Harrison's Cabinet" for September, page 227. Camellias, Fuchsias, and other Greenhouse Plants; Forest and Fruit-trees, Shrubs, &c., of which Lists may be had.

CORNISH KIDNEY POTATOES.—THE EARLIEST OF ALL EARLY POTATOES. It is remarkable that this valuable sort should be so little known and cultivated in England. It is grown to some extent in the West of Cornwall, AND HAS BEEN PRODUCED IN THE OPEN GROUND DURING THE LAST TEN YEARS, FROM THE 15TH TO 18TH OF APRIL, (on an average.)

Upwards of three hundred acres are annually grown in the neighbourhood of Penzance; and thousands of baskets are sent, by steamers, to supply the London and Bristol Markets.

The growers obtain them so early, that they are enabled to procure an excellent second crop on the same land.

It is a most valuable sort, and should be grown in every garden where early vegetables are required.

Sold in Boxes, at 5*s*. and 7*s*. each, package and carriage free to London or Bristol, which will be forwarded on receiving a Post-office order, on application to WILLIAM E. RENDLE.

Union-road Nursery, Plymouth, December 14th, 1844.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 6½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford street.—Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

THOMAS JACKSON, of the Priory Farm, Childwall, near Liverpool, begs to inform Nursery, Seedsmen, and others, that he has saved a fine quantity of the Incomparable Hardy Green COLEWORT, which was Advertised in the *Chronicle* of 2nd March last. T. J. can refer any person to a respectable Nursery-man in this neighbourhood, as to quality and being genuine. Price 2*s.* per lb.—Dec. 14.

EXHIBITIONS AT THE GARDEN OF THE Horticultural Society of London,

FOR THE YEAR 1845.

THE DAYS OF EXHIBITION will be the three following Saturdays, viz.: May 24, June 21, July 12.

EXHIBITORS.—All Persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

FLOWER STANDS.—Exhibitors of Cut Flowers must SUPPLY THEIR OWN BOXES OR STANDS. No box or stand should exceed eight inches in height at the back, or 18 inches in depth from front to back. The lids of all boxes MUST either be loose or made to unhinge.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards,—namely,

	value.—£	s.	d.
C. The Certificate	0	10	0
SB. Silver Banksian Medal	1	0	0
SK. Silver Knightian Do.	1	5	0
LS. Large Silver Do.	1	15	0
SG. Large Silver Gilt Do.	4	0	0
GB. Gold Banksian Do.	7	0	0
GK. Gold Knightian Do.	10	0	0
LG. Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or on account. *If within one month after the third Exhibition of the year* no intimation shall have been received from an Exhibitor of the manner in which he desires his Medals to be disposed of, all the Medals due to him may be prepared and *transmitted to him through the usual public conveyances, without further notice.* In case an Exhibitor shall receive a First Prize in any one letter, he shall not be entitled to receive any other Medal in the same letter, except in *K K*, *M M*, and *N N*.

IT IS, HOWEVER, TO BE PARTICULARLY OBSERVED that if any Exhibitor shall obtain the award of a Medal, and it shall be afterwards ascertained that he has gained it by exhibiting plants not *bond fide* his own property, or that of his master, such award shall be cancelled, in favour of the Exhibitor next below him, whose Medal shall in like manner be transferred to the person immediately following him in the award, and so on.

SUBJECTS OF EXHIBITION.—These will be divided into Classes, as explained further on. No articles not of Horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following List, as they will in ALL CASES BE REQUIRED TO SIGN A PRINTED FORM OF DECLARATION TO BE FURNISHED TO THEM IN THE GARDEN, stating under what letter their plants are to be shown; and they are particularly requested to TAKE NOTICE, that if errors in the awards of the Judges should occur, in consequence of mistakes on the part of Exhibitors in filling up such Declarations, the Society cannot undertake to rectify the errors afterwards.

Names fairly written are to be attached by Exhibitors to all Florists' Flowers; and the Judges are restrained from awarding any Medal to such Exhibitions, whatever their merit may be, if this regulation is not complied with. By Florists' Flowers are meant not only flowers usually so named, but also Fuchsias, Pelargoniums, Roses, and Calceolarias. It is also hoped that all other subjects of Exhibition will be neatly and legibly labelled with their names.

(*Corrected List of Medals, &c.*)

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums; in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS.

B. Pelargoniums; in collections of 12 varieties, in pots of 24 to a cast. GB—SG—LS.

C. Pelargoniums; in collections of six varieties, in pots of 8 to a cast. LS—SK—SB.

D. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct vars. GB—SG—LS.

N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots, and not to allow cut specimens to be exhibited at all.

E. Roses in pots; single specimens displaying superior cultivation. SK—SB—C.

F. Moss Roses, in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB.

N.B. No one who exhibits in this letter can also compete in the following.

H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK—SB—C.

N.B. Higher Medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

I. Cape Heaths; in collections of 20 entirely distinct varieties. GK—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths; in collections of 12 entirely distinct varieties. GB—SG—LS.

L. Cape Heaths; in collections of 6 entirely distinct varieties. SG—LS—SK.

N.B. No person will be allowed to show in more than one of the classes *I*, *K*, and *L*.

M. Cape Heaths; single specimens displaying very superior cultivation. LS—SK—SB.

N. Calceolarias, in sixes; in pots of 24 to the cast. LS—SK—SB.

O. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

P. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

Q. Pinks, in pans of 24 distinct varieties. SK—SB.

R. Ranunculuses, excluding Turbans; in stands of 12 distinct varieties for Private Growers, and 24 for Nurserymen. LS—SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

S. Stove or Greenhouse Plants; in collections of 40 plants. LG—GK—GB.

N.B. Calceolarias, Fuchsias, Orchidaceæ, and Pelargoniums to be excluded from *S*, *T*, *V*, and *W*.

T. Stove or Greenhouse Plants; in collections of 20 plants. GK—GB—SG.

N.B. Exhibitors cannot show in more than one of the classes *S*, *T*, *V*, and *W*.

V. Stove or Greenhouse Plants; in collections of 12 plants. GB—SG—LS.

W. Stove or Greenhouse Plants; in collections of 6 distinct species. SG—LS—SK.

X. Greenhouse Azaleas; in 12 distinct varieties. GB—SG—LS.

Y. Greenhouse Azaleas, in 6 distinct varieties. SG—LS—SK.

N.B. No one can show in both classes of Azaleas.

Z. Stove or Greenhouse Climbers; in collections of 6 species. SG—SK—SB.

AA. Exotic Orchidaceæ; in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes *AA*, *BB*, and *CC*.

BB. Exotic Orchidaceæ; in collections of 12 species. GK—GB—SG.

CC. Exotic Orchidaceæ; in collections of 6 species. GB—SG—LS.

DD. Scarlet Pelargoniums; in 6 distinct vars. LS—SK—SB.

EE. Pelargoniums; in 6 DISTINCT SPECIES. SG—LS—SK.

N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden crossbreds.

FF. Achimenes; in collections of 6 species, grown in pans not less than a foot in diameter. LS—SK—SB.

GG. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

HH. Fuchsias; in collections of 12 VERY DISTINCT varieties, of which one-half should have a light calyx. LS—SK—SB.

II. Cinerarias; in pots, in collections of 12 distinct varieties. SK—SB—C.

KK. New or extremely rare ornamental Plants. SG—LS—SK.

NB. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Garden on a previous season.*

LL. Single specimens of very superior cultivation. SG—LS—SK.

MM. Miscellaneous subjects. SK—SB—C.

N.B. Exhibitors under *MM* will not be thereby *entitled* to a pass-ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets are altogether excluded from exhibition.

NN. Seedling Florists' Flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than 6 seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass-ticket. For seedling Pelargoniums exhibited the first year no higher prize shall be given than a Certificate, and this is to be awarded to flowers of decided merit. Seedling Pelargoniums of the second year must be shown in pots not smaller than 32s, and each exhibitor may produce six of them, but not a larger number.

IN ADDITION to any Medals assigned to the classes *I*, *S*, *T*, and *AA*, the SK, SB, and C are offered for the collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's Officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT; for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the Market, and Private Growers, exhibit independently of each other.

N.B. All Fruit must be FULLY RIPE and WELL-COLOURED and PROPERLY NAMED by the Exhibitor as far as practicable; if the contrary it will be disqualified.

OO. Miscellaneous Collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B.—Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

PP. Grapes. SG—LS—SK—SB.

QQ. Pine Apples. SG—LS—SK—SB.

RR. Peaches or Nectarines, in dishes of six specimens. SK—SB.

SS. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the Silver Medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the Collector as to reward the skilful Gardener. They are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

By order of the Exhibition Committee, JOHN LINDLEY,
Aug. 31, 1844. Vice Secretary.

*** Copies of these Regulations can be procured upon application at the Society's Office, 21, Regent-street.

In 8vo, boards, with very numerous woodcuts, price 10*s.* 6*d.*,

LINDLEY'S ELEMENTS OF BOTANY:

STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, AND MEDICAL.

Being a Fourth Edition of the "Outline of the First Principles of Botany."

Contents of the Work—I. STRUCTURAL and PHYSIOLOGICAL BOTANY:—1, Elementary Organs; 2, Compound Organs; 3, Root; 4, Stem; 5, Leaf-buds; 6, Leaves; 7, Food and Secretions; 8, Flower-buds; 9, Inflorescence; 10, Floral Envelopes; 11, Male Organs; 12, Disk; 13, Female Organs; 14, Ovule; 15, Impregnation; 16, Fruit; 17, Seed; 18, Acrogens, or Flowerless Plants.

II. SYSTEMATICAL BOTANY:—1, Linnean Sexual System; 2, Analytical Method; 3, Natural System; 4, Natural System of De Candolle (*this Part illustrated with Numerous Figures of the details of the more important Natural Orders*); 5, the Alliances of Plants; 6, Sketch of a New Distribution of the Vegetable Kingdom.

III. MEDICAL BOTANY; consisting of a Classified List of the Principal Medical Plants that are known in a living state in Europe; with an Explanation of the Purposes to which they are applied Medicinally.

TAYLOR and WALTON, and all Booksellers.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their establishments, 22, Regent-street (corner of Jermyn-street); or 45, Moorgate-street, City. New Goods plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the Kingdom and abroad free.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON AND Co., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own Manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co.," under a crown. Old articles replated and gilt.

PRINTED FOR
TAYLOR AND WALTON,
BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,
UPPER GOWER-STREET.

DARLEY'S SCIENTIFIC LIBRARY.

FOR THE USE OF
SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready*,

A SYSTEM
OF
POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION
TO THE
POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM
OF
POPULAR ALGEBRA;
WITH
A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM
OF
POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.

Registered under 6 & 7 Vict., Cap. 65.

No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.			Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£	s.	s.	s. d.	s. d.	s. d.		
10	1	5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.								
10	2	2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2	15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3	10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5	5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8	15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

COTTAM AND HALLEN, Engineers, Iron-founders, &c., &c., No. 2, Winsley-street, Oxford-street, London, and at Cornwall Road, Lambeth.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with Cottam's Patent or Rogers's Boilers. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for Agricultural and Horticultural Purposes.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

CONICAL BOILERS.—The Boilers invented by John Rogers, Esq., are made of several sizes, and may be obtained of John Shewen, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, Architects, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. Weeks and Day have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS and SONS, LONDON; Wm. J. MYERS and CO., LIVERPOOL;

And by their Agents,
COTESWORTH, POWELL, and PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Dec. 14, 1844.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, Fenchurch-street, City, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil cake Crushers	Threshing Machines for the
Double action Turnip-cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, Mary Wedlake, 18, Fenchurch-street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING,
Saving half the Timber usually consumed.
Weight, 24 lbs. per square of 100 feet.
Cost, 8s. 4d. per square of 100 feet.
The above Material has been used and approved of by the NOBILITY, GENTRY, and AGRICULTURISTS generally, as a
ROOFING & COVERING to SIDES of FARM BUILDINGS.
Its advantages are
LIGHTNESS, DURABILITY & ECONOMY.
Being a non-conductor, it has been proved an efficient
PROTECTIVE MATERIAL TO PLANTS,
and is now in use at the Royal Horticultural Society's Gardens, Chiswick.
It can be had of any length, 32 inches wide, at 3d. per foot, super. A discount to the Trade.
THOMAS J. CROGGON,
8, Ingram-court, Fenchurch-st., London.

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT

Is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non-conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and [illegible] directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now very generally used for Packing Houses, Verandahs, Sheds, Workshops, Roofings, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

TESTIMONIAL.

London, Nov. 1, 1844.

H. C. Bowden, Esq., Agent for McKibbin's Roofing Felt.

It is with much pleasure I add my humble testimony to the superiority of your Felt over any other preparation of the kind with which I am acquainted. This testimony I give with the greater cheerfulness from the many reports I have heard in its favour, and from the likelihood of its being used extensively in Agricultural purposes. I shall not fail to notice it in my Lectures when on the subject.

(Signed) John Robinson, M.B., Senior Lecturer on Chemistry, &c., as applied to Agriculture and Rural Economy in this Kingdom.

Sold in Sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet).

Apply to H. C. Bowden,
Agent to the Manufacturers,
No. 18, East India Chambers, Leadenhall-street, London.

HOT-WATER HEATING APPARATUS.—J. PORTER begs to announce that, in addition to the many other and valuable purposes for which Galvanised Iron is peculiarly applicable, he is now manufacturing Tanks and Gutter for Vaporising, and Pipes for heating by top and bottom-heat, Hothouses, Pineries, Conservatories, &c. J. P. has also to state that, having secured the assistance of parties of the greatest skill and experience, he is prepared to furnish Plans and Estimates for Heating and Ventilating Horticultural Buildings, Public Edifices, Private Houses, Churches, Warehouses, Manufactories, &c., accompanied by references to executed works. J. P. does not profess to offer any one particular form of Boiler as the best, to the exclusion of every other, but adopts those which will ensure the greatest share of efficacy and economy, in each particular case.—Grove Patent Galvanised Iron Roof and Fence Work, Southwark, second carriage turning to the right from Southwark Bridge.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and Obtained the Prize for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price Only One Penny Per Square Foot.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Building, Bunhill-row London.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers, as follow:—Cottage Pattern—1 Cover of 20 inches, 3l. 19s.; 1 do. of 18 inches, 3l. 3s.; 2 do. of 14 inches, 4l. 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 inches, 4l. 16s.; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz. Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 Engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. West, Silversmith, 18, Ludgate-street, London.

BUTTER MADE IN TEN MINUTES.—Much time and labour will be saved by the use of the SUSSEX CHURN, manufactured solely by GREEN and HALL, late Attwood, Wimble, and Warner, Lewes. The [illegible] is entirely of block tin, the necessary degree of temperature can be given to the cream by placing the Churn in a pan of hot or cold water, which insures the butter coming in ten or twelve minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 00	0	1	2	3
To Churn	2½lb.	4lb.	7lb.	14lb.	28lb.
Price with pans	18s.	20s.	25s.	[illegible]	[illegible]

Delivered (carriage paid) to any part of London.

N.B.—Pans for making clouted cream.

London Agents:—Benham, 19, Wigmore-street, Cavendish-square; Bailey, 71, Gracechurch-street; Yates, Arthur-street East; Deanes, London Bridge. Export Agents, Barnes and Co., 109, Fenchurch-street.

STOOPING of the SHOULDERS AVERTED. CURVATURE of the CHEST are entirely prevented, [illegible] and effectually removed in Young [illegible] by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily [illegible] or invisibly, without bands beneath the arms, [illegible] constraint, or impediment to exercise. Sent per [illegible] A. Binyon, 40, Tavistock-street, Strand, London. [illegible] culars on receiving a postage stamp.

NEW GARDEN SEEDS.

MESSRS. SUTTON AND SONS have the pleasure of intimating to their customers in North Britain and elsewhere, who have annually intrusted them with selecting supplies for the year of home-grown GARDEN SEEDS, that their crops are all now harvested and arranged for delivery, and prices same as last year. The sorts are all the very best in cultivation, and will include all or most of the following

NEW VARIETIES:

Cormack's Prince Albert and British Queen Peas, Sutton's Superb do. (finest known), Shilling's Early Grotto do., Victoria do., Auvergne do., Thompson's Early Dwarf do., True Walcheren Broccoli, Chappel's Early White and Large Cream do., Lake's Superb White do., Howden's Superb Purple do., Hammond's White Cape do., Adey's Large White Cos Lettuce, Ice Cos do., Black-seeded Bath Cos do., Sutton's Superb White Celery, Lion's Paw do., True German Cauliflower, Early Dutch Horn Carrot, Long Surrey do., Reading Onion, White Globe do., Latter's Victory of England Cucumber, Cuthill's Black Spine do., Beechwood Melon, Cabul do., Wonder Longpod Beans, New thick Windsor do, Early Six-week Dwarf French ditto. Whyte's New Dark Beet.

Those who have not hitherto honoured Messrs. SUTTON with their commands are hereby informed that the prices of Collections are:—

	£	s.	d.
For Full Collection, being sufficient annual supply for a Large Establishment	3	3	0
For ditto, second rate Establishment	2	2	0
For ditto, third-rate ditto	1	1	0

The new sorts above-named may be purchased separately, if preferred, at the lowest prices at which such sorts are offered in the Trade. Known correspondents, and such as will give satisfactory references, are not required to remit the money with their orders.

N.B.—Parcels delivered free to any steam-packet or railway office in London, Oxford, or Bristol. Export orders well executed.—Reading Seed Warehouse, Reading, Berks.

TO GENTLEMEN, NURSERYMEN, SEEDSMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed to Sell by Auction, on the Premises, Windmill Lane, and Camberwell Nurseries, on Monday, December 16th, 1844, and following days, at 11 o'clock, by order of the Sheriff of Surrey, without Reserve, the whole of the choice GREENHOUSE PLANTS, consisting of Fine Double and Single Camellias, well furnished with bloom buds; Erica in fine varieties; Epacris, Azalea indica, Chorizema correa, Tropæolum; choice Geraniums, Petunias, Fuchsias, &c.; also the remaining Nursery stock, consisting of choice Pinus, Cupressus Juniperus, Vines, &c.: Ivies in pots, Evergreen Oaks, Double Blossom Furze, Garrya elliptica; choice Standard and Dwarf Roses; American Plants, including Ghent and other Azaleas: hardy Scarlet Rhododendrons; Magnolias, Kalmias, Hardy Heaths, &c. One and Two-light Boxes, Hand Glasses, Four Tram Carriages complete, Garden Pots, Utensils in Trade, &c. Also the unexpired term of the Lease of 22 years of the Windmill Lane Nursery, will be sold on Monday, Dec. 16, at 11 o'clock, on the Premises.—May be viewed prior to the Sale. Catalogues may be had of Mr. C. J. Holmes, Solicitor, 163, Fenchurch-street; of the principal Seedsmen; and of the Auctioneers, Leytonstone.

TO GARDENERS, FLORISTS, AND NURSERYMEN.

TO BE DISPOSED OF by Private Contract, an OLD ESTABLISHED BUSINESS, in the above Line, with the Dwelling-house, Greenhouses, Land, Buildings, &c., together with a thriving Stock of Plants, Shrubs, Fruit, and Forest-trees of every description. The Nursery Grounds comprise about 10 Acres of Land of the best quality, held on a renewable Lease, with about 12 years to expire, and within a quarter of a mile of a Market-town, having a population of nearly 6000 inhabitants. To an industrious and persevering person the above affords a most advantageous opportunity, the death of the late Proprietor being the sole cause of its being disposed of. Should it not be sold the present owner will have no objection to admit a partner. Further particulars may be known by application to Mr. S. OLIVER, Accountant, Ludlow.

COUNTY OF DORSET.

TO BE LET UPON LEASE, and entered upon at Lady Day, 1845, a FARM upon the Chalk formation, consisting of 1100 acres of Arable, Pasture, Water Meads, and Down-land, with permission to break up the latter. Application to be made to R. S. GRABURN, Esq., Walton in Gordano Bristol.

NURSERY AND SEED BUSINESS.

THE GUILDFORD NURSERY, in full cultivation and work, with one of the first Seed Trades in the county of Surrey, late in the occupation of Mr. THOMAS DICKENSON, deceased, TO BE DISPOSED OF, entire, or a portion of the Land will be taken to by the Landlord.—For particulars apply to Mr. CREE, of Addlestone, near Chertsey; Messrs. BECK and HENDERSON, Strand; Messrs. BATT and Co., Strand; Mr. LEGG, 27, Watling-street; or at the Nursery.

TO NOBLEMEN, GENTLEMEN, TRUSTEES OF LANDED PROPERTY, AND OTHERS.—Messrs. BROOKS and GREEN have an opportunity of introducing a Gentleman who has been accustomed for some years to superintend the Farming department of an extensive Estate, and thoroughly understands the most approved Principles of Agriculture, Breeding and Management of Stock, and who wishes to devote a great portion of his time for the same purpose, in any of the Midland Counties. Satisfactory references will be given as regards capability and integrity, by addressing to Messrs. BROOKS and GREEN, Estate Agents, Surveyors, and Auctioneers, 28, Old Bond-street.

NEW NEWSPAPER.

On Saturday, Jan. 4, 1845, will be published, price Sixpence, stamped (to be continued Weekly), No. I. of,

THE HISTORICAL REGISTER, an Original Journal of Family Events, National and Private Biography, Health, and General News, free from all political bias; under the Sanction and with the Assistance of various Government Departments.

Detailed Prospectuses will be transmitted on application at the Office, 7, Catherine-street, Strand.

ORDER OF ANY NEWSMAN.

WITH 100 PRACTICAL ILLUSTRATIONS.

This day is published, price 15s., handsomely bound in cloth,

THE GARDENER AND PRACTICAL FLORIST, Volume III., containing several hundred Original Papers and Treatises on Floricultural subjects, together with the Garden Practice for the entire Year. A few copies of Vol. I., price 7s. 6d., and Vol. II., price 10s. 6d., may still be had; the Three Volumes comprising the best Miscellany of Gardening ever published.

London: R. GROOMBRIDGE, 5, Paternoster Row.

TRUST MONEY for MORTGAGE.—TWENTY-ONE THOUSAND POUNDS (Trust Money) are ready to be advanced on Mortgage in England for a certain term of Fourteen Years, at Three per Cent.

Address by letter, free of postage, JOHN JAMES COWARD, Esq., Lansdowne-crescent, Bath.

DOUGLAS JERROLD'S SHILLING MAGAZINE will be Published on the 1st of January, 1845, (to be continued Monthly.)

The Work will be printed in small octavo, each Number containing Ninety-six Pages, and Illustrated by an Etching on Steel, by Leech.

Published for the Proprietors of "PUNCH," at the "PUNCH" Office, 194, Strand (where Communications for the Editor are to be addressed), and sold by all Booksellers.

This day is published, price Half-a-crown,

PUNCH'S POCKET-BOOK FOR 1845, with numerous Illustrations on Steel and Wood.

"Containing all the information which is to be found in other Pocket-books, and a great deal of fun, which is not to be found in any one of them."—*Times.*

Office, 194, Strand; and sold by all Booksellers and Stationers.

PUNCH'S ALMANACK FOR 1845, AND PICTORIAL CHRONOLOGY FOR 1844.

Will be published on the 24th instant, price 2d., or 4d. Stamed.

The SEVENTH VOLUME OF "PUNCH" will be published on the 28th instant.

London: Published at the "PUNCH" Office, 194, Strand.

GEORGE CRUIKSHANK'S TABLE BOOK, Edited by GILBERT A. À BECKETT, will be published on the 1st of January, 1845, and on the first day of every succeeding Month. It will contain some of the best and most carefully selected Articles by the most popular Writers of the day, profusely illustrated by GEORGE CRUIKSHANK, and handsomely printed on fine paper. Price One Shilling.

London:—Published for the Proprietors, at the Office, 194, Strand, where communications, &c., are to be addressed to the Editor.

PROFESSOR JOHNSTON'S WORKS.

I.

LECTURES on AGRICULTURAL CHEMISTRY and GEOLOGY. With an Appendix, containing Suggestions for Experiments in Practical Agriculture. Price 24s.

II.

ELEMENTS of AGRICULTURAL CHEMISTRY and GEOLOGY. The Fourth Edition, greatly enlarged, price 5s.

III.

A CATECHISM of AGRICULTURAL CHEMISTRY and GEOLOGY. Seventh Edition, price 10d.

The Publishers make a deduction when a quantity is taken for Schools, or for Distribution.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

Recently Published, in 3 large vols. royal 8vo, price 4l. 10s.

THE BOOK of the FARM; Being a Systematic Work on Practical Agriculture, detailing the Labours of the Farmer, Farm-steward, Ploughman, Shepherd, Hedger, Cattleman, Field-worker, and Dairymaid.

By HENRY STEPHENS, F.R.S.E.

Illustrated with Portraits of Animals painted from the Life; and upwards of 600 Woodcuts and Seventy Plates of Agricultural Implements, so particularised as to enable country mechanics to construct them from the descriptions.

"The best practical book I have ever met with."—*Professor Johnson, of Durham.*

"We have thoroughly examined these volumes, but to give a full notice of their varied and valuable contents would occupy a longer space than we can conveniently devote to their discussion; we therefore in general terms commend them to the careful study of every young man who wishes to become a good practical farmer.—*Times*, Dec. 2, 1844.

Wm. BLACKWOOD and SONS, Edinburgh, and 22, Pall-mall, London.

THE EDINBURGH REVIEW, No. CLXIII., will be published before Christmas.—ADVERTISEMENTS for insertion are requested to be sent to the Publishers' by Friday, the 20th inst.; and BILLS on or before Saturday, the 21st.

39, Paternoster-row, Dec. 14.

Second Edition, price 1s. 6d.

CHEMISTRY MADE EASY FOR AGRICULTURISTS. By JOHN TOPHAM, M. A.

"A more useful, *practically useful* work than this it would be impossible to place in the hands of a Farmer."—*John Bull*, Sept. 21, 1844.

WHITTAKER and Co., Ave Maria-lane, London.

BLACK ON BREWING—THIRD EDITION.

Just published, Third Edition, 8vo, 10s. 6d. cloth,

A PRACTICAL TREATISE ON BREWING, based on Chemical and Economical Principles: with Formulæ for Public Brewers, and Instructions for Private Families. By WILLIAM BLACK. Third Edition, revised and corrected, with considerable additions. The Additions are revised by Professor GRAHAM, of the London University.

"We can recommend this book to such of our readers as practise brewing, either privately or professionally."—*Magazine of Domestic Economy.*

"Invaluable to the practical brewer and private families."—*Chemist.*

"I take occasion, in concluding this article, to refer my readers to the 'Practical Treatise on Brewing,' by Mr. William Black, a gentleman experienced in the business. His little work contains much useful information."—*Dr. Ure's Supplement to his "Dictionary."*

London: LONGMAN, BROWN, GREEN, AND LONGMANS.

THE HORTICULTURAL MAGAZINE. — Mr. HOULSTON, 154, Strand, will publish, on the 1st of JAN., 1845, Price One Shilling, PART I. of the "HORTICULTURAL MAGAZINE," a New Periodical on Flowers and Gardening.

CONTENTS:—Cultivation of Hardy Lilies—Pruning Forest-trees—Ornamental Timber—Application of Manures—Landscape Gardening—Management of Grape-Vines—Planting Shrubs—Grafting—Hybridising—Horticultural Buildings—Description of New Flowers—Wonders of the Vegetable Kingdom—Designs for Rock Gardens—Irrigating Lands—Select Fuchsias—Hardy Annuals—Reviews—Practical Gardening, and Management of Hothouses, Greenhouses, and Frames—Horticultural Notes, &c.

Advertisements must be sent on or before the 26th of each month.

The Introductory Number, containing a variety of Original Essays, and a Plan of the Work may be still had, price 1s., of THOS. HOULSTON, 154, Strand, London, and all Booksellers.

MR. DICKENS'S NEW CHRISTMAS BOOK.

On December 16th, in foolscap 8vo, price 5s.,

THE CHIMES: a Goblin Story of some Bells that Rang an Old Year Out and a New Year in.

By CHARLES DICKENS.

The Illustrations by Daniel Maclise, R.A.; Clarkson Stanfield, R.A.; John Leech and Richard Doyle.

London: CHAPMAN and HALL, 186, Strand.

THE FOREIGN LIBRARY.—Just published, Part 25, price 5s.,

TALES FROM THE GERMAN. By JOHN OXENFORD and C. A. FEILING. Part the Second, completing the Volume.

Part 23, price 6s.,

MICHELET'S HISTORY of FRANCE. Part the First; to be completed in Four Parts, forming Two Volumes.

CHAPMAN and HALL, 186, Strand.

On the 1st of January will be published, to be continued in Weekly Numbers, price 1½d., and in Monthly Parts, price 7d., stitched in a Wrapper; handsomely printed in large 8vo, double columns, with a clear type, No. 1 of

THE EDINBURGH TALES: Conducted by Mrs. JOHNSTONE, Author of "Clan Albyn," "Elizabeth de Bruce," "Nights of the Round Table," &c. &c.

Under this title will be published a Series of Stories and Novelettes, illustrative of English, Irish, and Scottish Character, Domestic Manners, and Social Duties, by Mrs. JOHNSTONE, and other well-known Writers of Fiction, whose Works have obtained a large share of public approbation.

WILLIAM TAIT, Edinburgh; CHAPMAN & HALL, 186, Strand, London.

CHRISTMAS PRESENT.

With 180 Woodcut Illustrations, price 8s. 6d. in cloth, or in morocco, 14s.,

SYRIA AND THE HOLY LAND; their Scenery and their People, Incidents of Travel popularly described, &c. By WALTER K. KELLY.

"The execution of this work is truly admirable. It reads like an original work, instead of a compilation, being written with spirit, elegance, and an eye for picturesque groupings. The moral, social, physical, political, and geographical features of the East are well brought out, and the reader is at home with the Turk, the Arab, the Jew, the Druse, and the Maronite."—*Westminster Review.*

CHAPMAN and HALL, 186, Strand.

CHRISTMAS PRESENT.

Small octavo, price 7s. cloth, or in morocco, 10s. 6d.

HOURS of MEDITATION and DEVOTIONAL REFLECTION, upon various subjects connected with the Religious, Moral, and Social Duties of Life. By H. ZSCHOKKE. Translated from the German by JAMES D. HAAS.

"It is said, and we believe it to be the fact, that upwards of 200,000 copies of the work have been printed, including the last, which was the twenty-third edition. The volume before us is a selection from the original."—*John Bull.*

CHAPMAN and HALL, 186, Strand.

LIFE ASSURANCE AND ANNUITIES.

THE following are specimens of the low rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age.....	20	30	40	50	60
Ann. Prem.	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid in the hands of the Assured, at interest to be deducted from the sums assured, when they become claims.

Peculiar facilities are afforded for the assurance of the lives of persons proceeding to or residing in Australasia and the East Indies.

Immediate and Deferred Annuities are granted by the Company, on very favourable terms, and it is a peculiar feature in its constitution, that Annuitants participate in the profits.

DIRECTORS.

E. Barnard, Esq., F.R.S. — Gideon Colquhoun, Esq.
Robert Brooks, Esq. — C. E. Mangles, Esq.
Henry Buckle, Esq. — Richard Onslow, Esq.
John Henry Capper, Esq. — William Walker, Esq.

SECRETARY.—E. RYLEY, Esq.

For Prospectuses and other Particulars apply at the Offices, No. 126, Bishopsgate Street, corner of Cornhill.

NOTICE is hereby given, that the ACHILLES LIFE ASSURANCE ASSOCIATION has been UNITED with the GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY; and the holders of Policies effected with the said Achilles Life Assurance Association are hereby requested to pay the renewal premiums on such Policies at the Office of the Great Britain Mutual Life Assurance Society, No. 14, Waterloo-place, London. E. GILBERTSON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.

The Chisholm, *Chairman.* W. Morley, Esq., *Dep. Chairman.*

GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

PROFITS.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

CREDIT.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

Loans granted upon approved Security.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*

AGE.	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£. s. d.	£. s. d.	£. s. d.
20	1 0 9	1 1 6	1 13 11
30	1 2 9	1 3 3	2 2 1

50	1 15 9	2 1 6	4 1 11
60	3 3 5	3 17 0	6 8 3

Full particulars are detailed in the Prospectus.

A. R. IRVINE, Managing Director.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID AND GENERAL LIFE OFFICE, 25, PALL MALL, LONDON.

SUBSCRIBED CAPITAL £500,000.

THIS Office is provided with very accurately constructed Tables, by which it can ASSURE DISEASED LIVES on Equitable Terms. The EXTRA PREMIUM DISCONTINUED on restoration of the Assured to permanent health. INCREASED ANNUITIES granted on UNSOUND LIVES, the amount varying with the particular disease. Members of CONSUMPTIVE FAMILIES ASSURED at Equitable Rates. HEALTHY LIVES are Assured at LOWER RATES than at most other Offices. POLICIES of twelve months' standing are NOT AFFECTED BY SUICIDE, DUELLING, &c.; and Assigned Policies are valid from the date of the Policy, should death ensue from any of these causes. F. G. P. NEISON, Actuary.

LANDSCAPE GARDENING AND GARDEN ARCHITECTURE.

MR. GLENDINNING, since his residence near the Metropolis, has had the honour to be consulted by a number of Noblemen and Gentlemen in the improvement of their Parks and Gardens, and in the construction and heating of Horticultural Buildings in the most ECONOMICAL as well as effectual manner. He has now made such arrangements as will enable him to devote his particular attention to these important subjects; and Noblemen and Gentlemen desirous of consulting him, are respectfully requested to address him at Chiswick Nursery, near London.

TO THE SEED TRADE.

J. G. WAITE, Wholesale Seedsman, begs to inform the Trade, that his PRICED CATALOGUE is now ready, and can be had on application.

1 and 4, Eyre-street-hill, Hatton Garden, December 14.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 14, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

SATURDAY,	Dec. 14	Royal Botanic	4 P.M.
TUESDAY,	Dec. 17	Linnean	8 P.M.
WEDNESDAY	Dec. 18	Society of Arts	8 P.M.

WHEN, at p. 795, we adverted to the difficulty of obtaining information as to the TEMPERATURE OF SOIL, we had overlooked the very able paper on this subject by Mr. Parkes, Consulting Engineer to the Royal Agricultural Society. If the reader will turn to the volume of that Society's Transactions for 1844, he will see that we are not alone in our regret at finding so little precise evidence upon one of the most interesting and important points to which the cultivator, whether philosophical or merely practical, can turn his attention.

The highly interesting experiments recorded by Mr. Parkes in the paper alluded to, do not touch upon the depth to which frost penetrates the soil, for his observations were made in the summer, and had reference to other questions; but every farmer and gardener in this country ought to learn them by heart. We have, however, been favoured by this gentleman with some unpublished observations bearing directly upon the frost and Potato question, and with his permission we are able to make them public:—

"It may not be uninteresting," writes Mr. Parkes, "to know that I preserved Potatoes in the ground, perfectly, through the excessively hard winter of 1829-30, in France. In that season the Seine carried down ice on the 9th Nov., but it melted again; the ice began to pack up against the various bridges between Paris and Rouen about the 1st Dec., and the river was finally sealed over at Paris on the 9th of Dec. Winter did not break up until the 9th of March, the ice then being from 18 to 20 inches in thickness opposite my house at Puteaux, near Neuilly, four miles from Paris. A long pit, 4 feet deep, was dug in a dry sandy part of the garden, and filled with Potatoes to within 2 feet of the surface, being covered with the same soil quite flat; no straw was used. The bury was opened in the early part of March, and the whole of the Potatoes were discovered to be quite sound; the frost had not even penetrated to the upper layer, and very little sprouting had taken place. During three weeks of this period, I never observed the thermometer hanging in the garden to rise higher than 16½° *below* zero, even during the daytime, with a cloudless sky and brilliant sun. No rain, and but little snow fell during this severe winter, and that little rapidly wasted by evaporation. The hygrometrically dry condition of the atmosphere was evidenced by the rapid drying of linen hung out of doors quite wet; in a minute or two, the clothes were frozen solid, and quickly afterwards they were limber and dry. A large Plane-tree was split open in the same garden during this frost. I discovered, on examining it, that a decayed part of the heart had admitted water, which became a core of ice, about a yard in length, and this burst the tree by its expansion with a loud explosive report—a well-known phenomenon in cold climates, but which I had not before experienced. I also preserved Carrots for the horses, and salads throughout this winter, by lining or walling the inside of a pit, first with stable-dung (a common plan in France), then clean straw against it, and intermixing tolerably dry sand with the vegetables throughout the mass. The Carrots were perfect, and the outer leaves of the Lettuces, Celery, &c. only were affected. No disagreeable flavour was imparted by the dung.

"It may be added, that the severity of this winter was considered by the Parisians to be equal to the *Moscow* winter, 1812. Fires were lighted in the streets for the poor houseless wretches, and many were frozen to death."

These facts testify to the very extreme and long-continued frost that is necessary to bring down the temperature of dry soil to the freezing point at 2 feet deep. In fact, Mr. Parkes's garden was not frozen to that depth during the whole of that rigorous season.

It may be interesting to add, that since the frost of the present year set in, the following has been the actual temperature of the soil in the Garden of the Horticultural Society:—

A Return of the Temperature of the Air and Earth in the Garden of the Horticultural Society.

1844.	Air.			Earth.	
	Min.	Max.	Mean.	One foot deep.	Two feet deep.
Dec. 4	22	40	31	40	43
,, 5	14	35	24½	38	43
,, 6	14	30	22	37	42
,, 7	20	34	27	37	41
,, 8	26	32	29	36	41
,, 9	28	32	30	36	40
,, 10	28	32	30	36	40
,, 11	22	30	26	36	39

From this it appears that in five days after the frost set in this year, the thermometer had fallen within 4° of freezing, at one foot below the surface of the soil; that the cooling down was a slower process than might have been supposed, and not coincident with the air-cold; for it was 3 days after the greatest amount of air-cold was felt before the lowest temperature at a foot below the surface was attained.

Should the coming winter prove a severe one, we trust that some of our friends will make similar observations on this point, or at least ascertain to what depth their soil is frozen. For ourselves, we shall certainly recur to the subject at no very distant period.

Next week we shall resume the experiments on Potato-growing.

WHEN we see a plant which will endure the highest temperature given to stove plants, without being incommoded, and that for many seasons in succession, we naturally conclude that it is not of the class from which SUBJECTS fit for CONSERVATORY CULTURE might be expected. Taking this presumptive evidence, and reasoning, in the absence of direct experiments, we probably exclude many fine plants that would otherwise excite great interest, and give a more exotic cast to our conservatories.

A proof of this may be adduced in the case of Calliandra Houstoni, a plant lately noticed in our Calendar of Operations under the name of Acacia kermesina, for its graceful habit, and fine foliage, and for its flowering in winter. It has been in our stoves for upwards of 50 years, under different names, but was never suspected of being anything else than a stove plant. More recently, however, some one gave it the popular name last quoted, when a place was assigned for it in the conservatory, where, we are told, it has proved to be sufficiently hardy to stand all the year round. In fact in the Camellia-house of Messrs. Pince and Co., of Exeter, it was removed because it threatened to smother the Camellias. Since we are certain that not more than one plant passes under this name, the fact of its being so hardy becomes more generally interesting, for there can scarcely be a more graceful or more suitable plant for covering the bottom of a pilaster in the conservatory—a situation often in want of some such ornament when strong-growing climbers have become naked at the bottom, as they often do after a few years.

In some instances the more hardy stove climbers are now planted out into the conservatory after they have been grown in vineries or other forcing-houses, or in stoves, till they are long enough to reach the top of the house at once, which is kept sufficiently close to afford them the necessary temperature. Many of this class must necessarily be left naked at bottom, where the air of the house is too cold for their young shoots, and thus, a space is left for choice woody plants that are not climbers, among which the subject of these remarks may take a leading place.

At present, when climbers get naked at the bottom, the practice is either to cover the parts with long shoots from the top of the house, or to plant slender-growing climbers round them; but a better way would be to select fine plants, not exceeding ten or twelve feet in a rich border, or that might be easily kept to the required height by pruning; such plants being remarkable for some peculiar feature, such as a graceful mode of growth, fine foliage, conspicuous or sweet-scented flowers, &c. A situation of this kind would suit Luculia gratissima, particularly if it happened to be near the doors or source of ventilation. This beautiful shrub, so lovely at this dull season, although a strong-growing plant, is a delicate feeder, and a strong climber planted behind it may be said to assist its growth rather than impede it, by appropriating to itself the more gross parts of the soil in the border. If the climber, however, is of the very fibrous rooted kind, like the Ash, few plants can compete with it for nourishment; whereas, such climbers as Ipomœa Horsfalliæ, Combretum purpureum, Beaumontia grandiflora, and most of the Passion-flowers, Hardenbergias, Zichyas, &c., form their roots differently, and are suitable for this kind of furnishing when they become naked below.

Plants for such a purpose ought to be well established, and of considerable size, before they are finally planted out, and all plants, whether climbers or otherwise, that have been first reared in the stove or in heat, ought to be thus treated, otherwise it is found in practice that many of them make little progress for the first season or two. Another cause which operates against the free progress of some climbers is, that for the sake of convenience they are increased from cuttings of the flowering shoots, which are more or less stunted, and the young plants for a time retain that character, until forced by good feeding or strong heat to assume their native freedom; and even after that is effected, if they are afterwards much confined in small pots, they become again stunted; then the best remedy is to cut them down to the surface of the ground, and force them in a hotbed to make a fresh growth. Beaumontia grandiflora, and some of the stove Bignonias, are the first to suffer from either cause; yet when they are young and vigorous they grow from ten to twenty feet in length in one season, and some Bignonias even much more. The former should be about two or three years old, and from 15 to 20 feet in length, before it is planted in the conservatory, where it flowers freely for two or three months, in terminal heads of large white trumpet-shaped fragrant flowers.—*D. B.*

NATURE AND ART.

IN Nature all plants seem to enjoy a soundness of constitution which bids defiance to disease—no failure of crops or falling off of bloom prematurely; age after age views these inhabitants of mountain and plain luxuriating in wonted vigour, and rarely dying out before a progeny to continue the species has been insured. They may be browsed on by wild beasts, and have their seeds gathered by birds for food; yet they are still found flourishing in their natural habitats, peering forth in humble beauty from the sod, or flaunting with gorgeous festoons in the fitful zephyr. Such are plants, and so would they continue, if left to Nature; but man desires their service and company; their flowers please his eye, and their produce gratifies his palate; and as he cannot at all times afford to travel "from Indus to the Pole," to admire and collect them, he has attempted to domicile his favourites with himself, and with wondrous success. Plants have thus been nursed, fed, petted and fondled, until they have fairly outgrown and excelled the humility of their origin; nor, indeed, would the parent of some of these prodigies be known in its offspring if placed beside it, so little family likeness is there between them. Like spoiled children in general, however, these pets are capricious and delicate, and if returned to their pristine condition, would seldom outlive the change; they have been so habituated to artificial training and luxurious habits, that, thrown on their own resources, they would either pine away or again relapse into savage nature, and become as plain and commonplace as they originally were. Even with all the care and kindness that their guardians can employ, these nurslings frequently get sickly and diseased, falling into consumption, cancer, gangrene, and various incurable maladies, disappointing the hopes of their unfortunate possessors, decimating their ranks, or sweeping them almost entirely away.

Without, however, proceeding farther metaphorically, let us inquire how far Nature and Art seem compatible in the growth of plants, and to what extent we can effect improvements in them for our own purpose, without impairing that constitutional vigour which in their wild state they appear to possess.

The first idea which strikes one on inquiry into this subject, is the latent capabilities of plants in relation to our own wants; and as this principle lies at the foundation of all horticultural improvement, I may, perhaps, be permitted to enlarge a little on the topic. A leading and prominent feature in the mind of man is curiosity, or, as phrenologists term it, wonder. This gives him a desire after, and keen relish for variety, novelty, and change; it is the first faculty which becomes apparent in the restless gaze of the infant, and in the rambles of the child. One new object after another engages its attention incessantly, and handfuls of wild-flowers are successively deserted for the possession of a new assortment. Nature in her extensive domains offers a vast field for the indulgence of this appetite; the mountain and valley, the forest and glade, the sea-shore and inland seclusion, have all been ransacked to furnish objects for its gratification; for the adult acknowledges its sway equally with the tiny collector of roadside beauties. Nature, however, has limits, while the passion for novelty knows no bounds; and thus, at first sight, there seems an incongruity or want of harmony between them; but in reality this is not the case. Plants possess latent capabilities, as I have stated, and man has powers, by the exercise of which these are ascertained and brought out. What are all our florist flowers in Nature, or our fruits without cultivation, compared to the progeny which has been elicited from them! The Tulip might command a passing gaze from the traveller, or the sour Crab-apple a single trial of its unpalatable austerity, but with their occult properties, partially unfolded, the one offers a display, varied and gorgeous in the extreme, to the eye of the beholder; and the other affords a profusion of the most delicious fruit which Pomona can present at her banquet. Thus it is that the vegetable world and man are linked together in the most explicit and intimate union. Plants possess powers of variation and improvement, which in Nature would exist, and continue in abeyance, but for man to call forth and embody them;

and man, on the other hand, has been endowed with propensities, faculties, and feelings which urge him on to ascertain these dormant capacities, and work them out to suit his own ends. And here, *en passant*, let me remark, that horticulture presents one of the most cogent proofs of a creative Intelligence that natural theology can offer for consideration. Of what use would these hidden powers of plants have been if man, or some such being, had not been present with them, to embody their latent forms? or of what use would have been those qualifications in man merely to operate on plants which doggedly disappointed all his expectations of change? But there is no such discrepancy in creation: the constitutions of man and of plants harmonise with an exactitude so nice, that no species of reasoning can invalidate the inference of their mutual adaptation; and if this is so, it speaks of a creative Power which has planned and completed the beautiful arrangement. He that would sneer, therefore, at the cultivator of plants, knows not his own mental organisation, nor its harmony with the vegetable world; he arraigns the Author of both in a scoff at his neighbour's foible.

Each plant in Nature has its own soil and climate, where the parent, in its old age, will be succeeded by its seedling offspring, and continue thus to thrive as a species without interruption for unlimited years. When we bring a plant under cultivation, we endeavour to place it, as far as possible, under the same circumstances, provided our object be merely its conservation. The nearer we can bring these circumstances to those of Nature, the better will our plant thrive with us; but, in some cases, this is impossible, as when we attempt to cultivate an Alpine plant on grounds near the sea level. The Potato may here be given as an instance; it grows in its wild state on the high lands of Peru, and, of course, under a much lower atmospheric pressure than in any situation in which we are in the habit of cultivating it in Britain. This may be one of the causes of the sickliness of that succulent, now so much complained of; and I imagine that this opinion may, to some extent, be borne out by observation, for the plant is, in general, much less liable to failure in the hilly districts than it is in the low grounds, and on this account seed Potatoes are generally procured, on account of their vigour, from the former situations. One thing, however, from experience in the cultivation of this root, is clear, that for many years after its introduction, there was no sickliness or death in its ranks—every paring with an eye was sure to sprout forth. The plant must, from the first, have been declining in vigour, although that did not become obvious until frequent mortality gave evidence of the fact: another cause besides—a difference in atmospheric pressure—tended to produce this evil; while the plant was in full vigour with us, we continued to propagate from the same root, not considering that any individual plant must necessarily get old and feeble, and we had not recourse to the only natural process of reproduction by seed, till that feebleness of constitution could only give us a sickly offspring, by which, of course, the evil has not been remedied. We should again have recourse to the plant in its native wilds, import seeds or roots from Peru, renew them occasionally by seedlings from healthy plants, and there will be no danger of losing this valuable succedaneum for bread.* That which gave us a stock of flourishing Potatoes for many years after their first introduction, will, there is little doubt, do so again by a repetition of the same means; if the soil is at fault, chemical analysis can tell us where.

As reproduction by seed is the only natural mode of increase with plants, we cannot expect to possess them for any length of time in luxuriance by other modes of increase, however suitable our soil and climate may be for their growth. Of whatever longevity an individual plant may be possessed, old age will at last creep on it with all its feebleness, and although we may protract the period of its natural existence, by transferring a bud or scion to a youthful stock, or give it fresh roots in the soil, it is still a portion of the same individual, and will at last die out: hence it is that many of our fine Pears and Apples are giving way to this imperative law of dissolution, and sinking under their load of years. Here Art fails to preserve for us that which she has reared, and we must go again to her for a fresh progeny.

There are several modes by which plants may be varied, or, as I have termed it, by which their latent capabilities may be called. The mere receiving the growth of Oats, for instance, is said to be sufficient for its transmutation into Rye; and it may be that other annual Grasses and plants may have changes effected in them by a similar process: that subject, however, is yet new, and demands extensive investigation. By excessive nourishment, and repeated sowings of the seeds of plants thus fed, we often effect changes of a remarkable nature: many of our finer fruits and florists' flowers have been thus obtained; but the very means employed to effect these changes seem often to impair the vitality of the produce, so that it requires constant care, skill, and attention, to preserve the fragile beings in life and health which we have thus given birth to. The fact is, that while artificial means seem necessary to effect a change on vegetable forms, Nature is only assiduous in preserving her own, and denies that perpetuity to the results of art, which she vouchsafes to her own uncultivated offspring; so that we must cease from his labours,

* The native Peruvian Potato yields much less increase by root than ours, and the stem and seed may, in consequence, possess a higher vitality and vigour. I have grown a Peruvian Potato for three successive years, without a single tuber of increase. The original tuber has merely tripled its size.

Nature would again assert her supremacy, and return to that class of forms originally committed to her trust. In all instances where the high-feeding system is had recourse to, in order to effect a change of form or colour, whether in fruits or flowers, this resulting debility more or less takes place; and although we desist from the system after obtaining the desired improvement in any plant, still our purpose is not gained; it either dwindles back and makes approaches to its original type, or continues as liable to disease as heretofore. This evil is often committed where there is no necessity for its occurrence; in the usual routine of nursery business plants are overstimulated in order to procure an adequate supply of saleable specimens of any new variety, and their future vitality and strength of constitution are thus impaired, so that they often give way under agencies which would not affect them seriously if more considerately treated. How many fine Dahlias, Pansies, and other plants are thus lost, after they, with great trouble, have been procured! From the same excessive competition amongst salesmen, many of our hardy forest-trees are murdered in their infancy. Larches, for example, are reared in nurseries, in a hotbed, comparatively speaking, to their final destination; they are sown thickly in a good soil, suffered to draw each other up to so many saleable inches of growth, reared from any sort of seed that may be conveniently or cheaply come by, without regard to a healthy parentage, and sent out for planting on sterile wastes and bleak slopes of hills, where they are expected to grow and become valuable timber without further trouble. The fact, however, speaks for itself at last, in rotten hearts and unsaleable timber; the soft, spongy heads derived from quick rearing in the nursery, and often perpetuated by close planting and untimely thinning out in the young plantations, decay ere many years, and pumped timber, as it is termed, is the natural result.

By far the most important and extensively applicable mode by which we can vary plants is hybridisation; and here Nature and Art are often comparible in perpetuating fertile varieties which have been in this manner once obtained. It is not at all necessary to enter into the *modus operandi* of this process—every cultivator of plants knows enough of it, and deems it one of the most delightful and interesting of his occupations in the garden. Congeners have been brought from various and far distant climes, and mated with each other in the hothouse and garden, so that their progeny are now, like the Israelites of old, like the very sand on the sea-shore in number. Considering how readily crosses are often effected, it is wonderful how comparatively seldom they appear in nature. There are causes in operation which tend to prevent this. In the first place, plants are more readily fertilised by their own pollen than by that of another; and in the vegetable world there is no superfœtation. In the second place, insects have generally their own particular species of plants, whose flowers they frequent to the exclusion of others. These wild crosses are occasionally, however, evident, as in the Cacti and Aloes, and hence the botanical difficulty of properly defining a species. In crossing, if one desires a healthy sound-constitutioned offspring, the purest plants should be kept as nearly as possible in their natural condition, neither over stimulated nor under-fed, unless it is intended to combine high-feeding and hybridising, which is frequently done, but at the risk of a shorter lived progeny. —*Vidimus.*

ON THE PRESERVATION OF SNOW AS A SUBSTITUTE FOR ICE.

We have no ice-house here: much building has been going forward, and the ice-house was therefore unavoidably delayed till other more important structures should be completed. The following statements with reference to snow as a substitute for ice, will I think show that an ice-house is not essential, nor indeed necessary. Such houses are costly in the first instance, and nothing is more common than disappointments in the preservation of ice.

There is but little water here, and this chiefly running water, which does not very readily freeze. It would have been impossible for us to have filled an ice-house this season or last. The frosts in both years have seldom been of long enough duration, even where water is favourable and in sufficient quantity. Last year I was in hopes of getting some ice, as I had done the former year (about 48 cart-loads; this was preserved till about the beginning of October in a heap on the surface of the ground). Towards the end of January then, last year, we had a heavy fall of snow, and having hitherto had no chance of getting ice, my employer suggested a trial to be made with snow. Accordingly I looked out a place (to be afterwards described), and carted 170 loads in a heap, partly under, and partly above ground, and thatched it over with straw, &c. This stood all the demands upon it, which were considerable, up to February in the present year, when we had another deep snow. The heap was uncovered to be renewed, and it was found there were about 30 cart-loads remaining. To this 196 loads were added. It is deposited in a sort of hole, in a grove of oaks, which, however, do not by any means fully shade it from the sun. The hole is of an oval form, about 15 yards long, by about 11 yards wide at the top, and falls in every way gradually to the centre, which is about 8 feet deep below the level of the surrounding ground. The bottom is a thickly stratified rock, the fissures of which in all probability permit the escape of the dissolving snow. In order to make quite sure of this, a drain was cut after the snow was lodged last year. This was easily done, as one side is close to a rapid declivity. This is the state in which I found the hole; no faggots, straw, or anything of the kind was laid in the bottom. It is difficult to think what such an excavation could have been made for. I conceive the snow to be in the best possible state for collecting and carting, when thawing, and quite soft. In this state I commenced with it last year, and this, in the following manner:—All hands proceed to roll snow-balls, and the ground in the direction of the hole being a gentle declivity on smooth Grass in the park, a man can continue to roll a ball till it is above two cart-loads. I have found it prudent to roll a great deal more up at once than I supposed I should haul, thereby making ample allowance for a rapid thaw. In the balls it of course keeps much longer. It is compressed by its own weight in rolling. In the soft state described, it is also much easier filled into the carts; and, what is of more consequence, it is in the best state possible for treading in the heap, which it is impossible to overdo. Eight or ten men are stationed at the heap, treading and beating it as brought in. As soon as a sufficient quantity is deposited in the bottom of the hole to render it safe, the horses and carts are driven in at one side over the snow. This is continued to almost the close of the carting. It is so hard, that the horses' feet and cart-wheels make scarcely any impression upon it. They are thus of the most essential service in giving it solidity. It is carried up at first without regard to form, in order to prolong the practicability of driving the horses over it; but eventually it is marked out in a circular form, not unlike the top of a corn-rick, and the sides without such circle thrown on the top, which is about 14 feet above the level of the ground; thus making it 22 feet thick in the centre. It is then covered all over with short Wheat-straw, such as is not fit for thatch, then another covering over this with Fern, found in the Park; finally, a third covering of thatch. These different coverings and thatch are about a yard thick. The hauling this year occupied 6 horses with four carts, and about 17 men, two days; throwing up into form, hauling, and putting on covering, &c., about another half day. This, I feel persuaded, does not exceed the time and cost of filling an ordinary ice-house. I think, too, that the thatch might be dispensed with, which would abridge the labour, and save the most valuable part of the material used. Fern is found near the spot, and this, or short straw alone, of sufficient thickness, I have little or no doubt would answer the purpose. If I am right in this supposition, there is no question with me that the annual expense of collecting and storing ice is, in most cases, much greater than that now described. It will be obvious, that in taking out supplies the heap has by far the advantage; a cart-load may be got in ten minutes. Houses very generally have double and treble doors, and the intervening passages are filled with straw, all which has to be more or less displaced at every time ice is wanted; and when within the house, its atmosphere is unwholsome, and even dangerous, as a correspondent of the *Gardeners' Chronicle* in 1841, p. 797, truly states.

Local circumstances will of course, in some cases, affect the comparative advantages that I have stated snow to possess; as, for instance, where there is a large surface of still water, and the ice-house near to such water, and ice can always be obtained from it, all is well; but were I to have the water, I should be very content without the house. I should then lay in a supply of either ice or snow, just which might come first. Ice, however, has to be pounded small; there is not this labour with snow, and the rolling of the latter takes less time certainly than getting ice off the water, and pounding it; and I think it can more generally and certainly be obtained. Those situated like myself can be in no hesitation. I trust I need not insist that snow answers every purpose quite as well as ice; when taken out of the heap, it cannot be distinguished from pounded ice.—*J. W., Salop.*

ACORNS AND THEIR USE.

A paragraph has appeared in the Papers, giving an account of a great demand for Acorns in Sussex, and great curiosity is expressed at the use that is to be made of them. Without diving into this mystery, the readers of the *Chronicle* will perhaps be satisfied with reflecting that, except when Acorns are very plentiful, which happened to be the case this year, the use that is to be made of them cannot be of any importance to the growers of Oak; plentiful Acorn years are not very common, the severity of our springs often destroying the very early blossoms of the Oak. In general, however, there are Acorns enough to carry on the great purposes of Providence, the continuance of the species of tree which produces the Acorn, and the supply of food for the animals that feed upon them—some useful, others not positively so—though it would be rash to say that any animal in the creation is not useful: among the former may be reckoned sheep, pigs, and deer; squirrels and mice can hardly be defended on the score of utility, as far as we know of their modes of life, though they eat Acorns also.

In all seasons, however, the Oak in general produces Acorns sufficient to carry on one of the great purposes of their creation, as before mentioned—the propagation of this species of tree: and it is of this part of the subject I am going now to treat.

Any body who has attempted to raise Oak plants in places near a rabbit cover, can fail to have observed how soon the plants are attacked by them; and hares are very ready to assist. The observer of any young plantation may also have seen how much sooner a new planted tree is attacked than a young tree, grown up from seed naturally sown, or from a shoot from a cut-over root;

it appears as if animals preferred a dry, withered plant to a vigorous, fresh one, as no doubt they do. When high winds have strewed the ground with small branches of trees, particularly the Ash, the observer may notice that hares and rabbits do not bark their branches till after they have lain a few days, and have become withered and made fit for food.

This circumstance led me to reflect that it would be a more certain way of raising Oak plants—and it is probably the case with seeds of other trees—if the ground intended to be planted were first properly sown with Acorns, instead of planting the trees separately, almost ten years ago, I prepared a few rods of land in the immediate neighbourhood of some of the plantations, which increased, in spite of their enemies, and sowed it with Acorns, without any fence whatever to keep off the rabbits. The Acorns were sown in drills, far apart, with a view to clean the ground from weeds as the Oak plants came up, and also for the facility of re-planting the Oaks, if required. The Oaks came up plenty, but not very regularly, some not appearing for nearly two years; which I at first attributed to accidents, but eventually occasioned by some of the Acorns having been sown too deep—a great error in seed-sowing: however, with this disadvantage, the seedlings fairly beat the rabbits, and even afforded protection to a colony of hares, that took refuge in the cover of the young Oaks. Besides the casualties among the seedlings, above 500 were annually transplanted as single trees into vacancies in an old wood; and, in spite of hares and rabbits, many succeeded, though outstripped in size and beaten by those left in the seed-bed. This plantation was examined last year, and the result was as above described, many of the trees varying from the height of 10 to 12 feet.

The plantation was regularly thinned out a few years ago, and I have long since required another thinning: part of it had been cultivated, and on that part the trees grow least well. As to the time of sowing the Acorns, I should recommend following Nature, that is, sowing the Acorns when they drop ripe from the tree; they then soon vegetate, after which mice will not touch them, for they appear most fond of them when dry: pheasants are then, also, apt to scratch them up, for Acorns have many enemies to contend with, even before they grow into trees, but will beat them all, if man gives them fair play afterwards, in thinning, and judicious, moderate pruning. —*M. D. P.*

ENTOMOLOGY.

THE SPRUCE-CONE GALL APHIS.—(*Sacchiphantes Abietis.*)—The economy of an insect, probably nearly related to the present one, was discussed in my last Essay, and I shall now give a detailed account of the animals which cause the curious pseudo-cones, so much resembling the genuine fruit of the Spruce, upon which they are formed, that even naturalists have been deceived, and mistaken them for a modification of the cones.

In the third vol. of this Paper, p. 630, will be found a good figure of a sprig of the Spruce Fir, exhibiting these galls, and one which I divided longitudinally showed the structure represented at fig. 1, exposing eight cells on one side and nine on the other; but there were probably 50 cells altogether, as they were packed all round the circumference in about 12 rows; the woody stalk passed through the centre unaffected, but the bark was greatly thickened by the secretions injected by the female insect when the eggs were deposited, and forming oval cells exceedingly

smooth inside, and opening with a transverse suture or mouth, which is closed until the enclosed brood has been fed, perfected, and changed to their pupæ state; the upper lip projects, the under one is lobed in the centre, and supported by the leaf, which is very short, and forced back as this lip recedes from the upper one, to allow the insects to issue forth.

In the beginning of last August some of the Spruce Fir galls were sent to me from Lanark, which produced winged and wingless specimens in numbers, the latter being the pupæ. The galls were produced towards the tops of the twigs, but there were younger and smaller excrescences formed above them, which were solid when cut through, and these, of course, kept up a succession of broods. Towards the end of the same month I found two spikes of the galls on a Spruce Fir; they were beautifully formed, of a charming green colour, and looked like Pine-apples in miniature: on pulling off the scales I found the flesh-coloured larvæ covered over; they were similar to the pupæ (fig. 4), and it is I think clear that these were the offspring of eggs deposited early in the year; they were imbedded as usual in somewhat imperfectly-formed cells (fig. 2), the partitions appearing like a resinous exudation. The pupæ are of a lead colour, being covered with a kind of powder or bloom; the head is broad and rounded, with a small black eye on each side, and a very minute black ocellus on each side of the crown; the prothorax is not much broader than the head, and the alitrunk is the broadest part of the animal; the sides are convex, rather jet, and slightly green, from the incipient wings shining through; the antennæ and legs are short and ochreous: the former are filiform and five-jointed, the latter are tapering and simple. When these Pupæ are sufficiently developed, they fix themselves by their feet and crawl out of their skins, which are of a yellowish-white colour, and remain sticking to the leaves; as soon as they have cast off their coats, they become considerably shorter and of a greenish colour; the encrusted and contracted wings are spread out like little bright green pinions. One of the pupæ which I was preparing to change, having attached itself, writhed about a little for some time to contract itself and determine all the fluids to its thorax. I then perceived a small white margin to the tail, which was the loose skin that shortly formed a wrinkle down the back; this was followed by a crack along the thorax, which, widening, soon extended to the head, and I became by degrees sufficiently enlarged to allow the head to emerge, sliding out so gradually that it was scarcely possible to detect any motion: yet shortly after, the first pair of legs was liberated and hung down, and so of the other two pairs successively; and they were not used, as I expected, to assist it in crawling out; and when the tail alone remained enveloped in the skin, the animal raised and depressed itself alternately, with unusual force, employing its legs a little, whilst the antennæ were set at liberty and vibrating: and this seemed to be the most difficult part of the operation, for I observed two of them walking about with the exuviæ still adhering to their tails. Immediately after its birth it appeared very weak on its legs, but soon walked off to a vertical position, where it remained nearly quiet, the wings expanding and becoming paler, until in twenty minutes they were completely developed, and I think that the entire change did not occupy more than forty minutes.

The perfect insect (fig. 5, natural size; 6, magnified and flying), is of a dull yellowish or ochreous green; the eyes are black, remote, and granulated, and close to each on the crown is a bright ocellus; the antennæ and legs are transparent green, the former are short and five-jointed, the latter have biarticulate tarsi and very minute claws; the rostrum is somewhat short and rests between the anterior coxæ; the wings are greenish-white, the superior having a portion of the costa very bright green; the costal nervure the strongest, the others are very indistinct; the first forms an oval apical cell, the second is oblique, as well as the third, but this is curved at its origin. The head and thorax become blackish as they get older and rubbed, and the wings after death fade to a pale brownish tint, and the costal nervures become rosy. Most of those which hatched under my glass bell were males, but a few had more acuminated tails, and these, I suspected, might be females, but I had no further evidence.

As there are excellent characters for distinguishing this group from Eriosoma, especially in the neuration of the wings, which are strikingly different, I shall propose the generic term of *Sacchiphantes*, or sack makers, for them, and I think it exceedingly probable that the Larch species will associate with this group. I must have named our insect Chermes Pini Abietis, and De Geer described it as the Aphis gallarum Abietis.—*Rusticus.*

ROSE GARDEN.—No. XXII.

(*Continued from page 812.*)

THE following brief List may perhaps prove acceptable to those who desire to collect some of the varieties most desirable to possess; no attempt has been made, however, to classify them, with the exception of defining in a *slight* degree the purposes for which they are most adapted.

CLIMBERS OR STANDARDS.

Lamarque.—Flower large and brilliant white, always expands well, and every bud formed comes to maturity; very fragrant, very free in the flower, which keeps and blows well in water when cut; the foliage is good, the growth rapid, but it requires much sun and some management in pruning; is rather delicate in some soils and aspects, but is the most perfect of all Roses for beauty, fragrance, colour, and freedom of flowering combined, where it does succeed; and it flowers twice, remaining each time long in beauty, the flowers being frequently much above 12 inches in circumference.

Madame Desprez.—A most hardy climber, fragrant, free in flower, fine in foliage, vigorous in growth; it stands at the head of the red climbers, as Lamarque of white; but although the flowers are neither so fragrant nor so well expanded as the Lamarque, the wood is more hardy and foliage more rich.

Jaune Desprez.—Colour of the flower flesh-yellow; habit like Lamarque, and like it, somewhat tender in winter or rather in the spring, at the rise of the sap; not so free blowing in the flower, and the petals fall off when the flower is cut for nosegays: its chief value lying in its singularity.

Rivers.—Rapid in growth, free in flower, fragrant in smell, the best adapted for arbours and lattice-work, and may be trained and cut with perfect facility.

Bracteata alnata alba.—Desirable to cover a wall as an evergreen; but the flower does not expand. this Rose differs from the Macartney Rose, in being more vigorous and yielding buds with perfect eyes more freely; its growth is rapid, its branches tortuous, appearance wild.

Princess Maria, Princesse Helene, Félicité Perpétuelle.—For wild growers, trees and shrubs, &c., some of which train well.

Brennus.—Colour splendid, size large, shape perfect, scent very fine, vigorous in growth, requires much wood to be left in pruning, very healthy, and perhaps the handsomest Rose of that character known.

Fragosa.—Colour bright, growth strong, moves well, but grows so fast it should not be left long in one place, to be transplanted.

Félicité Perpétuelle.—Profuse in flower, healthy, vigorous, fast in growth, and hardy.

Lilac Noisette.—Very free, and continually in flower.

Bougainville Noisette.—Flower free, but small; not so vigorous as many others.

Common Noisette.—Seen everywhere; but the colour is clear, and habit of growth desirable.

Boulon Nankin.—Buds marbled coloured; singular in appearance.

Billiard, Coupe de Vesus, Blairii, Boursault Amadis, Dr. Reade, Perpetuelle de Neuilly, Belle Evire, Princesse Helene, Princesse Nassau, Ariel.—Colour intensely bright, wood healthy, growth free.

STANDARDS AND DWARFS.

Brennus, Marchant de Lacroy, Aimée Vibert, Coupe de Venus,—Flower in bunches freely, colour delicate, growth free.

Queen of Bourbons, Queen of Belgians.—Beautiful colour.

Archduke Charles.—Colour dark and uncommon, foliage particularly rich, leaf large.

Napoleon Bourbon.—Continues late in flower.

Attelaine de Bourbon.—Colour bright, and flowers produced twice.

L'Isle de Bourbon.—Colour bright; flowers once only.

Bourbon Nankin, Dr. Billiard, Noisette Bougainville.—Free in flower, colour rosy lilac.

Noisette Fellenberg.—Colour bright, growth free.

Belle Auguste, Vivarious, Charles Auguste, Madame Hardy.—Vigorous in growth, colour brilliant white.

Enchantress.—Formal in shape, very double, no scent, healthy grower.

Josephine Antoinette.—Formal in growth, perpetual, scent fine.

Bourbon Faustine, Noisette Pæoniflora, Ariel, Antinous Perpetual, Madame Lofay, Père Bernard, La Biche, Euphrosyne, Noisette de Luxemburg.

Smith's Yellow Noisette.—Splendid yellow, opens badly; when cut for nosegays the buds should be opened with the fingers or the breath; scent fine.—*A. H. B.*

NOTES ON AMERICAN PLANTS.

[FROM PERSONAL OBSERVATION.]

Continued from page 216.

Gerardia quercifolia.—I was much pleased when, for the first time, I saw this noble species in flower, and imagined that I had discovered a new plant: but on consulting my American Flora I was soon undeceived. Of all the herbaceous plants with which I am acquainted, there are few, if any, that surpass this in beauty. It grows about three feet high, branching out about 18 inches or two feet horizontally at the stem, and loaded with flowers as large as those of a Gloxinia, and of nearly the same shape, the colour being of a brilliant yellow. This beautiful plant, although not grown in England, is common in many places in the States. I found strong plants growing in light sandy loam, and near the edges of woods, exactly in such places as we often find the common Foxglove growing with us. Some of your readers having correspondents in America, might easily procure seeds or roots, and try their skill in flowering it: if they succeed they will not begrudge the trouble.

Gerardia flava.—This may be called the yellow Foxglove of America—a most beautiful plant. The flowers in size and colour are nearly the same as the preceding, but growing with a single stem about three feet high, with a densely covered spike of bright-yellow flowers as large as the common Foxglove. It grows in situations similar to G. quercifolia. The best time to procure plants would be in the month of June, before they begin to throw up their flower-stems; and plenty of seed may be obtained in the autumn, as they seed freely. I am surprised that these two beautiful plants are not as yet found in our collections, and should be glad to hear of some one being successful in their cultivation. I also met with two or three annual species, which were very handsome, with finely-divided foliage and small purple flowers, exactly resembling Boronia pinnata, when viewed at a little distance; they would make beautiful pot-plants for autumn sowing.

Liatris.—This is a beautiful genus, containing species well worthy the attention of all plant-growers. The spikes are of various forms and heights, some of the kinds are nearly as graceful as Hunnemannia elegans, and all produce the most inimitable brilliant purple flowers; nothing can be more beautiful; their bulbous roots are

frequently imported to this country, but I have never seen or heard of their being successfully cultivated. They are all natives of the Southern States, and their time of flowering is October and November. Now, it appears to me that if they were grown in pots on the one-shift system, with two or three bulbs in each pot, and treated like hardy greenhouse plants, or like Chrysanthemums, they would succeed well; they would come into flower at the same time as Chrysanthemums, and form a fine contrast with them. It is of no use to treat them as hardy plants (as I have seen done), as, even after the long hot summers of the Southern States, they do not flower till October; the bulbs are in fine order for taking up just when the plant is in full flower, so that autumn is the time to give orders for them; and I have no doubt, if well managed, they will make a valuable addition to our winter flowers.

Asclepias tuberosa.—This beautiful plant is well worth general cultivation; it grows in dry sandy and rocky soil, rooting deep into the ground; it should be planted in a warm sunny aspect, and should never be disturbed afterwards. When I lived in Devonshire, I had a plant of it growing in sandy peat, which a few years after planting produced annually from 40 to 50 flower stems, terminating in heads of the most dazzling scarlet; it continued a long time in flower.

Asclepias quadrifolia.—This is the next best of the genus that I met with; I found it invariably growing in shady woods. The flowers grow in heads about the size of Hoya carnosa; they are of a delicate white colour, and the plant is altogether of a most graceful habit, and well deserving a place in any collection.

Lilium superbum, canadense, and philadelphicum, are all very beautiful plants, and well worthy of a place in every garden. L. superbum grows in moist meadows, where I found it of the height of six feet, with 50 or 60 fully expanded flowers on a single stem. L. canadense delights in open, dry situations; it is more highly coloured than the last; it grows from 2 to 3 feet in height. L. philadelphicum I invariably found growing in dry shady woods, not in masses like the two former species, but in solitary stems, thinly scattered here and there through the woods; it is the most brilliant in colour of all the American Lilies, and grows from 1 to 3 feet high. To cultivators of exotic Liliums the above are well deserving attention, and I make no doubt but that they would succeed well in this country. I would recommend them not to be disturbed for years after they are planted, and I always found the bulbs from 12 to 18 inches deep in the ground.

Houstonia cærulea.—I met with nearly half an acre of this in full flower on the banks of the Skuylkill River, growing on a poor sandy soil. The sight was so beautiful that I shall never forget it; I notice it here because I am fully persuaded that it would make a most excellent greenhouse annual; it seems too delicate to be treated as a perennial. Abundance of seed might easily be procured.

Convallaria racemosa.—This may be called the American Queen of the Meadows; it is very showy, and grows in damp situations like Spiræa ulmaria, but in larger masses. I once noticed a large mass of it in the middle of a Grass field; it had a very fine appearance contrasted with the dark-green Grass surrounding it.

Cnicus odoratus.—This is a delightfully fragrant dwarf Thistle, growing about a foot high, with large purple flowers; it is well worth growing on account of its sweetness, and I should think would be an excellent bee flower; if I rightly remember it is a biennial.—*R. Reid, Noble Thorp.*

THE ANTIQUITIES OF GARDENING.

No. II.—Extracts from Sir Thomas Hanmer's Manuscript on Gardening—1660, 1670. (*Continued.*)

"*Tulips.*—I have found by experience that the best Tulips do not prosper in a great spatious garden, where cold winds have power on them, nor in borders among bushes or other shading plants; but thrive best by themselves, in some warm well-sheltered ground from the spring easterly winds; yet they delight in a sweet air, and not to be too closely pent up.

"It is impossible to say which are absolutely the best Tulips, there being such variety of most beautiful ones of several colours, well sorted together; some with great bold panaches or stripings, others with weaker smaller marks; some of deep colours, others of paler only; and some with white, others without. Amongst the most knowing florists, some fancy one sort, some another; yet they ever agree in these things, so necessary to make up a good Tulip,—that the flower bee of a good form, that is, neither too great and flapping, nor too small and starved; that it open well, and therefore the figure must not be very raised, neither must the petals be too sharp-pointed; that the stamyns be large and of a purple colour, not greenish nor yellow; that the white be a clean pure white, from the first opening of the flower, and not turn white from yellow at the first, as many do that are esteemed reasonable good flowers; that the other colours be thick and rich, shewing like an enamel, distinct from each other, and not confounded; that the blew bottom bee spent away in all or most of the petals; and lastly, that the stalk be not weake-which makes the flower to hang down the head, but strong and of a competent length. These are the chief qualities of Tulips which now come to my mind.

"Now, how to raise good Tulips of your own (which is the great secret) I shall here disclose. If you go to buy them of others you will soon empty your purse, for a good new Tulip will cost at least 30*s.* or 40*s.*, though the world is full of them, and within these few years has been worth 4*l.* or 5*l.* in London, and 10*l.* or 20*l.* in Paris; and some have paid much more in France.

"The way therefore to have the best perfected striped or party-coloured Tulips, and variety of such, is by sowing the seed of Tulips; but all seed will not produce good ones; no, not the seed of the best striped sorts themselves, which many will not believe; but experience hath given assurance of the contrary, and the reason is not altogether hid from us. In the fine curious striped sorts nature hath spent its stock and vigour to bring them to that delicacy, and there is little virtue left to come to the seed of such, and therefore such seed often produces plain yellowes and reds; and you shall see that your neat striped ones have either no seed or that which is but light and small. But the good hopeful seed is that which is yielded by strong vigourous Tulips, which are all of a colour; yet, every single coloured which affords strong seed will not produce good Tulips, such as the ordinary red, yellow, or white; but the single coloured from which you choose your seed must be either oranges, grisdelines, or other shadowed colours, which wee cannot well tell what name to give to their colours, and their bottoms within must be either a fine celestial blew or sapphire coloured, either pale or deepe, or greenish. Those with blacke bottoms, or faint yellow, or none at all, are worth nothing for this purpose. The seed of those colours now spoken of must be chosen ripe, weighty, dry, and full, in July or August, as it is ready; the stalks full withered, and the seed case opening and rattling. Having gathered your seed when it is full ripe, and before it falls it blows away, sow it in very good sifted mold, in boxes or earthen pans, in September or October. In the spring they will come up like young Onyons. They must be taken out of the hot sun into some shady place as soon as these young leaves begin to wither, and then sift a very little fresh earth on them, and so let them stand abroad all winter. The next spring they will come up with small leaves, like such as they will ever after have. The second autumn take them up, sifting the earth, that you leave no root behind, and in September or October set them in fresh fine sifted earth again, and soe take them up yearly at the same time or thereabouts, and replant them again in October, in new fresh earth, and soe by this ordering they will bear flowers the fifth or sixth year. They never have more than one leaf till they bear flowers. When they bear, choose out the hopeful colours, and plant their roots by themselves. Having stood two or three years in a place, these single colours will become finely (panacheed, or) striped flowers. Those with blew bottoms will stripe white; those with greene bottoms with yellow. Few stripe perfectly in each leaf the first year, but when they do there is none or very little of the blew bottom to be seen. Commonly, the saddest duskyest colours, when they stripe, turn of a lighter colour, and soe, on the contrary, the paler reds turn deeper crimsons or purples; and the older the root is the more perfect the flower will be, if the soil and ordering be the best."

Home Correspondence.

The Ribstone Pippin.—In consequence of the statement concerning the original Ribstone Pippin-tree (p. 812), I wish to inform you that, at the particular request of the late Mr. Sabine, I examined the tree, which had no appearance of having been grafted, and sent to the Horticultural Society suckers from it; from which suckers the tree raised at the Chiswick Garden 18 years was obtained. No doubt was entertained by Mr. Sabine, after the receipt of the suckers, of their identity with the fruit-bearing portion of the tree. I also transmitted to him the account given to me by Lady Goodriche of the raising that tree from the seed of an Apple imported from Normandy, together with a sister seedling of inferior merit, which was then, and probably is still, on the Ribstone premises. The broken down stem was severed from the stump, and carried away by a violent gale of wind, after the head had rested a few years on the ground. —*W. Herbert, Deanery, Manchester.*

Gardeners' Benevolent Institution.—Observing in the two last Numbers of the *Chronicle* some strictures on the management of this Institution, and feeling an interest in that Society, believing it to be calculated to do much good, I beg to submit to the writers of those strictures the following remarks:—The fault that Mr. Whiting finds is, that there are more pensioners elected from the vicinity of London than from more distant parts of the country. But a little consideration will show that this is a necessary and unavoidable result; for the majority of the subscribers residing in or near London, it follows that they must recommend and vote for those of whom they know something, or whose personal appeals to their benevolence render their destitution more apparent. Again, London is the centre from whence gardeners go to fill the different situations in the country, and to which they return when out of place, or overtaken by misfortunes or old age; consequently the mass of destitution amongst gardeners lies near the metropolis. Further, those recommended from the more distant parts of the country are so by only one or two individuals, and those often non-subscribers—perhaps applying for a pension for an old servant who has lived with them till unfit for work; thus throwing a burden off themselves upon a Society to which they have never contributed. The committee have only a limited number of pensions to bestow, and whether they are bestowed upon individuals residing in Cornwall, Cumberland, or London, can make little difference, provided the persons are equally deserving and equally destitute: the same amount of human misery is alleviated. Besides, the committee have no control as to who shall or shall not be elected—they have simply their own vote to give. If there is any fault to be found it is with gardeners themselves, who do not join a Society established for their benefit; they have been applied to by letter to the number of 2000, and if only one-tenth of that number had responded to the call, the elections would have been in a great measure in their own hands. Further, any gardener who has subscribed for five years, upon producing the necessary recommendations, becomes a pensioner without election; so that they have everything wholly in their own power if they would only join the Society. Mr. W. P. Ayres points out another error in the management, viz., the price of the dinner-tickets; but this has, in reality, nothing to do with the Society. The dinner is a thing by itself, which may or may not take place, as thought most desirable. I believe that several members of the committee, if they only consulted their own inclination, would be averse to a dinner; but there are others who think differently, and who urge, that as other Societies acquire funds from the contributions of those who are gratified by being solicited to attend (and who otherwise would not join the Society), the committee would not be doing their duty did they not avail themselves of this source of increasing the funds of the Society. A dinner being agreed upon, stewards are appointed, and the arrangements are left in their hands. If Mr. A. has dined at the London Tavern, he must have found that an unlimited quantity of wine could not be allowed for even 15*s.*; each person will be allowed one bottle only. It is the lighting, professionals, and et ceteras, necessary to a public dinner, that becomes expensive; and if gentlemen are invited, they must have some enjoyment.* That these dinners are very absurd things I allow; yet they seem necessary, for some persons, without that stimulus to excite their benevolence, would not ever join a charitable institution devoted to their class. —*A Subscriber.*

Manure for Spinach.—On one occasion I had some Spinach sown in autumn on a very poor spot, without any manure having been applied. When it should have been fit for table in the spring, its leaves were all yellow, except the young budding ones; it was miserably poor, and was condemned to be pulled up and thrown away. It was, however, allowed to remain; the ground was well forked up and broken. It was raked and hoed, and then well watered; the soil was raked over daily. I then had a liquid compost prepared of several buckets of blood from the slaughterhouse, salt well stirred in, some wood-ashes and charcoal—filling the tub with water. This stood till my Spinach was making healthy growth; then, stirring up the mixture, and straining the thin part, it was poured to the roots—water was freely given before and after the application; the effect was wonderful. I had plants pulled up daily for use; the eradication effectually stirred up the soil where the fork could not be used. I tried by increasing degrees what forcing Spinach would bear in this way; morning, noon, and afternoon this liquid was applied, first and last resorting to the watering-pan; and every time the rich mess had been robbed, the butt was refilled with water and stirred, and once a week a bucket of fresh blood was added. Such was the growth of the Spinach, that numbers came to see it and my Bath Cos Lettuces, which were similarly nursed; the Spinach-leaves were larger than any dinner-plate. They were more like Rhubarb than Spinach, and of a fine Myrtle-green. My Melons and Cucumbers shared the same food, and with full success.—*A. W.*

Cropping of Fruit-tree Borders.—Shallow planting is now considered to be one of the most essential points by which we can obtain successful cultivation; but some gardeners, after bestowing the greatest care to plant their trees properly, have recourse to the injurious practice of cropping the ground over their roots; thus at once setting defiance to the effort made to keep them near the surface. I am aware that want of sufficient space for the culture of vegetables compels some gardeners to do this, but I imagine that the majority of them have it in their power to keep up a sufficient supply of culinary vegetables without having recourse to cropping the borders on which, at least, Peach and Apricot-trees are growing; their roots are destroyed by the operation of digging to the depth of a spade, and cropping exhausts the soil and forces them to descend still further, in order to obtain a sufficient supply of food. It is much more profitable to keep the ground over the roots mulched with rotten dung in winter and summer; this answers two purposes—it encourages the roots to approach the surface, and retains plenty of moisture during the summer season. A good watering occasionally, when the trees are in active growth, is, however, of great service, if the season is very dry. By this treatment many of the evils to which fruit-trees are subjected will be overcome. I may mention that the best crop of forced Grapes I have seen for some years has been produced by these same means.—*J. W.*

Brewing.—"A Farmer's Daughter" would much oblige a constant reader of the *Chronicle* if she would state how many pounds of Hops she uses to 6 bushels of Malt, and whether she puts into the boiler the decoction of the Hops only, or Hops and all.

Destruction of Small Birds.—Although it must be acknowledged that sparrows do much good by destroying hosts of caterpillars, grubs, &c., I think it remains a matter of considerable doubt whether the good thus conferred upon the gardener is not counterbalanced by the injury they inflict upon the buds of Currant and Gooseberry trees. Just now my trees are suffering much from these little busybodies, the buds being excavated to an alarming extent. I have tried every method I can think of, but cannot keep them away. If any of your correspondents will suggest a plan by which this may be effected, they will greatly oblige—*The Laird o' Cockpen.*

* If the stewards could calculate upon twice the number attending, they could reduce the price of the tickets probably one-third.

Pruning Forest Trees.—I observe that Mr. Billington and some of your other correspondents are at issue, as to whether the growth of timber proceeds from the ascending or the descending sap; and as this appears to me to be easily proved, I wonder that some one has not pointed out the method of doing this. Let the diameter of a young tree or branch in a state of vigorous growth be carefully noted the first week in May; then cut out a ring of bark, a quarter to half an inch broad, just above the measured part. On measuring this again in a month or two, it will be found, that whilst the diameter above the ring has increased very considerably, the increase is scarcely perceptible below: thus, in my opinion, proving Mr. Billington's assertion, that the increase is from the descending sap: for if, as physiologists tell us, the sap rises through the young wood, and descends between the bark and the wood, the circumcision of this ring would not prevent the ascent of the sap, although it would prevent its descent; and therefore, it appears to me that this ringing proves the truth of the physiological theory also. But here I must demur to going further with Mr. Billington. It may be true that timber grows best if all the branches are left on the tree—I am disposed to grant this, for the sake of the argument—but every one who uses timber knows that it is comparatively worthless when branched from top to bottom; the grain is twisted and distorted in all directions, and the timber is full of knots, which unfit it for any but the roughest and meanest purposes. "A. Thompson" (p. 795), as well as others, have shown very satisfactorily, that the value of a tree does not entirely depend upon the number of cubical feet contained in it, but in its suitableness for all useful purposes.—*Clitheroe, Dec.* 3.

Shanking of Grapes.—The theory which "An Amateur" has advanced as an explanation of one of the causes of the shanking of Grapes, is the same as was promulgated some 10 years back by Mr. J. D. Parks, of the Dartford Nursery, I think either in the Horticultural Society's "Transactions" or in the "Gardeners' Magazine;" and is sufficiently answered by the fact that many good growers of the Grape syringe their Vines early in a morning, and give no air until the moisture is dissipated, without being troubled with shanked bunches, or berries—to say nothing of a majority of the bunches, in most vineries, being under the shade of the leaves, and therefore beyond the influence of the sun's rays. It is premature to find fault with the tank-system of heating, unless we have better evidence than that advanced by your correspondent. In a majority of cases, when the cause of shanking does not originate in the border, I believe it may be attributed to the admission of cold currents of air on the young and tender bunch, careless handling when thinning, and other external injuries. Over-cropping is probably the most prolific source of bad fruit; and it is surprising that gardeners should persist in imposing upon the good-nature of their plants in forcing them to produce 20 lbs. of worthless fruit, when they might perhaps take 15 lbs. of first-rate quality. Clement Hoare's rule for cropping Vines is a good one, though perhaps under the mark; yet, if it was more acted upon, we should certainly both see and hear less of bad Grapes.—*W. P. Ayres, Brooklands.*

Ice.—Having no ice-house here, we last year made a large heap of ice above ground, and thatched it 18 inches thick. It has kept well until this time. This year we are adopting the same plan, with the difference of thoroughly watering the heap as we proceed. Is not the plan a bad one? and instead of causing the heap to become a solid body, will it not have the very contrary effect?—*J. Greenshields.* [No. But we see no advantage in watering it. It should be pounded fine.]

Advantage to Gardeners of a Knowledge of Vegetable Physiology.—Every gardener in this age of science, who aspires to anything like eminence in his profession, should know something of Vegetable Physiology. He ought, at least, to be so far acquainted with its true principles, as to be able to conduct his operations with some degree of certainty. Many will say "I am generally successful in my undertakings, without knowing anything of physiology, and I am acquainted with many good gardeners who scarcely know the meaning of the word." This may be the case; but is it not far more business-like, more systematic, and more advantageous in every way, to be able to calculate pretty correctly the result of an operation, than to be working in the dark? But admitting that the gardener can conduct his operations without a knowledge of the various organs of plants and their functions, it is surely preferable to understand the beautiful economy of the vegetable fabric, to comprehend how the crude fluid is absorbed by the roots, and conveyed through the intricate ramifications of tubes spread out to the action of the atmosphere, in the leaves, and to watch it returning a nutritious fluid for the nourishment of the several parts of the plant. Surely it must induce us to take a greater interest in plants, to watch the many beautiful contrivances of nature which insure the reproduction of each species, to behold the exquisite adaptation of each individual to its assigned place on the surface of the globe, whether beneath the sun of the tropics, the regions of perpetual snow, or the more genial climate of the temperate zone, or the many varieties of situation which each climate affords. In each and all, we behold subjects peculiarly adapted to their several situations, and each offering abundance of matter for our study and contemplation, and from which we may derive much that is useful and instructive. Linnæus, when instructing his pupils, is recorded to have merely placed his hand upon the turf on which they were standing, and to have pointed out to them the many specimens growing in that little space worthy of their attention. In fact, almost every spot offers something capable of arresting our attention.

> "Not a plant, a leaf, a flower, but contains
> A folio volume. We may read, and read,
> And read again, and still find something new—
> Something to please, something to instruct
> E'en in the noisome weed."

In no branch of gardening, perhaps, is a knowledge of physiology more requisite, or more certain of directing our operations with success than in propagation. It is to the operator what a knowledge of navigation is to the mariner in steering his vessel through a dangerous sea. A person unacquainted with either may perform their work in both instances correctly; but there is a want of confidence, and the results, be they what they may, are but the offspring of mere chance. In looking over the rising generation of plants, intended by their possessors for the next year's decoration of their flower-gardens, while in the cutting-pots, how many are the instances in which failure is certain! or, at best, a poor sickly plant will be the result, arising solely from a want of determination in the selection of the cutting. And this discrimination can best be exercised by a knowledge of the structure of the part selected for the cutting; whether it contains those tissues from which roots are to be formed in sufficient abundance, or which part is most calculated to repay us by the production of a vigorous and healthy plant. That this can, in a great measure, be calculated upon from the appearance of the branch selected, admits of no question. The gardener, surrounded as he is by the many beautiful processes in the great laboratory of nature, must, before he can enter fully into the spirit of the thing, be a scientific man; and I trust to see the day (although much must co-operate to bring about such a state of things) when a knowledge of the sciences which most directly bear upon his profession, will be looked upon as an indispensable qualification in him. But I would not be misunderstood: the mere scientific man can never be a good gardener. Science can only be looked upon as an assistant. A man may be a good gardener (and undoubtedly there are many), who knows nothing of the scientific portion of his business. A long and careful practice, with a keen and perceptive observation may, in a great measure, dispense with science; but it is bad policy to occupy a long series of years in obtaining a knowledge which might be gained in a far shorter period; and by the aid of science this can be effected. It is by practice alone that many of the operations of the garden can be thoroughly carried out with success; but by science we understand the general principles of everything pertaining to gardening, and by it we can direct our operations with a confidence which, in the absence of such a knowledge, is mere hazard. Let the young gardener, however, always bear in mind that nothing will compensate for want of practice and observation; blend these with science, and success is certain. —*Walter Wakefield.*

Liquid Manure applied to Carnations.—I mixed Peruvian Guano with rain-water at the rate of half an ounce to a gallon, with which the pots were watered once a week. Another quantity of pots was watered with Potter's liquid guano, mixed, if anything, a little weaker than he directs. All did well. I never had such healthy plants, nor so fine a bloom; nor had I ever so few run flowers. I think manure can hardly be the cause of running, for I potted some Rose-flakes, which were always apt to run, in a mixture chiefly composed of rotten dung and soot which had been exposed to the weather for a year; they grew well, and bloomed clean and fine, as also did some purple flakes in the same mixture. Pinks in pots, in an eastern aspect, watered always once, and often twice a day with a mixture of old manure and soot with rain-water, laced remarkably well; whilst others, planted in a bed of extra rich compost, under a south wall, the autumn previous, did not lace so well, although they grew luxuriantly. Perhaps the regular moisture affected the lacing as much as the manure.—*G.*

Humphreys's Compound.—This agreed very well with Polyanthuses and Pinks in pots, and next to that superphosphate of lime, made by burning bones, and steeping them in sulphuric acid and water, seemed to produce the most visible effect in a short time, the plants being top-dressed with it.—*G.*

Passiflora quadrangularis.—This plant is generally cultivated for the sake of its beautiful flowers and climbing habit, but it may also be made to produce large and excellent fruit. The treatment required to fruit the plant is, however, somewhat different from that usually employed to make it flower only. It may be grown in the stove, or better, perhaps, in an intermediate house between the stove and greenhouse. It is necessary to the perfect cultivation of the plant, that it should grow in a border in the inside of the house, rather than in pots, however large. If no other situation presents itself, a border may be made beneath the path, taking care to leave a space of 3 or 4 inches between the surface of the soil and the stones, so that there may be a free access of air, and that water may spread equally over the surface of the soil and moisten it thoroughly. Whatever may be the situation of the plant, particular attention must be directed to the drainage, which must be as efficient as possible. As the plant may have to remain some years in one situation, five or six barrowfuls, or even more, of good soil, composed of three-fourths good loam and the rest leaf-mould, should be prepared in a very rough state. A spare rafter, or any such place near the glass, will do exceedingly well for the plants to be attached to. If young when turned out, the plants should not be allowed to bear flowers or fruit the first year. One, or at most two branches should be allowed to grow, and after they have extended 10 or 15 feet, they should be stopped and should not be allowed to put forth any laterals. During winter no water should be given unless the plants droop. Some time in February the branches must be well cut back; and if it is necessary to leave any length of stem between the ground and the glass, all the buds, excepting three or four at the top of each branch, must be rubbed off. The number of branches allowed to grow in the second year must be determined by the strength of the plant; from two to six being the usual number. Advantage should be taken of the first flowers that open to fertilise the stigma, for fructification will not always take place naturally. From one to three fruit are sufficient on each branch; if a greater number are allowed to remain they will be small and of little value. The fruit-bearing branches may be stopped at the distance of 5 or 6 feet above the fruit. Some cultivators, however, do not stop the branches at all, but I consider it better to stop them, but in either case no laterals must be allowed to grow on any part of the plant: for no fine fruit can possibly be obtained if the plants are allowed in any way to run wild. Treated in this way, P. quadrangularis will frequently produce fruit 4 lbs. in weight; and though not ranking as a first-class fruit, it makes a rather novel as well as a useful addition to the dessert, at which its pulp is eaten with sugar and wine. None of the other species of Passiflora bear so large fruit as quadrangularis; of others, edulis and laurifolia are amongst the best. Unlike quadrangularis the branches of these smaller-fruited species must not be stopped, and they will continue to flower and fruit for several months in a stove. The fruit is eaten with the same ingredients as the larger kind, and has a flavour agreeable to most palates. It is necessary to be particularly careful in selecting good varieties, for there are several spurious kinds in cultivation. The best way is to get plants from old ones which are known to bear good fruit.—*J. W. Jones, Royal Botanical Garden, Kew.*

Honeycomb Labyrinth.—A honeycomb labyrinth was discovered a few weeks ago in the upper part of an antique side-wall of Nateby Hall, near Garstang, the residence of J. Stuart, Esq. At what period this insect labyrinth had been established, is unknown. The longest winding passage in it was about 6 feet in length, the widest part was about 18 inches across, and the highest part was about 20 inches in height. The entrance was from the centre to the outside of the roof, which is high, and concealed from view by branches of lofty trees. The discovery was made by a person in an upper room, who from time to time hearing a noise, communicated the circumstance, and an aperture was made in the wall of the room. In a short time the hive was discovered, and the whole of the bees destroyed; their labyrinth was minutely examined, cut down, and removed by making a number of apertures in the wall. The weight of the honey and the comb was 140 lbs. It appears that they had first commenced to build in the centre, as about two feet of the honey and the comb in that part was black; in other parts it was excellent. It is stated by some writers that there are bees which produce black honey, but from this it would appear that it is age that turns it black.—*M. Saul, Fort Green Cottage.*

Contrast between English and Irish Weather.—I have just learned from Mr. Boylan, gardener to the Earl of Kenmare, Killarney, that many of the Rhododendrons are now in full flower, and he has also a Yucca gloriosa with seven flower-stems, also in full blossom. In this neighbourhood we have still in bloom Dahlias, Leonotis Leonurus, and many varieties of annual flowers, as well as Apple-trees and Narcissus. This contrasts strangely with the account of the weather on your side of the Channel, as recorded in the *Chronicle* of the 7th inst.—*John Haycroft, jun., Victoria Nursery, Cork, Dec.* 9.

Birch Coppice.—If "Romseyoniensis" had stated at what time of the year he cuts over his Birch stools, perhaps the cause of their dying might have been explained to his satisfaction. In the mean time, however, I would advise him, if it has not hitherto been his practice, to defer cutting the produce from the Birch stools, or the cutting off young plants or trees, to form stools, till the buds are fully expanded, or rather broken into leaf. This, I have no doubt, will prove a cure for his failures. Will "Romseyoniensis," after he has tried this plan, favour the readers of the *Chronicle* with the result?—*W. Billington.*

Bees.—When I recommended bee-keepers to use large hives, I did not wish them to believe that, by putting a small swarm into a large hive, a greater quantity of honey would be obtained at the end of the first season, but simply that the bees would, during the second and following seasons, gather more honey, hatch more brood, and send out larger colonies, &c. Surely, England is more able than Wales to send out large colonies to other countries. My brother informs me that, in 1842, he realised from his apiary, consisting of 7 stocks, 19*l.* 10*s.*; in 1843, from 8 stocks, 20*l.*; and in 1844, from 11 stocks, 20*l.* If any apiarian has made more of his bees during the last three years than the above sums, I shall be obliged by his informing me how he manages them. Mr. Wighton's possessing a bit of worker's comb, containing young drones, does not disprove the assertion that bees' eggs are transmutable. I have long ago seen drones bred in workers' cells. When there are no drone-cells in a hive the bees generally hatch a few drones in workers' cells, about the time in which the first swarm leaves the hive. These drones are bred for the purpose of impregnating the young queens. Bees will not breed drones when the bees have a timely impregnated queen, no drone's cells, and plenty of room. The transmutability of bees' eggs has already been so well proved in the

Chronicle, that it is a correct account of the case, or to say anything further on the subject.—*A. Pettigrew.*

Baskets round Flower-borders.—As the Article (p. 622) descriptive of the noble gardens at Hewell appears to have been written by a person of some taste in gardening matters, I am rather surprised that when he was commending the "wicker work" which gives the appearance of "rose baskets of evergreens and flowers" to the beds on the lawn at that place, he did not advise its removal from the centre of the lawn, instead of recommending its use for beds of flowers and other plants. I should be much obliged to see how it is at present used, and in what manner "G." is at present [illegible], to justify its use on the same lawn for beds of flowers? In my opinion wicker-work, or indeed fancy edgings of any kind, are altogether out of place when surrounding flower-beds; and though we see such things in many places where one would expect to find an exemplification of better taste, yet they are not to be followed on that account. In the garden of a noble Countess not many miles from the place where this is written, the flower-beds are edged with cockle-shells placed on strong stakes about 9 inches high; and to render such an arrangement more extraordinary, the roots is regularly every spring [illegible]. At Blenheim and I remember right, at Chatsworth, some of the flower-beds are edged with dressed oak trees, which is most assuredly a singular fancy—to make the mourners of the forest subject the flowers to! Now, although fashion—which ought to be in gardening matters designated the whim or caprice of [illegible]—may sanction such things, there cannot be two opinions about their being in direct opposition to good taste, though not so much so, edgings of wicker-work. If such work must be adopted into garden scenery at all, [illegible] be as good for wild [illegible], and not in the place of [illegible] for the cultivation of plants.—*Argus, Newmarket.* [It would not be *very* difficult to answer these objections, in which we need hardly say that we do not concur.]

Miscellaneous.—*Mr. Thomas Potter*, of Sutton, inquires what the difference is between Mr. Dale's system of growing Pine-apples and that of Mr. Knight's; and whether that of the latter is different from the way in which Pines produce fruit in their natural state? He remarks that the Pine in its native country produces suckers which bear fruit in succession until they become so crowded that they break down in large masses of a cartload at a time. Finally, he states that the best flavoured fruit from plants in a wild state, is produced from those growing in sand.

Reviews.

The Gardeners' Almanack, for the Year 1845. By G. W. Johnson, Esq.

THIS is what it calls itself, and something more. It is exactly what such a publication should be—full, accurate, and novel. Ninety-six pages of very closely printed matter are crowded with information of all sorts, upon subjects of horticultural interest, besides which there is the usual information contained in a pocket-book. In short, we can recommend it to anybody who wants a Garden Almanack, as the best of its kind.

Some extracts from it will give the reader an idea of the author's mode of treating his subjects:—

"*The Allotment System.*—Many years since, the present writer advocated, to the best of his ability, this best of all aids to the labourer, and he is glad that this improvement in our social system has at length so far progressed, as to have attracted the attention of the legislature, to whose judgment a Bill, regulating and promoting parochial allotments, will be submitted by the Hon. W. Cowper. We implore every member of that legislature to give it his support, and we give our testimony in concurrence with the evidence produced before the late Committee of the House of Commons, that an allotment of land to every cottage is the most efficient mode of improving the condition of the labouring classes. Indeed, it requires no evidence to sustain its merits, for all experience testifies that a man, with the occasional help of his wife, can, during his over-hours, cultivate a quarter of an acre—and that this space will nearly supply with Potatoes and other vegetables, throughout the year, the parents and four children. This is a fact beyond the reach of dispute. Then, we ask, what argument can prevail against such a space being the least allotted to every cottage? We have heard it said that if men grow Wheat and Barley, it will prevent detection should they steal their master's;—to which we reply, that supposing it does prevent the detection of one theft, yet by giving a good example to every cottager, you save hundreds from the temptation to thieving. Again, we have heard it said that the labourer who toils in his garden, expends the strength which should be husbanded for his master's service:—to which we reply, that all experience demonstrates that those labourers who devote their leisure to their own gardens, are invariably the best characters and the best workmen in a parish. But, suppose that the cottager was such, and that the man who dug in his own garden could not labour quite so vigorously on his master's land—yet, if that garden kept him from the poor's rate, the latter would be more than a gainer still; and it is a fact, to which we have ample testimony, that allotments of land do keep the labourers from requiring parochial relief. We have no space to go into detail, but we implore every magistrate, every country gentlemen, to act up to the spirit of the 31st Elizabeth, cap. 7, which prohibited a cottage being built unless four acres of land were appended to it. Let every cottager have no less than his rood of land—and we ask it, because the language of the committee we have noticed we know to be the language of truth, when it says, 'The garden allotment system is a powerful means of bettering the condition of the poor; nor are its benefits obtained at the expence of any other class, nor accompanied by any corresponding disadvantage.'"

"*Steeping Seeds.*—The most ill-founded idea that has been suggested by the minds of those who have been labouring to improve the arts of cultivation during the past year (1844), is that by steeping seeds in certain solutions, the vigour and fecundity of the plants to which they give birth might be promoted. A certain degree of heat, oxygen gas, and water, are all the requisites for germination; and until this process has commenced, no liquid but water, at common temperatures, will pass through the integuments of a seed. So soon as germination has commenced, this power to exclude foreign fluids ceases, but the organs starting into activity—the radicle and the plumule—are so delicate that the weakest saline solutions are too acrid and offensive for them. So utterly incapable are the tender roots of imbibing such solutions, that at first they are absolutely dependent themselves for their very existence upon the seed-leaves, and if these are removed the plant either looks no further advance, or altogether perishes. Many years since we tried various nostrums to facilitate the germination of seeds, but, with the exception of those which promoted the decomposition of water, and the consequent more abundant evolution of oxygen, we found none of any efficiency. As to keeping the seeds in saline solutions until they germinated, we never, certainly, carried our experiments so far as that, and we should be most astonished if any other effect than injury or death to the plant is the consequence. Such has been the result in the Horticultural Society's Gardens, where the seeds of Lupinus Hartwegii were made to germinate in a weak solution of phosphate of ammonia."

Before we dismiss Mr. Johnson's useful book, we must not forget to correct an error into which he has fallen, in ascribing (p. 11), some very curious experiments on the power possessed by mortar of lime of retaining moisture, to Dr. Lindley. They were really made by Mr. Edward Solly, in the course of his examination of various facts brought under the notice of the Chemical Committee of the Horticultural Society.

The Garden Almanac. By G. Glenny. Westley. TRASH!

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

GAYLUSSACIA BRACHYSTACHYUM. Pilberry-like Gaylussac-wort. (*Hardy Greenhouse Shrub.*) Vaccinaceæ. Decandria Monogynia.—The genus Gaylussacia, so named after M. Gay Lussac, the eminent French chemist and philosopher, differs from Vaccinium in the same way as Arctostaphylos from Arbutus—it has but a single seed in each cell. The species are chiefly found in Brazil, where they are common, Peru, and the North of India, but among them are several which, as this species shows, would be worth introducing to cultivation. G. pseudovaccinium is stated to be a native of sandy, open plains in Brazil. Auguste de St. Hilaire says that he found it on the coast from the city of Caravellas in the province of Porto Seguro as far as the island of St Catharine, so that it forms a shrub from 1 foot to 2½ feet high. At least it is to be presumed that this is the plant he means, though he describes the corolla as somewhat narrow, and the ovary as five-celled, with one-seeded cells; for the flowers are much too globular, and M. de St. Hilaire adds that the fruit of his plant is 10-seeded when dry, in consequence of its containing 10 seeds; whence it is evident that his account of the ovary is erroneous. It is a hardy and very pretty greenhouse shrub, which should be grown in a mixture of sandy peat and loam, and treated in the same way as Cape Heaths. It may be increased either by seeds or by layers. Seeds should be sown in pans filled with sandy peat about February, and covered with a bell-glass. The layering should be effected before the plant commences its fresh growth.—*Botanical Register.*

TETRATHECA HIRSUTA. Hairy Tetratheca. (*Greenhouse Shrub.*) Tremandraceæ. Octo-Decandria Monogynia.—Where the name has been published which this pretty plant bears in our gardens I have failed to ascertain. It is certainly no other than Tetratheca hirsuta, and by no means a Tremandra, for, as seems clear, the essential character of that genus consists in its anthers not terminating in a tube nor opening by a pore at the point. Messrs. Rollissons received it from Baron Hugel in the summer of 1843, and flowered it last March. It is a very nice greenhouse plant, gay with purple starry blossoms. It grows freely in a compost of peat loam and sand in equal proportions, and if a few potsherds are mixed with it so much the better. In summer plenty of air and water should be given, and shade in sunny weather. In winter the plant should be placed in some airy part of the house, where it will be secure from damp. Fire-heat should not be applied, except to keep off frost. It may be propagated by cuttings in the usual way.—*Bot. Reg.*

Garden Memoranda.

Horticultural Society's Garden, Turnham-Green.—The Chrysanthemums here have been a failure this season, probably in consequence of their having been put into the conservatory too early and placed too far from the glass there. The cuttings were struck about the end of March, in a cold frame, and were potted off and regularly shifted from 60s into 32s, 24s, 16s, and ultimately into 8s. The soil employed was a mixture of loam, peat, and well decayed cow-dung in nearly equal proportions. After receiving the last shift, which was about the beginning of August, the plants grew very rapidly, and soon formed handsome bushes. They were watered with manure water once a week from the beginning of August until the middle of October, when they were removed from the open air into the conservatory and placed along the side of the pathway. Here they continued growing instead of immediately setting for bloom, and small ill-formed flowers, showing the centres in many cases, was the result. Had the plants been weakly we should have attributed the cause of failure to late stopping, which is an error into which many fall; but this is not the case, for the plants exhibit good cultivation as regards [illegible], and a multitude of strong shoots covered with dark green foliage to the very root. Want of sufficient air and light, which Chrysanthemums in particular require, and without which they cannot be expected to succeed, seems to be at the root of the evil, to which cloudy and warmer weather when the plants were placed in the house after a hot dry summer, has doubtless contributed. In the conservatory a plant of Lonicera japonica, now called Lin[illegible], has been in bloom for at least [illegible] months. The branches have upwards of 15 feet in height. It commenced producing its dull yellow blossoms about the middle of the month, and is now in full bloom, having a profusion of blossom, the succeeding gradually progressing towards [illegible]. The two Lemon trees on [illegible] in the large stove, are about 5 feet in height, and promise to flower well. The Aristolochia gigas, trained along the roof of this house, has since the 26th of October, produced 163 fully expanded flowers, besides many [illegible] which have not opened. It proves to be a [illegible] flower, the only fault connected with it being its bad smell, which, however, when it is placed on the roof of a stove is hardly perceptible. In this house is also in bloom a Hoya Cunninghamii, having flowers somewhat resembling those of Asclepias picta, or polymorpha. It was sent by Mr. Harvey, who found it on the [illegible] near Bhoosa. In one of the pits belonging to the [illegible] department was a small pan containing young plants of the Tea-plant, which has vegetated freely in a very cool, in comparison temperature. [illegible] of Cephalotaxis drupacea, from Mr. Fortune, about 6 inches high. This is said to be a tree like a Cypress, of great beauty, and attaining a height of [illegible] 40 and 50 feet; and if it proves to be hardy, as it is expected to be, it will form a valuable addition to Coniferæ. In the orchard [illegible] are busily employed in preparations for renewing the [illegible] Peach-trees. The Trees which grew [illegible] the walls to the [illegible] are being [illegible]; the best of these are trained in a row along the [illegible] of the [illegible] garden. Although it is upwards of 20 years since these trees were first planted, yet, being on Quince stocks, they removed with an abundance of fibres. The border is being trenched for the reception of the young Peach-trees, and a quantity of North Hyde loam has been procured for the purpose of mixing with the soil in which the trees are to be planted.

Stackpole Court, near Pembroke.—Phormium tenax is grown on rather a large scale here, and to what may be considered near perfection, its foliage averaging, over the whole plantation, from 6 to 7 feet in height. A great annual weight could be produced if a ready mode of converting it could be hit upon; and we should feel obliged if any of the numerous correspondents of the *Gardeners' Chronicle* would furnish some information on the subject.—*Dec. 9.*

Miscellaneous.

New Uses of Indian-rubber.—[illegible] years ago its chief [illegible] consisted in the manufacture of Macintosh's waterproof coats, the fabrication of some surgical apparatus in which elasticity and pliability were the objects desired, the rubbing out of black-lead pencil-marks from paper, and a few other minute and unimportant applications. Now, however, this substance is employed in some highly important branches of our manufactures, and has become a valuable agent in the arts and sciences—showing what an extensive field the rapid advance of science may open up for the appliance of materials hitherto considered as next to useless. From its peculiar elasticity, its impermeability to air and water, its being soluble only in [illegible], and from its great durability, it has been extensively employed in the fabrication of various cloths, besides those of Macintosh; for air-cushions, safety-belts and jackets; pigments and bandages for gloves, stockings, braces, and other articles of dress; for boots, stoppers for bottles, and numerous other purposes. With these applications most of our readers may be familiar; but few may know, or might expect, that it would be employed as a pavement for stables, lobbies, public halls, and the like; that it is now being used in the construction of life-boats; and that it is also proposed to use it extensively in the fitting up of our men-of-war. The Elastic Pavement Company have lately erected machinery for the preparation of the material for these important purposes, and can produce it, it seems, at a price [illegible] on account of its general adoption. As a pavement for [illegible] the caoutchouc preparation is said to be [illegible], preventing the lodging of [illegible] and consequent noxious exhalations; requiring little [illegible] and preserving [illegible] injuries to the [illegible] and other parts of the [illegible] from injuries which are [illegible] to the [illegible] stones. By a [illegible] preparation, the [illegible], which [illegible] to a white [illegible], and the [illegible] of the [illegible] horses may be [illegible] and the injuries of the horses' hoofs may be [illegible]. The cost of the pavement is stated at from 2*l.* to 3*l.* per [illegible] yard. The stables of the [illegible] of Wellington, in Portsmouth dockyard have been paved with this material for upwards of two years, and are stated to be superior in point of cleanliness, freedom from smell, and [illegible], to what they were previous to the laying down of the [illegible] pavement. It has also been laid down in the Admiralty courtyard, and the carriage entrance court to Windsor Castle, where it has given most satisfaction. "With respect to its application to naval purposes," says the *Railway Gazette*, "a life boat is now being constructed on the Company's premises (34 feet length of keel, and 12 breadth of beam), which, with the exception of the keel and some iron braces, will be entirely formed of

India-rubber and cork planking. She will weigh but one ton and a half, an ordinary life-boat weighing three tons; and it is the opinion of all naval men and engineers who have seen her, that it will be almost impossible to sink her under ordinary circumstances, and that, when driven on a rock by the action of the waves, she will rebound like a ball, without fracture. It is also proposed to use the caoutchouc preparation for an inner lining between the guns in war-vessels, to prevent the effects of splinters; for hammock-nettings and bulwarks, to save the crew from canister, grape, &c.; and for other useful though less obvious purposes." Such are the numerous purposes to which human ingenuity can apply a single, and to all appearance an insignificant substance —the exuded sap of a tree; showing that science not only supplies our more obvious wants, but creates others, and calls into use hitherto neglected materials to supply them. Nothing in nature is useless; if we cannot now see its value, let us rest assured that the time will come for its profitable application.—*Chambers's New Edinburgh Journal.*

Allotments.—Among other instances of great success in carrying out this system, may be named the village of Pytchley, in Northamptonshire. In that parish are 56 allotments, and their crops have been "superb," to use the words of a correspondent. One man had 7½ bushels of clean Wheat off his half rood, and a large crop of Potatoes off the other half rood. Many others were scarcely inferior. *Pergite pueri!*

The Chocolate Tree and its Uses.—What is generally called Cocoa is merely the berries of Theobroma Cacao, pounded and drank either with water or milk, or with both. Chocolate is a compound drink, and is manufactured chiefly from the kernels of this plant, whose natural habitat would seem to be Guayaquil, in South America, though it flourishes in great perfection in the West Indies. It grows also spontaneously and luxuriantly on the banks of the Magdalena. Mr. Schomburgk, in his recent expedition into the interior of British Guiana, found the country abounding in Cocoa, "which the Indians were most anxious to secure, as the pulpy arillus surrounding the seed has an agreeable vinous taste. Singular to say, however, they appeared perfectly ignorant of the qualities of the seed, which possesses the most delightful aroma. Mr. Schomburgk states, they evinced the greatest astonishment when they beheld him and Mr. Goodall collecting these seeds and using them as Chocolate, which was the most delicious they had ever tasted." The height of the Cocoa shrub is generally from eighteen to twenty feet; the leaf is between four and six inches long, and its breadth three or four, very smooth, and terminating in a point like that of the Orange tree, but differing from it in colour; of a dull green, without gloss, and not so thickly set upon the branches. The blossom is first white, then reddish, and contains the rudiments of the kernels or berries. When fully developed, the pericarp, or seed-vessel is a pod, which grows not only from the branches, but the stem of the tree, and is from six to seven inches in length, and shaped like a Cucumber. Its colour is green when growing, like that of the leaf; but when ripe, is yellow, smooth, clear, and thin. When arrived at its full growth, and before it is ripe, it is gathered and eaten like any other fruit, the taste being sub-acid. Chocolate, so called, and so prized both in the Spanish Continent and in the West Indies, never reaches Great Britain except as a contraband article, being, like nearly all colonial manufactured articles, prohibited by the Custom-house laws. What is generally drank under that name is simply the Cocoa boiled in milk, gruel, or even water, and is as much like the Spanish or West India Chocolate as vinegar is to Burgundy. It is, without any exception, of all domestic drinks the most alimentary; and the Spaniards esteem it so necessary to the health and support of the body, that it is considered the severest punishment to withhold it, even from criminals; nay, to be unable to procure Chocolate, is deemed the greatest misfortune in life! Yet, notwithstanding this estimation in which it is held, the quantity made in the neighbourhood of Carthagena is insufficient for the demands of the population, and is so highly priced that none is exported but as presents! The signs by which good Chocolate or Cocoa is known are these:—It should dissolve entirely in water, and be without sediment; it should be oily, and yet melt in the mouth; and if genuine and carefully prepared, should deposit no grits or grounds. That made in the West Indies and in some parts of Cuba is dark; but that manufactured in Jamaica is of a bright brick colour, owing to the greater quantity of arnatto which is used in the preparation, and which, I think, gives it a richer and a more agreeable flavour. In an economical point of view, Chocolate is a very important article of diet, as it may be literally termed meat and drink; and were our half-starved artizans, over-wrought factory children, and ricketty millinery girls, induced to drink it instead of the innutritious and unwholesome beverage called Tea, its nutritive qualities would soon develop themselves in their improved looks and more robust constitutions. The price, too, is in its favour, Cocoa being 10*d.* per pound; while the cheapest black Tea, such as even the Chinese beggar would despise, drank by milliners, washerwomen, and the poorer class in the Metropolis, is 1*s.* 8*d.*, or 240 per cent. dearer, while it is decidedly injurious to health. The heads of the naval and military medical departments in England have been so impressed with the wholesomeness and superior nutriment of Cocoa, that they have judiciously directed that it shall be served out twice or thrice a week to regiments of the line, and to the seamen on board Her Majesty's ships, and this wise regulation has evinced its salutary effects in the improved health and condition of the men. Indeed, this has been most satisfactorily established in Jamaica among the troops; and a remarkable fact corroborating this statement is, that by returns to the Horse Guards, it is shown that only one death took place at Newcastle Barracks, in that island, out of a force of 700 men, for the quarter ending Sept. 30, 1842; and the same may be asserted of other regiments in the West Indies, and of the seamen in Her Majesty's ships on the coast. But the excellent qualities of Chocolate were known not only to the Mexicans and Peruvians, from whom, as a matter of course, the Spaniards acquired a knowledge of its properties; but European nations also acknowledged its virtues. The Portuguese, French, Germans, and Dutch, considered it an exceedingly valuable article of diet, and Hoffman looked upon it both as a food and a medicine. In his monograph, entitled "Potus Chocolate," he recommends it in all diseases of general weakness, macies, low spirits, and in hypochondriacal complaints, and what since his time have been termed nervous diseases. As one example of the good effects of Cocoa, he adduces the case of Cardinal Richelieu, who was cured of eremacausis, or a general wasting away of the body, by drinking chocolate. Liebig and other chemists have demonstrated beyond question that no part of an organ which possesses motion and life is destitute of nitrogen:—"All parts of the animal body which have a decided shape, which form parts of organs, contain nitrogen;" and the chief ingredients of the blood contain 17 per cent. of nitrogen, and no part of an organ less than 17 per cent. It follows, therefore that nitrogen is that principle of the body which, being in the greatest quantity, and pervading all tissues, is that most frequently wasted, and most frequently in need of renewal. This must be admitted. It follows, then, that those substances which possess this principle in the greatest quantity in a given bulk, are those which must be best calculated to renew that which has been lost or wasted by the operations of the body. Now caffeine (the principle of Coffee), and theobromine (the principle of Theobroma Cacao), are the most highly nitrogenised products in nature, as the following analysis will show:—Caffeine according to Pfaff and Liebig contains—

Carbon	49·77	Nitrogen	28·78
Hydrogen	5·33	Oxygen	16·12

Theobromine, according to Woskresensky, contains—

Carbon	47·21	Nitrogen	31·28
Hydrogen	4·53	Oxygen	17·00

—*Dr. Burns, in Symonds' Colonial Mag. (abridged).*

Upon the Degeneration of Brussels Sprouts.— The degeneration of this plant has been much discussed. It remains unchanged in the soil of Brussels, and also in the environs of Louvain, but at Malines, which is at equal distances from these two towns, and where every possible care is paid to the cultivation of vegetables, yet, after the first generation, it loses its peculiar character. It does not, however, appear that any particular soil, or special precautions, are necessary for its cultivation, for these sprouts grow in Brussels and its environs, in all kinds of soils and situations. According to M. Van Mons, its degeneration had been very sudden at Malines. "The plants which I sent there," says he, "and which were produced from true seed, made shoots exactly like those which are seen at Brussels; but the seed which was obtained from it produced plants which made shoots, not in little compact heads, but open, with long drooping leaves; so that after the third generation, it entirely lost its primitive character. The same phenomena of degeneracy have also been observed in Germany, where, at different times, they have tried to cultivate Brussels sprouts. At my request," continues M. Van Mons, "they sent me some seed, gathered from the degenerated plants. I sowed it by itself, and as the plants grew, I observed that they showed the same character of degeneracy that they did at Malines. I allowed them to seed, which I carefully gathered. The second time of sowing they came nearer their original character, but the heads were still not very compact, and did not shoot a second time, as the true sort does. At the third generation, the plants had regained all the merits of their original character." These experiments, and their results, certainly deserve our attention; but as we have said before, the influence of the pollen extends to such great distances, that the re-establishment of the sprout might be attributed to fertilisation by the pollen of sprouts growing in the neighbourhood. Besides, it is easy to explain the degeneracy of a plant, if external influences become unfavourable to it; but that a plant once degenerated may regain its original characters by mere local influences, would require more than one experiment to prove.—*Journal d'Horticulture de Bruxelles.*

On the Advantage of the Use of Carbonate of Soda in the Preparation of Coffee (by Professor Pleischl).—It is a fact well known in Prague, that the water of the wells in that town is better adapted for use in making coffee than the river water; comparative analyses of the water indicate that this depends on the carbonate of soda contained in the former. Pleischl found this opinion corroborated by the fact, that a small quantity of the salt added to Coffee improves its flavour, and advises consequently the addition of 40 grains of the pure carbonate to each pound of roasted Coffee, as an improvement to the flavour and also to the therapeutic effect of this beverage, as it neutralises the acid contained in the infusion. —*Pharmaceutical Journal.*

New Zealand Coal.—Some interesting specimens of coal have been recently brought over from New Zealand. The coal traverses, in seams, the seagirt rocks of the island, and the specimens that have come to hand are nodules of a moderate size, composed of carbonate of baryta, coal, and sulphuret of iron. The coal itself is exceedingly black, clean, and glistening, is easily inflammable and appears to be little, if anywise, inferior in quality to the best Wallsend or Lambton Main samples in the London market, and far superior to the Burdwan coal of India. The proportion of coal to baryta and sulphuret of iron, in the above samples, is as 13 to 20.—*Daily Papers.*

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Where practicable, plant-houses ought to be covered with mats or some other covering in severe weather, particularly the stove. The steady high temperature maintained in Cucumber-pits could not be effected without thick coverings; slight skeleton frames made to fit the glass sashes, and covered with some waterproof material, are most convenient, and in the long run the cheapest. Where mats are used they should be sewn together, for the convenience of being rolled off and on easily. All stove plants, except a few Orchidaceæ and some bulbs, &c., should now and at the new year be quite at rest, and in their winter quarters for cold weather. No more water should be given to the roots than what will keep their leaves from flagging, but the atmosphere ought to be kept more or less moist. A high dry atmosphere is much more prejudicial to stove plants than any cold they can suffer in a temperature of 45°.

Conservatory.—About 45° is the best temperature for this house in cold weather; not but that the generality of half-hardy plants will outlive the winter if the frost is kept from them, but 40° is high enough for [illegible] and only used [illegible] specimens without plants in flower. A few good stove plants and a forcing pit are essentials to a good conservatory in winter. See that the fire-place, flues, and pipes act properly, as we often hear of accidents arising from such sources. Where the heating apparatus is sufficient to keep up the required temperature, accidents are more likely to follow. Sometimes plants are injured at this time by being placed over where the pipes pass under the pavement, &c.; in such cases an empty pot placed under them would lessen the risk of the roots being dried to death. Another source of great injury to plants in the border is their roots getting in contact with the walls which divide the flues from the hot water pipes where they are so arranged. Keeping these parts well watered prevents part of the injury, but in cases of this sort the beds or borders ought to be protected by a few inches of some non-conducting material, as dry sawdust or pounded charcoal, cased with a brick-on-edge wall between it and the soil. This arrangement could [illegible] be omitted where the pipes run under the paths, &c.—*D. T.*

II.—FLOWER-GARDEN AND SHRUBBERIES.
Out-door Department.

This has been a very favourable season for the blooming of out-door Chrysanthemums, and I could not have wished to have ever before seen them in such full condition, or to so much advantage. [illegible] of the flower-garden, especially in the [illegible], by the [illegible] of more attention than has been usually bestowed upon them; and for that reason I have, [illegible] the names of the flowers. Chandler, who favoured us with specimens of their newest flowers, made an arrangement [illegible] in the figures below, in which some of the best sorts in cultivation are grouped according to their complementary, or most contrasting colours. The figures may be considered either to represent separate groups, or single plants in a large bed. Whichever arrangement is adopted, it is necessary that the plants should not exceed [illegible] in height, and for this reason they ought to be layered in July in the reserve garden, and be removed to their flowering quarters in October —

1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20	21	22	23	24	25	26	27
28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45

1 Isolier	16 Aristides	32 Marie
2 Golden Lotus, flowered	17 [illegible]	33 Compactum
3 Imogene	18 Julius Cæsar	34 Comte de Liu
4 Casimir Perrier	19 Park's Small Yellow	35 Elegans
5 Geoffroi St. Cyr	20 Général Lebarde	36 Duc de Cornegliano
6 Horatio	21 Horatio	37 Phidias
7 Madame Pompadour	22 Conductor	38 Defiance
8 Defiance	23 [illegible]-Perlope	39 De Creuil
9 Surprise	24 Marshal Soult	40 Annie Jane
10 Grand Napoleon	25 Comte [illegible]	41 Queen of Yellows
11 Lucidum	26 Empress	42 Leontine
12 Incomparable	27 [illegible]	43 Arago
13 Celestial	28 Julius Cæsar	44 Formosum
14 Sappho	29 Minerva	45 Fischer
15 Bijou	30 Queen of Gipsies	
	31 Phidias	

The preceding arrangement would, I am certain, produce a fine effect in the autumn, and would amply compensate the culturist for any care he might bestow upon the preparation of the plants.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Should the weather continue frosty little can be done amongst Florists' Flowers; still there is always full employment even in unpropitious weather like the present. We last week stated that Carnation compost (turf, as the case may be, should be frequently turned: when the outside of the heap is frozen it may be removed, so that another layer of soil may be exposed to the action of the frost: should the hard weather continue, this in like manner may be removed, and each successive crust taken away till the whole heap has been frozen. This has a highly beneficial effect in [illegible], and is the means of destroying the eggs and larvæ of [illegible] insects. Leaden Carnation pegs may now be straightened, cleansed by washing, and put by till the next layering season; fresh ones may also be cast. Carnation sticks should be repainted, and, in fact, all auxiliaries must be attended to. As for layers in pots, the less they are meddled with during severe frost the better; where they have been potted off early, and are well established, they will endure severe cold without injury, and may have all the air possible; on the other hand, if they have only been put in during November, the frames must be kept rather close, only giving air during the middle of the day. *Auriculas*—When healthy will bear frost well enough. The frame-lights may be taken off in the day. We have known the soil in Auricula pots [illegible] as hard as marble without any apparent injurious effect on the plants. *Ranunculuses*—May occasionally be looked over, taking care to keep them in a moderately dry place; if not previously done, the roots may be cleaned and made ready for planting. The beds will be benefited by being turned during the frosty weather, but as Ranunculuses do better on beds of a close texture, it will be as well not to remove the soil after the ground is frozen, merely throw it up in ridges of about [illegible] inches, that thus be exposed to the action of the weather, and may remain so till planting time, when all that need be done will be to rake the beds level, previous to putting the roots in the ground. *Pansies*—Are kept by many in pots during winter; when well established they will bear a great degree of frost. It would be advisable, however, where the collection is of importance, to hoop the beds, over which mats may be thrown.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—During the continuance of severe frost, the temperature of the fruiting-pit need not exceed 60° by night. The other Pines may also be kept a few degrees lower than in mild weather without injury, if not with benefit. The fires necessary to maintain a high temperature during severe frost, are always more or less injurious to the plants, as a corresponding degree of moisture cannot be beneficially maintained. Examine frequently the plants near the pipes or flues, and supply water to any that may require it.

Vineries.—The best time to start Vines for an early crop has often been discussed, and some attempts have been made to have ripe Grapes in March, by beginning to force in September or October. This, however, is not often done, November being the time when most gardeners begin to force their first house. From my own experience, I am led to believe there is no difficulty in getting Grapes early in March, even from Vines having their roots outside the house; and I will shortly give my reasons for so thinking, and my mode of practice. Vines to be started between this time and Christmas should now have their roots covered with leaves and stable litter, so as to create a gentle heat in the border, in order to put the roots in advance of the branches. Continue to keep the night temperature of the vinery started in November at 50°, if the buds have not began to swell generally, and sprinkle frequently the Vines and the floor of the house. Vines now breaking keep between 50° and 55° by night, and 60° by day.

Peach-house.—Continue to keep the night temperature at 50°, with a day temperature of 55°, allowing a rise of 10° or 15° with sun-heat. As soon as the blossoms begin to expand, let a small portion of air be left on during the whole day, making up the deficiency of temperature by fire heat, if necessary. This is requisite to give strength to the blossoms. Sprinkle the trees frequently, until they are in bloom, after which only sprinkle the floor and paths until the fruit is set.

Cherry house.—This house may now be shut up, and kept at a temperature of 45° with fire-heat. Cherry-trees are easily excited; great caution should therefore be used not to keep them too warm. Giving air is not necessary, except during sunshine, until the buds begin to expand, when it must be admitted at all favourable opportunities. Plunge trees in pots in slightly-fermenting material.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

The latter end of last week, and the commencement of the present, would witness abundance of protecting operations. Fortunate were those who had everything in readiness for the work, for, though we had a warning of keen north-easterly winds for some time, yet 12 or 16 degrees of frost has of late been so uncommon in the beginning of December, that many of us are too apt to procrastinate, and say "It is time enough yet." All the more tender vegetables, such as Cauliflower, Lettuce, &c., previously secured, will now be found of great service during the winter. The possession of rooms, or sheds, with thick walls, and lathed and plastered so as to be cool in summer, and warm in winter, or access to cellars, or underground rooms, will be of great advantage, as then a supply may be maintained with comparatively little trouble, during either severe weather in winter, or for a month or two of dry scorching weather in summer. The north side of a wall, with material to keep out the wet, and leaves or straw, to keep out the frost, may also be used with advantage. The passages of an old-fashioned ice-house, to which access is requisite several days in the week, may also be used as a substitute for cellars, &c. I tasted some Cauliflowers the other day, crisp, and fine-flavoured, that had been so kept for more than two months. *Store-house.*—Secure Potatoes from frost; examine Onions, removing every one that has the smallest speck; keep a supply of Turnips, Celery, Jerusalem Artichokes, Horse-radish, &c., in case the frost should be apt to continue. *Fruit-room.*—Keep the temperature as regular as possible, ranging from 35 to 45°; if allowed to rise higher, the fruit will ripen too fast; and if the fruit is frosted, the flavour will be apt to be injured, besides being liable to rot, if it should be thawed suddenly. When it is desirable to render any sort fit for table, it may easily be done by exposing it to a higher temperature, and thus accelerating the saccharine fermentation. *Forwarding.*—Keep up a supply of herbs, such as Tarragon, Mint, &c., by placing roots either in pots or in Asparagus-frames at work. The same thing may be done with Parsley, Chervil, &c., if you are likely to be short. Fill pots or boxes with Rhubarb, Sea-kale, Chicory, &c., to be placed in the Mushroom-house, or in any corner where you can have heat and darkness at command. Those who have commenced Cucumbers, or have some in a bearing state, will find considerable attention necessary, where there is nothing but fermenting material to depend on.

Routine.—Wheel dung upon vacant ground; remove old decayed borders, and drive good fresh loam to form new ones. Mulch all fresh-planted fruit-trees; protect the tops of those the wood of which is not properly ripened, with Fir-branches, Fern, &c. Clean old shreds not too much wasted for use, by boiling them, and cut plenty of fresh ones. Deprive nails that have been used, of the adhesive mortar, &c., by heating them red hot in an iron vessel; and to prevent them from rusting, immerse them in oil before they cool. Anoint all trees and bushes that are pruned with a mixture of equal parts of cow-dung, clay, soot, and lime, made to the consistence of paint, with strong soapsuds, urine, or the rich drainings of the dung-hill; and if you prune at all in such weather; let the wounds be immediately daubed up with a thick composition of the same. —*R. F.*

VI.—ARBORICULTURE.

Old Woods.—As the weather has set in frosty, continue to fell trees, and clear them away. Cut hedges, and forward any other work which can be done in frosty weather.

Coppice.—The cutting of poles and other produce might be forwarded, where there is much to do in that way; but February, March, and April is the best season for such work.

Young Plantations.—Where there is much thinning to be done, such weather as we now have is excellent for cutting out Larches, &c.; but such plants as are required to spring up again, for underwood, to be headed off, should be left till the spring months.

Hedge-rows.—Plashing and cutting these may be proceeded with.

Nursery Work.—Little can be done now in this department while the frost lasts. Secure the plants from hares and rabbits, if previously omitted; and shelter tender plants from the severity of the weather.—*W. B.*

VII.—COTTAGERS' GARDENS.

Pelargoniums that were cut down, disrooted, and repotted in fresh soil early in autumn, should now, if they have been well treated, be handsome plants, and should be carefully protected from frost. In weather like the present, these, as well as other plants, should be drawn back from the window, or set down on the floor of the room. Water very sparingly while the frost continues, and even in mild weather no more water ought to be given to plants in windows in winter than just enough to keep *all* the soil in the pots sufficiently moist to maintain the plants in a healthy state. Cauliflower-plants, if any, growing under a south wall, will be greatly benefited by a few Spruce Fir-branches or some other material being laid over them, partly with a view to keep off the severe frost, and partly for the purpose of preventing the plants from being suddenly thawed by sun-heat in the middle of the day, for no plant that is at all tender will stand being subjected alternately to hard frost at night and a moderately high temperature during the day, which is generally the case with plants that are unprotected in such a situation. Now that the ground is hard frozen, and nothing for the cottager to do in the way of digging, I shall feel greatly obliged to any one who will send an account to the *Gardeners' Chronicle* Office of the greatest depth to which the frost has penetrated the soil, when the frost breaks up.—*J. McH.*

State of the Weather near London for the week ending Dec. 12, 1841, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 17th 1832—therm. 57°; and the lowest on the 18th, 1841—therm. 16°.

Notices to Correspondents.

The Reprint of Mr. PAXTON'S COTTAGERS' CALENDAR is now ready, price 3*d.* each Copy. An Index has been added to this present Edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5*s.*

APPLES.—*G.*—The Waltham Abbey Seedling is a good kitchen Apple, requiring very little sugar. You will probably find it, when cooked, much superior to the very sweet Apples you mention.‖

ASPHALTE.—*G. R.*—This substance has not been used in the gardens of the Horticultural Society for the roofs of buildings. It has only been employed for small boxes to guard plants in the open air from cold, and to cover borders for experimental purposes; for this it answers very well. We are unacquainted with the other. Your commission shall be attended to.

BOOKS.—*A. B.*—"Glendinning on the Pine-apple," and "Hamilton on the Pine apple." Both should be in the hands of all gardeners.

CAMELLIAS.—*Amateur.*—Certainly Camellias will grow against a brick wall with an east aspect, in a border of fresh sandy loam, leaf-mould, and peat, 3 feet broad and 1 foot deep, with 9 inches of broken bricks and gravel below, upon a dry bottom, if you cover them during winter with sashes and mats when necessary, although you are in a rather cool and moist climate. Plant them 6 feet apart; if they like the soil, they will soon meet. It will be as well, however, to enrich your soil with a good dressing of manure. Experiments show that guano and urine furnish a most efficient liquid manure for these plants. Keep their stems pretty close to the wall, but suffer the branches to grow bushy. The mat covering will not be important, unless the weather is very severe, and not even then, if your sashes are tight, and the border thoroughly drained. As to Mangoes, they most certainly will not bear the treatment of the Peach. It is folly to think of it.

CARNATIONS.—*G.*—The "black spot" on the leaves of Carnations is infectious, propagating itself in the same manner as *rust* in corn, or mildew on plants. If you will submit them to a powerful microscope you will find that they are composed of innumerable small *fungi*. We should imagine that the spots on the leaves of Polyanthuses (though we have never submitted them to the same test) are of a similar nature.—*W.*

CELERY.—*An Inquirer* solicits information from some of the successful competitors at the Uxbridge Show as to their manner of managing to obtain such fine heads.

COVERING FOR FRAMES.—*J. G. Reading.*—The following is the mode of preparing the composition described by "Devoniensis," at pp. 301, 1843; and 392, 1841, viz., "Three pints of old pale linseed oil, 1 ounce of sugar of lead, and 4 ounces of white resin. The sugar of lead must be ground with a small quantity of the oil and added to the remainder, incorporated with the resin by means of gentle heat. The composition is to be laid on by a brush, after the calico is nailed to the frames. One coat annually is sufficient. It dries in a short time when exposed to the air; and excludes as little light and heat as anything except glass, and does not become mildewed."

FRENCH BEANS.—*An Old Subscriber.*—The Early Dwarf Dutch Haricot is one of the very best for forcing.‖

GAME.—*J. M.*—We are sorry to hear that your plantations are destroyed by hares and rabbits; and we are still more sorry to be unable to help you to a remedy. Shoot, snare, trap, and poison, we should say, if you dare; but as we presume you have no taste for transportation, we do not advise you to practise such devices. The truth is, that until the Game-laws are wholly repealed, poor people must submit to have their property destroyed for the gratification of the rich.

GOLD FISH.—*W. Ellis.*—The trout is a fish of prey, and consequently would devour small Gold-fish. The best time to put Gold-fish (that have been kept in a glass globe in the house) into a pond will be the spring, say the end of April, or beginning of May, and not in the autumn. The Strawberries can be had of all nurserymen.

HEATHS.—*W. T. O.*—The following varieties, if treated in the usual way, will flower between the months of November and May, viz., Verticillata, Mammosa, M. pallida, Hyemalis, Willmoreana, Wescotii, Grandinosa, Arbuscula, Umbellata, Lamberti, L. rosea, Vernix coccinea, Acuminata, Persoluta rubra, P. alba, Pyramidalis, transparens, and Regerminans. In the case of the plants exhibiting a disposition to bloom early in summer, the strongest of the shoots should be stopped, which will make the plants flower more profusely in autumn and winter. Heaths are not fond of manure. The sizes of flower-pots vary in different parts of the country; a No. 12 near London measures 11½ inches in diameter at top, and 10 inches in depth.‡

HEATING.—*C. N.*—We should not have thought it possible that your house would be too damp. If it is so, you may diminish the porosity of your tiles by a coat of Roman cement. That would be the cheapest plan, and effectual.——*A. B. J.* says that in "Loudon's Encyclopædia of Gardening," p. 590, is a paragraph respecting the cementing of brick flues with "lime putty." He inquires what is meant by "lime putty," and how to make it.

HOTHOUSES.—*A. B.*—Two feet is not too much for the width of your shelves, but that is a point of little consequence, and usually depends upon the fancy or objects of the person who constructs a greenhouse. It is of far more importance not to construct such shelves of wooden rails. By all means use, if you can, stone or slate shelves. The pipes may be midway between the floor and the shelves, but that is not of much moment; the *lower* you keep them, the better. Hollow walls have the advantage over solid walls of being rather cheaper, and much drier and warmer. Nine inches are enough for the side shelves. Determine the size of the panes of glass by the size of your pocket.

INSECTS.—*I. A. M.*—The leaves of your plants have probably been punctured earlier in the year by the Thrips or some other insect, but the species cannot be determined, as there are no specimens to be found upon them *R.*

IVY.—*Philo-kissos.*—This plant does not derive much nourishment from the roots by which it is attached to walls; by no means enough to render the branches independent of the roots in the earth. If you want to cut a window through a mass of it, you must do so by carefully putting it aside—not by cutting through the main branches.

LESCHENAULTIAS.—*J. W. B.*—Your treatment has been judicious. These plants do not require stove temperature, nor do they like it. Full details of their management would occupy more space than we can afford them at this late period of the year. As soon as the next Volume commences we shall give *full practical directions* for the management of all such things.

MANURES.—*Hounslow.*—Certainly, if you have no tank to hold the chamber-ley, pour it upon your beds; that is better than letting it run to waste. But it is a bad way of applying it. Cannot you get an old wine hogshead or something of that sort, and when it smells throw in some sulphate of iron? You may depend upon it this sort of manure, well managed, is among the best, if not the best of all.

MISTLETOE.—*R. W. T.*—The Mistletoe is found in this country upon the Lime, Maple, Apple, Oak, Willow, and Poplar. In Germany it grows in great quantities upon the common Pine. It may be increased by making an incision in the bark of the tree on which it is to grow, and inserting a berry or two; then tying a little damp Moss over the part. The operation may be performed in April or May; the berries like to be kept rather moist until they begin to grow.‡

NAMES OF FRUITS.—*T. H. T.*—1, Beurré Diel; 2, Crassane; 3, Glout Morceau; 4, Chaumontel; 5, Passe Colmar; 6, Beurré Diel; 7, Marie Louise; 8, Brown Beurré; 9, Chaptal; 11, Easter Beurré; 12, Bishop's Thumb; 13, Blenheim Pippin.‖——*Mickle.*—Nos. 1 to 6 inclusive, correct; 7, Scarlet Nonpareil; 10, London Pippin; 11, Royal Russet; 12, Northern Greening.‖——*A Subscriber.*—Your Pear is not the Van Mons Léon le Clerc.‖

NAMES OF PLANTS.—*D. M., Cork.*—Maxillaria picta.—*M. R. L* Acacia lophantha.——*Alpha*—1. Viola lutea; 2. Anemone ranunculoides; 3. Chamæledon procumbens; 4. Campanula; 5. Trifolium elegans; 7. Smilacina bifolia; 8. Erigeron acris; 9. Myosotis arvensis; 10. Trifolium incarnatum.§——*B.*—Apparently Oncidium Suttoni.

PINES.—*Reformer.*—Your questions should be addressed to the nearest bookseller. Such inquiries as you have made cannot be answered without subjecting the answer to advertisement duty.

ROOT-PRUNING.—*An Old Subscriber.*—If the roots of young trees can be properly spread out it is not necessary to prune them, in planting, if they are sound; and all that is unsound should of course be cut clean off.‖

ROSES.—*S. Warnford.*—The following are handsome, and are suitable for being planted out singly on a lawn, viz.:—Lamarque, Madame Desprez, Brennus, Félicité Perpétuelle, Blairii, Billiard, Amadis, and De Lisle.‡

STABLES.—*Eques.*—We will give you an answer next week. It is certainly desirable that a loft or chamber of some kind should be constructed over a stable.

STRAWBERRIES.—*John.*—Some kinds of Strawberries originally obtained from North America, and varieties subsequently raised from them, are so hardy that our most severe winters do not materially injure them. But the Chili Strawberry is rather tender, a characteristic which the numerous cross-bred varieties from it more or less inherit. Myatt's British Queen, and some other new kinds, though not perhaps directly cross-bred, yet appear to have something of the Chili in their constitution, and therefore you will do well in covering those you planted in August with litter, or leaves, or with a mixture of both.‖

TIMBER.—*Clithero.*—The plan of barking trees while standing, and leaving them till another year before felling them, has long been practised, but it seems out of favour. Boucherie's mode of injecting trees is only applicable to them when freshly cut or growing. His mode of proceeding has been described at p. 911 of the Volume for 1843.

TRANSMUTATION OF CORN.—We learn from a correspondent that the statement in an Irish newspaper about Oats having been found growing on an ear of Wheat originated in error.

TRANSPARENT COVERINGS.—*X. E. L.*—The turpentine should not be boiled with the oil, but stirred into it when taken off the fire. The oil is raw linseed-oil.‖

WINDOW FLOWERS.—*J. H. G.*—All common greenhouse plants, with the exception of Heaths and shrubs of that description, will grow in windows, provided they are properly managed. The easiest to grow are what gardeners call soft-wooded, such as Geraniums, Fuchsias, and Aloysias; or herbaceous plants, like Chinese Primroses; or succulents, among which Echeverias and some of the Crassulas, especially C. coccinea and versicolor are the best; or, finally, the common bulbs and corms called in the shops Dutch roots. The difficulties to contend with in a sitting-room are darkness and dryness of the air; the former interferes with blooming, the latter with growing. The former is only to be remedied by turning the whole window-garden out of doors for a few weeks every year; the latter by the use of bell-glasses at night, or similar contrivances. The common errors to avoid are insufficient drainage, a most important point; watering with cold water, and allowing water to stand in the pans that receive the pots. In the early part of next year we shall furnish a series of articles on these matters, till when we must solicit your patience. For outside creepers, take Honeysuckles, Glycine sinensis, White Jasmine, and the Sweet Virgin's Bower.

MISCELLANEOUS.—*F. M.*—Triptilion spinosum is a pretty plant enough, but very hard to grow. We doubt whether it can be had in the trade. It may be kept in a cold frame, but it requires a very abundant ventilation, and is best in a greenhouse.——*A. W. B.*—Caffre Corn is the grain of Sorghum saccharatum and some other species. It is too tender for cultivation in this country. The Hottentots are very fond of sucking the sugary straw. The common Passion-flower often ripens its fruit near London. We never heard of its seedlings being hardier than the parent, and should doubt it. Your information delights us.——*J. C. S. B.*—Neither you nor any one else can raise Rhododendrons true from seed, unless you take the precaution of *setting* them when in flower. If you sell them all for R. ponticum nobody can complain.——*J. H. G.*—You can have all the Numbers for this year.——*Tamarisk.*—The arrangement of plants in a garden, according to their natural system, is possible, but incompatible with ornamental effect. For this reason it is not found in gardens. At the Horticultural Society's Garden the plants are usually labelled with their names and native countries. R. E. is alive and well; he is not the person to be alarmed by silly and ignorant people; but he has been too much engaged to find leisure for us. With the turn of the year his contributions will be resumed. Your question concerning species is very difficult to answer, for it involves some of the most obscure phenomena of vegetation. It is probable that we shall touch upon it in a few weeks. As to the other matter, it is, we fear, irremediable.——*D. P.*—Cabul being a large city several varieties of Melon are sent from there, which are all termed Cabul Melons. The name is not applied to any particular sort, consequently both your green-fleshed and scarlet-fleshed varieties may be equally Cabul Melons.‡——Received, *X. X.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

DRAINING OF LAND. — THE WORKMAN'S LEVEL, invented by Mr. BAILEY DENTON, is made and sold, as approved by him, by Messrs. JONES, Opticians, 30, Lower Holborn, London, price 30s.

The Agricultural Gazette.

SATURDAY, DECEMBER 14, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Dec. 18—Agricultural Society of England.
THURSDAY, Dec. 19—Agricultural Imp. Soc. of Ireland.
THURSDAY, Dec. 26—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Dec. 19—Richmondshire. Grove Ferry.
Dec. 20—Wrentham. Stoke Ferry.
Dec. 21—Winchcomb. Gloucester.
Dec. 23—West Hereford. Fairford. Wenlock.
Dec. 24—Yoxford. Framlingham. Rayleigh.

WE refer our readers to the Report, in another column, of the SMITHFIELD CLUB SHOW OF FAT CATTLE, &c., which has taken place during the past week. We shall have a few remarks to make next week upon the relative and actual importance of that branch of farming which this Society takes under its patronage. In the mean time, we have only to observe that the animals shown were in no respect inferior to those exhibited last year; and, what is of importance to the exhibitors, the weather has been such, that the butchers have not been afraid to give full prices for what has been sold.

LET us now apply to the systems under discussion—those of PERMANENT PASTURE and ARABLE CULTURE—the tests, the accuracy of which we last week justified. How do pasture lands fulfil the required conditions? Do they yield much profit to the occupier? Are they largely productive of food for man? Do they give much employment to the labourer? The very *best* pasture lands—lands naturally fertile, and upon which Grass is a natural crop, and is, therefore, produced in abundance—answer the first and second questions satisfactorily. They afford a good profit to the owner and occupier, and produce a fair amount of food, in the shape of beef and mutton, for the public. The third condition, however, is totally neglected; they provide scarcely any labour. The labourer's share is, in fact, absorbed by the owner, and that without gain to *him*. For instance, upon soil of this sort the rent is never less than half the gross produce. The same soil under the plough pays only one-fourth its gross produce; though ordinarily the *amount* of rent is the same in each case. If labour were employed in the former case, as in the latter, rent would necessarily suffer a reduction. It is obvious, therefore, that the former system yields too little produce, as the rent is the same in amount in both cases, and that its produce is divided between the *owner and occupier only*, instead of admitting the labourer to a share. To admit him to a share without diminishing that of the owner and farmer, a system must be adopted which produces *more*. Whether this can be done or not, however, he is entitled to his proportion, and in this system it is forgotten.

If we apply the same test to the medium and inferior Grass lands—in fact, to three-fourths of the pastures of the country, the demerits of the system are fully developed. The profit upon them in the shape of rent is small, and the interest to the occupier, except in the shape of convenience or accommodation, is in most cases insignificant; in many it is on the wrong side of the book. The gross produce of such land, in the shape of flesh, is on the same scale as the profits—fat, of course, it does not supply. Indeed, there is a great proportion of our inferior pastures which will not *feed* anything. Upon these young stock *exist*, and the progress of age is in some degree attended by growth; the stock, therefore, in time acquires an increased marketable value. In amount, however, this is trifling, and would (were it not that such lands are but *parts* of a farm, and are in some cases let for convenience, and make part of a better bargain) afford a rent very much less than they now pay.

On these soils, however, the labourer is entirely forgotten. Producing so small an amount of food for the country—*little* for the owner, and *less* for the occupier—there is *nothing* for the workman; for the amount of employment on bad Grass is not worth naming. On each point, then, in which it is essential that a system of management should excel, this fails. A method which affords little for anybody, and nothing for some who ought to receive advantage from it, cannot be acceptable to any interest, or worthy of being practised by any enlightened cultivator.

The question is, however, now, How would the arable system answer in these cases?

To plough out these soils, say many spirited and intelligent advocates of the arable system, would do all that we require; would protect the two interests which, under the other system, suffer most—the country and the labourer—without injury to the interest of the owner and cultivator.

Investigation bears out this statement. Even on the good pastures, to which we in the first instance referred, the arable system would produce to the labourer at least a quadruple supply of *employment*, and to the country a doubled amount of *produce*; for two excellent artific al green crops, and two grain crops, would undoubtedly be twice the value of four crops of Grass to be depastured. *The profit*, therefore, would surely not be diminished, as there would be one-half of the produce to pay the labourer and other expenses, and still as much left for rent and profit as was produced altogether under the pasture system. This is evidenced by the fact already noted, that a similar rent for land under the plough and under pasture, is at least calculated at respectively one-fourth, and half the produce. It is clear, therefore, that the produce is in one case double what it is in the other, and that one half of it is paid away in the *extra labour*, &c., and still the rent and profit is as great upon the arable as upon the Grass land.

If these advantages accrue in adopting the system upon even *good pasture land*, how much more strongly must they be felt upon the ordinary and inferior soils, where, in many cases, sterility is the natural condition? To such poor or unimproved soils rich herbage is not natural: they will not, therefore, voluntarily produce it. But by cultivation, tillage, and manure, they may be made to produce artificial crops, however inferior their natural one was, and consequently they will, under such a system, afford in a higher degree than when under Grass, all the essentials we require—viz. *profit*, *produce*, and *labour*. In illustration of this, on a moderate estimate we may, on that half of the Grass which on the alternate system would be under Turnips and Clover seeds, keep quite as much stock as the whole in bad Grass would keep. The country would suffer no loss of *mutton* from the change. We should, in addition, have the other half in corn, and this would be so much clear *gain to the country*, and would be equal in value to at least three times the former produce of the whole in Grass.

The gain to the labourer, and the profit to the farmer, &c., are also evident. With the same permanent burthens (rent, taxes, &c.) to bear, and a produce quadrupled, there is (taking the value of the old pasture for these burthens) three times the whole produce if under Grass, to pay the interest of capital with, to employ the labourer, and to spend in manures and in other matters requiring the capital and industry of the country.

Upon these grounds, then, it will be evident that the conditions which we consider essential, in order that a system of cultivation may be beneficial to *all the interests* vested in the soil, are more fully answered by the arable than the pasture method. We have no hesitation in affirming, therefore, the truth of the position which has been publicly propounded, that the interests of the community require that the change from the pasture to the arable method of cultivation should be extensively adopted on the medium and inferior lands of the country. We say medium and inferior lands, because they are far the greater proportion of the pasture lands of England; and it is on them that the greatest and most striking benefit would arise from the change of system. Moreover, the best Grass lands are principally held in small quantities, and along with other qualities of land; they are, therefore, matters of great convenience to the farmer, allowing him to keep more cattle in his yards during winter, to consume his straw and improve the quality of the manure, as he can feed them off in summer on this good Grass land. Although, therefore, by ploughing out such land we might obtain a greater annual produce, and perhaps more profit, yet, paying as they do a fair interest and affording accommodation in so many instances, it can scarcely be expected that these lands will be ploughed out solely because they do not afford labour. Nor indeed can we wish for the change while the medium and poor Grass lands exist in such quantity, and promise so much more beneficial results. In *them* the change is from *nothingness*, both as regards *occupier's profit*, *gross produce*, and *labour*, to a fair proportion of each. And from being a burthen (for such we maintain they are to many farmers who, taking them in their farms, are not aware what they pay for them, and are almost as ignorant of what they get from them) they become a source of wealth to the country, and a means of ministering comfort to our fellow beings.

The case, indeed, is simply this:—We can grow good crops, by artificial means, in soils which of themselves will grow little. Are we to compel these soils to be useful or not? We can, in fact, increase the value of the crop *fourfold*, and at the same time quadruple the amount of employment, and consequently the amount of payment to the labourer. The question, therefore is—Is it good policy to do this at a time when both are objects of the greatest national importance?

As it may undoubtedly be urged that the increase of produce and employment, to the extent we have claimed, from the conversion of pasture into arable land, is an assumption, we shall in a future Paper *prove* that facts bear out our assertions.—*H.*

INCLOSURES FROM THE FRITH OF TAY.

"WHAT is the best mode of bringing mud from the sea into cultivation?" In answer to this query I beg to say that the remarks I intend to make will have reference only to the river Tay, and of course may not be applicable in all cases, as much depends upon the nature of the river, its currents, &c., and the geological formation through which it flows; so that the alluvial deposit of one river may differ from that of another.

The subject may be divided into three divisions, and a few remarks on each made.

1st. The method of gaining land from the river.
2d. The method of protecting it when gained.
3d. The mode of cultivating it.

1st. As to the method of gaining land from the river. The process usually followed with the most advantage is to run out at intervals double rows of stakes, driven five or six feet into the ground, leaving their tops three or four feet above it, two or three feet apart from each other, then firmly filling the space between with twigs, branches of trees, or tops of hedges, calculated to catch the particles of mud but to allow the water to pass through. A sediment thus takes place between the rows, and gradually increases, and ultimately forms a firm productive surface; care must be taken to prevent all ditches or running streams from passing through it, as they would prevent it from mudding up. Sometimes a row of loose stones is laid between the current and the deposit, or between high and low water mark, which will similarly catch mud and sand, and while forming new land will, by narrowing the channel, give greater impetus to the stream, and help to deepen its bed: but lately, since the dredging or deepening of the bed of the Tay, proprietors have availed themselves of the sand and gravel excavated from the bottom of the river in forming fine sloping beaches, thereby saving the expense of loose stones. Sir John Richardson, of Pitfour, in particular, has now a fine hard sloping beach of about two miles in extent, along the extremity of about 100 acres in process of mudding up.

2d. As to the method of protecting it when gained. This is done by raising a large earthen mound parallel to the shore. The two sides of such a mound are generally formed on different slopes; that towards the land is always the most abrupt, but can never be secure if more than at an angle of 45°; that towards the water varies from 45° to 25°; of course the greater the slope the better, but as a general rule it should never be less than two feet to every foot in height—the power of the bank to resist the weight of the water, as well as to break its force when in motion, being inversely as its steepness. Some of the banks are formed with a stone wall half their height next the water, with a long slope, and then a mound of earth at the back and over it: but the earth alone is the most general mode, and seems better adapted than the other. Mr. Stephens says, "An embankment was thrown round the small island of Mugdrum in the river Tay, to protect the land from being overflowed by the tide, but it was made so steep that the first spring tides levelled the greater part of it to the ground; a second attempt was made, with the additional expense of a stone wall facing the water, which shared the same fate with the former bank. Since these failures, a third embankment has been erected, with nothing but the natural soil of the land, and the whole covered with thin turf: the length of the present slope next the sea is five times the perpendicular height of the bank, and the inner slope three times; the water meeting no resistance rolls down the long slope without doing any injury." Sluices or tunnels of boards, with a valve opening outwards on their exterior extremity, are introduced here and there through the bank dyke, to carry off the water within; when the flow water from without approaches, it shuts the valve, which remains in this state till the tide recedes, when the height of the water within being greater than that without, it presses open the valve and escapes.

3d. As to the mode of cultivating it. This does not seem to be a very difficult process, as the soil, if not taken in too soon, is comparatively dry, and naturally a very fertile one. In 1826, about 80 acres were taken in on the estate of Pitfour. The first year it was trenched to the depth of 18 inches, the surface or the undecayed vegetable matter thrown into the bottom of the trench, then sown to Oats, next Potatoes, then Wheat, and, with the exception of occasionally Clover, Oats, and Beans, has been Potatoes and Wheat, alternately, ever since; in fact, this, generally speaking, is the mode of cropping followed, Potatoes and Wheat being held as staple articles. On a neighbouring estate, about 60 acres were taken in two years ago: after allowing it to dry so as to carry the horses, it was ploughed, then levelled with a levelling box, and Oats sown the first year, then planted with Potatoes, the crop of which averaged somewhere about 20 tons per Scotch acre. Perthshire has for a long time grown large quantities of Potatoes for the London market, and these alluvial or haugh lands, as they are locally termed, are first-rate Potato-growing soils. The average rent of such soils may be from 4*l.* to 5*l.* per acre, or an equivalent in grain.—*A Strathearn Farmer.*

THE PLOUGH.

(*Continued from p.* 818.)

WE have now to consider the second question we proposed—What form of the plough will effect its pur-

pose with the least exertion of power? It is only the mould-board which is here referred to—the cutting parts of the plough, to the action of which much, perhaps most, of its draught is owing, have been already considered. I am persuaded that the theoretical consideration of this question is of little utility. I believe that the form of mould-board of least resistance will be sufficiently nearly pointed out by experiment. The question is, however, an interesting one, and that perhaps chiefly on account of its great complexity. It appears that in ordinary cases, and more especially in ploughing turf, the friction of the sod upon the mould-board is due to the action of two causes. One of these is the weight of the sod, and the other is its resistance to being bent—its elasticity. Let us divide the mould-board of the plough into two parts:—first, the front part, which is employed in raising the turf from the horizontal to the vertical position; and secondly, the hinder portion, which is employed in pressing the turf from the vertical to its ultimate position. A little consideration will show that in the former of these portions both of the above causes act, while in the latter only one of them acts. In the former, both the weight of the sod on the mould-board, and the resistance it offers to being twisted, concur in pressing on the mould board, and thereby producing friction; in the latter the sod, so far from lying on the mould-board, tends to fall away from it: its elasticity alone remains to produce friction. It is evident that the twist of a sod will be most easily effected if done gradually. If the elasticity of a turf were all that was to be overcome, this would be more easily effected by laying hold of it at a distance of four feet from where it was attached to the fast land, than if it were held and forcibly bent at a distance of only two feet from the same spot: obviously, if the elasticity of the turf only were to be overcome, the longer the mould board the more easily it would act. If we now look at the influence of the mere weight of the sod in producing friction, and thus adding to the draught of the plough, we shall find that the shorter the mould-board the more easily it would act; for the longer the mould-board, the greater would be the weight of turf lying on it, and, consequently, the greater the friction due to that weight. The inference from the results at which we have thus arrived is, that the hinder part of the plough, on which only the elasticity of the turf acts, should be as long as is consistent with convenience, and that the length of the front part of the mould-board should be such that the sum of the two portions of the friction on it—the one due to the weight, and the other to the elasticity of the turf—may be a minimum. With reference to the front part of the mould-board it thus appears that the proper dimension lies somewhere between the shortness, which is in accordance with the one view, and the length, which is in accordance with the other; in which, each kind of force being taken into consideration, the sum of the forces required to overcome each is a minimum. It is the length of the front part of the mould-board that forms the great difficulty of the question; for consideration must be kept alive to the fact, that as it varies, one of the above portions of friction increases and the other diminishes, and this too at very different rates.

For all practical purposes, however, we need not perplex ourselves thus; for in nine cases out of ten the sod has no elasticity whatever; and I believe in almost—perhaps in all—cases, when it has elasticity, the limit before alluded to, which is put to the shortening of the mould-board by the angle of repose of soil on iron, will insure to the mould-board a length greater than what would be given to it on a review of the influences respectively of the weight and of the elasticity of the sod--the one anxious to shorten and the other to lengthen it.

Were there no other matter for consideration, this would at once determine the question of the form of the mould-board of least resistance; for we have only to ascertain the length of the mould-board, such that the angle which its surface makes with a vertical plane across the direction of the plough's motion may always be more than the angle of repose of soil on iron, and then the surface of uniform curvature of this length, which commences with a horizontal line where it joins the share, and terminates with a straight line hanging over beyond the perpendicular at an angle of 45° will be the surface of least resistance, which will answer all those conditions required of a good mould-board.—*M. S.*

THE ISLAND OF LEWIS.

At a late meeting of the Glasgow Philosophical Society, Mr. Smith, late of Deanston, gave the following details of a visit to that island:—Lewis is the most northerly of the western group of Scottish islands, and though generally spoken of as a distinct island, is nevertheless connected with Harris by a narrow neck of land, from which circumstance they are sometimes called the long island. The rocks are of the primitive or granitic formation; and the surface of the country has altogether a very peculiar aspect. It appears that the peat moss has begun to be formed immediately upon the granite rock; for when you get to the bottom you find at once a rough gravel, mixed with small quantities of clay, and hardly such a thing as a distinct alluvial deposit. The whole surface is covered with bog, from 2 to 10 feet, and in some places 20 feet in depth; although the general depth may be stated at about 4 feet. Upon the surface of this bog nothing grows but Bent Grass and stunted Heath: it has a very dreary aspect. Not a tree is to be seen; and in the after part of the year, when the Bent becomes decayed, the appearance is peculiarly bleak and desolate indeed. The most remarkable thing connected with the island, however, is this—that the slightest improvement does not appear to have gone on for a very long period. The inhabitants still use the ancient distaff, although it is 100 years since it has been superseded in this country by the Dutch wheel. The advantages which the best machinery of the day possess over the distaff, are as 1000 to 1; yet, by means of the distaff, these people manage to manufacture their clothing, which, under the circumstances, is very comfortable. Their cultivation of the soil is as primitive as their manufacture of cloth. Their holdings are very small; the island has been for 50 or 60 years in the possession of proprietors who had no money to improve, or with which to encourage the people; and to this, in a great degree, their present primitive state is to be attributed. Their possessions extend only to a few acres each; and the people are congregated in villages or little towns, instead of being dispersed in farms over the face of the country, as is the case elsewhere. They have, therefore, their little portions of land around for cultivation, and a right to grazings in the neighbourhood. In regard to their houses, they do not live in dwellings such as are seen in the mainland, for they are more like huts than anything else. The walls are from 6 to 8 feet thick, composed of bog in the centre, and faced with stone inside and out. There is sometimes only one apartment, but generally two, and under the same roof the people live and keep their cattle. There is, however, a fall of 18 inches from the apartment in which the family live to the adjoining one in which the cattle are kept. This may seem to some to be rather a queer arrangement; but the people themselves consider that there are points in it which contribute to their comfort. The room in which the cattle are kept is the entrance one, and as the air passes through it, it comes into the adjoining portion of the house, appropriated to the family, in a warm state. Where ponies are kept, an outer hall or shed, beyond the cattle apartment, is reared for their accommodation. Some of the better houses have a division wall, which separates the cow-house from the family apartment; but generally this is not the case. Most people would think it strange to live along with their cattle; but the people of Lewis have different notions on the subject, and when shut up in the long winter nights, they consider it comfortable to have the beasts in the next apartment, to hear them, and see their motions, and occasionally to supply them with food. One peculiarity in the building of their houses is, that the roof is within the wall, instead of projecting beyond it; and in this way something like a series of terraces sometimes extend over half a town. One use of them is, that when the children become troublesome, or the mother is more than usually busy, the children are disposed of on these terraces or high places, and it is quite amusing to see the little whitterets looking down over the wall at what is going on below. The parents, however, do all this in the most kindly manner. They have done all they can to cultivate their little possessions in the best manner. Their cultivated portions are those from which the peat has been cut away; they then come to the gravel, and gather soil from one part to add to another. Two-thirds are taken from one part and added to another third, and thus a soil is formed; but in winter a complete pool is formed between these ridges of soil. They have done nothing in the way of draining; they have never attempted to penetrate the hard subsoil, which is often steeped in water. They have no system of winter ploughing, but just move the land immediately before planting the Potato crop or sowing the seed; and the only preparation they make is that of sometimes pulling the weeds in the summer season. Mr. Smith then described some of the implements in use among this primitive people. He exhibited the "crass-croom," or hand and foot plough. It is an instrument with a sole about 15 or 18 inches in length, thick behind and sharp in front, which latter, being the part which first penetrates the soil, is shod with iron. It is pushed forward by means of a long handle fixed into it, and also by a pin attached to the heel of the sole or sock, for the foot of the labourer. A more unlikely implement to have the name of a plough it is scarcely possible to conceive. The people lay the land over in furrows, by successive movements of hand and foot, but of course the line is not drawn in a continuous form. When two of the neighbours have a pony each, they occasionally use another kind of plough, with only one stilt, the beam of which rests on the ground. Mr. Smith exhibited this implement also, which appears to be scarcely a step in advance of the other. The great difficulty in providing their implements is the scarcity of timber, of which none grows in the island, and they have consequently to send to the mainland for it. As a proof of its value, the shaft or handle of the "crass-croom" (which is a piece of wood about the size of a broomstick) costs 3*s.* 6*d.* From the scantiness of the soil, they do not, of course, produce heavy crops. Good produce of Potatoes, Barley—or rather Bear or Bigg, for the new kinds of Barley are unknown to them—and Oats, however, are sometimes obtained, and they manage to produce these results by the skill with which they prepare the manure. It is efficacious, in the first instance, in the raising of Potatoes, and afterwards it produces a fine Barley crop. When the Barley is ripe, they do not cut it as elsewhere, but pull it up by the roots, and tie the whole up in sheafs. When it is "wen," and ready for the stack, the straw is then cut from the sheaves below the band, which has this advantage, that it enables them to stow away the grain in small bulk—a matter of no small moment in a country exposed to so much wind and rain. After the grain itself has been thus preserved, they take the straw which has been cut from it, and place it on the roofs of their houses. They lay it loosely on, just as the farmers here spread it over the top of a stack, and then tie it down with ropes spun from the Heath. In this position it is exposed to the smoke of their peat fires. The fire is placed in the middle of the room, and there are no vents; but instead of this, a number of holes are ranged all around the top of the side wall. When the smoke ascends, therefore, and a portion of it is forced back, it escapes by means of these holes. A great deal of it, however, makes its way up through the straw on the roof, and when approaching one of these little towns, its appearance is to nothing more like than that presented by the smoke rising from a cluster of heated grain-stacks. This straw becomes very valuable, from the great condensation of ammonia and other products which takes place in it. The people of Lewis plant their Potatoes without any manure whatever; but when the plant has got up to the length of 2 or 3 inches, a general unroofing of the houses takes place, and the straw which has been preparing there all the season is thrown upon the drills; it is rarely covered up, excepting in windy weather, when a slight sprinkling is put upon it to prevent its being blown away. Well, this manure gets into the soil immediately, and the Potatoes forthwith come up with the greatest luxuriance. Indeed, if guano were to be scattered on the soil, the effects would not be more rapid or complete than those produced by this prepared straw. This certainly evinces great ingenuity on the part of these people, who from the difficulties of their position, are driven to it as the only means of preparing manure. The people of Lewis, however, have also the manure produced from their cows, and their care of it evinces a degree of intelligence superior to that of farmers of much higher pretensions, for they keep it constantly covered up, and all join in the opinion that if it was exposed it would lose, to a great extent, its efficacy. When the manure, therefore, is taken out of the house for one crop, they immediately commence to accumulate for the next, and thus they keep adding to its bulk, till it is needed for the Potatoes or Barley. It may seem strange that the people should live in the next apartment to so much decaying matter; but the people feel no inconvenience from it. At the time, however, the manure is taken out, fever often prevails amongst the people, which is only attributable to this cause. Some of our best agriculturists are about to follow this plan of keeping the manure constantly covered up; I do not say that they should live in the same house with it, but it is of great moment that the manure should be constantly under cover. In Lewis they certainly follow a strict rotation of cropping. They have first Potatoes, then Barley or Bigg, then Oats—constituting a three years' shift. According to this rotation they had grown their crops for 100 years, and one might naturally suppose that the lands would be worn out by it; but this is not the case, for they had generally fair crops, and last year it was an extraordinary one. The Potatoes were good; and as to the Barley, though dark in the straw, it presented in a marked manner that golden appearance which indicated a healthy yield. On the whole, there is no doubt that if these people were properly directed in the best modes of cultivation, they would, with their habits of industry, make rapid progress. Happy days, it is believed, are yet awaiting them, for they have now got a gentleman connected with them who devotes his money to work out the improvement of their country, and otherwise promote their welfare. On their shores there are millions of tons of shell-sand, which is so nicely pulverised that it can be at once applied to the soil. It would, no doubt, be much improved were it calcined or burned, and mixed; but even taking it in its native state, great advantage will be derived from its application to the ground. There is no lime or coal, but the want of the former would be made up by this shell-sand, if they could only get easily at it. It lies amongst the perpendicular rocks around the island; and as there are no roads, the difficulty of procuring and transporting it is very great. When the roads are made, however, means will be taken by which the inhabitants will avail themselves of these deposits, and they will form a material element in fertilising the soil. So much for the agriculture of Lewis. As to their manufactures, they make their own dishes or vessels from the clay found amongst the granite gravel. They fashion the vessel merely with the finger and thumb; and the strength and thinness with which they are made, prove the quality of their clay. They turn over the neck or mouth, and by putting a cord, or rather a leather thong, round it, they are enabled to carry them from place to place, containing water or milk; and they also stand the heat requisite to boil their contents when placed on the fire. They also make their creels, for carrying out their manure, and for other uses; and the audience will be surprised to hear they are made of the stem of the Dock. So much is this plant prized amongst them, that when it grows between the possessions of two farmers, the Docks are carefully divided between them. There is not a Willow in the island; and the Dock, therefore, is very much prized for its usefulness. Another mode of the people of Lewis is that of feeding their cows on sea-ware. It is just the dulse tangle, which is often seen sold on the streets of Glasgow; and it is no unusual thing, when a woman goes out to milk the cows, to take some of this dulse or tangle, which the animal consumes with great satisfaction when the process of milking is in progress. The cows often seek it for themselves on the sea-side, especially in seasons when Grass is scarce. There are some seasons, indeed, when they almost entirely live upon it. At one time a large revenue was drawn from sea-weed from converting it into kelp; but from the various changes it has fallen in value from about 20*l.* to 2*l.* 10*s.* per ton. It does not, therefore, now pay for the

manufacture of kelp, and it is therefore better to apply it to the soil. Forty tons of sea-ware are equal to one ton of kelp, and twenty tons of this sea-ware is quite enough to dung an acre; this is 25*s.* for manuring an acre, and doubtless this sea-ware will come more and more into general use for the purposes of cultivation. The lecturer then exhibited a large bag in use in Lewis, which was made of the stem of the Bent Grass, and spun in the long winter nights; they are used for keeping the corn in, and carrying such portions of it to market as they are able to spare for sale. There is a distillery on the island, which takes up all the surplus of the Barley crop. After giving a few geological details, Mr. S. stated that the population exceeded to 17,000 souls, and there were 270,000 acres of land, which, if improved as it might be, would maintain twice the number of people in more comfort than they were at present.—*Abridged from the Scottish Guardian.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Live Stock.—East Lothian being essentially a Corn-growing county, grazing is carried on only as subservient to tillage, and the rearing and management of live stock is therefore regarded as an object of secondary consideration by most of the farmers. Cattle and sheep are fed to a considerable extent, but comparatively few of the former are reared in the county, the greater number of them being purchased annually at Dalkeith Tryst, Allhallow Fair (held in Edinburgh), and other markets; only a very few farmers keep more milch cows than are sufficient to furnish a regular supply of dairy produce for their families. Each hind or servant having a house, has also a cow supported for him throughout the year on the farm in which he works. No oxen are employed in farm labour, every description of work at which beasts are employed, being performed by horses. The attention of the intelligent agriculturists of this county not having necessarily been so much directed towards the rearing and improvement of cattle, as in other districts where these animals form a more important branch of farm management, the stock farming of East Lothian does not exhibit much deserving of commendation. There are, however, several exceptions to this, as many fine specimens of the short-horned breed are reared in different parts of the county; a circumstance confirmed by the fact that many of the prizes awarded at the Highland Society's Show in Edinburgh were carried off by East Lothian farmers.

The method of feeding usually practised is to allow the cattle, in lots of five or six, or more, according to their age and size, perfect freedom in open courts or yards provided with sheds, to which they may retire for shelter in inclement weather. Each yard has along one or more of its sides a range of shallow troughs formed of wood or flag-stones, about 3 feet high, from which the cattle eat their Turnips or other food. Oil-cake and bean-meal are used to a considerable extent as auxiliary to Turnips in fattening off cattle in spring. As has been already observed, many farmers let the greater portion of their Turnip crop to cattle-dealers, either at a certain price per acre or at an agreed rate—now 4*s.* to 5*s.* a week, for each beast.

Permanent and extensive flocks of sheep are almost confined to the Lammermoor district—the upland part of the county. The kinds kept there as being the best adapted to the situation, are the black-faced and Cheviot breeds. Improved Leicester sheep are common in the low parts, as are also the Cheviot. Crosses between the last named breeds are held to be better adapted to the soil and climate than pure sheep of either of those kinds. In the low district sheep are kept chiefly to consume a portion of the Turnip crop on the ground; black-faced hogs are most generally preferred for this purpose, as their mutton is most esteemed, and obtains the highest prices in the market. Turnips are also frequently sold to dealers to be eaten by sheep, either by the acre or at an agreed rate, generally 5½*d.* a week for each sheep. These are commonly purchased in autumn, and again sold off when ready for the butcher. A very considerable number of lambs are brought up for the supply of the Edinburgh market, and many are annually shipped for London.

The horses generally kept are of moderate size, combining much strength with activity, and partaking largely of the Clydesdale breed. These animals receive much attention, and are, generally speaking, maintained in good condition, *i. e.* equal, if not superior, to the work which they have to perform. A pair of stout horses are allowed to be capable of working 60 Scotch acres of land of an average quality. The following is the mode of feeding and managing farm horses generally adopted in the Lothians:—About the beginning of May they are turned out to graze at nights, but receive their usual allowance of Corn—three feeds of about 4lbs. each, with a limited quantity of hay during the mid-day rest; very little hay is used by the farm horses, but what is given is always reserved till the period of hard work attendant on the preparation of the land for green crops. This management is continued until the Clover is ready for cutting, the horses are then kept in the stable during the night, and receive a limited allowance of cut Grass. When the Turnip seed is all sown, and the fallow land (if any) finally ploughed and worked, the horses are again turned a-field, where they remain day and night until the carrying of the Corn-crop commences. Green Clover being then generally consumed, Tares are substituted during harvest, the horses being still kept out over night till the ploughing of the stubble, or of the land for autumn-sown Wheat begins; they then receive their full winter's feeding—about 14lbs. of Corn each, per diem, and straw *ad libitum*: four bushels of Oats is the general allowance to a pair of horses in the week. Most farmers give a boiled mixture of Beans and Barley, two or more nights a-week; and instead of giving the Corn entire to horses, it is not uncommon to bruise or break it with an apparatus for the purpose, driven by the same power that propels the threshing machine. A few Swedish Turnips are given daily to each horse during the winter and spring months, which tends very much to their improvement. There are, no doubt, many little deviations in the practice of different farms, but the above is the general management of farm-horses adopted in this county, and indeed throughout the south of Scotland. There is, perhaps, too little attention paid to cleanliness in the stable; and it is a fact generally observed by strangers, that the harness of the farm-horses here is much inferior in appearance and quality at first, to that commonly met with in other parts of Scotland, and that much less pains are taken by the servants in keeping the harness belonging to their horses clean and in good order. This carelessness is supposed to arise in a great measure from the circumstance that those working with horses are, for the most part, married servants, who are generally found to possess less taste for neatness in this respect than younger and unmarried men. In spring and summer the time of working is nine hours a day, except at seed-time and other hurried occasions, and in winter from daylight to dusk, with an interval of an hour for dinner at 12 o'clock; but in many places it is usual to go six hours at one yolking during the short days of winter, and to increase the quantity of Oats given to the horses, with an additional pair. The economy practised is to clean the horses and take dinner in the stables, to avoid the loss of time occasioned by going to and returning from the steadings.—*T. Stirling.*

Home Correspondence.

The Allotment System now appears to be caught at as the remedy and panacea to meet the distresses of the labouring poor. "Drain, drain your land and give employment," is now the cry. "Subsoil and turn chemist, to find out the food best adapted for your different soils, and you will enrich yourselves beyond belief;" for so says the editor last. Suppose this to be true—and I do not question but the man who has a knowledge of chemistry, and a purse, to drain and subsoil, may increase his crops marvellously—I ask who is to start these schemes? Why, the landlords to be sure; few tenants have the means. It is all very fine talking of the landlords laying the foundation of good crops on their tenants' lands by draining, and getting 5 per cent. for doing so. But many owners of property are as poor as the tillers of it; and others are unbelievers in these plans, or excuse themselves under various pleas. Some say, "Give the tenants leases, or they will not put their capital and give employment with that zeal in the new system as generally recommended." And some there are that would do so; but as I take it, with the plurality even of these, there would be many things wanting to bring about the desired end; for education, as far as I can see, has not travelled very rapidly in the agricultural provinces; besides, how few tenants have capital, if it had. I am no friend to leases; 9-tenths of them are dropping in, with the farms little better, often worse, than they found them. And what is the allotment system to do? The answer is glibly given—"It will ameliorate the condition of the poor." There are many difficulties in practice connected with this new scheme. It often disgusts the man, striving to assist his labourers, to find in numbers, how many are unwilling to help themselves, and how many are careless of your consideration. Certainly, many are benefited by having a piece of land, and comfort, health, enjoyment, and comparative wealth, bless many a family that cultivates it well; but how few are there of such! How many smile and say, "What new crotchet now has the squire got in his head?" How many do not pay, and say it does not answer! How many tell you, "How can I (and strength poorly fed) to work from six to six on my master's farm, and then set to work upon my own?" The wife has indoor work, and children to look after; but there are many men who think it beneath them that digging and delving for a woman is bordering on slavery. Suppose a nobleman or gentleman kept 50 labourers, and to each he gave an allotment of land; to see that they observed all the rules laid down would occupy much of his or the bailiff's time, which possibly would be cheerfully given if the results would turn out beneficial to all parties. As the seasons are the same for all, and so are the preparations for planting, sowing, and in the end reaping, the one interest, I apprehend, would greatly interfere with the other: and for the landlord in the midst of his own harvest to be asked by his labourers for half and whole holidays to do their own work, appears to me likely to create unpleasantness. If all labourers can get work all the year round, my advice to them would be to stick to it, and trust alone, for the goodness and benevolence of the old country gentleman still exists in our landed proprietors—they seldom turn adrift the man in short winter days, or when the sere and yellow leaf is come upon him. It is not with them to cheapen wages, and grind them down, and use them only for their own profits.—*L. L.* [These oft-repeated objections to the system are sufficiently refuted by history and fact. See the "Labourers' Friend" for August, September, October and November, 1843.]

Services of the Rook.—A strong prejudice is felt by many persons against rooks, on account of their destroying grain and Potatoes; and so far is this carried, that I know persons who offer a reward for every rook that is killed on their land; yet, so mistaken do I deem them, as to consider that no living creature is so serviceable to the farmer, except the live stock he keeps on his farm, as the rook. In the neighbourhood of my native place is a rookery belonging to Wm. Varasour, Esq., of Weston, in Wharfedale, in which it is estimated there are 10,000 rooks; that 1 lb. of food per week is a very moderate allowance for each bird; and that 9-10ths of their food consists of worms, insects, and their larvæ. For, although they do considerable damage to the fields, for a few weeks in seed-time and a few weeks in harvest, particularly in backward seasons, yet a very large proportion of their food, even at those seasons, consists of insects and worms, which (in the absence of Acorns and Walnuts in an unripe state, on which they, the whole of their subsistence. How, then, if my data be correct, there is the enormous quantity of [illegible] tons of worms, insects, &c. [illegible] destroyed by one single rookery; and to every one who knows how very, very destructive to vegetation are the larvæ of the tribes of insects [illegible] such a rookery [illegible] which [illegible] the means of prevention. I have understood that in Suffolk, and in some of the southern counties, the larvæ of the cockchafer are so exceedingly abundant that the crops of corn are almost destroyed by them, and that their ravages do not cease even when they have arrived to [illegible] proposed to [illegible] little [illegible] to account that rooks [illegible] either from [illegible] or that they [illegible] many rooks [illegible] is not known [illegible] insects of this [illegible] food of the [illegible] the utility of the rook, which [illegible] hood many years [illegible] and they were so numerous as to create considerable alarm among the farmers of the district. They were soon, however, relieved from their anxiety, for the rooks flocked in from [illegible] thousands, and [illegible] all destroyed in a very short time. It was stated in the newspapers, a year or two back, that there was found an enormous quantity of cockchafers in Scotland, that they deserted all the vegetation on the mountains, and people were actually employed to collect the grubs in the inclosed lands; but the rooks (which are fond of high ground in the summer) having discovered them, in a very short time put an end to their ravages.—*T. G., Cobham, Surrey.*

Tusser's Husbandry.—[illegible] MSS. to the [illegible] time there was much discussion as to whether all his papers had found their way to that depository, especially a copy of "Tusser's Points in Husbandry," to which the indefatigable baronet had added many valuable notes, containing his personal observations. I think [illegible] was employed in preparing the [illegible] these times such a work would be very [illegible] any one give any information on the matter?—*Farmer.*

Potato-seed.—In your [illegible] "A Farmer" wishes to know [illegible] preserve, and sow Potato-seed. I beg to say that the [illegible] gathering is any time from [illegible] fully ripe to the present: [illegible] in tolerably dry soil, either [illegible] keep them in the straw from frost, and in March or April take and mix the soil in which they have been kept, and sow altogether and cover with [illegible] inch deep.—*John Jones.*

Malt Tax.—[illegible] previous to 1830 [illegible] though the population had increased more than one-third, but in consequence of a reduction of beer duty in 1830, we find that the consumption of malt by private brewers was in the year only 2,649,472 qrs. of more, but in 1841 was 4,082,307 qrs.; the government in 1830 reduced the duty on malt and hops 5 per cent., and in 1840 put it on again. Now, in 1843 the consumption of malt by brewers had fallen to 3,566,298 qrs., thus showing that with a duty of 20*s.* 8*d.* per qr. on [illegible] 2,367 qrs. in 1841, the government received a revenue of [illegible]; in 1843, on [illegible] qrs., at 21*s.* 8*d.*, 3,683,489*l.*; showing a loss of 354,956*l.* by the increase of duty: whereas the 5 per cent. ought to have increased the revenue by 204,118*l.*, supposing we had no increased population from 1830 to 1843, and that the consumption had remained [illegible]; whereas the former had increased by full [illegible] per cent., and the latter had decreased by [illegible], we find that 5 years previous to the [illegible] laid on Malt and Hops, the number of acres cultivated for Hops was about [illegible]; in the last 5 years 44,500; showing a decrease of 10,000 acres during the last 5 years as compared with 5 years previous: this, alone, is a serious injury to the farmers employed in producing Hops, and also a serious loss to the revenue, for during the 5 first years the average amount of revenue derived from Hops was about 245,[illegible] during the last 5 years, with increased duty of 5 per cent., only 228,040*l.*; showing a loss of 117,[illegible] per annum by the increase of duty. Now, the object of taxes I imagine to be, to raise and increase the revenue, and not to decrease consumption, for this last might be effected by a positive and prohibitory law. The object, therefore, of the 5 per cent. duty is manifestly nullified; for we see, that as

the duty is raised, so the consumption, and therefore the revenue is decreased. Of course it is easy to see that any decrease in the consumption of an article would be the means of throwing out of employment those whose occupation is connected with it; and we now find our Union houses overflowing with persons seeking employment, who, by a total and immediate repeal of the Malt-tax, would be provided with work, and with one of the chief necessaries of life to those who are engaged in arduous and manual labour.—*A Tenant Farmer.*

Drainage and Irrigation.—In the last Number of your Paper, "A Leicestershire Farmer" observes—"It appears possible to double the value of some districts by draining alone." In the village in which I reside I see a specimen of improvement by draining. There are 18 acres of meadow and 26 of pasture. Before alterations were commenced, the meadow-land was considered of average quality—some parts very rough, and full of hassocks—[What are *they* ?]—while the produce of the other parts was good, but never very large. In the winter, during wet weather, it was always flooded; the brook was small and circuitous in its course, and this, which caused it to overflow, hindered the water from rapidly subsiding. It was not drained deep, and consequently, during the winter, was always wet, and considered an admirable place to rot sheep. So much for it in its primitive state. In the autumn of 1841, the owner commenced his operations. The channel of the brook was altered, the whole of it was deep-drained—in some parts 5 or 6 feet deep; the surface made perfectly level, and carriers formed for irrigation. One brook takes its course down the middle, and another on its higher side; and it can be irrigated during the winter, and after heavy rains in the summer. The subsoil is a stiff, tenacious clay, and the neighbours thought the owner a great fool for expecting to find water in such a bottom; the owner's anticipations, however, proved correct. At the depth of from 4 to 6 feet, he found beds of sand and gravel, whence issued a spring, in many cases not very strong, but which rose to the surface when the intervening beds of clay prevented them from draining. 15 out of the 18 acres are inclosed in one meadow; the remaining three, which were a bog, being a paddock. The improvement of the meadow cost 17*l.* per acre. The owner was regardless of expense, and some things might have been done in a more economical way, but he thought the most substantial way would, in the end, be the cheapest. In 1842 much good was not expected, as a great portion of the turf had been moved, and a large part was not finished till late in the spring. During the winter of 1842 it was irrigated, and in March 1843 it was stocked with sheep; for the months of March, April, and May, it kept more than 100 sheep, a few beasts, and the ewes with couples. It was again irrigated and mown in the middle of July; again irrigated and mown in September, bearing larger crops than ever had been known in it before. It went through the same process in the winter of 1843, and, I think, this year was stocked in February, and kept a larger quantity of stock for three months. By the time the Grass was eaten off, the dry season had commenced, and it was not possible to irrigate it; and, therefore, there was no more in it than in other meadows; though, after it was mown, there was a good after-math. After the first heavy rains, it was irrigated and mown in October; a very good crop, though, unfortunately for the owner, it was very wet weather, and he sent all his stock, and had most of it consumed by them; and they were very willing to eat it after the dry summer. The pasture-land of which I spoke, was, before draining, of good average quality; but I think I speak within bounds when I say one-third was Rushes, and in winter it was so wet as to be impassable after rain by a pedestrian. It was drained in a manner similar to the meadow, and was found to be in a similar state. In this case the expense amounted to between 7*l.* and 8*l.* per acre. The whole had years ago been drained with tiles about 15 inches deep, and therefore the cry that it was impossible to get rid of the Rushes without ploughing. The Rushes gradually diminished, and last year, 1843, there was an immense crop of Grass; this spring it was stocked till after the dry season commenced, and it never grew till the rains in the autumn. There is, however, scarcely a Rush to be seen. I should conceive the whole expense has been about 600*l.*, and the owner has let his farm at 30*l.* a year more rent than he had before. The farm is only 100 acres in extent, and no other material alterations have been made, as the owner has only had it in his own occupation five years. The arable land has been improved by cleaning, and by having more manure applied, which manure was obtained by stall-feeding, and by cutting and steaming the food during winter; but I have allowed 5*l.* for that improvement. You will observe I do not speak positively—I am merely a looker-on; but any information asked for was always given me.—*A Leicestershire Yeoman.*

Mr. Smith, of Deanston.—I have a letter now before me, dated December, 1824, from my early friend and benefactor, James Smith, Esq., of Deanston, now of 13, Queen-square, Westminster. It tells me that he is draining the whole of the Deanston farm, which I knew to be nothing but a morass, where the greyhounds sunk to the second joint every step they took; and that in a very short period, by good management, with proper draining and subsoil-ploughing, it could be brought from a condemned farm, not worth more than 5*s.* per acre, to be now let at from 2*l.* 10*s.* to 3*l.* per acre is most astonishing. Mr. S. was at that time everybody's friend, rich and poor; his advice was courted by all; all differences that were likely to lead to anything serious were settled by Mr. Smith; and I believe the greatest loss that Deanston and the neighbourhood ever felt, was the leaving of this much esteemed gentleman. He was manager of all those extensive works at the early age of 17; at that period he showed great powers as an engineer, and he is now carrying out to the fullest extent, and in the most skilful way, his draining and subsoil-ploughing all over Great Britain and Ireland; and through his great knowledge no man can be better qualified, for his heart and soul is in improving the land; and my earnest prayer is, that long before he closes his eyes, he will have the pleasure of seeing every acre in Great Britain and Ireland, producing double to what it did when he first began upon the Deanston bog—misnamed a farm.—*James Cuthill, Florist, Denmark-hill, Camberwell, London.*

Lucerne.—Your advice to "Delta," as to the mode of cultivating Lucerne, page 806, is not good. Lucerne should be planted in well-trenched ground, in drills, 2 feet at least apart, and the plants should be 12 inches, at least, apart in the rows. If "Delta" pursues this plan, putting in the seed not earlier than the last week in April, thinning them to the distance I have stated as soon as they get well out of their first leaves, he may cut the Lucerne at least twice in the first year. I think 30 inches between the rows, and 15 between the plants, a better distance; but that is mere opinion. At the distances I have named, I planted Lucerne on the 1st of last May, and although, from the extreme drought, it was for some weeks so entirely at the mercy of the fly, that I was near ploughing it in, yet when once it got good hold of the ground it grew so rapidly that we have cut it three times—the two last, heavy crops, some of the roots having by that time 70 distinct stems, and none less than 40. I find constantly many valuable hints in the *Chronicle*, and generally adopt them. Doubtless there are many who pursue the same course, and I have therefore thought it right to trouble you with this. Lucerne, properly grown on land to which it is adapted, is perhaps the most valuable of all crops for cattle-feeding, and everything should be done to promote its greater cultivation.—*Frederic Kelly, 49, Hunter-street.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

DR. PLAYFAIR'S FIRST LECTURE.

THE first of the ANNUAL LECTURES of this Society was delivered in the Theatre of the Royal Institution, on Wednesday evening, the DUKE OF RICHMOND, President, in the chair. There was a large attendance of Members, and we observed present the Marquis of Northampton, Lord Spencer, the Marquis of Downshire, Lord Essex, Dr. Buckland, Dr. Daubeny, Dr. Falconer, Prof. E. Forbes, Dr. Day, P. Pusey, Esq., M.P., Sir O. Mosley, E. Chadwick, Esq., and other distinguished Members of the Society and men of science. The Lecturer commenced by pointing out the value of the principles of science, as a guide to the practical details of art. In the present lecture he should give an outline of those scientific principles which could alone safely guide the practical man in the new features of his art. In the second he should apply those principles. Experience was by some regarded as the only guide in practice; but there were many cases in which experience could suggest no alternative in practice, and here science stepped in to the aid of the practical man. The farmer in Virginia had found, by the experience of a hundred years, that his land would grow Wheat every year; but, when his land failed to do this, his experience suggested no alternative. In other parts of America the soil had afforded nutriment to alternate crops of Wheat and Tobacco; but at last the soil failed to grow either, and individual experience was of no value. The question for the Americans to consider in these cases was, Can we again make our land grow Wheat and Tobacco as it has done? and this could only be answered by science. The answer was, that these crops had exhausted the soil of ingredients necessary to their existence, and these ingredients must be again supplied. It was the same in certain counties or districts in England; the land failed to produce certain crops in a given time, and the season could only be ascertained by scientific inquiries. It would be vain for the farmer of light lands to suggest to the cultivator of a heavy land the expedients he had found of avail in restoring the fertility of his soil, and *vice versâ*. Such differences existed in every district, and the cause of these differences could only be ascertained by scientific inquiry. It was only by a combination of experience and science that the object of the pursuit of the farmer could be obtained, and for that object this Society had been instituted. Before proceeding to theory, he would make a statement of the constituents of the soil required by plants; these were:—Silica, alumina, lime, magnesia, iron, potassa, manganese, soda. These bases were combined with sulphuric acid, phosphoric acid, chlorine, fluorine, iodine, bromine, carbonic acid. These were the ingredients with which the soil was stored, and out of which the whole vegetable kingdom had been formed. These constituents existed at the creation of the world, and it was from these that the primitive forests and plants of the world had been created. What took place on a large scale in the field of the world, must also take place on the field of the farmer. It was from Nature we must learn the principles of farming. The constituents out of which plants were formed existed in the primitive rocks, from which every other strata was formed. These rocks consisted of granite; and granite was a compound of substances, known under the names of felspar, mica, quartz, and hornblende, (specimens of granite, and these constituents of it, were exhibited). Now, in these rocks all the substances that entered into the composition of plants existed. Chemists had not examined these rocks accurately. Phosphate of lime had not been supposed to be a constituent of granite, yet late researches, especially those of Dr. Daubeny on the rocks of Estremadura in Spain, proved that there was considerable quantities of phosphate of lime in these primitive rocks. Common salt, chloride of sodium, had not been found in these rocks, but it existed abundantly in the waters of the ocean. The carbonic acid needed by plants existed in the atmosphere, and also in the waters of the sea. The inquiries of Brongniart rendered it exceedingly probable that carbonic acid existed in much greater quantities in the air and in the water of primitive states of our globe than at the present moment. The carbonic acid of the water must have played a most important part in the original economy of creation. It was only by its means that the alkalies and earths could have been dissolved out of the primitive rocks. When these constituents were dissolved, the great mass of the rocks over which the waters rolled would be easily disintegrated, and the particles of silica and alumina would then be deposited in another form. It was thus that the three principal constituents of our present soils were deposited. The silica being deposited formed the sandstone rocks, and gave the character to arenaceous soils; the alumina formed the clay beds and argillaceous soils; the carbonate of lime the limestone strata and calcareous soils. There had been a question as to how these latter rocks had been formed. The carbonate of lime (chalk) was an insoluble substance, and did not exist to any extent in the primitive rocks, but it was easily formed by the union of carbonic acid and lime. It was a property of carbonic acid that, when diffused in water, it would dissolve carbonate of lime; it was thus held in solution in the first water. If the carbonic acid was in any way separated from the water, then the carbonate of lime was deposited. Mr. Lyell had supposed that all the limestone beds were deposited from springs from under the surface of the earth, which, coming up charged with carbonic acid and carbonate of lime, the former escaped on coming in contact with the atmosphere, and the latter was deposited. But the limestone beds gave evidence of being deposited at the bottom of tranquil seas. They contained remains of animals, and before animals could live, there must be plants. Now, one of the principal constituents of the food of plants was carbonic acid, and he (Dr. Playfair) would suggest that it was the marine vegetation of those periods which, taking up the carbonic acid of the waters, caused the deposition of carbonate of lime. It was no argument against this view, that remains of plants were not found in limestone beds, as Dr. Lindley had proved that decaying vegetable tissue was quickly reduced to its elements before any deposit could be formed to seal its existence. The animals which existed at the time, afforded to the chalk its phosphates, and the analysis of chalk soils proved that they contained this ingredient. It was not, however, the fact, as some geologists had supposed, that the limestone beds were formed entirely by animals. Some had asserted that chalk was composed entirely of infusoria, and it was from these and other animals that the chalk obtained its silica; but the chalk could not be composed entirely of infusoria, as their function indicated. One function of infusoria, hitherto unexplained, was the undoubted fact that they gave out oxygen. This was exactly the contrary of what other animals did. They only existed where the higher forms of animals or plants were decaying, and where they existed they indicated this fact. They were the scavengers of nature, and acted as purifiers, just the same as the fungi did on land. The fungi existed by means of decaying vegetable and animal matter, but they differed from infusoria in giving out carbonic acid. This was a curious fact, that the lowest animals performed the function of the highest plants, and that the lowest plants performed a function in common with the highest animals. But other means were taken to prepare the soil from primitive rocks, so that the secondary ones should become a fit theatre for terrestrial animals and plants to live upon. The rocks were thrown, by volcanic action, above the surface of the water, and then, by the action of the oxygen of the atmosphere, the carbonic acid, rain, and frost, they were decomposed, and their elements entered into combinations fitted to become the food of plants. The iron of these rocks underwent changes. Iron existed in nature in two forms, that of the protoxide, or one proportion of oxygen and one of iron; and that of the peroxide, with two proportions of iron and three of oxygen. The former was injurious to vegetation, and to animal life; the latter was beneficial and necessary. The protoxide could be converted into the peroxide by the absorption of oxygen from the air, whilst the peroxide was reduced to the protoxide by action of decomposing organic matter. This was an important practical fact. It went on, on a great scale in nature. The blue clays of the lias and coal-beds, where there was much organic matter, always contained the protoxide. The red sandstone contained the peroxide. A curious instance of the formation of the protoxide had been observed by Mr. Binney, of Manchester, in the coal-measures about that neighbourhood. Wherever shells were found open, where there is occasion to suppose the animal escaped, the rock in which it was embedded was red, indicating the presence of the red or peroxide of iron; but where the shells were closed, and the animal had gradually decomposed, it was blue, indicating the protoxide; which had been formed by the decomposing matter of the animals. In the red sandstones there was the peroxide; and one important fact regarding this substance was that it had a great affinity for ammonia, which it absorbed, and could be detected in all

red sandstones. The sandstones and the limestones were thus replete with matter ready-formed to be used as food for plants. Succeeding to the period of their formation was that of the great vegetable era in which the coal-beds were formed. The effect of the decomposing vegetable matter on the peroxide of iron was remarkable, and worthy of attention. When the plants began to decay, they converted the peroxide into the protoxide, and when this latter was formed, it acted injuriously on vegetation and destroyed it. It was thus, he believed, that great beds were formed at the present day; the decaying plants converted the peroxide of iron into the protoxide, and when this ingredient was formed it destroyed the remaining living plants. The blue clays deposited underneath Peat-beds was a proof of the correctness of this view. The peroxide was, however, easily convertible into the protoxide by exposure to the oxygen of the atmosphere. It was by subsoil-ploughing that the farmer could render available his blue clays for the nutrition of plants. It was thus that Nature came with her great subsoil-plough, the ocean, and threw up on the shores the injurious protoxide in the form of a peroxide, as well as effected other important changes. Now the farmer might learn a great lesson from the way in which Nature acted in preparing the constituents of plants. The elements necessary for feeding plants of the present era were in the primitive rocks, but they underwent preparation before they were administered as food. If a child became ricketty for the want of phosphate of lime in its food, no one would think of feeding it with crystals of Apatite phosphate of lime; or if a lady became bilious for want of soda in her system, what doctor would administer lumps of felspar? It was the same with plants: it is of no use to administer the constituents they require in a form they cannot digest. In the first place, the farmer must take care that he has food for his plants in the soil; and in the second place he must take care that they get at the food. Now, most soils contained many of the constituents required by plants in the rocks of which the earth was composed; but then these rocks required preparing; and how was this to be done? It was by *ploughing* and by *subsoil-ploughing*. Practice had suggested this, and science pronounced that it could not be dispensed with. By ploughing, the soil was reduced to powder, and the potash, the soda, and the lime had access to the carbonic acid and oxygen and water of the atmosphere, by which the important changes before referred to were produced. By ploughing, also, the soil became absorbent. It took into its very interior, where the roots of plants were seeking their food, the carbonic acid, the ammonia, and the water, which were the principal organic constituents of plants. In such a soil and with such agents did God grow the first forests of the world, and in such a manner must man act in order to grow the plants which he needs. The lecturer then went into calculations to show the enormous quantities of silicate of potash and soda contained in felspathic rocks, clay, slate, and loam, to show that where these rocks existed there could never be a deficiency of these agents. There was, however, a danger of ploughing up such soils too much; silicate of potash entered into the composition of the stems; it was phosphate of lime that entered into the seeds as well as the stems. Now, if the stems of plants were made to grow too luxuriously, by the aid of the silicate of potash, they would arrest the phosphate of lime going to the seed, and thus would do injury. The phosphate of lime existing in much smaller quantities in most soils, needed more frequently artificially renewing than the silicates. These were added in the form of guano, bone-dust, &c. In conclusion, he would add a few words on draining. When water was allowed to accumulate in a soil, it prevented the access of air, and thus prevented the action of the oxygen and carbonic acid on the ingredients of the soil. Water also dissolves up and carries off the most important constituents of a soil, and thus renders the land poor. Plants also require a certain temperature, and water, by its great absorption of heat during the process of vaporisation which was constantly going on, was a constant means of reducing the temperature of the soil. As a proof of the influence of the temperature of the soil on the development of plants, he pointed out that in low and heavy, and undrained districts, the harvest was always more backward than in high districts with a natural drainage, although the average temperature of the former districts was much higher. Whole counties in this country were badly drained; and he gave Cheshire as an illustration. This county was so badly drained, that it was said it was unfit for sheep to live in; he would only add, if it was unfit for sheep it certainly was unfit for man. This was an important consideration, that draining, which provided for a larger supply of food for man, also provided for the existence of man to consume the food. He illustrated the importance of drainage by relating a fact which had been communicated to him by Professor Liebig. Near Giessen is a prison from which dead bodies are supplied to the University for anatomical purposes. At one time it was very unhealthy, and a large number of deaths occurred, but the public authorities had lately had the district drained in which it was situated, and since that period the deaths in the place had been so few, that the University was now obliged to send to other places to supply its anatomical wants.

The MARQUIS of DOWNSHIRE hoped that the Lecture which had just been delivered would be published, and proposed a vote of thanks to DR. PLAYFAIR.—LORD SPENCER seconded the motion, and made some remarks on the geological view which the Lecturer had taken of the science of agriculture, and expressed his sense of its importance.

The CHAIRMAN stated that the Lecture would be published in the Journal of the Society, and proposed a vote of thanks to the Governors of the Royal Institution for their kindness in allowing the use of their commodious theatre for the Lecture of the Society.

DR. PLAYFAIR'S SECOND LECTURE.

The Lecturer commenced by stating, that in his last Lecture he had endeavoured to demonstrate that the sequence of events from the first dawn of creation was calculated to elucidate the theory of the practice of agriculture. It was seen how carefully Nature had prepared her soils for cultivation, long before man had devoted himself to her service. He had showed how the ocean had acted as a great *plough* and *subsoil-plough*, and ameliorated the noxious ingredients in the rocks, and fitted those which were fertile for the purposes of vegetation. How curiously she locked up in the soil those treasures of fertility, and the manner in which she presented the key to the industry of man, and showed him, by her own example, wisely reduced in energy from the past, when she herself had to clothe her own lands with vegetation, without man's aid. Still, though she reduced in intensity the causes formerly in operation, she preserved them in store for action, if that became necessary; and instances were seen in the operations of subsoil-ploughing and draining, in which she proved no niggard, when these causes were called into activity. We followed Nature also in those high and bleak regions of calcareous and cretaceous rocks, and then of the old red sandstone, in which she compensated for their elevation by an admirable system of drainage, either by causing numerous clefts or a porous nature of materials, so that the water might be quickly draughted away, and not by its evaporation render the soil cold; and, in this manner, how she pointed out to the farmer how best to improve the climate of his own district, how to increase as well as hasten the amount of vegetation, and the best way of making the capability of the soil available, and of obtaining the quickest return for the labour which was expended in its cultivation. In the present Lecture he should endeavour to apply the principles deduced from the observation of Nature, on a large scale, to the practice of the farmer, on a small one; and he believed that every one who neglected the study of these principles, would ever after have much reason to regret that he had not consulted the wishes and become acquainted with the elevated character of his great mistress. In the last Lecture, the importance of ploughing and draining had been insisted on; and this involved the explanation of fallow—the exposure of the constituents of the soil to the atmosphere. But although a soil is exhausted, for instance, of silicate of potash, so that Wheat would not grow, it did not follow necessarily that no other crop would grow, as there might still be plants that would grow with the remaining constituents of the soil. This subject was one of importance, as, if there were such crops, it would obviously present the necessity of a naked fallow. Professor Low, in his Agriculture, had recommended that soils be ploughed six or eight times: and this was a great waste of time and money, if nothing else could be grown in the interim. But in Scotland, in many parts of England, and in Jersey, such a system was now entirely dispensed with, and the theory of such a practice is easily understood by referring to what has recently been ascertained with respect to the composition of the mineral ingredients of plants. In the last Lecture a table was exhibited showing the principal mineral ingredients of plants, and although all plants contained these, they existed in very variable proportions, as the following table would show; and Liebig had even divided plants into classes, according to their mineral constituents:—

	Salts of Potash and Soda.	Salts of Lime and Magnesia.	Silica.
SILICA PLANTS.			
Oat-straw, with seeds	34.00	4.00	62.00
Wheat-straw	22.00	7.20	61.05
Barley-straw, with seeds	19.00	25.70	55.03
Rye-straw	18.65	16.52	63.89
LIME PLANTS.			
Tobacco	24 34	67.44	8.30
Pea straw	27.82	63.74	7.81
Potato-herb	4.20	59 40	36.40
Meadow Clover	39.20	56.00	4.90
POTASH PLANTS.			
Maize-straw	71.00	6.50	18 00
Turnips	81.60	18.40	—
Beet-root	88.00	12 00	—
Potatoes (tubers)	85.81	14.19	—
Helianthus tuberosus	84 30	15.70	—

This Table is only an approximation to the truth, and its classification inadmissible, as it was opposed to a beautiful law, pointed out by Liebig himself, and confirmed by the experiments of Will and Fresenius, which was that certain bases may replace each other, according to the law of equivalents. Thus, soda may be substituted for potash, and *vice versâ*; lime for magnesia, and so on; but it did not appear that an alkali could be substituted for an earth; still the Table was practically useful. The *rotation* of crops must depend on the character of the soil, and this would be seen by observing what kind of plants grew on the rocks mentioned in the last Lecture. On the granite rocks, the soil of which contained abundance of silicate of potash, the farmer grew mostly the silica plants, as Wheat, Barley, and Oats, after taking care to manure well with lime or seashells, to supply the absent calcareous matter and phosphates. It is seldom that such soils are devoted to pasture, or in other words, to the growth of lime plants. Clay, slate, and grauwacke are degraded granite, but deficient in lime and phosphates; for animals had not yet been formed, and their great characteristic was the possession of potash; and two potash plants, Oats, and Turnips, were most frequently cultivated on these soils, both of them requiring little of the phosphates and little of lime; on the sandstones, which were much richer in lime and phosphates, but still possessing potash, so that potash plants, and in addition, Wheat, Barley, and Clover, are grown on these soils. Above the sandstones we come to rocks abounding with animal and vegetable remains, and containing little potash; these rocks are not adapted for Wheat, Barley, Oats, or Turnips, and the lime-plants forming pastures are mostly grown. On the coal measures vegetation is poor, arising from the enormous exhaustion of the soil, produced by the plants forming the coal-beds; the clays, however, contained silicates and iron, and with care were cultivated so as to produce various crops. On the magnesian limestone plants were grown which required magnesia, and Potatoes, Wheat, and Barley flourished on these soils. After this we come to the new red sandstone, a soil composed of the detritus of former rocks, and capable of supporting potash, soda, and silica plants. The calcareous soils of the lias, the oolite, and the chalk yield lime-plants, Beans, Peas, Clover, and Barley. In examining the various kinds of rotations, it would be found that they were precisely such as were adapted to the soils in which they took place. Thus the Norfolk course begins with Turnips well manured, succeeded by a corn crop, followed by artificial Grasses, and concluded by another crop of corn; and this took place on most of the inferior clays of England. The manure yielded phosphates, but neither these nor the silica were taken up by the Turnips, and the soil thus became prepared for the growth of the corn, as the only thing of importance removed from the soil by the Turnips was the potash; and, what was important, potash uncombined with silica. If sheep upon the Turnips, they return to the soil the potash contained in the Turnips, and also of phosphates. After the second or corn crop has exhausted the soluble silicates and phosphates, a green crop is then grown, and this takes up the lime. By the time the lime is taken up by this crop, the action of the air upon the soil has liberated a further quantity of phosphates and silicates sufficient to grow for a fourth crop corn, which is often Barley, where lime is present, or Oats, or Wheat where it is deficient. Where there is magnesia present, as on the magnesian limestone, Potatoes may be substituted with advantage for the green crop, especially as their stems return to the soil the silicates. The curious rotation of the lower lias, consisting of Wheat, Beans, fallow, Oats, and Potatoes, would in the same way be found adapted to the particular composition and characters of the soil on which it was practised. Enough had probably been said to show the farmer that rotation was not a means of *improving* the soil. The soil remained in the same state, as far as the plant was concerned, and the great advantage of it consisted in the fact that one crop could be grown whilst the soil was preparing for another. The theory of De Candolle, with regard to plants throwing out excrementitious matter injurious to themselves and beneficial to other plants, was now generally exploded, and many facts were entirely opposed to it. Thus, in Hungary, there was never a poisonous effect produced on the Wheat crops, although in some districts Wheat had been grown in succession for centuries. A like result to that of rotation is produced by many other processes on farms; take, for instance, burning and paring. By this process injurious organic matter is consumed. Plastic clays are quite changed in their character, not only by having all their constituents brought into contact with the oxygen of the atmosphere, and thus undergo change, but the clay itself acquires another character, it becomes absorbent, and takes up from the atmosphere ammonia, carbonic acid, and watery vapour, as well as afford more ready access to the nutritious substances which may be dissolved in water. But in this, you see nothing is destroyed, and the inorganic elements of the soil are only brought more fully into contact with the absorbing organs of the plants. Another process of the farm was what was called liming. When the chemist, in his laboratory, wished to dissolve up potash and silica from the soil he was examining, he used lime; and by this means he rendered soluble that which was insoluble before. Just what the chemist did in his laboratory by the use of lime, the farmer did in his fields; and this was the use of lime, that it rendered certain important ingredients of the soil more soluble than they were by nature. In this way, lime became a key by which the ingredients in the soil were unlocked; it did not in itself become an important ingredient in the soil. It may, however, happen that where we add lime, we may not only be using a means for unlocking the ingredients of the soil, but we may also be adding an important constituent of the soil. This was what made lime an important ingredient as a top-dressing where Clover and Grasses were to be grown. It would be seen, then, that lime was not used principally as a *manure*; it was seldom required as a manure, for a manure added to the composition of the soil; its principal use was as a solvent of other materials. Common salt was sometimes used as a manure, and Liebig supposed that it acted beneficially by combining with sulphate of lime, and a sulphate of soda was produced. If this was the case, it should act most beneficially on the cereals, and on the leguminous plants because they are the great generators of the constituents

of blood, gluten, albumen, and casein, and these are the parts of plants for which sulphur is absolutely necessary. He was not aware that this was the case. In connection with chloride of sodium he might say, that in a former part of the Lecture he had alluded to the fact, that soda might be substituted for potash in plants, and *vice versâ*, but this was no proof that potash could be substituted for soda in the system of the animal. Now it was found that soda was essential to the formation of healthy bile, and when animals were fed on potash plants in the centre of this island, or far away from the sea in continents, they sought with avidity soda in the form of common salt, for the purpose of adding this essential constituent to the elements out of which their secretions were formed. Another process which did not act in the way of direct manures was *irrigation*—the application of water to the soil. When fresh water was applied to the soil it was beneficial, but it was necessary, in order to insure its success, that the soil should be drained, as it was only fresh water was beneficial. Liebig accounted for this fact by the oxygen contained in the water; when the oxygen came in contact with the soil it united with its constituents, and thus assisted in the process of disintegration. Another valuable property of the oxygen was that it united with the blue or protoxide of iron, and converted it into the peroxide; in the soils where this was contained, he had pointed out in the first Lecture the importance of this action. Again, other waters contained carbonic acid, and where this was the case in limestone districts, the water also held in solution carbonate of lime. Now the carbonic acid acted also on the constituents of the soil, and produced disintegration; and whilst this process went on, the carbonate of lime also, which it held in solution, was deposited on the soil as a manure. Stagnant waters, unless they contained uninjurious organic matters, were not beneficial to the soil, and when they became so they acted as true manures. He now came to the *true manures*. These matters supplied some substance that was destitute in the soil. The food animals got from plants consisted first of those secretions, containing large quantities of carbon, as sugar, starch, gum, &c., and those secretions which contained nitrogen. Now, although these secretions contained principally carbon, hydrogen, oxygen, and nitrogen, yet they required for their development inorganic matters. Thus Liebig had proved, that the carbonaceous secretions could not be developed in plants without the presence of small quantities of potash, phosphate of lime, &c. It was the same with the nitrogenised secretions. The forms of protein, albumen, fibrin, &c., required for their development phosphorus and sulphur, and these were obtained from the inorganic constituents of the soil. An important fact connected with the action of inorganic manures was, that none of these substances were destroyed in the system of adult animals—they were not destroyed as the carbonaceous and nitrogenous secretions, but were always again restored to the soil in the form of excrementitious matter. It was thus that all animals, in their fæces and urine, returned to the soil those inorganic ingredients which they had taken up from the soil in their food. The Lecturer here went into a series of calculations, showing the necessity of using human excrement as manure. Where man ate Wheat, he threw off from his system those inorganic ingredients which were necessary to the growth of Wheat; where he ate Potatoes he furnished material for the growth of Potatoes. He proved these positions by reference to many well-conducted experiments on the composition of human excretions, from which it was found that they alone were capable, when properly preserved, of supplying all the exhaustion of the soil produced by the growth of food for man. These excretions varied in their composition, but it would be found they only varied according to the food which had been used. He urged upon all present the necessity of every means being used to make available this precious storehouse of inorganic manures for manuring, which not only existed in the right quantity as a food for plants, but also existed in the best form for the nutrition of the plants most needed by man. The value of the waste of these materials that was constantly going on was quite prodigious, and could only be estimated by those who looked upon the subject with a scientific eye. As some questions had been put to him since he had been in London, he would refer, before concluding his Lecture, to some remarks and experiments which had been made by M. Boussingault, the most distinguished agricultural chemist in France. This learned chemist had lately referred to some experiments of his own, with regard to feeding cattle. The French chemists had all along maintained that the fat of animals was only obtained from the fatty matter which they already took in with their food. On the other hand, the German chemists and himself maintained that the fat of animals arose from an imperfectly consumed form of the carbonaceous secretions, such as starch, sugar, and gum. A familiar instance of such a change took place in the burning of coal; when this substance was burned in the open air the whole of the carbon of the coal was consumed and carbonic acid was formed, but when coal was burned in closed vessels without access of oxygen, then a tarry matter was formed from the imperfect combustion. What took place in the coal took place in the starch, sugar, &c. Now, when animals have small lungs, these substances cannot be fully consumed by the want of oxygen, and an imperfect metamorphosis takes place—they are converted into oily matter, which is deposited in the form of fat. Dr. Lankester had pointed out this fact, in connection with a series of tables, drawn up by Mr. Hutchinson, of measurements and weights of human beings, in which it was found that in proportion to the circumference of the chest was the weight of the individual. He had, in previous Lectures before this Society, pointed out the fact that the broadest-chested animals had the smallest lungs, and there could be little doubt that the smallness of the lungs taking up less oxygen in the human being accounted for the increased weight observed by Dr. Lankester. With regard to the experiment which M. Boussingault had criticised, and which he had characterised as having been performed "*avec une telle activité*," he could only say that he had stated at the time they were performed, they were to be taken only for what they were worth, from the short time in which they were performed, and as indications of experiments, with the same object in view. M. Boussingault had performed experiments to prove that he had been wrong in his conclusions, and he would allude to these experiments with that respect which was due to so distinguished a chemist. M. Boussingault, in order to prove that the fat of animals was not derived from the starch, sugar, &c., weighed animals before and after feeding with Mangold Wurzel and Potatoes (substances which contain very little fatty matter), and found that, instead of increasing in weight they diminished; and not only did they not diminish in weight in proportion to the less quantity of fatty matter they had been supposed to consume, but they diminished 100 lbs. in addition. Now, M. Boussingault had not considered the causes of this extra diminution of weight—a diminution so much greater than his theory required. But what were the real causes? Why, the cow had been fed on food which was unnatural to it; formerly it had been fed on hay, and other materials, which required the powers of its four stomachs to digest, but now it was given a food which it could not digest without bulk to assist the peristaltic action of its stomachs, and the consequence was, as every farmer knows, the animal was purged. Now, it was this purging that must have reduced its bulk, and not any want of the conversion of sugar and starch into fatty matter. These experiments of M. Boussingault did not prove that he was right, and they did not prove that he (Dr. P.) was wrong; at the best the experiments remained where he had placed his own at first, as among subjects that required further examination.

At the end of the Lecture, which occupied two hours in the delivery, P. Pusey, Esq., M.P., arose and said that Dr. Playfair had alluded to the debtor and creditor account of the farm, and he felt that the Society was deeply his debtor. He felt quite sure that the relation of science to practice, established in these Lectures, would be beneficial in causing more attention to the subject, and he had much pleasure in proposing a vote of thanks to Dr. Playfair. Earl Spencer seconded the motion. The first was an important Lecture, as embracing the scientific part of the question, and he considered this Lecture doubly important as applying that scientific part to practice. He particularly alluded to the portion of the Lecture with regard to manures, which he considered of great importance in establishing a relation between practice and science, which would lead to most beneficial results. Dr. Playfair had formerly given Lectures which had been productive of much practical benefit, and he was sure these would lead to the same result.

The Duke of Richmond put the motion, which was passed with acclamation. As President of the Society he felt indebted to Dr. Playfair for the ready manner in which he had responded to the hasty call of the Society, without throwing any difficulties in the way.

The Marquis of Downshire expressed himself as indebted to the Governors of the Royal Institution, for having afforded them the opportunity of hearing these Lectures in their theatre, and proposed a vote of thanks. The Earl of Essex seconded the motion.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the half-yearly meeting of this Society, held on Friday last, the half-yearly Report for the current year was read, from which we make the following extracts:—

"At the close of the year 1843 the number of members who had paid in their subscriptions amounted only to 500, whilst 945 have paid their subscriptions for the current year. This gratifying fact may be attributed in some measure to the rule which was adopted at the last general meeting, namely, requiring that to entitle a local farming Society to the premiums of the central Society the members of it shall contribute a certain proportion to the funds of the central Society. The propriety of this regulation was much questioned at the time, but its adoption has proved most beneficial, not only in the increase of members, but from the greater interest in the affairs of the Society which it has caused. Of the 160 local Societies at the commencement of this year, in connection with the central body, only 16 have failed to avail themselves of the provisions of the rule referred to; while in those which have so qualified, the competition for the different premiums has been much increased, and the prizes themselves claimed to a much greater amount than in previous years. The second source of increased revenue to the Society, during the present year, was its great annual Cattle Show, held in the city of Dublin on the 14th and 15th of August last, on which occasion upwards of 200 new members were also added, making a total of 450 new members in one year. The number of subscribers is still, however, very disproportionate to that of the landed proprietors of Ireland; yet your council deem it a source of gratulation to find such a steady and progressive increase to the Society, and they feel that the addition may be fairly considered the best possible proof of the favour with which the operations of the Society are now regarded by the public. When the council consider the many advantages to the country at large from the great Cattle Show in Dublin—the vast numbers which attended from all quarters on the occasion, and the success of the different entertainments incident to the Show, they have every reason to be satisfied with the result of the meeting. The number of entries to the show-yard was greater than on any former occasion, as appears by the following return, viz.:—

Short-horned bulls		48
Devon	do.	13
Long-horned	do.	4
Hereford	do.	4
Ayrshire	do.	4
Polled Angus	do.	5
West Highland and Kerry	do.	4
Extra stock.		10
Total number of bulls		92
Cows and heifers, general competition		39
Ditto, local competition		132
Extra stock		16
		187
Fat stock		16
Horses, mares, colts and fillies		74
Extra stock		11
		85
Sheep		68
Swine		52
Total number of entries		499

The council have also observed with satisfaction that in most cases the prizes were carried away by animals bred and reared in this country, and therefore recommend that in future the distinction between local and general competition shall be abolished, and that all the premiums should be open to general competition. The advantage of this arrangement, they trust, will soon be felt in stimulating local breeders to increased exertion, and introducing animals into this country. The exhibition of implements was the largest and most varied that has yet appeared under the auspices of the Society—many most valuable and well-arranged lots having been sent from England and Scotland, while the different exhibitors in this country showed the greatest anxiety to forward the objects of the Society by contributing largely upon the occasion. The council, therefore, recommend that the premiums for implements at the next Show should be increased considerably, and classified like the other prizes. The exhibition of flax, wool, and butter, was not so extensive as might have been desired, but the council are so satisfied of the necessity of calling public attention to the improved manufacture of these several important articles, that they strongly recommend a continuation of the premiums for them at the Show for the ensuing year. Your council have also turned their attention, during the present year, in some measure to the distribution of practical and useful knowledge among the farming classes; and for this purpose have caused a second edition of the Society's Transactions to be published for circulation, and have appointed Messrs. Curry and Company, of Dublin, publishers to the Society for Ireland: Messrs. Longman and Company, of London, for England; and Messrs. Frazer and Company, of Edinburgh, for Scotland. This, the Society's first volume of Transactions, contains, exclusive of the ordinary proceedings of the Society, much useful and valuable information, particularly on the subject of thorough-draining and reclaiming waste land in Ireland, which they feel they can confidently recommend to the members of the Society and the public at large. The balance-sheet of the late Cattle Show, held in this city, was next laid before the meeting. The following is a correct account of the receipts and expenditure on that occasion:—

Balance Sheet of Cattle Show in Dublin.

Expenses.	£.	s.	d.
By amount of expenditure in Show-yard	888	11	9
Ditto Council Dinner, Rotunda	328	10	9
Ditto, Banquet Dinner, Theatre	435	19	11
Ditto Ball, Theatre Royal	493	9	0
By sundries, including Printing, Stationery, Advertisements, Staff-Assistants, &c.	321	8	7
Premiums awarded at Cattle Show	601	0	0
Medals ditto	67	1	10
Extra	0	6	0
	£3087	17	10
Receipts.			
To amount of receipts on foot of Show-yard	773	13	6
To ditto on foot of Council Dinner	527	12	0
To ditto on foot of Banquet Dinner	324	0	6
To ditto on foot of Ball	545	8	6
Local Fund	861	11	0
Premiums unpaid	55	0	0
Extra	0	1	0
	2987	6	6
Balance	312	1	4
	£3199	7	10

The secretary here stated, that although the amount of balance against the Society might appear large at first view, yet, in consequence of the demonstration made by them, there had been an addition of 450 new members, which was mainly attributable to the Society having made those demonstrations by which the expense had been incurred; and that, taking this fact into account, there would be altogether a balance of 16*l.* 7*s.* in favour of the Society. It was then resolved, "That the next Cattle Show be held at Ballinasloe, on Tuesday, the 30th of September next, and continue for three days." The Marquis of Downshire then rose to say that chemistry was making its way in England amongst the agriculturists, and he hoped to see it advancing equally in this country. He had, therefore, suggested to Mr. Bullen, the secretary to the Society, that one or more chemists should be selected in each town in Ireland, who should be requested to name their price as to the analysis of earths, manures, &c., whenever they should be applied to by gentlemen or farmers on the subject. His attention had been first drawn to the subject by his having been applied to to become a subscriber to the new College of Chemistry

about to be established in London. He had felt great pleasure in contributing to so excellent an institution; and he could name several noblemen and gentlemen, among them the Duke of Wellington and Lord Ducie, who were to be found among its supporters. His present suggestion was merely thrown out as a preliminary step for a similar institution in this country, and he thought the proposal worthy of the serious consideration of the Society.

FLAX SOCIETY OF IRELAND.

At the Monthly Meeting of the Committee, the following letter was read from Mr. Northcote, written by order of the Right Honourable W. E. Gladstone, President of the Board of Trade:—"Whitehall, Nov. 16, 1844. Sir,—I am directed by Mr. W. E. Gladstone, to acknowledge the receipt of your communication, of the 12th instant; and to thank you for your information respecting the increased growth of Flax in Ireland. The quantity of foreign Flax imported, in the year ended the 5th January, 1844, was 1,437,150 cwts.; of which 1,422,992 cwts. were entered for consumption. The quantity imported, this year, up to the 10th October, was 1,129,173 cwts.; and the quantity entered for consumption, in the same period, was 1,129,536 cwts. I am, sir, your obedient servant, STAFFORD H. NORTHCOTE.—James Mac Adam, Esq."

SMITHFIELD CLUB.

THE EXHIBITION OF FAT CATTLE, for the Premiums offered by this Society, took place during the past week at the Horse Bazaar, Baker-street. The following is the award of the Judges:—

OXEN.

CLASS I.—*Oxen or Steers, of any Breed, under 5 years old, without restrictions as to feeding; yet the kind or kinds of food must be certified.*

To Mr. ROBERT SMITH, of Burley-on-the-Hill, near Oakham, Rutland, for a 3 years and 11¾ months old improved Short-horn Steer, bred by himself, and fed on Oil-cake, Barley, and Bean-meal, vegetables, and Hay; travelled to the Show, by van, 20 miles, and by railway 100 miles—*Prize*, 20*l*., and *Silver Medal* to the breeder.

To Mr. JOHN HUDSON, of Castle Acre, near Swaffham, Norfolk, for his 3 years and 10 months old Hereford Ox, bred by Mr. John Longmore, of Orlton, near Leominster, and fed on Grass, Hay, Swedes, Linseed-cake, and Mangold Wurzel. Travelled to the Show by van 100 miles—*Prize* 15*l*.

To Mr. T. L. MEIRE, of Cound Arbor, near Shrewsbury, Shropshire, for his 3 years and 11 months old Hereford Ox, bred by himself, and fed on Cake, Pea, and Barley-meal, boiled Barley, Grains, Grass, Hay, Turnips, and Mangold Wurzel. Travelled to the Show on foot 2 miles, by van 7 miles, by canal-boat 50 miles, by railway 100 miles—*Prize* 10*l*.

HIGHLY COMMENDED:

Mr. R. M. LAYTON, of Thorney Abbey, near Peterborough, Northamptonshire, for his 4 years and 8 months old Hereford Bullock, bred by Mr. John Turner, of Stoke, near Leominster, Herefordshire, and fed on Hay, Linseed-cake, Bean-meal, Carrots, and Swedish Turnips. Travelled to the Show by van 54 miles, and by railway 67 miles.

Mr. RICHARD MEIRE, of Cound, near Shrewsbury, Shropshire, for his 4 years old Hereford Ox, bred by Mr. T. L. Meire, of Cound, and fed on Oil-cake, Barley, and Pea-meal, boiled Barley, Grains, Grass, Hay, Turnips, and Mangold Wurzel. Travelled to the Show on foot 2 miles, by van 7 miles, by canal-boat 50 miles, and by railway 100 miles.

Mr. WILLIAM TRINDER, of Wantage, Berkshire, for his 3 years and 5 months old Hereford Steer, bred by Mr. William Hewer, of Northbench, Gloucestershire, and fed on Grass, Hay, Turnips, Mangold Wurzel, Carrots, Meal, and Oil-cake. Travelled to the Show on foot 2 miles, and by van 80 miles.

CLASS II.—*Oxen or Steers of any breed, under 6 years old, weight 90 stone and upwards, that shall not have had Cake, Corn, Meal, Seeds, Grains, or Distillers' Wash, during 12 months previous to the 1st of August*, 1844.

To Mr. JAMES BULT, of Kingston, near Taunton, Somerset, for his 4 years and 10 months old Short-horned Steer, bred by himself, and fed on Hay, Grass, Swedish Turnips 300 lbs. of Flax-seed, 5 bushels of Peas, 11 bushels of Barley, and 9 bushels of Beans. Travelled to the Show on foot 5 miles, and by railway 163 miles—*Prize* 30*l*. and *Silver Medal* to the Breeder.

To Sir JOHN HENRY PALMER, Bart., of Carlton, near Rockingham, Northampton, for his 4 years and 2 months old Durham Ox, bred by himself, and fed on Grass, Hay, Turnips, Carrots, Mangold Wurzel, Cabbage, 1545 lbs. of Oil-cake, and 435 lbs. of Bean-meal. Travelled to the Show by van 25 miles, and by railway 60 miles—*Prize* 10*l*.

CLASS III.—*Oxen or Steers, of any breed, under 5 years old, under 100 stone and above 70 stone weight, that shall not have had Cake, Corn, Meal, Seeds, Grains, or Distiller's Wash, during 12 months previous to the 1st of August*, 1844.

To His Grace the DUKE OF BEDFORD, of Park Farm, near Woburn, Beds, for a 4 years old Hereford Ox, bred by his Grace, and fed on Grass, Green Tares, Hay, Turnips, 500 lbs. of Barley-meal, and 500 lbs. of Linseed-meal. Travelled to the Show by van 6 miles, and by railway 41 miles—*Prize* 15*l*. and *Silver Medal* to the Breeder.

To Mr. H. CHAMBERLAIN, of Desford, near Leicester, for his 4 years and 10 months old Hereford Ox, bred by himself, and fed on Grass, Hay, Green Vetches, Turnips, 810 lbs. of Cake, and 695 lbs. of Pea-meal. Travelled to the Show on foot 10 miles, by railway 102 miles.—*Prize* 10*l*.

Highly commended.—The Right Hon. EARL SPENCER, of Althorp Park, near Northampton, for a 4 years and 5 months old Durham Ox, bred by his Lordship, and fed on Mangold Wurzel, Turnips, Cabbages, Hay, and 1452 lbs. of Cake. Travelled to the Show by van 10 miles, and by railway 60 miles.

CLASS IV.—*Oxen or Steers, of any breed not exceeding 4 years and 3 months old, and under 80 stone weight, that shall not have had Cake, Corn, Meal, Seeds, Grains, or Distiller's Wash, during 12 months previous to the 1st of August*, 1844.

To his Grace the DUKE OF BEDFORD, of Park Farm, near Woburn, for a 3 years and 9 months old Hereford Ox, bred by his Grace, and fed on Grass, Green Tares, Hay, Turnips, 500 lbs. of Barley-meal, and 500 lbs. of Linseed-meal. Travelled to the Show on foot three miles, by van 6 miles, and by railway 41 miles—*Prize* 10*l*., and *Silver Medal* to the Breeder.

To Mr. JOHN MANNING, of Harpole, near Northampton, for a 3 years and 10 months old Hereford Ox, bred by Mr. James Williams, of Culmington, near Ludlow, and fed on Grass, Hay, 850 lbs. of Cake, and 4 bushels of Bean-meal. Travelled to the Show on foot 7 miles, and by railway 69¾ miles—*Prize* 5*l*.

Highly commended.—The Right Hon. LORD SOUTHAMPTON, of Whittlebury, near Towcester, Northamptonshire, for a 3 years and 9 months old Hereford Ox, bred by Mr. F. Corton, of Hayton, near Ludlow, and fed on Corn, Hay, Chaff, Tares, Turnips, 1050 lbs. of Cake, 17 bushels of Oats, and 120 lbs. of Barley and Bean-meal. Travelled to the Show on foot 8 miles, and by railway 60 miles.

CLASS V.—*Oxen or Steers, of any breed, under 4 years and 6 months old, and under 80 stone weight, without restrictions as to feeding, yet the kind or kinds of food must be specified.*

To Mr. W. J. BAILEY, of Shenley House, Stoney Stratford, Bucks, for a 3 years and 8 months old Hereford Steer, bred by Mr. W. Wheeler, of Ivington Park, near Leominster, and fed on Grass, Hay, and Cake. Travelled to the Show on foot 8 miles, and by railway 50 miles—*Prize* 10*l*., and *Silver Medal* to the Breeder.

COWS AND HEIFERS.

CLASS VI.—*Fattened Cows or Heifers under 5 years old. Freemartins and Spayed Heifers are not qualified.*

To Mr. HENRY BROWN, of Ashby-de-la-Zouch, Leicestershire, for a 4 years and 6 months old Durham Heifer, bred by himself, and fed on Oil-cake, Barley, Grass, Cabbage, Swedish Turnip, and Hay. Travelled to the Show by van 25 miles, and by railway 96 miles—*Prize* 20*l*. and *Silver Medal* to the Breeder, and *Gold Medal* as the best Beast in any of the Classes.

To the Right Hon. EARL SPENCER, of Wiseton, near Bawtry, Nottinghamshire, for a 4 years and 5 months old Short-horned Cow, bred by his Lordship, and fed on Hay, Turnips, Cabbages, Pea-meal, Barley-meal, and Oil-cake. Travelled to the Show by van 20 miles, and by railway, 172 miles—*Prize* 10*l*.

To Sir THOMAS WHICHCOTE, Bart., of Aswarby Park, near Folkingham, Lincolnshire, for a 4 years and 5 months old Durham Heifer, bred by himself, and fed on Linseed-cakes, Bean-meal, Oat-meal, Hay, and Vegetables. Travelled to the Show by van 38 miles, and by railway 107 miles—*Prize* 5*l*.

CLASS VII.—*Fattened Cows or Heifers, of 5 years old and upwards. Freemartins and Spayed Heifers are not qualified.*

To Mr. JOHN BEASLEY, of Chapel Brampton, near Northampton, for 5 years and 4 months old short-horned Cow, bred by himself, and fed on Grass, Turnips, Mangold Wurzel, Hay, Linseed-cake, and Oat-meal. Travelled to the Show by van 9 miles, and by railway 60 miles—*Prize* 20*l*. and *Silver Medal* to the Breeder.

To Mr. JOHN CARWARDINE, of Marsh, near Leominster, for a 5 years and 11 months old Hereford Cow, bred by the late Mr. John Morris, of Stratford Bury, near Leominster, and fed on Grass and Oil-cake. Travelled to the Show on foot 48 miles, and by railway 113 miles—has had 1 calf—*Prize* 5*l*.

CLASS VIII.—*Fattened Cows, of 5 years old and upwards, that shall have had at least 2 live Calves at separate births.*

To Mr. J. S. BURGESS, of Holme Pierrepont, near Nottingham, for a 7 years and 5 months old Short-horned Cow, bred by Mr. Burgess, of Cotsgrove Place, Nottingham, and fed on Cake, Beans, Vegetables, and Hay. Travelled to the Show by van 5 miles, and by railway 136 miles—has had 3 calves—*Prize* 15*l*. and *Silver Medal* to the Breeder.

To Major BROWN, of Welbourn, near Grantham, Lincolnshire, for a 13 years old Short-horned Cow, bred by himself, and fed on Linseed-cakes, Swedes, Turnips, Hay, Clover, and Lucerne. Travelled to the Show by van 49 miles, and by railway 103 miles—has had 6 calves—*Prize* 5*l*.

Highly commended.—Mr. WILLIAM FIRTH, of Kirkheaton, Yorks, for a 9 years and 8 months old Short-horned Cow, bred by Mr. William Henlock, of Great Houghton, York, and fed on Oat-straw, Turnips, Oil-cake, Hay, Grass, and Clover. Travelled to the Show by van 4 miles, and by railway 196 miles—has had 4 calves.

EXTRA STOCK.—CATTLE.

Highly commended.—His ROYAL HIGHNESS PRINCE ALBERT, of Windsor Castle, a 5 years and 6 months old Pure Angus Polled Ox, bred by Mr. Hugh Watson, of Keillor, Forfarshire, and fed on Oil-cake, Oats, Beans, Hay, Swedes, and green food. Travelled to the Show by van 24 miles. [This was an extraordinarily large animal.]

SHEEP.

CLASS IX.—*Long-woolled fat Wether Sheep, 1 year old, that have never had Cake, Corn, Meal, Seeds, or Pulse.*

To Mr. J. S. BURGESS, of Holme Pierrepont, Nottinghamshire, for a pen of three 20 months old Long-woolled Wethers, bred by himself—*Prize* 20*l*. and *Silver Medal* to the Breeder.

To Mr. THOMAS TWITCHELL, of Wellington, near St. Neots, Beds., for a pen of three 20 months old Leicester Wethers, bred by himself, from rams hired of Mr. Samuel Bennett, of Bickerings Park, near Woburn, Beds.—*Prize* 5*l*.

CLASS X.—*Long-woolled fat Wether Sheep, 1 year old, under 8 stone weight, that have never had Cake, Corn, Meal, Seeds, or Pulse.*

To Mr. J. S. BURGESS, of Holme Pierrepont, Nottinghamshire, for a pen of three 20 months old Long-woolled Wethers, bred by himself—*Prize* 10*l*. and *Silver Medal* to the Breeder.

CLASS XI.—*Long-woolled fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To his Grace the DUKE OF BEDFORD, of Oakley West Farm, Bedford, for a pen of three 20 months old New Leicester Wethers, bred by his Grace—*Prize* 20*l*. and *Silver Medal* to the Breeder, and *Gold Medal* as the best pen of Long-woolled Sheep in Classes IX., X., and XI.

To Mr. JOHN PAINTER, of Burley, near Oakham, Rutland, for a pen of three 21 months old New Leicester Wethers, bred by himself, from a ram hired of Mr. Thorpe, of Clifton, Nottinghamshire—*Prize* 5*l*.

CLASS XII.—*Long and Short-woolled cross-bred fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To Mr. C. TOMSON, of Sundon, near Luton, Beds., for a pen of three 21 months old Southdown and Gloucester Cross Wethers, bred by himself—*Prize* 10*l*. and *Silver Medal* to the Breeder.

To Mr. W. BENNETT, of Lewsey Farm, near Dunstable, Bedfordshire, for a pen of three 21 months old Down and Leicester Cross Wethers, bred by himself—*Prize* 5*l*.

EXTRA STOCK.—LONG WOOLLED SHEEP.

To Mr. C. LARGE, of Broadwell, Oxfordshire, for a 56 months old New Oxfordshire Ewe, bred by himself—*Silver Medal*.

CLASS XIII.—*Short-woolled fat Wether Sheep, 1 year old, without restrictions as to feeding.*

To Mr. SAMUEL WEBB, of Babraham, near Cambridge, for a pen of three 20 months old Southdown Wethers, bred by Mr. J. Webb, of Babraham—*Prize* 20*l*. and *Silver Medal* to the Breeder.

To His Grace the DUKE OF RICHMOND, of Goodwood, near Chichester, Sussex, for a pen of three 20 months old Southdown Wethers, bred by His Grace—*Prize* 5*l*.

CLASS XIV.—*Short-woolled fat Wether Sheep, 1 year old, under 8 stone weight, without restrictions as to feeding.*

To Mr. HENRY UPTON, of Oving, near Chichester, Sussex, for a pen of three 20 months old Southdown Wethers, bred by Mr. A. Pinnix—*Prize* 10*l*. and *Silver Medal* to the Breeder, and *Gold Medal* as the best pen of Short-woolled Sheep in Classes XIII. and XIV.

CLASS XV.—*Short-woolled fat Wether Sheep, 2 years old, without restrictions as to feeding.*

To Mr. E. G. BARNARD, M.P., of Gosfield Hall, near Halstead, Essex, for a pen of three 32 months old South Down Wethers, bred by himself—*Prize* 20*l*. and *Silver Medal* to the Breeder.

EXTRA STOCK.—SHORT-WOOLLED SHEEP.

To Mr. T. HARRIS, of Hinton, near Abingdon, Berkshire, for a 21 months old South Down Sheep, bred by himself—*Silver Medal*.

PIGS.

CLASS XVI.—*Pigs, of any breed, above 18 and under 26 weeks old.*

To Mr. W. F. HOBBS, of Murks Hall, near Kelvedon, Essex, for a pen of three 25 weeks and 4 days old Improved Essex Pigs, bred by himself, and fed on Oats, Peas, Meal, Potatoes, Mangold Wurzel, and milk—*Prize* 10*l*., and *Silver Medal* to the Breeder.

To His ROYAL HIGHNESS PRINCE ALBERT, of Windsor Castle, for a pen of three 25 weeks and 4 days old Suffolk and Bedfordshire Pigs, bred by His Royal Highness, and fed on Milk, Barley-meal, and Pea-meal—*Prize* 5*l*.

CLASS XVII.—*Pigs, of any breed, above 26 and under [illegible] weeks old.*

To Mr. J. R[illegible], of Normanton Hill, near Loughborough, Nottinghamshire, for a pen of three 27 weeks and 2 days old, bred by himself, and fed on Barley-meal—*Prize* 10*l*. and *Silver Medal* to the Breeder.

To the Right Hon. the Earl of R[illegible], of Cole-Hill, near Farringdon, Berks, for a pen of three 31 weeks and 1 day old Cornhill Pigs, bred by His Lordship, and fed on whey, Barley-meal, and Potatoes—*Prize* 5*l*.

EXTRA STOCK.—PIGS.

To Mr. W. F. H[illegible], of Murks Hall, near Kelvedon, Essex, for a 25 weeks and 4 days old improved Essex

Pig, bred by himself, and fed on Oats, Peas, Meal, Potatoes, Mangold Wurzel, and Milk—*Silver Medal*.

It will be observed that His Royal Highness Prince Albert exhibited several animals, amongst which were Pigs to which a Prize of 5*l*. was awarded, and an Ox of the Polled Angus breed, which attracted considerable attention.

Besides the Show of Fat Cattle, which *alone* was originally established by the Smithfield Club, there has grown up of late years an Exhibition, in the same place, of Agricultural Implements; manufacturers no doubt finding it profitable to take advantage in this manner of these annual assemblages of farmers. There was not many new implements exhibited: the following reference to some of the articles shown may interest some of our readers:—The stand of Messrs. H. Gibbs & Co., seedsmen to the English Agricultural Society, was the first that met the eye on entering. We noticed there enormous specimens of long red and globe yellow Mangold Wurzel, and also of Kohl Rabi. There was also some series of specimens of Grasses and Wheat on the stand. Specimens of all these were also exhibited by Messrs. G. Gibbs and Co. At another stand specimens of Swedish Turnips, weighing about 20 lbs., were exhibited; and Mr. Skirving exhibited heavy specimens of his well-known variety. Among the implements we noticed two applications of the lever-power to Hand-threshing Machines—a mode of working them which was first introduced by Messrs. Ransome, of Ipswich. In one—that by Mr. Cambridge, of Devizes—the oscillatory motion of the lever was converted into the rotatory motion of the drum of the implement, by means of sun-and-planet toothed wheels; in the other—a heavy and bulky machine, exhibited by Lieut. Viburt, R.N.—the crank was employed for this purpose, and the action of three levers worked by three men was brought to bear upon it. One of the cleverest implements in the gallery was a Horse-rake, exhibited by Mr. Smith, of Stamford, in which all the action of Mr. Grant's excellent and well-known implement is obtained in a very simple manner. We must postpone a description of this implement till another opportunity. Nothing new was observed among Drilling-machines: implements of this class were exhibited by Messrs. Hornsby, of Grantham, Garrett and Exall, and Smyth, of Ipswich. A variety of Cake and Corn-crushers was exhibited by the two first-named manufacturers; those of the former being distinguished by their peculiar make—the working cylinders being covered with pinnacle instead of ridge-formed teeth. Among Turnip-cutters we noticed an ingenious implement by Mr. Wedlake, in which the working cylinder cut slices or finger-shaped pieces according to the position of the hopper, and the direction in which the handle was turned. Another, exhibited by Messrs. Wedlake and Thompson, consisted of a horizontal revolving circular disc, on which the cutters were placed, and through which the slices fell as they were necessarily cut off the lower surfaces of the bulbs placed in a box above it. We must not forget mentioning Smith's Field-garden Hand-dibble, exhibited by Messrs. Cottam and Hallen. It was referred to some weeks ago in this Paper by a correspondent, and, though we have no experience of it, appears likely to answer its purpose. Its cost is 35*s*.

Besides the few we have mentioned, the usual variety of agricultural implements was exhibited by their respective manufacturers; and notwithstanding the absence of implements from the factory of the Messrs. Ransome, at Ipswich, which generally sends out so many, there appeared to be both number and variety sufficient in the Exhibition to interest the crowds that inspected it.

An intimation was given by Earl Spencer that it was the intention of His Royal Highness Prince Albert to honour the Club with a visit, but the day had not yet been fixed. It was, however, generally supposed that this morning (Saturday) would be the most likely time.

FARMERS' CLUBS.

Stewponey.—The twelfth Monthly Meeting of this Farmers' Club was held on the 2d inst. Mr. Maughan, of Dudley, read the following Essay on the Expediency of Leases. First, As to the objections against leases:—"I find some brought together by an annotator on 'Tuke's Survey of the North Riding of Yorkshire.' He observes, it is the popular fashion of the times to rail at tenancy from year to year—to assert that a country so held must be devoid of improvement, the tenantry oppressed, and the landowners deprived of that share of rent which they ought to receive were their lands let on what they call a more durable tenure. He observes that the permanency of tenure under lease is held to be one of the greatest inducements to cultivation; but he contends that, with tenants from year to year, occupation is more durable than with the former—that the occupations of the latter are rarely changed, except for faults; and so far as leases prevent such changes, they are evils. He alleges that few estates let to yearly tenants can be pointed out where the same families have not remained on them for many generations. He contends that where leases are common, the greater part of the tenants are changed at their expiration, for, no mutual tie, either of friendship, honour, or attachment, existing between landlord and tenant, the former is bound only by interest to the latter, and the latter, presuming upon the certainty of his lease, gives probably some occasion of offence, which is not forgiven when it expires. It is contended, too, that in cases of tenancy from year to year, rents are not so frequently advanced as on estates where leases are granted, and that both for permanency of occupation and moderation of rent, tenancy from year to year is most in favour of the tenant, and that, for such moderation, the landlord has an ample return in the attachment and good offices of his tenantry. Another objection, on behalf of the tenant, made to leases is, that if a rent be reserved fluctuating with the price of produce, the rent bears hardest on the tenant when he is least able to discharge it. Another objection to leases made on behalf of landlords is, that leases fairly granted on fixed money rents—I mean fairly granted with reference to circumstances existing at the time of the contract—often become, by a change of circumstances, altogether one-sided, and in favour of the tenant; for if the prices of produce advance, the landlord cannot share in the benefit; but if, on the other hand, prices fall, he is obliged to reduce the tenant's rent, to keep him (as the phrase goes) on his legs. Secondly, As regards the arguments advanced in favour of leases. It is said that no prudent tenant farmer will venture his money in the improvement of his land without security; that is to say, not an absolute certainty that the money expended will be returned to him, but certainty in the opportunity of conducting and of carrying out, in a series of years, that course of operations on which, at the commencement, his calculations were founded, and whereby alone he could hope to redeem his expenditure with compensation for the time bestowed, the labour imparted, and the hazards incurred in the enterprise. Another argument in favour of leases is derived from experience of their benefit in many parts of the kingdom, where they have been judiciously adopted. In connection with this subject it has been, perhaps not unjustly said, that in almost every field in the country there is an unworked, or an imperfectly worked mine of agricultural wealth, but that it cannot be brought to light without an expenditure of money, which, once sunk in the soil, can only be recovered in the course of years; and it is asked, Can the farmer who has his farm from year to year only, with justice to himself and his family, enter freely upon this outlay? The ordinary confidence reposed in landlords, and in the agents of landlords, will not overcome those prudential considerations; the thought that his security is not real, alarms the worldly prudence of the tenant, and banishes all idea of improvement or outlay. This is a fact of which we may convince ourselves by the evidence of our own eyes, that under a system of tenancy from year to year, the lands of this kingdom generally are cultivated imperfectly. There is good and spirited management by yearly tenants here and there to be met with, but it is the exception, and not the rule. In examining the arguments of writers upon leases, I have nowhere found so much said, and so well said, in their behalf, as in an article written by Mr. Hannam, of North Deighton, in Yorkshire. As I doubt whether it be possible to add much to his conceptions upon this subject, or to improve upon his manner of expressing them, I shall, with this willing acknowledgment, borrow freely from Mr. Hannam's paper. After speaking of the disadvantages with which the tenant farmer often has to contend—fickle seasons, fluctuating markets, insolvent customers, and other evils—he proceeds to remark, that greater than all those is the disadvantage arising from the uncertainty of the tenant being allowed to continue unmolested in his occupation, after his money shall have been embarked in improvements requiring more than that average outlay which is necessary for ordinary and routine management. Mr. Hannam observes that upon the system of yearly tenancy there are other attendant evils; one is the facility which it affords to men without skill or capital to obtain farms; and another, the temptation it holds out to the needy man to make a temporary convenience of a farm. Hence, we continually see tenants with a capital of 500*l*. upon a farm requiring 1000*l*.; for as the occupier is a tenant from year to year, there is not generally that investigation into his qualifications which there ought to be, and which there undoubtedly would be were a lease for a long term of years about to be granted; and on his side the tenant is often impelled to take hold of an engagement, though not to his mind exactly, as a convenience, and until he meets with something that suits him better. The result, he observes, of these contracts may easily be defined. If the farm be out of order at first, the tenant who takes it as a convenience (*i. e.* on the determination to get all he can from it without much cost), soon finds that it will not bear robbery; but he finds out also that it will not do to expend money on it; he is therefore content to take what it gives, and to return to it nothing; and he robs it, or it robs him, till after a time there is no more left to rob. In the other case, the tenant finds himself on a farm with a supply of cash below the demand, his farm requiring improving, but "it must be done bit by bit; he must see how it answers," are his cogitations; and of course—as under this sort of management it grows worse—his land goes half stocked, his crops fail, and he finds himself in difficulties before he knows how to turn himself; the capital he had is melted, and that without making any reform in the condition of his farm; and in a short time he is left penniless and in the possession of a farm which after such a course of negligent management requires a capital double of what it ought to do. So much, then, for the evils of the system, which the advocates of leases would abolish! The advantages of the one they recommend may be stated to be the prevention of those very evils which the other produces. They would endeavour to raise up a class of men possessing capital to expend, and they would give them confidence to expend it. It is not, however, as Mr. Hannam remarks, to be asserted that all tenants holding from year to year are bad managers; on the contrary, there are many, very many, first-rate farmers who are tenants merely from year to year. But then, as tenants it may be said their lines have fallen in lucky places, or they would not risk the outlay generally necessary to superior management. And even in these cases we may rest assured that those tenants who do much without the security of leases would do more, much more, if they possessed such security. They are, consequently, not such good farmers as they would be were they secure, for a series of years, under the stipulations of a lease. It will perhaps be urged that the farmer will, under a lease for 15 or 20 years, be too much affected by a depression of prices, unless his contract be a very advantageous one; and that, under such circumstances, he will not be able to procure any relief from his landlord. Now, it is true the tenant will not be able to say "You must reduce the rent of my farm, or I must leave it." There is, however, no reason to assume that this demand will be made. A contract which has to be in force for a length of time would be considerately made; it would be based upon the prices of products for a number of years preceding the contract. But when the holder of a lease takes a farm, he values the gross products of the same in its present condition. If, therefore, he can make it produce one-fourth more than it did formerly, his lease insures him the benefit of it, and encourages him to continue his improvements; and when a depression of the market takes place, if his produce does not fetch so much as it did once, he finds he has more in quantity, so that the aggregate value shows still in his favour; but, should brisk markets come, he has both good prices and an increased quantity of produce. I deem it too obvious to require to be argued that the rent reserved ought not to be a fixed money payment, but should fluctuate with the fluctuations in the prices of produce—in most cases with those of grain. By this means, the landlord and tenant are alike protected. But some will say that if this arrangement does good to the tenant at one time it does evil to him at another; for, since high prices are not only caused by increased consumption, but also by decreased production, when the price of grain rises, owing to a deficient yield, or to a bad harvest, the farmer will have to pay an increased rent. This may, in the opinion of some, be a weighty objection. But it really is not a weighty objection, when the subject is duly examined; for, if all the circumstances producing fluctuations in prices are considered, it will be found that the tenant holding under a lease, at a corn or other produce rent, will have three points out of four in his favour. I particularly invite attention to what Mr. Hannam so well says upon this branch of the subject. Take the case of a corn rent for the purpose of illustration. Thus, First—if prices are low from a limited demand, he has a reduction in rent. Second—If prices are low from increased production, he has more grain, yet, at the same time, a reduced rent. Third—If, on the other hand, prices are high from an increased demand, he has a higher rent to pay, but then he has more money to pay it with. Fourth—It is only when the advance of price arises from decreased production that it operates against him. Then he has a higher rent without any advantage of market; for it is probable that the advance of the value of his grain is more than counterbalanced by the diminution of the quantity. But it should not be forgotten that this diminution in the quantity of his grain is not all loss to the farmer. His original rent is founded upon the presumption that his land will grow a certain quantity per acre; but this quantity is the average of a number of years, so that if in one year he falls short of the quantity, it is reasonable to suppose that in other years he exceeds it. When we consider, too, that he is, or ought to be, making improvements, it is fair to presume that he exceeds the estimated quantity upon which his rent was originally based, much more frequently, and more largely, than he falls short of it. Whilst, however, I am of opinion that the agriculture of England and Wales generally is retarded by the practice of withholding leases, or rather of not insisting upon their acceptance, I wish it to be understood that I do not for a moment recommend an indiscriminate granting of leases to occupiers of farms. The owners of small farms, for instance, will feel that they can seldom enter safely into contracts for a long term of years with the class of tenants who compete for small farms. Their narrow means, their want of capital, renders their covenant of little, if any value. And again, if upon many large estates the owners were suddenly to require and to insist upon a change involving a spirited and enlightened system of farming, and were even at the same time to hold out to their tenantry the security of leases on corn or other produce rents, it would be utterly impossible, in numerous cases, to carry out the commendable objects of such landlords, with the bulk of the tenantry existing upon such estates. An immense proportion of the soil of England and Wales is occupied by men of inadequate capital; another large proportion is held by men devoid of energy and enterprise, who are so wedded to their antiquated ways that they will hardly look over their own hedges to see what is being done by their more spirited neighbours. There cannot be any doubt that if it were the practice of an estate to insist upon the acceptance of leases, landlords or their agents would be constrained to sift the resources and circumstances of applicants much more closely than they do at present, when letting farms merely from year to year. The consideration weighs with the landlord or agent that the contract is but for a year, and that if the tenant does not go on pretty well he can be removed by a six months' notice; but we all know that such is the generosity and forbearance of English landlords, generally, that when once an indifferent tenant becomes seated in a farm, he is generally allowed to remain there; he is tolerated and borne with long after a proper

regard either to the landlord's interests or the public interests has suggested the reasonableness and the propriety of his being removed. I have lately availed myself of an opportunity of witnessing the effect of leases for 21 years, granted in a somewhat indiscriminate manner about 14 years ago to a tenantry occupying an estate of some extent in Cheshire. The Beeston Castle and Peckforton estates, of about 4000 acres, at the period referred to, belonged to the late Sir Thomas Mostyn, as tenant for life, with remainder to a party whose pecuniary embarrassments gave grounds for apprehension that he would, if he came into possession, bear hard upon his tenantry. Sir Thomas—than whom a better landlord, or kinder hearted man never lived—offered, under the powers he possessed, leases for twenty-one years to such of his tenants on those Cheshire estates as might choose to apply for them, and his agent might deem fit to be intrusted with them. Thirteen of the principal tenants on those estates asked for, and obtained, leases—the only test of fitness applied to the applicants being their having paid up their rents. The leases have been granted about 14 years. I went over the estate in September last with my relative and namesake, who has been familiar with every corner of the property for 30 years, and who settled the terms of the leases 14 years ago, which were very well and equitably arranged. The farms in question being dairy farms, the rents were made to fluctuate with the price of cheese. From the testimony of my relative, and that of some intelligent parties who accompanied us, and from my own recollections of the property, I can state, that only two individuals out of the whole number of 13 have made the least use of the security and advantages afforded them by their leases. As to 11 out of the 13, they and their land have remained alike, as it were, in *statu quo;* the idea of improvement never for one moment appears to have entered into their minds. Some of those men—the greatest part of them—had not the necessary means of effecting material improvements: they were needy men; some few were in better circumstances, and better results might have been expected. There were, however, two individuals, whom I may hope without offence to name, who had the good sense to set to work at once to put their land into condition. The name of those tenants are Mr. Bird, of Beeston Hall, and Mr. Jones, of Park Gate, a farm near Beeston Castle, both near Tarporley. Their process of improvement consisted in draining and in dressing heavily with bones. They drained extensively, and they manured with bones at an expense altogether of from 10*l.* to 12*l.* per acre. Mr. Bird's leasehold consists of two farms, one of about 330 acres, the other of about 84 acres. I heard Mr. Bird affirm that such was the change produced by management upon the farm of 84 acres (where he, when he was first married, was by his late father placed to live) on nearly the whole of which he expended 10*l.* per acre at the commencement of his term, that where his predecessor made about 25 or 30 cwt. of cheese per annum, he (Mr. Bird) made upwards of four tons, and maintained besides as much stock in horses and young cattle, unproductive of milk, as had been before maintained. Other portions of Mr. Bird's land, besides the 84 acres farm, have been much improved, and he has been repaid, and is being repaid, in a degree that is satisfactory to him, and to which his good management and industry entitle him. The case of Mr. Jones is scarcely less striking. His farm is about 200 acres. He adopted a course of treatment similar to that of Mr. Bird. It is known to all his neighbours, and I heard him admit it, that before he drained and boned, he kept only 23 cows. His land now maintains 46, and such of his lands as were in tillage before are in tillage still, and partake of the good management bestowed upon his Grass lands. I consider the case of those Cheshire estates very interesting, in connection with the subject of leases, and I give the names and addresses of Mr. Bird and Mr. Jones, that those who take any interest in the matter may, if they please, take occasion to see them and their farms. This case proves how important, in a national as well as individual point of view, would be the effect of granting leases to well-selected tenants, and how absolutely necessary it would be, under a system of leasing, to constrain the drones and the incapables to move on or out of the way. If individuals who advocate leases imagine that material advantage would ensue from the granting of leases to tenants *indiscriminately*, those individuals labour under great mistake. There must be a great disturbance of the present occupiers—a great severing of old connections, and a great uprooting of old attachments, if the system of leasing is to be suddenly attempted with a view to national and to individual benefit. Landlords cannot, with common prudence, demise their estates for a long term of years, and accept the covenants of parties who have nothing to lose, and who, if they had leases to-morrow, would not be able to turn them to the least advantage. In reference to the length of leases, I think where much improvement is to be made, our English term of 21 years, or the Scotch term of 19 years, very fair. If a farm, when leased, be in good condition, there is less necessity for extraordinary outlay, and consequently less necessity for the security of a lease which extraordinary outlay requires. In many cases, however, where outlay is to be made by the tenant, a lease for 7 years certain, and afterwards from year to year, and until a two years' notice to quit be given, would afford perfect security to the tenant, and would be conceded by the generality of landlords with less hesitation than a term of 19 or 21 years. I think, whatever the term may be, in the event of the death of the lessee, the lessor should, in addition to his ordinary powers of re-entry, for breach of covenant, have power to determine the tenancy before the expiration of the term by a two years' notice to quit. This period would afford time and opportunity to test the qualifications of the party introduced into the tenancy. If his management were good, public opinion, if the right feeling of an English gentleman were wanting in the landlord, would generally secure the tenant against unfair disturbance or molestation. I think such a power to determine farming leases as the one I have suggested ought to be reserved to lessors, and I think it is one with which English landlords may safely be entrusted. At all events, such a reservation of power to the landlord might be made perfectly unobjectionable, by a stipulation that, in the event of its being exercised, the tenant should be paid for all permanent improvements made with the acquiescence of the landlord or agent, of which he had not had time to reap the full benefit. As far as my experience of estate management and of farming leases goes, I should say that there is hardly any system of letting worse than that of leasing upon lives. I have had an intimate acquaintance with some extensive estates (particularly in South Wales) which had been demised for three lives at low rents, a consideration in money having been paid for the leases when granted. I first knew them at the period when the leases were beginning to drop in. The farming was in almost every case the very worst in the country, and although the rents were only one-fourth or one-third of the rack-rent value, most of the tenants had been reduced to beggary by their indolence and bad management. It seemed as if towards the expiration of their leases, when their leases hung upon one or two old lives, for instance—it seemed as if the uncertainty of their tenures had paralysed all their exertions. They would not improve, considering the time was near at hand when the lease must expire, and an advance in rent ensue. Another topic to which I will briefly advert, is that of the rate of interest to be charged on money invested by landlords in improvements on farms already let at fair and equitable rents. How often do we see gentlemen, in their desire for extended landed possessions, who, whilst they already have lands almost totally unimproved, imperfectly drained, imperfectly fenced, with bad roads and worse buildings—lands on which capital may be made sufficiently remunerative—how often do we see them borrowing money at four or five per cent. to pay for estates bought to pay two or three per cent. I submit, it is very obvious that, instead of indulging the passion referred to, it would be better for the interests of agriculture, and certainly, in a pecuniary point of view, much better for such purchasers and their families, were they to expend capital on such of their lands as allowed of permanent improvement, although that improvement might not be calculated to admit of the tenant bearing an increase of rent to a greater extent than five per cent. on the outlay. The tenant farmer, however, must obviously lay his account for a better rate of interest; for, in addition to the interest of his money expended in permanent improvements, he has his capital to redeem. If holding under a lease, it will depend upon the term remaining in such lease: if holding under a tenancy from year to year, it will depend upon the confidence he may have in the honour and fairness of his landlord how he ought to lay his calculations for redemption of outlay. In connection with our present subject it may be remarked, that where a tenant is highly rented, and somewhat crippled in his circumstances by the drain thereby occasioned, a landlord, instead of reducing the rent, may often, by a little judicious expenditure in promoting, or altogether executing, an improvement, sustain the rent, and confer a greater boon on the tenant than a reduction of rent would have conferred. It is always matter for the exercise of judgment and discretion, whether the landlord should charge any per centage at all upon an outlay made under such circumstances. I shall now bring my observations to a close, merely observing that it is impossible to travel through England and Wales, in any direction, without feeling a strong conviction that there must be some serious obstacles to the investment of capital in agriculture. The people at large are deeply affected by every measure which has a tendency to fetter the productive powers of the soil, and to depress one of the largest and most valuable classes in the country. It is clearly their interest that corn and other provisions shall be supplied in abundance; and, perhaps, the people of England and Wales may justly complain of the want of leases as one of the principal causes which check the improvement of their own territory."—On the conclusion of the Essay, it was proposed by Lord Lyttelton, and seconded by J. H. H. Foley, Esq., "That the thanks of this meeting be given to Mr. Maughan for his very valuable Essay." The motion was, by acclamation, carried. Both Lord Lyttelton and Mr. Foley, in speeches of considerable length, expressed their concurrence in the views on leasing embodied in Mr. Maughan's Lecture, and avowed their readiness to act upon them. After an animated conversation on the subject, the following resolution was carried: "That it is the opinion of this meeting that the present system of letting farms—large farms especially—to tenants to hold from year to year, begets, on the one hand, incaution in the landlords in the selection of tenants as regards their pecuniary resources and personal fitness; and on the other hand, affords mischievous facilities to men without calculation and competency for obtaining farms exceeding their skill and capital to manage, and begets in tenants generally holding from year to year an indisposition to hazard any outlay not required by ordinary and routine management; and that it is further the opinion of this meeting that the granting of farming leases for a term of 21 years, or thereabouts, on corn or other produce rents, to tenants carefully and judiciously selected, would tend, in an eminent degree, to elevate the pursuit of agriculture, and would incite to the general adoption of the best systems of husbandry."

Reviews.

The Industrial Resources of Ireland. By Robert Kane, M.D., &c. &c. Hodges and Smith, College Green, Dublin.

"In other countries it has been the most anxious care of Government, and of those entrusted with the superintendence of education, to ascertain the nature and amount of their means of promoting industry, and extending the employment of the people. It is thus that every year sees the continental nations making such giant strides in manufacturing activity. It is thus that the physical disadvantages, which had so long kept them back, are gradually being lessened in importance. If similar zeal and intelligence were manifested in developing the resources of this country, there would be no fear of the result. As circumstances, however, do not admit of this being done, the publication of even the short and imperfect sketch, which alone could be drawn up by an unaided individual, may be useful in awakening the attention of those practically engaged upon those subjects, and may lead to more extensive observation, and more detailed inquiry."

This extract from the Preface of this work is an exceedingly modest announcement of the Author's motive in its publication. This "short and imperfect sketch," as he terms it, of Ireland's resources will, we doubt not, be eminently useful in teaching her people how to exert and direct their industry profitably; and it will be the means not only of thus *creating* capital, but of indicating the many opportunities which exist in that country for its profitable *investment*.

Among the subjects of discussion in this volume are the following:—the circumstances of Ireland with regard to fuel—the water-power of Ireland—its manufacture of iron—the geological character of the country—its mines of copper, lead, &c.—its agricultural industry—its means of internal communication—the cost of labour in Ireland—its supposed want of capital—its want of industrial knowledge. It is only to the chapters referring to the Agriculture of this country that we shall direct the attention of our readers; and we can truly say that they will find in them much on the general bearings of the subject—many instances of what is now acknowledged to be the chief source of future improvements in practice, the skilful application of scientific truth—much information on the cultivation of particular plants—in short, much that will greatly interest those who may be neither personally nor specially interested in the great object of the Work.

It is our wish to convey an accurate idea of this portion of the volume—extending over about a hundred octavo pages of small print—and, in order to this, we cannot do better than transcribe the headings of the two chapters into which it is divided, and occasionally quote an illustrative passage from the pages to which they refer.

The following, then, are the subjects which have engaged the Author's attention:—"*The agricultural industry of Ireland—its importance as an occupation—relations of agriculture to manufactures—natural fertility of the soil of Ireland.*" On this last we quote the opinion of Arthur Young, who says of Limerick and Tipperary—"It is the richest soil I ever saw, and such as is applicable to every wish. It will fatten the largest bullock, and at the same time do equally well for sheep, for tillage, for Turnips, for Wheat, for Beans, and, in a word, for every crop and circumstance of profitable husbandry. You must examine into the soil before you can believe that a country, which has so beggarly an appearance, can be so rich and fertile."

We continue our Table of Contents. "*Distribution of the surface of the country—office of plants—correlative functions of the mineral, vegetable, and animal kingdoms—composition of plants—origin of the soil—connexion between the fertility of the soil and its composition—examples of fertile districts—nature of the soils of various parts of Ireland—composition of subsoils—organic elements of the soil—mechanical and physical office of the soil—of drainage; its importance to Irish agriculture—action of plants on the soil—of exhaustion—composition of the most important crops—of manures—composition and properties of the most important native manures—of lime and limestone; marl; sea sand; coral sand, its nature.*" Again we transcribe an interesting passage, descriptive of the extent and employment of these sources of manure, to which we have parallels in England in the extensive use made by farmers in Cornwall of the sea-sands accumulated on its northern coasts:—

"The shell banks of Lough Foyle form, when the tide is out, extensive flats, which are firm enough to be walked on without any inconvenience, and they are resorted to by numerous boats for loads of shells; and though this system has been pursued for more than a century, they exhibit no appearance of a failure in the supply. The shells hitherto examined are all of recent species; and it becomes a question whence they came. There are engaged in raising the shells

285 men for 26 weeks, at 10*s.*		£3705
50 boys	at 6*s.*	390
The cost of the labour alone is thus		£3595

There are annually employed about 94 boats, of tonnage from below 8 to 60 tons. The aggregate tonnage of 41 of the largest boats is 1226 tons. The total quan-

tity of shells raised each summer is about 59,496 tons, which on the shore immediately opposite the bank sell for 1*s.* per ton; but at Derry and Strabane for 1*s.* 6*d.* to 2*s.* per ton. Altogether Captain Portlock considers the shell banks of Lough Foyle to be worth 5000*l.* per annum to the country. 'They are particularly useful in bringing bad lands into cultivation, and in ameliorating stiff wet clays, deficient in calcareous matter, being applied at the rate of from 30 to 60 barrels per acre. They are preferred to lime, as warming and brittleing the land."

"*Value of those sands dredged upon the north and south coasts—of gypsum; of sea-weed; of bones; farmyard manure; its composition and relative power—importance of its preservation and suitable economy to practical agriculture. Of rotations—relation of Corn crops and green crops—amount of food produced by various systems of culture—influence of different cultures in the exhaustion or amelioration of the soil—size of farms in Ireland—principle of consolidation not as applicable to Agriculture as to manufactures—relation of the size of farms to the population—relative profit and employment afforded by large and small farms—average available farms for existing population.*" On these latter subjects we venture to quote a short passage from a lengthened argument, which requires, however, to be perused throughout thoroughly to appreciate it:—

"In his valuable work on Agriculture, Professor Low gives some estimates, from which it results that he considers a 500 acre farm to give an amount of occupation equivalent to the employment of 20 persons throughout the entire year. Now it has been already shown that the area of land available for cultivation is about 18,000,000 of acres, made up of:

Land actually cultivated	13,464,300 acres.
Land capable of cultivation . . .	4,600,000 ,,

Now if this be divided into 36,000 farms, of 500 acres, there will be given by their cultivation employment for 720,000 individuals; but as the actual agricultural population amounts to 5,106,743, the difference, or four millions and a half of human beings, will be thrown on the world without any means of subsistence."—"On the other hand, as the total number of existing agricultural families is 974,188, it results that from the available land there could be allocated to each a farm of 17 statute acres. That this quantity is sufficient to support a family, paying full rent, is a matter of which there is no doubt."

"*Secondary uses of food crops—manufacture of Potato-starch, sugar, and spirits—composition of different kinds of Potatoes—manufacture of Beet-root sugar; its economic circumstances—of fibre crops—cultivation of Flax and Hemp—composition of ligneous fibre—mode of culture and preparation of Flax—principles which it gives off in steeping—average crop of Flax—its value—uses of the Flax residue as food and as manure—Flax manufacture and linen trade—total value of Flax grown in Ireland—exertions of the Royal Dublin Society and Flax Improvement Society, and their results—employment given by the Flax and linen trade—tables of mill power and of exportation of Flax and linen—localization of this industry—favourable situations for it—culture and composition of Hemp—conclusion.*"

Our last extracts shall be on the cultivation of Flax—a crop which is becoming every year more extensively cultivated in this and the sister country:—"Mr. Crosthwaite, whose intimate acquaintance with all branches of this industry renders his authority highly valuable, considers that there are about 100,000 acres under Flax in Ireland, and that the produce is about 30,000 tons, of an average value of 50*l.* per ton. This is 6*s.* 3*d.* per stone, and should give about 12*l.* 10*s.* for the usual produce of the statute acre."—"The Flax, when it has grown to suitable maturity, according as the design is to allow it to ripen its seed or not, is pulled, and either immediately, or in the next spare season, according to the circumstances of the locality, it is subjected to the process termed rotting or watering. In the stem of the Flax there may be recognised three structures—the outer skin or epidermis, covering a close network of fibres which incloses the plant as in a sheath, and in the centre a stem of dense pithy material. The fibrous network is connected together by a glutinous matter which must be decomposed before the fibres can be separated from the stem, and it is to soften and rot this substance that the plant is steeped. If the steeping be continued too long, the fibre itself may rot, and be weakened and injured in quality; if the steeping be not continued long enough, the fibres are not thoroughly separated from each other, and the quality of the Flax is coarser than it might be."—"When the Flax is steeped, the water acquires a darker colour, a disagreeable odour, and, it is well known, becomes poisonous to fish. This arises from the solution of the glutinous material which had cemented together the pure fibres."—"The author of the Survey of Somersetshire (Mr. Billingsby) says: 'Having myself cultivated Flax on a large scale, and observing the almost instantaneous effect produced by the water in which the Flax was immersed, I was induced, some years ago, to apply it to some pasture land, by means of watering-carts similar to those used near London for watering the roads. The effect was astonishing, and advanced the land in value 10*s.* per acre.'"

This part of the subject is illustrated by analyses, executed by the author, of the Flax-plant, its ashes, the extract in the Flax-steep, &c. Professor Kane's work is one of national importance.

The British Farmer's Almanack and Diary of Agriculture and Gardening for 1845. Company of Stationers. London.

This is another well-compiled Farmer's Almanack. Its Agricultural Calendar has been written by a gentleman who, we happen to know, is thoroughly well qualified for the task.

Miscellaneous.

Practice of Irrigation.—The first operation on the intended meadow is, to free it thoroughly of water by draining. If springs exist, they should be cut off by drains of sufficient depth to reach the source of injury. But, in addition to this, the land, if the soil is clayey, or rests upon a tenacious subsoil, should be effectually furrow-drained, so as to afford a ready egress to the water underground. The land is then to be levelled and otherwise prepared. If it is already in old turf, it will be well to pare off the sward with the spade, and after having dug and prepared the ground, to replace the turf. In this manner the meadow will be ready for the reception of the water, as soon as it is formed. But should there be no turf upon the ground, or should this turf be filled with useless or innutritious plants, the land should be thoroughly worked, levelled, and otherwise prepared, and then sown with the suitable Grass-seeds. These Grass-seeds may be sown in autumn. We cannot, however, in this case, admit the water during the first winter. We must retain the land in pasture for the whole of the following winter and summer, so that the young plants may establish themselves in the soil. But in the second winter we may generally admit the water. The ground may be in part prepared by the plough, and we may even economise expenditure by taking a crop of some kind before we begin to level and otherwise form the meadow; but generally it is better to proceed at once with the formation of the meadow, and employ the spade in place of the plough for levelling and preparing the ground for the reception of the Grass-seeds in autumn. Along the higher side of the meadow is first to be formed the main conductor, to which the water is carried, and from which it is conveyed over the surface of the meadow. The earth taken out of this trench is to be employed in banking it, and filling up hollows in the surface of the ground. The size of the main conductor must be proportioned to that of the meadow, and the quantity of water to be conveyed. The next operation is, forming the main drain, at the lower part of the land to be flooded. It is of the same size as the main conductor, and the earth taken out of it is to be employed in banking or filling up hollows. The surface of the meadow, supposing it to be flat, is now to be formed into beds or panes, from 30 to 40 feet in width, extending from the main conductor to the main drain. These beds may be elevated about 12 inches at the centre; they are not curved like the ridges of a ploughed field, but form inclined planes from the centre to each side. At leaving the main conductor they may be 20 inches wide, gradually narrowing to nearly a point at their termination when they reach the surface. If stops of solid earth are left, these may be six inches either way, with their diagonal in the line of the feeder, and such of them as are not required may be afterwards removed. The earth taken out of these feeders is to be employed in making good their own banks, and in levelling inequalities of the surface. Corresponding with the feeders, and alternating with them, are to be formed the series of subordinate drains, communicating with the main drain. They are of the same dimensions as the feeders, with this distinction, that they are widest and deepest where they communicate with the main drain, and become gradually smaller to the upper part of the meadow, where they terminate. The surface of the meadow being formed, the Grass-seeds, where no turf has been reserved, are to be sown. The following admixture of Grasses will be found suitable:—1. Alopecurus pratensis—meadow foxtail; 2. Phleum pratense—meadow cat's-tail; 3. Agrostis alba—marsh bent-grass; 4. Poa trivialis—rough-stalked meadow-grass; 5. Poa pratensis—smooth-stalked meadow-grass; 6. Festuca loliacea—spiked fescue-grass; 7. Festuca pratensis—meadow fescue. When the old turf has been replaced, the water, it has been said, may be admitted in the first winter; when Grass-seeds have been sown, the water cannot be admitted until the second winter, and sometimes even not until the third. The ground should be depastured with sheep during the first summer, to such a degree as to prevent the plants from putting forth their flowering stems and producing seeds. The next point to be considered is the management of the meadow when completed. At the beginning of October, we are to prepare for admitting the water. To this end the drains and feeders are to be cleaned out, and the banks where injured repaired. The main sluice is then to be withdrawn, when the conductors and feeders will be gradually filled. The next point is to adjust the water in the several feeders. To this end the workman is to observe that each feeder, beginning with the first in order, receives a due quantity of water. If not, he enlarges the mouth so as to allow the proper quantity to enter. He then adjusts the stops in the several feeders, so that the whole surface of the beds shall be covered equally about an inch deep with water. During this and the three following months—namely, November, December, and January, the ground is to be regularly flooded for 15 or 20 days at a time, with intermissions at each time of seven or eight days, during which the ground is to be laid perfectly dry. Further, when severe frost is threatened, the water is in like manner to be withdrawn, so as that it may not freeze upon the surface. During this, the principal periods of flooding the meadow is to be inspected every three or four days, to see that no interruption from the breaking of banks, accumulation of weeds, or otherwise, is given to the flowing of the water. When the spring months arrive, and the Grasses begin to grow, the periods of flooding are to be shortened. In the month of February the water should never be allowed to flow above six or seven days at a time, and in severe frosts it should be withdrawn, so that no ice may be formed upon the meadow. The same management, shortening to five or six days the periods of flooding, may be continued till the middle of March, by which time the meadow will be ready for receiving any kind of stock. In this manner, an early supply of herbage is obtained, and after the stock has been removed, as by the beginning of May, the flooding may be resumed and continued till near the end of the month, so as to prepare the meadow for hay. But often this spring feeding is not resorted to. The irrigation is continued during the months of March, April, and until the middle of May, when it finally ceases. But during this period, the frequency and length of time of watering are gradually diminished from five or six days in March, to two or three in the latter period of flooding. Caution is required in flooding as the season advances; because, were the finer Grasses to be too long submerged at this period of their growth, they would be injured and destroyed. The actual periods of flooding differ with the state of the season and the nature of the soil. A practical rule adopted by irrigators is, never to continue to flood when a white scum is seen to form on the surface of the water, for this indicates that the putrefactive fermentation has commenced in the turf. By the middle of May, or rarely later, the flooding is to cease, and the land to be laid thoroughly dry. The Grasses will now grow with great luxuriance, and produce an abundant crop of hay. When the hay is removed, the aftermath is depastured, after which the same process of flooding recommences. Sometimes, after the hay is removed, the ground is again flooded; but, in this case, no sheep must be admitted on the flooded land, or, if admitted, they must be such sheep as are to be immediately killed; for this summer-flooding never fails to bring with it the disease of rot in its most destructive form. In place of the meadow being applied to the production of hay, it may be applied to the production of green forage for soiling. This is a more profitable mode of applying the watered meadow than for the production of a crop of hay. Three crops in this case may be taken, the meadow being flooded after each crop is removed.—*Professor Low, on Landed Property.*

Notices to Correspondents.

The letter, *J. C., Kent*, has been received: too late for publication this week.

Acorns as food for Pigs.—*T. D.*—See page 699.

A Leaking Tank.—*Bingo.*—The recommendation to put Oatmeal into such a tank was not ours; we cannot speak of the efficiency of such a plan, and should think it unsuited to your case.

Bacon.—To Readers.—*A.*—How can I prevent the formation of *reastiness* in bacon? Does it arise from improper curing, or improper *keeping?*

Books.—*Broadway.*—The works you want are published by the Society for the Diffusion of Useful Knowledge.

Boggy Land.—*Alricksey.*—Lime it at the rate of 100 bushels per acre; in spring you can apply ordinary farm manure.

Carrots.—*Subscriber.*—They can be given to milch cows, with advantage both to the health of the animal and the quantity and quality of the milk. We have given 100 lbs. weight a day to cows, along with the Wurzel.

Farm Accounts.—*J. M. M.*—There are some instructive chapters on this subject in Stephens's "Book of the Farm." The best principle of any system of accounts is of course that of double entry.

Gas Lime.—*Sheiravel.*—Your compost will be a powerful fertiliser. Turn the lime 3 or 4 times, at intervals of 8 or 10 days, before soaking it and the tan with urine. A waggon-load ought to dress an acre.

Guano.—*E. F. A.*—Apply guano and all other manures whose value depends in any measure on soluble ingredients, early in spring—say first week in April—in wet weather.

Price of Turnips, &c.—*Avon.*—Swedes, 1*l.* per ton; Mangold Wurzel, 15*s.* per ton; Carrots, 2*l.* per ton. These are prices which we have known given for large quantities; but of course they vary somewhat.

Sheep.—*J. E.*—We understand the sheep at Whitfield Farm do not receive any chaff as food. They are all fed in the yard under shelter, on Swedes and oil-cake.

Spring Wheat.—*J. M. F.*—It may be sown if the land be drained, on any suitable day through the winter. It is generally sown in February. The Belle Vue Talavera is a good variety.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Dec 9.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s 0	to 4s 4	Best Downs & Half-breds	4s 6	to 4s 6	
Best Short Horns	3 10	4 0	Best Long-wools	3 10	4	2
Second quality Beasts	3 6	3 6	Ewes and second quality	3 0	3	6
Calves	3 8	4 6	Pigs	3 4	4	4

Beasts, 4120; Sheep, 30, [illegible]; Calves, 90; Pigs, 43.

Our supply of Beasts to-day is very [illegible], with a fair [illegible] of good quality. The importation of Irish Stock is becoming an important feature in the consignments to our Market; we have to-day [illegible] from Ireland. Everything, in consequence of the supply, has receded [illegible] yet, the weather being good, the [illegible] fat Cattle have nearly sold at same money; in some instances a few of the best Scots have made [illegible] and some choice Short Horns 4s 2d. Trade is very heavy amongst the middling sorts, and several remain unsold. Sheep are rather more plentiful, the best qualities, however, are not very abundant and [illegible] late quotations. As is usual [illegible] Christmas [illegible] be disposed of. Veal-trade is heavy, but the best qualities are nothing [illegible] the same price as of late. Pork-trade is heavy.

Friday, Dec. 13.

The supply of fresh Beasts up to-day is but [illegible] consumption. We have a few lots of very fine [illegible] are heavy amongst them. In still being [illegible] not very eager to buy. The prices are [illegible] and several left unsold. Veal-trade is considerably worse; it must be a very choice [illegible] a great proportion are of middling quality, [illegible] best Sheep are worth a trifle less than on Monday, [illegible] ranging from 3d to 4s.

Beasts, 1598; Sheep, 4530; Calves, 147; Pigs, 370.

41, West Smithfield.

HOPS, Friday, Dec. 13.

We have again more demand for Hops at improved prices.

Farrenden & Sons, Hop-Factors.

COVENT GARDEN, Dec. 14.—The supplies of most articles have been tolerably good, and, in consequence of the frosty weather, prices have been considerably on the rise. Trade is somewhat brisker. Among Fruit, Pine-apples continue to be sufficient for the demand; they consist chiefly of Queens and Black Jamaicas. A few Hothouse Grapes have been offered during the week, and foreign sorts are pretty plentiful. The supply of good Dessert Apples is equal to the demand, and Pears of good quality are also abundant. Chesnuts, as well as other nuts, are scarcer, and consequently dearer than they were last week. Oranges are consequently much dearer. Good samples of Seakale and Asparagus are offered; for the latter, however, there is little demand. likewise slightly on the rise. Among vegetables, White and Purple Broccoli is good. Cauliflowers are good; but they are scarce, and Turnips and Carrots are considerably advanced in price. Leeks are likewise dearer, as are also Parsley and Celery; some specimens of the latter are very fine. A considerable quantity of Dutch Potatoes are in the market; they are said to be good in quality, and are selling at 6d. per lb. French Beans have been offered during the week at from 3s. to 4s. per 100. A few Tomatoes are still to be had; but they are becoming very scarce. Lettuce, Endive, and other salading, are tolerably plentiful, and pretty good for the season of the year. Among Cut Flowers we noticed Cypripedium insigne, Bignonia venusta, Luculia gratissima, Poinsettia pulcherrima, Gnidia pinifolia, Pentas carnea, Camellias, Epacrises, Heaths, Heliotropes, Cinerarias, Amaryllises, Azaleas, Narcissus, Chrysanthemums, Tulips, and Roses.

FRUITS.

Pine Apple, per lb., 3s to 7s	Oranges, per dozen, 1s to 2s
Grapes, Hothouse, per lb., 2s to 5s	— per 100, 5s to 12s
— Spanish, per lb., 10d to 1s	— bitter, per 100, 12s to 16s
— Portugal, per lb., 1s to 2s	Lemons, per dozen, 1s to 2s
Apples, Dess., per bush., 3s to 8s	— per 100, 6s to 14s
— Kitchen, 2s to 6s	Almonds, per peck, 6s
Pears, Dess., per half-sv., 4s to 8s	Sweet Almonds, per lb., 2s 6d to 3s
Quinces, per half sieve, 3s to 5s	Cob Nuts, per 100 lbs., 150s to 190s
Medlars, per bushel, 5s.	Nuts, Barcelona, 24s
Filberts, per 100 lbs., 140s to 150s	— Brazil, 16s
Chesnuts, per peck, 2s to 6s	— Spanish, 22s
Walnuts, per bushel, 5s to 8s	— Barcelona, 24s
— — shelled, 12s to 20s	— Cob, 16s

VEGETABLES.

Cabbages, per dozen, 6d to 1s 2d	Leeks, per doz., 2s to 3s 6d
— plants, per doz. bnch., 3s to 5s	Garlic, per lb., 4d to 6d
Cauliflowers, per doz., 2s to 10s	Onions, per bunch, 4d to 6d
Broccoli, per bundle, 1s 6d to 3s	— large, per bushel, 2s to 3s 6d
Brussels Sprouts, half-sv., 2s to 2s 6d	— Spanish, per doz., 1s 6d to 4s
Sorrel, per half-sieve, 1s 6d to 2s	Shallots, per lb., 6d to 8d
— Jerusal., p. half-sv., 1s to 1s 6d	Capsicums, per 100, 4s to 6s
Potatoes, per ton, 50s to 70s	Radishes, per doz., 6d to 1s
— cwt., 2s 6d to 4s	Lettuce, per score, 6d to 1s 6d
— bushel, 1s 6d to 2s 6d	Celery, White, per bunch, 1s to 1s 6d

POTATOES.—SOUTHWARK WATERSIDE, Dec. 9.

THE supply during the past week has been unusually limited, in consequence of the prevailing east winds. The best samples went off readily, and towards the close the weather set in very severe, with some appearance of its continuation, which increased the demand for the best samples.

MARK-LANE, MONDAY, Dec. 9.

THE supply of Wheat from Essex this morning was moderate, that from Kent and Suffolk good, and the whole met a tolerable sale on fully as good terms as this day se'nnight; in Foreign the business transacted was to a very limited extent only. There was less Barley offering than of late; fine malting qualities were taken on rather better terms; grinding and distilling found more inquiry at our quotations. Beans and Grey Peas must be written 1s. lower; White are unaltered in value. The quantity of Oats on sale continues moderate, but although prices are fully supported, the demand is not active.

FRIDAY, Dec. 13.

THE arrivals of Corn during the week have been very moderate, and the frost having closed the majority of the canals, and threatened to stop the navigation of the River, business generally has been very limited; we observe no alteration in the value of Wheat, but prices both for English and Foreign are fully maintained. Great difficulty is experienced in the disposal of the Barley left unsold from last day, but its value cannot be written lower. Beans and Grey Peas are unaltered, White continue inquired after. The quantity of Oats on sale is small, and meet a slightly improved demand at our late quotations.

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., F.R.S.,

Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution.

&c. &c. &c.

Extracts from the Introduction.—

"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

MECHI'S ELEGANCIES FOR PRESENTS and USE, manufactured on the premises, 4, Leadenhall-street, near the India-house, London, wholesale, retail, and for export:—Ladies' and gentlemen's dressing cases, in leather, wood, and papier maché, from 100 guineas down to 25s. Writing desks, 25 guineas down to 12s. Work boxes, 20 guineas to 10s. Ladies' cabinet and jewel cases assorted. Tea caddies, the most elegant in the world, 12l. to 6l. each, down to 7s. 6d. Ladies' papier maché work boxes, 10l. each down to 3l. Netting boxes, 30s. to 23s. Card boxes, 5l. 5s. to 11s. Set of tea trays, 20 guineas to 5l. Bottle cases, 30s. each, Companions, 2l. 10s. to 10s. 6d. each. Pole screens, 9l. the pair. Hand screens, 50s. to 20s. the pair. Card racks, 40s. to 25s. per pair. Note and cake baskets, 50s. to 20s. each. Bagatelle tables, 10l. 10s. to 3l. 10s. Leather writing cases, containing a complete dressing apparatus, 15l. 10s. to 5l. 10s. Pearl and fancy card cases, 3l. 10s. to 10s. each. Ivory hair brushes, 4l. to 2l. 10s. per pair. Splendid cases of seven-day razors, 10l. to 2l. 10s. the set. Ivory handled and other highly finished strops, from 25s. to 3s. each. Wharncliffe penknives, sporting knives, and fancy scissors, 3l. to 5s. each. Splendid cases of agate, pearl, and ivory dessert-knives and table knives, from 42l. to 1l. 4s. the case. A rich variety of plate, bronze, gilt, and papier maché and table inkstands, from 6l. to 7s. 6d. each. The quality generally of MECHI's madufactures, the elegance of their display, and the rare combination of excellence and economy, with a very extensive choice of stock, will amply repay the trouble of visiting his depôt, 4, Leadenhall-street.

HEAL AND SON'S LIST OF BEDDING.—Containing a full description of weights, sizes, and prices, by which purchasers are enabled to judge the articles that are best suited to make a good set of Bedding, sent free by post, on application to their establishment, the largest in London exclusively for the manufacture and sale of Bedding (no Bedsteads or other furniture being kept). HEAL AND SON, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham Court Road.

SEASONABLE FESTIVITIES.—The gaiety that reigns supreme at this festive season, when friends and lovers assemble at the social board, or whirl in the giddy mazes of the dance, induces both sexes to be more than usually desirous of shining in personal attraction, and to devote a greater share of attention to the toilet. It is at this particular season, that the VIRTUES and SINGULARLY HAPPY PROPERTIES OF THOSE AUXILIARIES OF PERSONAL BEAUTY, ROWLAND'S KALYDOR, ROWLAND'S MACASSAR OIL, & ROWLAND'S ODONTO, shine pre-eminent in their power; while the *white and swan-like neck*, the *rich luxuriant tress*, and the *Pearly set of Teeth* form admirable trophies of their INESTIMABLE QUALITIES! The august Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence, and the confirmation by experience of the infallible efficacy *of these creative renovating Specifics*, have characterized them with perfection, and given them a celebrity unparalleled. As presents for both sexes, none can be more recommendatory, or more now in general use.

*** Ask for "ROWLAND'S" Articles. All others, under the same names, are SPURIOUS IMITATIONS!!!

PRIZE IMPLEMENTS.

DEAN'S HORSE or CATTLE POWER has been awarded Prizes at seven Agricultural Meetings.

DEAN'S THRASHING MACHINES were awarded the highest Prize for Implements, by the North Staffordshire Agricultural Society.

DEAN'S IMPROVED CHAFF CUTTERS obtained Prizes at the Evesham and Gloucester Meetings.

DEAN'S CORN CRUSHERS, with recent Improvements, have taken Prizes at three Agricultural Meetings.

DEAN'S DOMESTIC CORN MILLS have obtained two Prizes, and the Silver Medal of the Royal Agricultural Society of England.

THE BRETFORTON CIDER MILL was also awarded the Society's Silver Medal.

DEAN'S PATENT LIQUID MANURE CART was awarded the Silver Medal of the Liverpool Agricultural Society.

DEAN'S PORTABLE STEAM ENGINE was awarded a Prize of 10l by the Royal Agricultural Society of England.

A. DEAN'S Descriptive Catalogue of the above Machines; Cake Breaker, Turnip Cutter, Linseed Mills, Bone Mills, and Corn Mills suitable for Emigrants, Farmers, Bakers, and Millers, &c., &c., may be had by post, the order being accompanied by six Postage Stamps.—New Canal-street, Birmingham.

TO FARMERS.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

IMPORTANT TO AGRICULTURISTS.

THE GOLD OF PLEASURE, or Cameline Sativa.—WILLIAM TAYLOR, having taken out a Patent for Manufacturing Oil and Cake from the above Plant, strongly recommends the growth of it to Landed Proprietors and Farmers, as being more productive and profitable than any seed that can be grown. The seed is sown in the middle of March, in rows 12 inches apart, and the crop ready to harvest the beginning of July, afterwards a crop of Turnips may be obtained, or the land fallowed for Wheat or spring Corn. It is a plant that may be cultivated after Wheat, Barley, Beans, or any Corn crop, without being found an exhauster of the land. The best soils adapted for the cultivation of this new Oil Plant are those of a light nature, but a crop will never fail on land of the most inferior description. The Gold of Pleasure is a plant, yielding a large and certain crop, producing 32 to 40 bushels per acre. The Patentee begs to inform Farmers, that he is ready to contract with them to grow 10,000 quarters, at 40s. per quarter, delivered in London. The seed to be had in 10lb. bags, at 5s. 6d., sufficient for an acre, with a pamphlet relating to its culture.—Direct to 314, Regent-street, London.

INTERESTING WORKS,

SUITABLE FOR PRESENTS,

PUBLISHED BY

SMITH, ELDER, AND CO., CORNHILL.

I.

Just published, in post 8vo, price 10s. 6d. handsomely bound in a new kind of cloth, silver gilt; or 9s. boards,

IMAGINATION AND FANCY; or, SELECTIONS from the best ENGLISH POETS, illustrative of those First Requisites of their Art, with Markings of the best Passages, Critical Notices of the Writers, and an Essay in answer to the Question, "What is Poetry?" By LEIGH HUNT.

"This volume is handsomely printed, and beautifully bound in a new style of exquisite delicacy and richness. To institute a comparison with the contents of the Annuals would be absurd, at any degree of distance,—there is no more relation between them than between a street lamp and a fixed star; but in external beauty 'Imagination and Fancy' equals any gift-books that have appeared; and it will form a more enduring memorial than any other volume that might be selected as a gift for the coming season."—*Spectator*.

II.

Just published, Sixth Edition, in 3 vols. fcap. 8vo, beautifully Illustrated, price 7s. 6d. each, in a handsome and uniform cloth binding, or 10s. 6d. morocco,

PICTURES OF PRIVATE LIFE. By Mrs. ELLIS, Author of "The Women of England," &c. &c. &c.

CONTENTS:

Vol. I. "Observations on Fictitious Narrative"—"The Hall and the Cottage"—"Ellen Eskdale"—"The Curate's Widow"—and "Marriage as it May Be."

Vol. II. "Misanthropy," and "The Pains of Pleasing."

Vol. III. "Pretension; or, the Fallacies of Female Education."

Each volume is complete in itself, and may be purchased separately.

III.

Just published, Fifth Edition, post 8vo, in a new and very elegant style of binding, silver gilt, and beautifully illustrated, price 10s. 6d.

LEGENDS and RECORDS, chiefly HISTORICAL. By the Rev. C. B. TAYLOR, M.A., Author of "Records of a Good Man's Life," &c.

CONTENTS:

Lucy—Lorenzo, or a Vision of Conscience—The Lady Lisle—Fulgentius and Meta—Ann of Cleves, or Katherine Howard—George the Third—The Lady Russell—Guyon of Marseilles—The Earl of Strafford—Dona Francesca—Joan of Kent—The Lady Anne Carr—The Son and Heir—Leonora.

IV.

RECTORY of VALEHEAD; or, RECORDS of a HOLY HOME. By the Rev. R. W. EVANS, M.A. Twelfth Edition, with Plate. Price 6s., cloth.

V.

LIFE ASSURANCE.

AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

CAPITAL £200,000—IN 2000 SHARES.

DIRECTORS.

Edward Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onlow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

The advantages offered to EMIGRANTS to the Australasian Colonies by this Company are,—First, That no extra Premium is charged for Residence in any of the Australasian Colonies, except in New Zealand. Second, That no extra Premium is charged to those who Assure for the whole term of life, for one voyage out to the Australasian Colonies, and for one return voyage; and that Premiums may be paid and Claims settled in those Colonies. And to all Persons who wish to Assure their Lives, the Company offers unusually favourable Rates of Premium, participation in Profits, and the guarantee of an ample subscribed Capital.

Prospectuses and full Particulars may be obtained at the Offices of the Company, No. 126, Bishopsgate Street, corner of Cornhill, City.

DISEASED AND HEALTHY LIVES ASSURED.
MEDICAL, INVALID AND GENERAL LIFE OFFICE,
25, PALL MALL, LONDON.
SUBSCRIBED CAPITAL £500,000.

THIS Office is provided with very accurately constructed Tables, by which it can ASSURE DISEASED LIVES on Equitable Terms. The EXTRA PREMIUM DISCONTINUED on restoration of the Assured to permanent health. INCREASED ANNUITIES granted on UNSOUND LIVES, the amount varying with the particular disease. Members of CONSUMPTIVE FAMILIES ASSURED at Equitable Rates. HEALTHY LIVES are Assured at LOWER RATES than at most other Offices. POLICIES of twelve months' standing are NOT AFFECTED BY SUICIDE, DUELLING, &c.; and Assigned Policies are valid from the date of the Policy, should death ensue from any of these causes. F. G. P. NEISON, Actuary.

News of the Week.

By the Overland Mail from India we have advices from Bombay to 1st Nov. The news is not remarkable, except in reference to the recent troubles in the Southern Mahratta country, where the youthful Rajah had been compelled to demand the assistance of the British troops to suppress a rebellion brought about by the despotism of the various agents who have administered the government during his minority. The insurgents had routed the Rajah's forces previous to the arrival of our troops, and had then retired to the mountain fortresses. One of these, Samunghur, was taken by storm by the British auxiliaries on the 13th Oct. The enemy fled at their approach, leaving nearly 600 dead upon the field, while about as many were taken prisoners. Our own casualties were very few, being confined to the loss of 3 officers, and from 20 to 30 men killed or wounded. Col. Outram has since been appointed political agent, and is making a tour through the country, accompanied by the Rajah, for the purpose of inquiring into and redressing the grievances which caused the insurrection. The news from other parts presents few topics which call for notice. Sir H. Hardinge is proceeding quietly at Calcutta studying the politics of India, and has hitherto confined his public acts to the extension of education among the natives. — In France the papers are chiefly occupied with the affairs of Ireland, and many angry comments are made on Mr. O'Connell's late attacks on the French press. The Ministerial and Republican organs concur in denouncing Mr. O'Connell's political inconsistencies, and censure him with much bitterness for deluding the people with perpetual promises of what he knows to be impossible. The election of the new President of the United States is another prominent topic in the Paris papers: those of the Opposition rejoice at the success of Mr. Polk as a new triumph of liberal principles, while the Ministerial journals regret it as transferring the supreme power to a party incapable of consolidating a society which they describe as shaken to its foundations. —From Spain we have melancholy accounts of the issue of Zurbano's insurrection. The chief himself is supposed to have escaped either into Portugal or France; but his second son and brother-in-law have been captured and shot without a trial. Great efforts were made by all classes to save their lives, but the Government were inexorable, and another sanguinary chapter has thus been added to the history of that unhappy country. General Araoz also has been sentenced to death at Cadiz without a trial; General Prim has been banished to Cuba; and eight other general officers have been ordered to quit Madrid on the mere suspicion of their guilt. In addition to these rigours it is said that orders have been issued for the execution of several additional partizans of Zurbano, including his eldest son, who have fallen into the hands of the Government forces since the dispersal of the insurgents. These acts of despotism have produced a deep sensation not only in Madrid but throughout all Europe:—the Paris papers, however much they differ on Spanish politics in general, are unanimous in stigmatising the cruelty of General Narvaez as unsurpassed in the very worst periods of modern history, and it is said that Mr. Bulwer and M. Bresson, the British and French Envoys to the Court of Madrid, have most earnestly entreated the Spanish Government to stop the further effusion of blood.—From Italy we have accounts of the marriage of the Duc d'Aumale with his cousin, the Princess Maria Carolina of Salerno, which was celebrated on the 25th ult. at Naples with great pomp. This alliance is regarded in France as one of the most important which has yet been made by the family of Louis-Philippe, as it unites the constitutional throne with the elder branch of the House of Bourbon.

Home News.

COURT.—The Queen and Prince Albert with their royal visitors are still at Windsor Castle, but have remained in comparative seclusion during the week, in consequence of the death of the Princess Sophia. Her Majesty, however, has taken her usual walks within the grounds of the Castle. The Chapter of the Order of the Garter, fixed for the 12th inst. at Windsor Castle, will be held on that day, but the intended banquet in St. George's Hall in the evening will not be given, in consequence of the decease of the Princess Sophia. Her Majesty and Prince Albert, accompanied by their Royal Highnesses the Duke and Duchess of Saxe Coburg Gotha, and the Duke Ernest of Wurtemberg, will take their departure from the Castle on Saturday for Claremont, where the Court will remain until after the funeral of the Princess Sophia on Tuesday next. The Court is expected to return to Windsor on Wednesday. It is stated that Her Majesty has signified her intention of honouring the Duke of Buckingham by an early visit. The precise day is not yet fixed, but it is believed that the Court will leave Windsor for Stowe either during the week before or the week after Christmas. It is also said that Her Majesty will previously pay a visit to the Duke of Wellington, at Strathfieldsaye.—Lord C. Wellesley (Clerk Marshal) has succeeded Colonel Arbuthnot as Equerry in Waiting on the Queen, and Major-General Sir E. Bowater has succeeded Lieutenant-Colonel Wylde as Equerry in Waiting on Prince Albert. The Earl of Hardwicke has succeeded Lord Rivers as Lord in Waiting on the Queen, and Colonel Drummond has relieved Mr. Ormsby Gore as Groom in Waiting on Her Majesty.—It is stated that the Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz will prolong their visit to the Duke and Duchess of Cambridge until the beginning of May, and that the Grand Duchess's accouchement, which may be expected early in January, will take place at Gloucester House.

Death of the Princess Sophia-Matilda.—The Princess Sophia of Gloucester expired on Friday, about 10 o'clock, at her residence on Blackheath, after a short illness. Her Royal Highness had been unwell at intervals for some time past, and was in the 72d year of her age, having been born on the 23d May, 1773, and was sister to the late Duke of Gloucester. Her Royal Highness had resided many years in the parish of Greenwich, and was the Ranger of Greenwich Park. The remains of Her Royal Highness will be interred in the family vault in St. George's Chapel, Windsor, on the evening of Tuesday the 10th inst., and in compliance with the wishes of Her Royal Highness, the funeral will be conducted with as much privacy as is consistent with the rank of Her late Royal Highness. In consequence of the death of the Princess, orders have been issued from the Lord Chamberlain's Office, directing that the Court go into mourning from the 5th to the 15th inst. The Earl Marshal has also issued the usual notice, stating that it is expected that the public put themselves into mourning for one week, commencing from the 5th inst.

Indian Postage.—The *Gazette* of Tuesday contains a Treasury Warrant, fixing generally at 4*d.* the rate on all East India and Colonial letters of not more than half-an-ounce weight.

The Church.—The Rev. Dr. Cramer, Principal of New Inn Hall, and Professor of Modern History in the University of Oxford, is appointed by Her Majesty to be Dean of Carlisle. The Rev. Prebendary Medley, Vicar of St. Thomas's, Exeter, has received the appointment to the Bishopric about to be constituted in the province of New Brunswick.

Consular Appointment.—Mr. G. W. Featherstonhaugh, of Scarborough, author of "An Excursion through the Slave States of America," has received the appointment of British Consul at Havre-de-Grace.

Pensions.—The poet Campbell's pension of 184*l.* a-year, payable out of the Scotch Excise, has been bestowed upon Mr. Patrick Fraser Tytler, the historian of Scotland.

The Sugar Duties.—The *Gazette* of Tuesday contains an Order in Council regarding the admission of sugar from Venezuela into this country. The order recites that portion of the last Sugar Duty Bill which alluded to the admission of this produce from China, Java, Manilla, &c., at a duty of 34*s.* per cwt., and 5 per cent., a certificate being given that this sugar is not the produce of slave labour, and not refined. The present order extends the benefit of this Act to Venezuela, the order having force from the 28th ult.

Foreign.

FRANCE.—The Paris papers are filled with angry strictures on the attack made on the French press by Mr. O'Connell at the last week's meeting of the Repeal Association. The papers of all parties take notice of his speech, and are very bitter in their replies. The Ministerial *Débats* says:—"Behold again O'Connell who re-appears on the horizon decked in a cap of blue velvet, embroidered in gold, with garlands of shamrock. We are really grieved that the air of his mountains has not better soothed his bile: and if we were not aware that great men had their weaknesses, and that even the most accomplished comedians cannot bear criticism patiently, we should be astonished at the transports of rage into which this irascible personage is thrown by the most moderate observations. Mr. O'Connell on that day was in full vein for applying epithets. He wished to give us our share, and we do him the justice to acknowledge that he placed us in good company. For this reason, we do not bear him any malice; and to prove it to him, we re-publish most accurately the abuse with which he honoured us. Mr. O'Connell, when he abuses, is sure to have the upper hand. He has such richness and fecundity of picturesque expressions, that unless we had at our service the catechism which is sold in the streets during the Carnival, and in which we are taught the manner of replying to personalities without falling into a passion, we could not reasonably endeavour to contend with him. For this reason God forbid that we should attempt it. We might well permit him, moreover, to call us 'incredulous,' for it is certain that we do not believe one word he says, and that it is that makes him so furious. Every one may have seen in the public squares a mountebank who begins by twisting the neck of a bird, and then places it on a table, saying, 'I will restore him to life immediately.' He then begins to tell anecdotes, whilst he is making his collection in the meantime. Those amongst the spectators who become weary depart, quite persuaded that the bird will recover; but there are others who have the indiscretion to await the miracle. Those persons are the most troublesome, and it is those that the operators love the least. It is thus that Mr. O'Connell proceeds. He commences by promising repeal. It will be had in six months; in three months. He then passes to another subject. He speaks of the four quarters of the world; of the emancipation of the negroes; of the French journals; of the impious university; &c., whilst his audience listen to him with their mouths open. But if some bungling spectator should demand news of repeal, he would do well to quit the ring as quickly as possible. This is nearly what has happened to us. We are unbelievers because we do not believe in O'Connell's word. We are atheists because we have no faith in his miracles. But if Mr. O'Connell cares so little about us as he asserts, why is he so angry? 'Why does there enter so much gall into the soul of a devotee?' In truth, when we see the sad position in which Mr. O'Connell is placed, and the extravagant tricks he is obliged to play before the public, we feel but commiseration for him. We must take into consideration his embarrassments. He can only speak. He has already consumed the Tories and the Whigs, who are not the worse. At present it is the turn of the King of the French, and of the University, and of that immoral French press, which has had the cruelty to refuse to believe him to be serious. The extravagance of the illustrious personage has arrived at that point that it can inspire no serious uneasiness to any but himself." The *National*, having been charged by Mr. O'Connell with advocating "the anti-monarchical and anti-Christian principles of M. Odillon Barrot," replies by stating, first, that M. Barrot has no connection with that journal, his organ being *Le Siècle*, and then proceeds to explain as follows the part it has taken in advocating Repeal:—"We should be happy to give assistance to the people of Ireland, as we should to every people sighing for independence. Stripped of its soil, reduced to a condition of frightful misery, deprived of its most precious rights, ever treated as a conquered race, the people of Ireland exhibits to us the most painful and palpable instance of the violence and cupidity of British aristocracy. And, when that people is struggling under the weight of so many chains, when it has neither bread nor an asylum left, it appears to us that O'Connell, armed with a power so great, could do better than eternally speak of himself. It appears to us that a man gifted with so much talent, if he had a particle of feeling, would not confine himself to act the part of a citizen advocate. We stigmatise as a cruel mockery the conduct of a mountebank who delights in throwing an entire famishing population into a state of sterile agitation. A good Christian should not assume an attitude so contemptible, nor everlastingly deceive by his falsehoods a people ground down by their misfortunes. It appears to us that a man, placed at the head of 7,000,000 of an ardent and almost desperate population, and receiving from them a liberal civil list, exposes himself to the contemptuous disdain of honest men by holding out to that people, from year to year, from month to month, the prospect of Repeal, which he knows to be impossible. Such are our sentiments. If O'Connell does not understand them, we are certain that they will be understood by the sincere men who surround him, and who address him in secret reproaches similar to those with which we publicly assail him. They have not the advantage of being crafty jurists, eloquent orators, and narrators of puerile trifling stories; but they ardently love their country, they share all the sufferings of the people, and they spurn the idea of making Ireland bleeding from all her pores, a pedestal for their own renown. If amongst them there are citizens who have not the courage to sacrifice their lives for the liberation of their country, they will no doubt leave to others the honour of placing themselves at the head of those who shall take the field Command in a country like Ireland is both an honour and a danger. No man ought to accept the one when he

has not the courage to incur the other." The *Presse*, the organ of Count Molé, disdains to speak at any length upon a discourse which contains, it says, its own refutation, and wishes, moreover, to avoid wounding the feelings of those who regard, or affect to regard, Mr. O'Connell as their leader.—Next to the affairs of Ireland, the election of the new President of the United States is a leading topic in the Paris papers. The Ministerial *Débats* is by no means satisfied with the turn the election has taken. "If the definitive result," it says, "should confirm our present impression, and it is not easy to doubt it, the election of Mr. Polk is certain, and we thus see the direction of public affairs, at a moment when it requires the most consummate experience, pass from the most capable hands into those of an *improvisé* candidate, of whom the best that can be said is, that he is 'a remarkable mediocrity.' The result will be to give the ascendant to the radical party; that is to say, to a party which its very essence renders unfit for the re-establishment of order, and the consolidation of a society which is, at the present moment, shaken to its very foundations." The Opposition papers, on the contrary, rejoice at the success of Mr. Polk.—M. de Logan, the French Consul-General for France, at Tunis, has arrived in Paris; and it is said that he is to be sent out to China as Consul-General.—The *Moniteur* publishes an ordonnance elevating Count Jaubert, who was Minister of Public Works in M. Thiers' cabinet, to the peerage. Of the large batch of new peers almost officially announced a short time ago, he is to be the only one now made.—It is understood that the two candidates for the chair of President of the Chamber of Deputies will probably be the same as last session; M. Sauzet on the part of the Ministry, M. Dupin on that of the Opposition. At present it is thought that M. Sauzet will be, as last year, the successful candidate.—A royal ordinance has been published, whereby, "in consequence of various mournfully celebrated trials which have taken place for some years past," a commission is appointed to examine into the question whether the selling of arsenic may not be entirely prohibited without detriment to medicine and trade. The commission is to consist of MM. Gay Lussac (President), Roard, Dumas, Payen, Orfila, Yvart, Bussy, de Ruolz, Lemire, Meilheurat, and Senac. The preamble to the ordinance adds, that the Academy of Medicine, the College of Pharmacy, the Council of Public Health, and the Commission of Arts and Manufactures have already been consulted as to the means of altering the colour and external character of arsenic in such a way as to render the use of it difficult for criminal purposes without immediate detection on the part of those to whom it is to be administered.—The trial of M. Sallior, Commissaire of Police, at Calais, for the murder of Mr. Thorn, an Englishman, took place on the 28th ult., at St. Omer. The fact of homicide was clearly proved, but M. Sallior was found "Not Guilty," the Jury having answered in the negative the two questions submitted to their decision by the President of the Court. These were—1st, Whether the accused had or had not committed the crime of wilful homicide under extenuating circumstances? 2d, Whether the accused had or had not committed the crime of wilful homicide?—The second performance of the English company in Paris was to have taken place, by command of His Majesty Louis-Philippe, at the Palace of St. Cloud, on Thursday, the 5th, but an accident which happened to Mr. Macready last week has unavoidably incurred the lapse, for the present, of that distinguished honour, as well as the postponement of the opening of these representations till Monday, the 9th inst.—A heavy fall of snow took place in Paris and its vicinity on Sunday morning, and continued at intervals throughout the day.

SPAIN.—There is no longer any doubt of the issue of the Zurbano insurrection. Zurbano himself has escaped, it is supposed, either into Portugal or France, and his second son and brother-in-law, Juan Martinez, whose capture and imprisonment at Logrono were reported last week, have been shot without a trial or even proof of identity. It appears by accounts from Bayonne that they were in an olive-grove, where they were found concealed, but without arms. The son, a young man, aged 23, esteemed in the army, in which he held the rank of major, excited a lively interest in the inhabitants of Logrono, and even the Moderados expressed a wish that the Government would spare him. General Oribe, who holds the command at Burgos, listened to these appeals, and considering that the real if not the only culprit was Martin Zurbano, and that the circumstances attending the capture did not imperatively prove the complicity of Benito Zurbano and his uncle, notwithstanding the general order issued by Narvaez for shooting Zurbano and his confederates, deferred the execution, and applied to the Government for express orders. The inhabitants of Logrono, profiting by the respite, sent to Madrid a numerous deputation, among whom were the most important men of all opinions, to lay a petition for mercy at the foot of the throne. The mother and mother-in-law of Benito Zurbano also went to Madrid, and drew tears from the eyes of the Queen-Mother, by throwing themselves in the attitude of supplication in the road by which Her Majesty was passing in her carriage. Their prayers, however, were of no avail, for the Government remained implacable. An order was immediately despatched to General Oribe to consummate the execution, and on the 25th ult. Benito Zurbano and his uncle, with their two servants, were shot at Logrono. This was not all the rigour of the Government; General Oribe was dismissed from his command for not having followed his first instructions, and it is even said that he is to be brought before a Court-Martial. This sanguinary act has caused a deep impression at Madrid, which is increased by the daily adoption of fresh rigours. Among other measures, eight more general officers, including Generals Ferraz, Van Halen, Camba, Lerron, Grasser, and Brigadier Montero, had been banished from Madrid, and it was said that an order had been issued for the execution of Gen. Araoz, at Cadiz, one of the ablest, and at the same time most peaceable men in Spain, who has been denounced by two soldiers, in the hope that their services may be as well rewarded as those of the denouncer of General Prim. The Supreme Tribunal of War and Marine had confirmed the sentence pronounced by the Court-Martial against General Prim, who left Madrid on the 23d for Cadiz, under a strong military escort. He was to be transported thence either to Cuba or to the Marianne Islands. The appeal of his co-accused, who were all civilians, having been admitted, they were to be tried over again by the ordinary courts. The Court-Martial, assembled on the 22d to try several officers of the army, charged with participation in a plot discovered at Valladolid, had sentenced Captain José Bartoli and Commander Pedro Contreras to be confined during ten years in a presidio, and Lieutenant Antonio Calleja to six years of the same penalty. General Narvaez has been made a Grandee of Spain of the first class, with the title of Duke of Ardoz. The discussion of the various articles of the Reform Bill is still in progress in the Chamber of Deputies, but the details are very tedious and have little interest for the English reader.

PORTUGAL.—We have accounts from Lisbon to the 27th November. The Chamber of Peers, by a majority of eight, have passed the bill declaring all the edicts of the Government, twenty-nine in number, promulgated during the prorogation of the Cortes, and consequently without the sanction of the Legislature—laws in force from the date of their promulgation. It is remarked as a curious circumstance that all the old supporters of the Queen's right to the throne are now in opposition, and the principal supporters of the Ministry are those who took a leading part in favour of Don Miguel. Amongst them is the Bishop of Braganza, who, in his pastoral addresses to the clergy, in the time of Don Miguel, designated Don Pedro as "a foreigner—an immoral man, who had sold his inheritance for a mess of pottage;" and yet, in his recent discourse, has spoken of him as "the immortal Pedro, of glorious memory." As the Bishop accused the Opposition of uttering nothing but falsities, the Count de Taipa wished to know where he was to look for the real sentiments of the prelate, whether in his pastoral or in his speech.—A dreadful fire, attended with the loss of twelve or fourteen lives, took place in Lisbon on the 21st inst.—The municipal elections throughout the country, with few exceptions, were carried in favour of Ministers.

GERMANY.—Letters from Berlin of the 26th state that it has been reported for some days that the King has confirmed the sentence of death pronounced against Tchesh, in the second instance, but by a special order of the Sovereign, the execution is to be left to the reign of his Majesty's successor. If this is true, the King, who in this case has to decide in his own cause, has granted the life of the criminal without opposing public opinion and the course of justice, for the sword is still suspended over the head of the criminal; but his blood is not shed before the eyes of the King, whose life was so providentially preserved. Accounts from the same city say that the Emperor of Russia has refused to allow Prussian officers to take part in the war in the Caucasus. We likewise learn that Russia will not extend the advantages granted to Prussia to the Zollverein, which it does not recognise as a Power. A Berlin letter of the 21st informs us that all the presents made to Blucher, and the various and valuable decorations bestowed upon him by different sovereigns, which were kept in a château belonging to his descendants, in the environs of Berlin, had been carried off by thieves, but were subsequently recovered by the police.—The 500th anniversary of the Prague University is shortly to be celebrated with unusual festivities in that city. A subscription list has been opened for the purpose, and nearly 7000*l.* has already been subscribed. Among the names who headed the list with munificent donations, are Prince Metternich, Princes Lobkowitz, Anersperg, and Furstenberg.—We learn from Frankfort that the mother of Messrs. de Rothschild, who is 99 years of age, has recovered from the late severe illness which placed her life in imminent danger.—A German journal states that the Cabinet of St. Petersburgh has received favourably the proposition of conferring the title of Royal Highness upon certain German princes who have hitherto not enjoyed that title, and has at once consented to give it in all public acts to the Dukes of Nassau and Brunswick.

SWITZERLAND.—Letters from Berne mention the death of the celebrated Fellenberg, at Hofwyl, on the 21st ult. Emmanuel von Fellenberg was born in 1771, of a patrician family of Berne. He was educated at Tubingen for the bar, but later took to the profession of teaching. He was professor at Pfeffel, near Colmar, and founded his agricultural school at Hofwyl in 1801.

ITALY.—Accounts from Naples state that at 8 P.M., on the 19th ult., the Gomer steam-frigate, having on board the Prince de Joinville and the Duke d'Aumale, arrived in the Bay of Naples. The Princes shortly afterwards landed, and, notwithstanding the lateness of the hour, they repaired to the theatre, where the Court was presiding at a performance given on the occasion of the Queen Dowager's birthday. The next morning at sunrise a salute of 120 guns was fired in their honour, and the three French ships-of-the-line stationed in the bay returned the salute. On the 21st a grand dinner, followed by a brilliant reception, took place at Court; and the King, accompanied by the two French Princes, was to hold a review of all the troops of the garrison on the 24th. The marriage of the Duke d'Aumale with the Princess of Salerno was celebrated on the following day in the Chapel of the Palace.—Letters dated Turin, Nov. 14, mention a new conversion to Popery. It is said that on the previous Sunday Miss Louisa Cambridge abjured Protestantism in the convent of the Sisters of the Good Shepherd at Genoa, and entered the cloisters as a noviciate.

RUSSIA.—Accounts from St. Petersburgh speak of a commercial treaty, for which negotiations are on foot, between Russia and England, and state that the conclusion of the treaty may be shortly expected. There are only some differences on a few points, which, it is thought, will be soon adjusted. On the other hand, nothing is said of a marriage of the Princess Olga to Prince George of Cambridge; but as the Court of St. Petersburgh is in deep mourning, and the Empress has been seriously ill, it is considered likely that the subject will be postponed for the present.—The cause of temperance societies has received a severe blow in the kingdom of Poland. They had been particularly successful in those parts of the kingdom which border on the republic of Cracow, and in Upper Silesia, where the country people, following the exhortation of the clergy, renounced in a body the use of brandy. But the Government has lately interfered to check the temperance societies, and has published a circular prohibiting them, and forbidding the clergy to promote the object by addresses from the pulpit. It is also said that the Government of Poland has issued an order by which all males without distinction are henceforth prohibited from contracting marriages till they have completed their 30th year.—A letter from Warsaw of the 16th states that several young Poles who had been banished to Siberia for conspiracy against their Government, had just returned, having received a free pardon. It is also stated that the rescript against the Jews is virtually abandoned. The latest letters from St. Petersburgh state that the direct communication between that city and Cronstadt is already obstructed. The steamers which started at the commencement of the month from Petersburgh for Cronstadt were obliged to return, the ice on the bar being too thick to attempt a passage.

SWEDEN.—The King has approved of all the modifications by the States in the fundamental law. The principal modifications are:—Convocation of the Diet every three years. The right of the King to give or to refuse his sanction to projects of law adopted by the States during the sitting of the Diet. The suppression of all distinctions of nobility amongst the members of the supreme tribunal. The abolition of the right of suspending the publication of journals.

INDIA AND CHINA.—The Overland Mail has arrived this week with accounts from Calcutta to Oct. 22, Bombay, Nov. 1, and Hong-Kong, Sept. 1. The troubles in the Southern Mahratta country have greatly abated in the course of the month. The Fort of Samunghur was taken by storm by the force under General Delamotte on the 13th Oct. Our troops met with little opposition, the enemy having fled at their approach. Nearly 600 of the Mahrattas fell in the course of the operations against them, and about as many more prisoners were taken by us. Our own casualties were insignificant: two English officers were killed, and one died of cholera during the siege; betwixt 20 and 30 men were killed or wounded. The army since then has marched to Kolapore, the capital of the disturbed district. The Rajah and his Minister have escaped from amongst the chiefs, by whom all their movements were constrained, and are now on a tour through the country, accompanied by Colonel Outram, who has been appointed Political Agent, and a light British force. The object is to inquire into and redress the grievances which have occasioned the late insurrection. The British force ultimately assembled in the Kolapore territories amounted to about 8000 men. Everything continues quiet in Scinde, and the prospects of the country are becoming more hopeful than they have hitherto been. At all the posts, save Shikarpore, the troops are in the enjoyment of good health. At this last station, the brigade is completely prostrated by disease, so as to leave scarcely as many men fit for duty as to mount guard, and give the requisite aid in the hospitals. The Punjaub still presents the same picture of distracted councils. Heera Singh, the Prime Minister of the young Lahore Rajah Dhuleep, has not terminated his disputes with his uncle, Ghoolab-Singh. Troops were prepared on both sides, but the Minister has sent some agents to try the effects of negotiations. Nothing positive was known of the results at the time of the departure of the steamer. Heera Singh is wily and crafty, and may succeed in overcoming the strength of Ghoolab, although the latter is now animated by a wish to avenge the death of his brother Suchet, who was slain through the machinations of the Minister.—From Affghanistan we learn that Dost Mahommed had contrived to give a semblance of stability to his power. He and his notorious son, Akhbar, were disposed to quarrel with the now enfeebled Government of Lahore, and to demand the restitution to the Affghans of the provinces on the western bank of the Indus, including Peshawur, &c., and perhaps also the far-famed valley of Cashmere, of which the Affghans were rulers some years ago. These demands cannot be acceded to by Heera Singh without exposing himself and his Government to destruction, and if they are rejected, they may lead to a war between the Affghans and the Sheiks, in which the British must interfere.—In Gwalior

GARDENERS CHRONICLE

the Minister Ram Rao Phalkea continues to be unpopular, and attempts have been made on his life. The capital is disturbed in consequence, and disaffection is rife. Bundelkund is quiet; the ex-Rajah of Jeitpoor being about to be surrendered to the British authorities by his own adherents, who are tired of long marches and the sufferings of midnight marauders in the mountains of that district. —From Calcutta the chief news relates to the quiet proceedings of Sir H. Hardinge, who appears now to be studying the politics of India. His only public acts have been directed towards extending education. At Bombay the chief subject of local interest has been the trial and conviction of the notorious Aloo Paroo, for his participation in the villanies of the Bunder gang, and being deeply concerned in the burning of the ship Belvidere, in the roads of Singapore some time back. He has realised from his villanies no less than 70,000*l.* sterling, besides property to a great amount—the whole of which has been confiscated, and himself banished for life. Another case, which has excited great attention, is one of wanton and systematic cruelty, perpetrated by the captain of the ship Neptune, from Liverpool. His name is Thomas Braithwaite. The cruelty referred to was exercised on his steward, and consisted of divers means of brutality. That exercised to his apprentice, a youthful Frenchman, consisted in giving him 250 lashes. The case has been tried before the Police-court, by which he has merely been mulcted in a paltry fine; but for the boy's case he will be brought before a jury.—From China the intelligence comes down to the end of August. The American Ambassador had negotiated a treaty such as that sanctioned with the British, with the addition of some clauses explanatory of it. The French Ambassador arrived at Macao on the 15th August, in order to begin negotiations for his treaty. The Governor of Hong-Kong, Mr. Davis, was about to proceed to the northern ports in order to observe how the Chinese authorities were conducting themselves towards the new traders. —From Singapore we learn that an English expedition had been sent to attack the piratical tribes on the north-west coast of Borneo: it consisted chiefly of H.M.S Dido, Captain Keppel, and the Company's steamer Phlegethon, which went up the river Sukarran. The boats were at first repulsed; but, being reinforced, they returned and demolished the fortifications, and took above 60 guns. Mr. Wade, first-lieutenant of the Dido, was killed while leading his men to attack a fort, and Mr. Steward and several men belonging to the same ship were slain by the pirates. H.M.S. Samarang was not far distant from the scene of action. The Dutch had also sent an expedition to Borneo in search of a missing ship, the Charles. The King of Koti, who murdered the Hon. F. Murray, having refused all satisfaction, had his town destroyed.

CITY.

Money Market, Friday.—Consols closed at 99⅞ to 100 ex. div.; Red. Three per Cents., 100¼ ⅜; Three and a Quarter per Cents., 102 ⅜ to ⅞; Bank Stock, 207 to 8; Exchequer Bills, 53 to 55 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—J. FINLAYSON, Ranelagh street, Pimlico, tea dealer—M. WALTER, Fleet-lane, Farringdon-street, wholesale hardwareman—C. DOTESIO, Slough, Buckinghamshire, hotel keeper—J. LADSON, Ramsgate, carver—W. H. BARTON, Commercial-road East, boot and shoe maker—W. K. ROBERTS, Abingdon, Berkshire, grocer—W. NORMAN, John-street, Tottenham Court-road, pianoforte maker —G. E. WHITE, Reading, tailor—W. KREVIL, Cornwall-place, Holloway, grocer—J. PEARCE, Praed-street, Paddington, carman J. WALKER and C. WHITE, Jewry-street, Aldgate, builders—W. BURCHETT, Whitechapel-road, chemist—J. WILLER, Windsor, Berkshire, licensed victualler—W. PERKINS, Portsea, upholsterer—H ROBINSON, Devonport, brewer T. WILLIAMS, sen., Cardiff, Glamorganshire, iron founder—J. WALLINGTON, Bristol, painter and ship chandler—I. KETCHUM, Liverpool, merchant—J. W. ROBSON and J. BARROW, St. Ann's place, Limehouse, patent pump and water closet manufacturers—S BUCKNALL, Hendon, carman—J. SAWYER, Egham, Surrey, butcher—C. CARTER, Saddington, Leicestershire, miller—J. MACKAY, Liverpool, merchant.

BANKRUPTCY ANNULLED.—J. SPENCER, jun., Liverpool, builder.

Metropolis and its Vicinity.

The Weather.—The winter may now fairly be said to have commenced, the weather during the last week having been extremely cold, with a cutting north-east wind. The ponds round the metropolis are covered with ice an inch in thickness, and hundreds of poor persons are daily employed in breaking it up and carting it to the confectioners, &c. in London. The thermometer on Thursday was as low as 27°, five degrees below freezing point, the highest point the mercury reached being 37°. The barometer denotes fair weather.

The Northern Lights.—On Monday night, about 8 o'clock, the *aurora borealis*, or the northern lights, which are looked upon as the prognostics of a severe winter, were visible for a considerable time in the neighbourhood of Islington, Kingsland, Hackney, &c. At Islington and Highbury, the inhabitants came out of their houses and inquired of each other where the fire was, the state of the atmosphere apparently showing that there was an extensive conflagration at some distance. A deep red glare was first observed at the west of the horizon, and then slowly moved toward the east; and after remaining there above a quarter of an hour, disappeared in the south.

The late Bank Forgery.—On Saturday William Burgess, the clerk of the Bank of England, who, in conjunction with Elder, plundered the Bank by means of a false transfer of 8000*l.* stock, which was upon the books in the name of Mr. Oxenford, and who succeeded in reaching America, was brought before the Lord Mayor in the custody of John Forrester, the officer, who arrived in the Hibernia steamer from Boston. As it was known that the prisoner was desirous to be remanded, and as he cannot be tried until next session, the investigation was merely extended to the formal examination of a couple of witnesses. Burgess, in walking into the justice-room, hung down his head, evidently anxious to avoid the gaze of the crowd. Mr. Oxenford, the owner of the stock, and Mr. T. Ingall, a clerk in the Bank, deposed to the necessary facts, and Burgess was remanded to Wednesday, when a further remand took place for another week. Burgess had a very jaded appearance, and continued to lean over the bar as if exhausted. He has, as may be expected, undergone a vast deal of fatigue and anxiety since he and his accomplice escaped with the property; and he observed to John Forrester, upon being apprehended, that he had always the apparition of that officer or his brother Daniel before his eyes. He expressed much surprise and regret at the violent termination of his confederate's earthly career, and said, "Poor fellow! he was a fool to destroy himself at any rate." Upon first observing John Forrester on the little island, where he had taken up his residence in the wooden hut of a poor Irishman, he said, "Ah, John, how do you do?" The officer replied, "I am sorry, Sir, to see you in this condition." "Never mind, old fellow, it can't be helped now," rejoined the prisoner, and accompanied the officer with readiness. He had been so roughly tossed about in the boat in which he had escaped from the hotel where he resided upon hearing that he "was wanted," that he for some time expected that he should make his exit amidst the waves. He had thrown away the oars, and was, after exposure to the inclemency of the weather for a considerable time, thrown upon the shore behind the cottage of the Irishman. The proprietor of the cottage was absent from home at the time, but Burgess gained ready admittance, although the poor man's wife was at the time in the pains of labour. On Saturday, John Forrester waited upon the governor of the Bank, and put into his hands the sum of 6500*l.*, part of the 8000*l.* of which the establishment had been plundered by Elder and Burgess. It is expected that upwards of 1000*l.* more, the produce of some stock which Elder had purchased, will be brought over in the next packet from Boston. It is said that there is no instance of such wholesale restitution in a case in which the thieves managed to reach another country as this.

The New Law of Banking.—Public attention has lately been called to what appeared to be an evasion of the law of last session, on the part of certain country bankers, by issuing bills not stamped payable to themselves or order. It is understood that this question has not escaped the attention of Government, and that directions have been given for instituting proceedings against the parties who have attempted to evade the law.

Presents from the Emperor of Russia.—On Friday last a great number of cases were landed at the Custom-house from Cronstadt, containing presents from the Emperor of Russia of great value. There are no less than twenty packages for Her Majesty; four or five of the cases with their contents weighing each above a ton. Sir R. Peel, the Duke of Devonshire, and the Duke of Buccleuch have had also several large cases directed to them, together amounting to about thirty. The precise nature of the imperial gifts is not known, but it is said that the Queen has received some superb Malachite vases of enormous value. Some of the cases are stated to be valued at 10,000*l.*

The Waterloo Medal.—It is stated that the long-expected Waterloo medal, commissioned to Mr. Pistrucci of the Royal Mint, many years back, will soon be completed. It appears that the delay has been owing to some misunderstanding between Mr. Pistrucci and the successive Masters of the Mint, ever since the time when the Earl of Auckland held that office. These differences have been satisfactorily arranged by the present Master, Mr. Gladstone; and Mr. Pistrucci has resumed his labours, with the expectation that the dies will be completed in the course of next year. These dies are five inches and a half in diameter; and the different groups engraved upon them contain no less than 54 figures.

The Greenacre Family.—The daughter of this noted individual, as well as her husband, are now inmates of hospitals—the latter as a lunatic, and the former in child-bed. On the execution of the father, the son and daughter took a shop in the London-road; and although their business, that of staymakers and hosiers, was prosperous, the effect produced on the mind of Greenacre's son-in-law was such that his senses gradually grew impaired, and he was obliged to be removed to a lunatic asylum.

Church Reform.—A petition has been prepared for presentation to the Archbishop of Canterbury. It has already obtained a large number of signatures, amongst which are those of the Duke of Sutherland, the Earls of Denbigh and Gainsborough, Viscounts Sandon and Morpeth, Lords Calthorpe, Rayleigh, Teignmouth, Bloomfield, F. Egerton, H. Cholmondeley, Ashley, Robert Grosvenor, Howard, Hon. W. Cowper, M.P., Hon. W. Ashley, Hon. F. Calthorpe, Hon. Colonel Upton, Hon. J. W. Percy, Hon. Capt. Waldegrave, Sir T. Baring, Bart., Sir T. Lawley, Bart, Sir H. Verney, Bart, Sir J. Kennaway, Bart., Sir W. R. Farquahar, Bart., Mr. Colquhoun, M.P., Mr. R.M. Milnes, M.P., &c. The following is the petition:—"The period which it has pleased Almighty God to continue to the Church of England the mild and paternal superintendence of your Grace, in the discharge of her highest ecclesiastical functions, has been marked by great and important changes in our social, moral, and political circumstances. A lengthened interval of peace, the advancement of literature, the arts, sciences, and civilisation, and, above all, the rapid increase of our population, have produced an alteration in the relative position of the several orders of society, which demand the grave consideration of every one who desires to promote the well-being of the nation, but more especially to those who are the appointed guardians of her religious institutions, and the pastors of her people. Under these circumstances, and impelled by a heartfelt attachment to the scriptural principles of our Established Church, and by an earnest desire that its efficiency should be increased, and the interests of true religion more effectually promoted through its agency, we, the undersigned lay members of the church, venture, with all respect, to bring under the consideration of your Grace some means by which we trust, under the Divine blessing, these great objects may be attained. Admirably as our parochial system seems calculated to meet the wants of the country, and to bring the ministration of the clergy within the reach of all classes, still the increase of our population, and its unequal distribution, render it impossible that they should extend their pastoral care to the great majority of their flocks in large towns and populous districts. We do not forget the attempts made by the Legislature, by voluntary associations, and by individuals, to remedy this defect; but we are convinced that further measures are required to reach the full extent of the evil. We believe that the usefulness and efficiency of the National Church might be very greatly increased by arrangements which, without introducing any organic changes, should bring into active operation the powers and capacities now lying dormant in her existing institutions. To effect this we believe that two important objects must be accomplished:—First, the clergy must be increased in number; and secondly, provision must be made for a more systematic employment of laymen in the exercise of functions which do not belong exclusively to the clergy. In the attainment of these objects we would respectfully request your grace and the other members of the episcopal bench, to take into your consideration:—First, The expediency of increasing largely the number of the third order of our clergy—the deacons; and we venture to suggest that this may be effected by admitting, on such condition as will maintain the order and discipline of our Church, persons who have not the means of proceeding to a university degree, but who are found competently trained for the service of the sanctuary; their advancement to the higher order of the ministry being made contingent upon a faithful discharge, during a lengthened period, of the office of a deacon; or upon such other circumstances as your grace and the other members of the episcopal bench may think fit. Secondly, The propriety of sanctioning and encouraging the employment of a class of laymen, who without altogether abandoning their worldly callings, might be set apart, under episcopal authority, to act as visitors of the sick, scripture readers, catechists, and the like, in parishes where their introduction should be approved by the parochial clergy. The system of district visiting, and the appointment of lay scripture readers under clerical superintendence, have already been adopted, we believe with much success, in many populous parishes; but the present state of society requires that both these means of usefulness should be greatly extended, and brought into more immediate connection with our ecclesiastical arrangements, for we are fully persuaded that the true strength of our Church can never be completely known until, by some such means, her lay members are enabled, under direct sanction and control, to take part in the discharge of all those offices which are not by her constitution restricted to the three orders of the ministry. To provide the necessary funds (which would be administered by a board, made up by a well-considered union of the clergy and laity), contributions may, we have little doubt, be extensively called forth in offerings and collections made for this specific object, at such periods and under such regulations as may be found desirable, and we venture to hope that an effort so directly affecting the efficiency of the church, would attract the sympathies and obtain the support of all classes within her communion. In venturing to urge upon your grace the adoption of these measures, which would supply a link much needed between parochial clergy and the community at large, we are far from desiring to make any innovation in our ecclesiastical policy. We only seek to restore to full vigour and efficiency one of the orders in our Church, and to promote the appointment of officers already recognised by ecclesiastical authority, and for which, at no period since the Reformation has the position of the Church more imperatively called."

Distressed Needlewomen.—A public meeting of the recently-established Society for the Protection and Employment of Distressed Needlewomen, and for clothing the poor, was held on Monday, at Willis's Rooms, at which Lord Ashley presided. The meeting was very fully and most respectably attended, the majority of the company being composed of ladies. The report of the committee presented a most favourable view of the progress the Society has made, and of the advantages it promises to bestow. It states that "Although the Society has been established only nine months, the committee feel confident that the benefits of the charity will be extended, and the Society prove to be one of the most useful and philanthropic institutions in the metropolis. It is most gratifying to the committee to state that, since the establishment of the institution, not one instance has occurred of work being detained by the persons employed—thus exemplifying that a fair price for work done is the surest preventive of workpeople pawning goods intrusted to their care. Many of the class of females employed by this institution are persons who have moved in a superior sphere of society, and who are anxious to hide their miseries from the public eye." The number of day-workers recommended from the institution, and engaged at wages not less than 9*s.* per week, amounts to 975, independently of those to whom work has been furnished, though the committee regret that that number is only about one-third of the applications that have been made to them by respectable unemployed

females. The committee express great confidence that, if proper assistance be rendered, the institution will be able to extend relief to the unemployed sempstresses in all parts of the metropolis. The timely interference of the institution has also been the means of rescuing many persons in the last stage of distress and misery from starvation and disgrace. Among the workpeople employed by the Society, and now earning 9*s.* per week, are numbers of those who were compelled to make shirts at 2½*d.* per shirt. From the account of receipts and expenditure, it appears that the subscriptions were 456*l.* 6*s.*, and the value of needle-work sent to be made up 336*l.* 1*s.* 5½*d.*, making the total receipts 792*l.* 7*s.* 5½*d.* The disbursements, which consist chiefly of wages to needlewomen, and of materials bought and made up for distribution to the destitute, amount to 730*l.*—Lord Ashley then addressed the meeting at great length, and said that this Society was founded for the purpose of carrying out that grand and glorious truth that "the labourer is worthy of his hire." Numerous modes were suggested to the committee for attaining this object, but many of them were open to objections. One suggestion was, that a large building should be taken where the goods manufactured might be disposed of; but this remedy the committee considered would be almost worse than the evil, as it would be interfering with trade, and that was far remote from their intentions. The assembling of the needlewomen in large houses would have been of itself a serious evil, and would have interfered with the objects the Society had in view. In carrying out their charitable efforts they did all they could to encourage the domestic system; to keep the mother at home to exercise her high and heavenly calling of wife and mother. It was also an object of this Society to obtain for the needlewomen a remuneration of at least 9*s.* per week, with moderate hours of work. They did not propose to limit the earnings of the workwoman to that amount, but the object of fixing that price was to prevent the growth of an evil similar to that it was their object to remove, by giving opportunity to any party to set up an establishment in which girls might be made to undergo the very privations the needlewomen of the metropolis are now suffering. He attributed the evils to which the needlewomen had been exposed to the efforts unfortunately now making to get everything done for the very *minimum* of remuneration, regardless alike of the condition of the labourers as mortal and immortal beings. This was the cause why these poor women had been ground down to the last stage of existence. As an instance of the manner in which they were overworked, his lordship adduced the case of one woman that had come within his own knowledge, who was compelled to work for 20 hours out of every 24, to earn enough for the subsistence of herself and children. It was, he observed, utterly hopeless to attempt to introduce any social or moral improvement in the condition of the distressed needlewomen whilst they were destitute of food and clothing, which were the necessary preliminaries to any moral or religious instruction, for it was absurd and almost cruel to talk of their moral improvement, until their urgent physical wants had been supplied. It should be borne in mind that many of these needlewomen were mothers of families, and that in their present state of destitution there was no chance of domestic or religious training for their children. He had on former occasions often said, and he would repeat it till satiety, that the women of a country were the chief sources of its virtue and its vice; and that, if they be not raised from a state of destitution and disgrace, there was little hope for the safety of the British nation. If, by means of this Society, they could train up a race of mothers, they would be conferring a lasting benefit on the country, and by removing the wants of the destitute they would prove that they considered themselves, as they professed to be, the children of one common Father. The report having been adopted, Alderman Farebrother moved that, as the Queen Dowager had consented to become the patron of the Society, Lord Ashley, the former patron, be requested to become the vice-patron. The resolution was unanimously adopted, and several gentlemen subsequently addressed the meeting in favour of the Society.

Bethnal-green.—The revenue of the rector of this parish has hitherto been chiefly derived from a fund called "Garden Pence," given in lieu of tithes. This source of income has greatly fallen off, as in a neighbourhood formerly notorious for its gardens, scarcely any now remain; and, though established from long usage, the rate being according to the rental, it has never been legalised, so that the payment of late years has been nearly entirely voluntary, for as soon as the circumstance of its non-legality came to the knowledge of the rate-payers, the great majority declined paying it. This has therefore led to an application to Parliament for a new source of levying a rate for the support of the church, notice of which was given in the *Gazette* last week.

Scottish Hospital.—The festival of Saint Andrew was celebrated by this ancient corporation on Saturday, under circumstances of more than usual *éclat*. The chair was taken by Lord Saltoun, supported by his brother, the Hon. W. Fraser, for many years the treasurer of the corporation, by Sir Henry Pottinger, by Colonel Burns, the son of the poet, by the only son, brother, and nephew of Mungo Park, and by 220 gentlemen. Several speeches were delivered, and the subscriptions amounted to 805*l.*

Peninsular and Oriental Company. — The half-yearly meeting of this Company took place last week. The first subject mentioned in the report was the contract with Government for the extension of the mail service to and from India. The financial arrangements for carrying out this service have been already made by the directors, and the proprietors have paid the first instalment of 5*l.* per share on the 4000 new shares of 50*l.* each. The report states that the directors have entered into contracts for four new ships of 1300 tons each, and one vessel of 700 tons, which are to be ready for sea next year. It is expected that the new monthly line of communication to Calcutta, Madras, and Ceylon, will be in operation from January next, and the communication to China will be opened as soon as the vessels now building for the service are placed upon that line. The profits of the year ending the 30th September are stated at 65,042*l.*, which, with the undivided profits of the preceding year, make a total of 109,897*l.* The usual dividend of 3½ per cent. was declared for the six months ending the 1st of October, and the undivided profits, after deducting both this and the April dividend, were stated at 74,020*l.* To reduce the expense of insurance, which is found to weigh heavily upon the profits of the company, the investment of 10,000*l.* towards the formation of an insurance fund was voted.

Mr. Belaney.—This notorious individual has again visited Stepney, and at present is residing with a friend, not more than a stone-throw from the spot where his unfortunate wife met with her melancholy fate.

The Barking Fishermen.—These sailors have almost all returned to their smacks, and proceeded to sea, the employers having consented to their return home every voyage, instead of stopping at Gravesend to unload their fish, and then going out to sea again without seeing their wives and families for six or nine months together. As regards extra wages, no concession has been made: the men, finding that their complaint respecting the voyages was attended to, were content to forego their demand on this point.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Nov. 30; West Districts, 147; Northern, 174; Central, 201; Eastern, 258; Southern, 295; Total, 1075. Weekly average for the last five years, 946.

Provincial News.

Bangor.—The local papers state that it is the intention of Earl Powys to renew his efforts, during the next session, for the preservation of the Welch bishoprics, should not the repeal of the act for the union of the sees of St. Asaph and Bangor be previously determined upon by Government. It is also said that during his recent visit to the Principality the Bishop of London stated, that as the members of the Church throughout the country generally were so eager in their desire to prevent the extinction of one of the Welch sees, he trusted that means would be found to establish the see of Manchester, without depriving the Principality of one of its bishops.

Bolton.—The Bishop of Chester consecrated a new church in this town on Sunday, under peculiar circumstances. The building was erected in 1822 for the use of the Methodist new connection, and was always well attended, on account of the learning and eloquence of the preacher. About four years ago the minister and congregation held several meetings, the result of which was that they determined on conforming to the Established Church. Since that period the building has been occupied as a chapel of ease to the parish church. A district has since been assigned to it under the provisions of the 6 & 7 Vic., and on being consecrated it has become a parish church, under the name of Christ Church.

Bristol.—The local Papers state that, on Wednesday week, the new leviathan iron steam-ship Great Britain, so long locked up in the Bristol docks, made her first experimental trip of her powerful engines in the Cumberland basin, when they were found to be perfectly satisfactory.—Intelligence reached this city at a late hour on Friday evening of an awful explosion of fire-damp at the Cwm Avon Collieries, near Neath, on Wednesday night, by which between 50 and 60 lives were sacrificed. The particulars were not given, but from accounts which have since arrived it appears that the first reports were greatly exaggerated, and that only four lives were lost by the accident, which was caused by a man entering a cell with a naked candle. At the inquest held on the bodies the jury returned a verdict of Accidental Death.

Cambridge.—The friends of Sir Peregrine Maitland, K.C.B., late commander-in-chief in South India, being desirous of testifying their respect and esteem for his character and principles, and for his disinterested zeal in the cause of Christian truth in the East, have raised a fund for the institution of a prize in one of the Universities, and for the establishment of two native scholarships at Bishop Corrie's Grammar School at Madras; such prize and scholarships to be associated with the name of Sir P. Maitland. In pursuance of this scheme, the sum of 1000*l.* is offered to the University of Cambridge, for the purpose of instituting a prize, to be called "Sir Peregrine Maitland's Prize," for an English Essay on some subject connected with the propagation of the Gospel, through missionary exertions, in India and other parts of the heathen world. This offer was accepted on the 29th ult., when a Grace passed the Senate for the purpose. On the same occasion the sum of 30*l.* was granted to Professor Henslow, to enable him to visit and obtain information respecting botanic gardens, with a view to the laying out of the new botanic garden.—The Vice-Chancellor and Heads of colleges have issued an order forbidding, on pain of rustication or expulsion, all undergraduates from having any tradings or dealings with Messrs. W. Crowe, Robert Haylock, and Daniel Pate, who have been severally convicted of lending money on security to a certain student *in statu pupillari*, contrary to the good order of the University.

Carmarthen.—We are happy to learn that the health of Gen. Sir W. Nott has much improved within this last week, and that no more fears are entertained by his medical attendants for his speedy recovery.—The subscription now in progress at Carmarthen for erecting a monument to the memory of General Picton is going on favourably.

East Farleigh.—A correspondence has been published between Mr. Gabriel Kennard, jun., late churchwarden of this parish, and the Archbishop of Canterbury, respecting certain forms and changes introduced into the church service by the Rev. H. W. Wilberforce, the vicar. Mr. Kennard complains, in a letter of Nov. 22, that the same doctrines and practices against which the parishioners protested eight months since, are still continued; that Mr. Wilberforce believes with Dr. Pusey that a change takes place in the consecrated elements; that he is an advocate for the use of the material emblem of the cross both in the service and in churchyards; and that he introduces the word "blessed" before the name of the Virgin Mary in repeating the Creed, where it does not occur. Mr. Kennard makes complaints on other points adverted to in the Archbishop's reply, and concludes by saying:—"I am truly sorry to be obliged to appear thus again before your Grace; but as I am unwilling to become a Dissenter, and as I feel that the Church is for the people, and that its services ought to be conducted strictly in accordance with the principles of our Protestant reformed faith, your Grace will pardon me when I say that I think it my duty still to go on persevering in my complaints until proper redress shall be administered." To this letter the Archbishop returned the following reply:—

"Lambeth, Nov. 25.—Sir—With respect to the complaints which you and some other parishioners preferred to me about eight months ago, I made you acquainted with my decision, which was founded on the reports, first of the Rev. Dr. Griffith, and afterwards of the Archdeacon of Maidstone, who at my request undertook the inquiry. Two more competent judges, in point of learning and piety, and knowledge of the particular subjects, could hardly be found, and I see no reason to question the propriety of that decision. I am willing, however, to consider any further complaints with respect to the performance of the Church services, if you will state the charges distinctly and clearly, avoiding generalities, on which no judgment can be formed. In your letter of the 22d of this month you say—1st, 'That the service is performed in a way that is unintelligible and unedifying; 2dly, that unedifying doctrines are preached from the pulpit—the Church being put in the place of Christ, and the sacraments being made of more importance than that inward and spiritual grace of the Holy Spirit of which the sacraments are the outward and visible signs.' The first of these charges is expressed in such general terms, that it must be regarded as mere assertion only, more especially as it does not concur with the opinion of the Archdeacon of Maidstone, who attended the church for the express purpose of ascertaining in what manner the service was performed. The second is more specific. It relates to points of so much importance, and is of so grave a character, that it requires to be substantiated by citation of passages, or by reference at least to particular discourses. Indeed, I cannot but think that here there is some misapprehension; it seems to me hardly conceivable that any clergyman should be so extremely absurd as to exalt the Church above its Divine Founder, the servants and ministers of Christ above their Lord, or so profoundly ignorant of the nature of a sacrament, which consists of two parts, the outward visible sign, and the inward spiritual grace, as to speak of the outward sign as the whole, and even attach to it greater importance than to the inward grace. You then speak of Mr. Wilberforce's reported intention of erecting crosses—an intention which, could it even be proved to be wrong, not having led to any overt act, would not constitute a legal offence. You state that Mr. Wilberforce has carried the practice of chanting the service to a still greater extent than before, so far indeed as to deprive the parishioners of the privilege of common prayer: but you have not informed me what additional portions of the service are now chanted, or from what source the anthems which you speak of as having been substituted for hymns, are taken. You complain of the introduction of the word 'blessed' before the name of the Virgin Mary; but you have not stated whether such is the regular practice of Mr. Wilberforce, or how often it has occurred. The introduction of any word not found in the Creed is wrong; otherwise the application of the term blessed to the Virgin Mary is justified by the rubric of the Common Prayer, as well as by the authority of Scripture. (St. Luke, chap. i.) I have purposely confined myself to those parts of your letter which relate to the performance of Divine service in the church of East Farleigh. Mr. Wilberforce cannot be answerable for what is done or written in other places, or by other persons; nor can I properly notice on this occasion that which does not immediately belong to my spiritual jurisdiction.—I remain, Sir, your humble and obedient servant, W. CANTUAR.—P.S. On referring again to your letter, I perceive I have overlooked one of the most serious charges against Mr. Wilberforce—belief in the doctrine of transubstantiation, a doctrine which I have not discovered in any sermon of his that I have seen."

To this letter Mr. Kennard replied, adducing specific instances of the various causes of complaint, especially of the doctrine of transubstantiation, and the partial manner in which the referees appointed by his Grace conducted the inquiry, concluding by saying:—"Mr. Wilberforce has been observed three or four times at least to introduce the word 'blessed' before the name of the Virgin Mary in the Creed, as also to mention her with laudatory epithets in his sermons, which practice would not perhaps have been noticed by me had I not known what Dr. Hook has acknowledged, that Mariolatry is advocated by some of the Tractarian party, to which party I have every reason, independently of this, to believe that Mr. Wilberforce belongs."

Exeter.—We noticed last week the intention of Bishop Philpotts to introduce certain alterations in the Church service throughout his diocese. The Dean and Chapter of Exeter have since addressed a memorial on the subject to the Archbishop of Canterbury, in which they state as follows:—"Whereas it appears to your memorialists highly desirable to put an end to certain diversities in the celebration of Divine service, which now agitate and weaken the Church, they most humbly and earnestly entreat your Grace that you would be pleased to consult with all the Bishops of your province as to the best means of obtaining this object; and, for that purpose, to procure their concurrence in some uniform interpretation of those Rubrics in the book of Common Prayer which may seem obscure or conflicting, and in some uniform rule

for the direction of the clergy with respect to certain forms and practices which have, more or less, fallen into desuetude. A measure of this nature, not confined to any particular dioceses, but sanctioned by the united authority of all the Prelates of our Church, would, as they humbly hope, under God's blessing, allay these unhappy dissensions, and would meet with the cordial acquiescence of the laity, who could not suspect the influence of party, when all the fathers of the Church concurred in the same regulations." This document was signed by the Dean, by Chancellor Pott, Archdeacon Stevens, and by Drs. Martin, Rogers, and Bull, Canons. The Archbishop has replied by simply acknowledging the receipt of the memorial without entering into the question to which it refers. — The Bishop has since published a pastoral letter to the clergy of the diocese, touching upon the several points which are at present causing so much dispute. His lordship deplores the threatened disunion in the Church, and expresses his conviction that the only means of counteracting it is by strict obedience to the law. He then lays down the law upon the several subjects at issue, especially in all that relates to Divine worship as enjoined in the Rubric; and proceeds to apply it by enjoining the clergy to read at least one sentence of the Offertory whenever the communion service shall be read, but leaving it to their discretion whether they shall read more, or, in other words, whether they shall enforce a collection. The Bishop advises a collection where the congregation are willing to assent to it, but in cases where "the pervading tone and feeling is not yet of this high order," he enjoins the clergy "to be patient, and strive to raise the people to a better mind." He recommends, however, caution in the adoption of these rules. "While I urge you," he says, "to return to a full observance of the Rubric—falling short of your prescribed part in nothing—beware of exceeding it. The peculiar dangers of the times, as well as the prevailing tone of public opinion, call upon you most powerfully, as you would avoid being in the number of "them through whom offences come," to forbear all unnecessary innovation, especially, as I have recently had occasion to urge, that worst kind of innovation, the revival of obsolete usages not required by law, which are associated in the minds of the people with the superstitions and corruptions of Rome." He also advises that no deviation be made from the mode which the clergy may be now in the habit of performing Divine service, until there shall have been an opportunity of collating the practices and propositions of the different deaneries. In conclusion his lordship states that the law is clear on the subject of the surplice, and he therefore requires that the surplice be always used when preaching the sermon. In regard to evening service, his lordship directs that where there is a sermon in the evening, it be delivered after evening prayer, preceded by a collect and the Lord's Prayer, and followed by the blessing, adding that the clergy must introduce no prayer of their own composing either before or after the sermon.

Hillmaston.—Another of those meetings of the working classes, which have lately been frequent in Wilts, took place last week at the Independent Chapel, Goatacre, in this parish, which was crowded with persons of both sexes long before the commencement of the proceedings. Mr. Read, the minister of the chapel, was unanimously called to the chair. Several working men and women addressed the meeting. The following are two out of several speeches:—Charles Gingell, of Preston, in the parish of Lyneham, said he felt great distress and grievances, but could scarcely find words to express himself. For the last 12 months his wages had amounted to 19*l.* 2*s.* He was 34 weeks working for 7*s.* a-week, and 18 weeks for 8*s.* per week. This gave an average of about 7*s.* 4*d.* a-week. Out of these wages he had to maintain himself, his wife, and six children. If he could spend all that sum for food he would not grumble, but there were many other things to be paid for; 3*l.* a-year rent; the shoe bill of the family he could not put at less than 1*s.* per week, and 1*s.* per week for firing, reducing the sum to about 4*s.* per week, or 6*d.* per head for food per week; to say nothing of tea, sugar, butter, soap, candles, &c. He wished to pay everybody their own, but he could not do it. It was high time some remedy was provided to alter the condition of the labourer; and he thought if they could once get free trade the condition of the people would altogether alter and improve. Eighteen years ago he married a wife from the manufacturing districts, and women at that time were earning 12*s.* a week. At that rate his family would earn 26*s.* a-week, while his wages from the land would increase.—Mary Ferris, of Chalcut, then addressed the meeting. She said the fathers did not know all the distress which was endured. When her husband was at work her children were frequently crying for food. Last year her husband earned 8*s.* a-week. The rich knew nothing of the misery which they endured. They thought if they saw the labourers with a decent smockfrock on that there was no distress among them. She had often gone to bed and lain awake for hours with the stomach-ache for want of food. She had three children, one 13 years old, who ought to earn 5*d.* a-day; another 10 years old, ought to earn 4*d.* a-day; and the third, 8 years old, ought to earn 3*d.* This would add 6*s.* a-week to her income, and then they would not complain of being badly off. If the factories were now open, as they were 30 years ago, the elder children would have employment in them, leaving the younger to fill their places on the farm. Now her husband frequently had "the trembles" so from want of food, that he could hardly do his work. (Voices, "I've often had the trembles too.") Her children were dirty and ragged; for she could neither buy soap nor firing to wash them or their clothes properly. The following resolutions were unanimously carried:—"Resolved, 1st, That we the labourers at this meeting assembled have met to make known our distress and our wants, trusting that our statements will meet the public eye, and reach the hearts of our legislators, to the end that they may pass such measures as shall secure to industry its full and fair reward, and thus improve the conditions of ourselves and our fellow-countrymen. 2d, That we meet not to ask for charity, but for justice in the shape of profitable and independent labour, so that we may supply ourselves and our families with the necessaries of life, which we find at present to be utterly impossible, in consequence of the scarcity of employment and the lowness of wages. 3d, That we firmly believe the restrictions imposed upon industry by the corn and provision laws are a principal cause of our destitute condition, inasmuch as scarcity, dearness, and uncertainty, are the result of tampering with the people's food; and that we further believe, if those laws were abolished, remunerative employment would be more abundant, competition for labour less severe, the farmer rendered more secure by steadiness of price and fair rentals, and the happiness and prosperity of all classes of society materially and permanently advanced."

Horsham.—A letter from the tradesmen of Mr. Hurst, M.P., has been published, in which it is stated that Mr. Hurst's departure from this country was not sudden, that the accounts of the subscribers had been always "fairly and honourably paid," and that they expect the claims for the current year to be duly met at the accustomed time. They add that Mr. Hurst's disappearance from Horsham, so far from being sudden and unexpected, was a matter of common notoriety for a considerable time previously to his departure, and that the other sale of household furniture, farming stock, &c., is nothing more than the ordinary sale of farming stock, &c., by a gentleman quitting his farm, and declining to follow that occupation.

Hurst.—On Friday week an influential meeting of the inhabitants of this place was held to express their disapproval of the innovations recently introduced into the Church Service by the Rev. Mr. Cameron, and to signify to him their hope that those innovations would not be persevered in, as they were the cause of the greatest dissatisfaction to the parishioners. The meeting was attended by T. Garth, Esq., J. Leveson Gower, Esq., J. Walter, Esq., the churchwardens, and the principal farmers in the parish. Mr. Gower took the chair, and said he trusted that Mr. Cameron would yield to the wishes of the parishioners upon the subject, for the feeling against these innovations was not confined to the parish of Hurst. Mr. Walter stated that in Islington, near London, similar innovations had been objected to; and in consequence of the objections they had been relinquished. In Tottenham, also, so strong a feeling had been manifested against them, that, on the advice of the Bishop of London, they had been suspended for a year. This compromise was useful, inasmuch as it implied a concession to the objections of the parishioners. Mr. Walter concluded his remarks by inquiring of Mr. Cameron whether or not he communicated to the churchwardens before he introduced the innovations which had caused such universal dissatisfaction. Mr. Cameron replied that he had mentioned the matter to the churchwardens and they made no objection. The churchwardens said that they had made no objection to the collection at first, supposing it to be for the Reading Hospital; but if Mr. Cameron had spoken out plainly to them about a general collection once a week, they would certainly have objected. Mr. Cameron having heard various statements made by the parishioners, observed that he felt bound to follow the instructions of the Rubric, by which he was ordered to read the sentences in the Offertory, and the prayer for the Church militant. He promised however to confer with the Bishop, and to inform the Chairman of his decision within a fortnight.

Isle of Man.—Mona's Herald states that Sir J. Graham has been in communication with the authorities of the Isle of Man, and has declared, "in the most unqualified and unreserved terms," that if the people desire popular representation in the House of Keys (an anomalous kind of local legislature and board of management), Ministers are prepared to concede the boon to the fullest extent.

Liverpool.—By the Hibernia steamer letters have come to hand with the melancholy intelligence of the shipwreck and total loss of the ship Elizabeth, Capt. Paton, belonging to Liverpool, with, it is apprehended, the loss of 22 persons, including the commander, mate, several of the crew, and many passengers. The vessel was on a passage to New Orleans, having on board 16 passengers, of whom there were a number of ladies, when on the 4th Oct. she sprung a leak in a gale of wind, and sunk. All hands got into the three boats belonging to the vessel, but they were separated by the storm. Two of the boats were picked up some days afterwards, but the third has not been heard of, and it is feared that all hands on board of her have been lost.

Luton.—The estate and mansion of Luton Hoo, belonging to the Marquis of Bute, was offered for sale at the Auction Mart last week. The estate comprises 3600 acres, and adjoins the town of Luton. The first offer was 100,000*l.*, and the biddings advanced to 131,000*l.*, at which sum they ceased, and the estate was bought in. The second lot was the next presentation and perpetual advowson to the vicarage of Luton, the tithes of which had been apportioned at 1350*l.* The net value, after deductions for poor-rates, &c., was 1168*l.* This was bought for 9650*l.*, the purchaser being the Rev. Mr. Sykes, curate of Luton.

Manchester.—The greatest excitement prevails in this district among the colliers, and little doubt is entertained that a general strike will be the result. Meetings are being held in most of the districts, and every preparation for a cessation from labour is making. The union among them is rapidly extending, and the weekly contributions in Lancashire and Cheshire alone are said to be upwards of 250*l.* On Monday two large meetings were held, one near Oldham, and the other at a village called Lamberton-green, about nine miles from Wigan, which is the most extensive coal district in Lancashire. At this place there was also a meeting of delegates, consisting of about one hundred delegates from as many coalpits in the two counties. The proceedings of this meeting are kept private, but it is said that their object is to make arrangements to enable them to withstand the strike.—A meeting of the leading merchants of this city was held on Monday, at which it was resolved to invite Sir Henry Pottinger to a public dinner, which, it is understood, is likely to take place about the 20th inst. It was also resolved that a subscription should be entered into, for the purpose of purchasing a piece of plate, or some other suitable testimonial; and it appears that the call has already been most cordially responded to by the public, for the subscription already amounts to 2044*l.* 5*s.*—The Lancashire Central Short Time Committee held a meeting in this town on Tue day, at which a letter was read from Lord Ashley, in answer to an inquiry as to the course his lordship intends to pursue in the next Session of Parliament, on the Factory Bill. His lordship, in his reply, says:—"I see no reason why the question of the Ten Hours Bill should not be renewed at the earliest possible period. I will endeavour, on the first night of our meeting, to fix a day for bringing the subject again under the consideration of the House."

Oxford.—The Committee of the Hebdomadal Board is still sitting on the subject of the Rev. W. G. Ward's recent work, entitled "The Ideal of a Christian Church considered." Some misapprehension appears to have existed as to the proceedings on Saturday and Tuesday, when Mr. Ward appeared before the Board, and that gentleman accordingly addressed a letter to the Vice Chancellor, after the meeting on Tuesday, from which the following is an extract:—"I was summoned on Saturday, not as before a tribunal which claimed the power of authoritatively putting questions, but merely that I might have the opportunity, if I so wished, of disavowing certain opinions, previously to the Hebdomadal Board proceeding further against me. The questions I was asked accordingly were these:—1. Whether I wished to disavow the authorship of the above mentioned work; secondly, whether I wished to disavow the sentiments contained in certain propositions, selected from it, which were then read to me. My answer was, that in a matter so important to myself, I wished to take no step whatever without the advantage of consulting with my friends, and taking, if necessary, legal advice; accordingly I asked to postpone my answer until to-day. You replied that nothing could be more reasonable than such a request, and kindly suggested that even a later day might be preferable, an offer, however, of which I did not wish to avail myself. On appearing before you to-day, I stated that, acting under legal advice, I must decline answering any questions whatever, until I should know more definitely the course which it was intended to adopt against me. From this statement it will appear, I think, that I have adopted no unworthy subterfuge, but rather proceeded on the acknowledged principles of justice. Whenever I am authoritatively informed of the whole method of proceeding which it is intended to pursue against me, there shall be no want of perfect openness on my side also; but nothing surely could be more unreasonable than to expect that, so long as strict secresy is preserved on that head, I should volunteer any statement, however unimportant, or make any admission, however apparently insignificant."

Portsmouth.—The Queen has presented Mr. Grant, storekeeper of the Royal Clarence Victualling Yard, with a handsome gold and silver tazza, bearing the initials of Her Majesty, Prince Albert, and the King of the French, and an inscription commemorating the circumstance of the royal party taking refuge in Mr. Grant's house during the storm of Oct. 14, and the attentions which they experienced from him on that occasion.

Southampton.—On Monday the Town Council of Southampton gave a public dinner to Sir Robert Sale previous to his departure for India. The greatest enthusiasm prevailed, and after the banquet Sir Robert joined Lady Sale at the theatre, where he was received with continued bursts of applause. On Tuesday afternoon Sir Robert and Lady Sale embarked in the Oriental steam-packet for the seat of their former exploits, amidst the cheers of hundreds of the inhabitants, who crowded the spacious quays of the docks. As the steamer went out of dock a salute was fired from the platform in honour of her gallant passengers.

Stourbridge.—The Worcester papers state that the County Assize Grand Jury have just ignored the bill against Mr. Hassall, of Stourbridge, charging him with manslaughter, in having accelerated the death of his wife.

Sudbury.—The Suffolk papers state that the Church of All Saints, in this town, narrowly escaped being destroyed by fire last week. The roof was found to be in flames about 6 o'clock in the evening, and but for the exertions of the parishioners, and the good supply of water, the whole building must have been destroyed. The fire, it has been ascertained, was caused by the care-

lessness of some plumbers, who had been repairing the leads during the day, and kindled a fire on a flag-stone placed upon the roof; this stone had split with the heat, and the embers falling through the fractures had ignited the timbers.

Uxbridge.—On Saturday a fatal accident occurred to the Prince of Wales coach while on its way from this town to Beaconsfield. The coach had only two passengers outside, an aged couple, who had a few days previously come up from Oxford to see a married daughter residing in town, and were on their return home. Just as the coach was ascending the hill at the entrance of Beaconsfield, the leader shied at a white post at the side of a ditch, and at the same instant the reins broke, by which the driver, Mr. Taplin, lost all command over the horses, which drew the coach up a bank, by which it was immediately overturned. Mr. Taplin and both passengers were thrown to the ground with great force, and the two passengers sustained such injuries that the man died next day and his wife is not expected to recover. The driver was also severely hurt.

Windsor.—The restoration of the Salisbury Tower, the official residence of the Chancellor of the Order of the Garter, agreeably to the original plans of Sir Jeffrey Wyattville, was commenced last week. It is intended to raze to the ground, at an early period, the five residences of the Military Knights on the Lower Foundation, and accommodation will be provided for three Knights in the Salisbury Tower, when the restorations and alterations have been completed. Accommodation for the remainining two Knights will be provided in the North Tower of Henry the Eighth's gateway. The Salisbury Tower will be entirely cleared, and convenient apartments substituted for the dilapidated portions which have been removed. A noble terrace, to be open to the public, will be formed on the site of the houses on the Lower Foundation.

Winchester.—A melancholy accident occurred here on Tuesday last. Mr. Kindersley, brother of Mr. Kindersley, of Lincoln's Inn, was out with the hounds in the morning, and in attempting to jump over something in his road, was thrown from his horse, and before medical assistance could arrive was a corpse. It has produced a great sensation in this neighbourhood.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2116*l.*; Bristol and Gloucester, 910*l.*; Eastern Counties, 3547*l.*; Edinburgh and Glasgow, 2227*l.*; Great Western, 13,100*l.*; Grand Junction, 7054*l.*; Glasgow, Paisley, and Ayr, 1453*l.*; Great North of England, 1649*l.*; London and Birmingham, 13,748*l.*; South Western, 4731*l.*; Blackwall, 660*l.*; Greenwich, 854*l.*; Brighton, 3615*l.*; Croydon, 384*l.*; Liverpool and Manchester, 4314*l.*; Manchester, Leeds, and Hull associated, 6603*l.*; Midland, 8159*l.*; Manchester and Birmingham, 2925*l.*; Newcastle and Carlisle, 1743*l.*; Newcastle and Darlington, 1062*l.*; Preston and Wyre, 305*l.*; South-Eastern and Dover, 4153*l.*; Sheffield and Manchester, 659*l.*; York and North Midland, with Leeds and Selby, 2266*l.*

—The long protracted inquest on the body of Mr. Dean, killed by the late accident on the Midland Counties Railway, was brought to a close on Saturday. After the examination of witnesses had closed on Friday, Mr. Campbell, solicitor, addressed the jury on behalf of Mr. Lightfoot, the Nottingham-station master, upon whom the evidence throughout bore with great severity. A letter was also handed in, addressed to Mr. Lightfoot by Gen. Pasley, the Government Inspector, in which the General states that he has felt it his duty to report to the Lords of the Privy Council for Trade, that he ascribes the accident on the 21st to an error of judgment on Mr. Lightfoot's part, in setting aside the directions given by the engine-man, and communicated at the Beeston station by the messenger. After some discussion, the coroner decided that this letter, and one from Mr. Campbell in reply, could not be admitted in evidence. It is fair, however, to state that several witnesses, and among them three directors of the company, gave Mr. Lightfoot the highest character for caution, ability, and judgment, on all former occasions. The coroner then summed up, and after recapitulating the facts as already given in this paper, said, that placed as Mr. Lightfoot was, in the awful situation of station-master, it became him to have taken greater precaution before venturing to leave the Beeston station. If, by an error of judgment, he had risked his own life, that was no excuse for his having risked the lives of others. The jury would say whether they thought proper precautions had been taken to avert the dreadful tragedy which had occurred; and, if not, the burden—though a heavy one to bear—must fall upon some one. It was impossible to recall the lives already lost, but the jury, by their verdict, might prevent the loss of many more lives. The Coroner next alluded to the discrepancy which had been shown to exist in the printed rules circulated among the company's servants. He confessed he had felt great anxiety on this subject, which the evidence had removed, and he congratulated the company, and also the jury, on the gentleman's explanation that the new books had been so recently removed from the printers. It would have been much better, he said, if even the delay which had been proved had not occurred. There was another question, as to whether the drivers were properly acquainted with the rules. He did think there was a laxity in this respect; for anything the jury knew, the drivers might have had the rules and not read them. Had the drivers known the rules and acted upon them, the present accident might have been prevented. It was incumbent on the directors to see that they did know them better. He considered they were responsible for their servants, and if the jury felt that the death of deceased had been caused by an omission of this description, it would be competent to them to fix a deodand on the company. If, however, they were of a different opinion, the question of deodand was at an end. The coroner then expressed the pain he felt at the position in which Mr. Lightfoot was placed, and concluded by remarking that he had no doubt the jury would be guided solely by the evidence, by doing which they might satisfy their own consciences, and at the same time best consult the public safety. The jury then retired, and after three hours' deliberation, they returned into court with the coroner, who said, that the Jury having given a full and patient attention to the evidence, were compelled, however painful to their own feelings, to return a verdict of Manslaughter against Robert Lightfoot. There was very little surprise manifested at the result. The Coroner, however, made a short pause after the name of Mr. Lightfoot, and great anxiety was felt to learn whether any other individual was about to be included in the verdict. The pause, however, was but momentary, and the Coroner immediately proceeded to read from a written paper which he held in his hand, the following appendage to the verdict:—"The Jury cannot separate without expressing their opinion that, notwithstanding the arrangements generally prevailing on railroads, much might yet be done, and ought to be done, to render railway travelling more secure, especially in regard to second-class carriages, which, though they may not be made as comfortable, may be made as safe, as those of the first class. The Jury further consider that passengers ought on no occasion to be taken on the wrong line of rails without their previous knowledge or consent. They also suggest to railway directors that much greater safety may be secured by the general introduction of electric telegraphs upon the various lines. There is another point which the Jury think ought to be attended to, and that is, that in future great care should be taken to ascertain that all the Company's servants are intimately and perfectly acquainted with their several duties; and the Jury cannot too strongly express their conviction that Jonathan Raven has not sworn to the truth in his depositions, and that he is utterly unworthy of the confidence of the Railway Company, and unfit for the service of the public. There is another point on which the Jury wish to remark respecting Mr. Lightfoot, and that is, they are exceedingly grieved on account of the many favourable circumstances in his favour, to place him in the painful situation which they have done, and nothing but a paramount sense of duty has induced them to do so. The Coroner wishes to join with every individual of the Jury in expressing his sorrow on the occasion. There is another thing which is desired to be recommended to the Railway Company, and that is the situation of Mrs. Dean, who, in the prime of life, has been suddenly, and in a moment, deprived of the stay of her existence and of her support; and the Jury hope that provision will be made for her by the Railway Company, so as to prevent her feeling, in addition to her heavy loss, the sorrows of destitution and privation." There was no sort of allusion to deodand, nor was the Amalgamated Line of Railway specifically alluded to in any way beyond the recommendation contained in the last sentence of the preceding paragraph. The verdict was not a unanimous one; but a sufficient number of jurors having agreed, the Coroner recorded the same. After the announcement of the verdict, the Coroner placed his warrant in the hands of the Nottingham police, for the apprehension of Mr. Lightfoot, who will be tried at the ensuing assizes, which commence on the 16th inst., before Mr. Justice Patteson. There is a unanimous feeling of regret among all classes on the subject of his committal. He is a man generally respected, and was formerly in much better circumstances. He is a widower, and has a family of four young children. After the conclusion of the inquest he was not to be found, but he did not leave Nottingham, and surrendered himself on Tuesday. — The adjourned inquest on Mr. Varnells, who was killed in the same accident, was brought to a close on Tuesday, when the Coroner summed up at great length, commenting on the various discrepancies in the evidence, and stating that if they thought, from the evidence produced, that blame rested on some one, then two other questions naturally suggested themselves; first, Who was the person to whom blame attached? and, second, To what extent was he blameable?—in other words, was the culpable party guilty of manslaughter, or merely of thoughtlessness and an error in judgment? In the course of this inquiry they had the names and conduct of several persons alluded to as blameable parties; for instance, the Directors of the Railway, the Nottingham and Beeston station-masters, the guards, the engine-men and stokers of the two trains, and the Wilford station-keeper; it would be for the jury to say whether any, and if any, who of those parties was blameable on account of the death of deceased. The Coroner then read over the whole of the evidence with respect to Mr. Lightfoot, and called upon the jury to say whether, taking all the circumstances into consideration, the fair presumption was not that, in starting the down-train, which he accompanied from Beeston, he had reason to believe the tender would have been by that time removed from the line, and the up-train would come on its proper line. He instanced the various particulars in which Lightfoot's statement was confirmed by other witnesses, and remarked on the improbability or glaring untruth of several of the points in which he was contradicted by others. He also referred to the strong testimony that had been borne to his character as a man of caution and humanity. If he had shown himself grossly ignorant of his duties, and grossly negligent in not detaining the down-drain at Beeston, and taking proper precautions, they would find him guilty of manslaughter. The Coroner then read the evidence with reference to the driver and guard of the Derby train, and called upon the jury to say whether they had sufficiently acted up to the 9th rule in not having sent the fireman up the line before the engine to signal their approach on the wrong line. He animadverted very strongly on the non-compliance with this rule, which seemed to him to have been the cause of the whole accident. If any party was pronounced guilty of manslaughter the law would be satisfied; but if none of the parties who had been alluded to were blameable, then it would become the duty of the jury to say whether the directors of the railway themselves were not, by defective management of the line, responsible. If the jury thought them blameable, the only way of reaching them would be by inflicting a fine in the shape of a deodand. It was a most unsatisfactory way of fining those parties to take the money from them and give it to the Queen, instead of to the injured parties or the bereaved family of the deceased; but that was the only way of reaching the directors. With reference to Mr. Lightfoot, he called upon the jury to dismiss from their minds all knowledge of the verdict in the other inquest. Nor were they entitled to draw any conclusion unfavourable to his innocence from the fact that he had absconded. He himself would have kept out of the way under such circumstances, knowing that in the course of two weeks he should be enabled to surrender for trial without undergoing incarceration for a fortnight, which he could not without a judge's order avoid, and that would cost at least 20*l.*, and be attended with great delay. On the whole, he left the case in the hands of the jury, feeling persuaded they would take all the circumstances into consideration and find that verdict which the justice of the case required. The summing up lasted two hours and a-half. The jury at half-past 3 o'clock retired to consider their verdict, and at 10 o'clock on the following morning they sent for the coroner, and informed him they could not agree upon their verdict, and that there was no probability of their agreeing. At 11 o'clock the coroner was again sent for, and at a quarter to 12 the jury returned the following verdict:—"We return a verdict of Accidental Death, and the jury impose a deodand of 1000*l.* upon the engines, tenders, and carriages, being the property of the Midland Counties Railway; but in so doing we beg to remark that we are convinced the collision took place in consequence of mismanagement, and the want of a clear understanding on the part of the company's servants of the directions which were given, but owing to conflicting evidence we are not able to decide who are the parties individually implicated. We are also of opinion that much improvement may be made in the general management of the Midland Railway, particularly at the Nottingham station, tending materially to secure the public safety. We think it important that the servants, and particularly the engine men and guards, should be instructed in and suitably impressed with the importance of the printed rules, and that as much as possible they should be observed to the letter. We are also of opinion that Jonathan Raven, the Beeston station master, has given evidence which the jury can place no reliance upon, and that he ought to forfeit the confidence of the company, and be no longer retained as a public servant."

—On Thursday night another accident, which might have been attended with most serious consequences, occurred on this railway. The London train, which should reach Derby at 10 minutes past 5, had arrived at the place where a short line of railway is in progress of formation, connecting the north with the London line by a nearer cut, about a quarter of a mile from the Derby station, and were proceeding at a slow pace, when, from the points not being properly laid, the train got on the new embankment. At present there is not more than 20 yards of rails laid down on the new line, so that when the train got to the end, it was stopped by the gravel, which luckily lay a considerable depth. The engine was buried in the earthwork, and several carriages were broken by the shock, but the passengers were not injured, further than the fright they sustained. Had the train been going at the usual speed, the loss of life must have been dreadful.—A meeting of the London and Birmingham Company was held last week to consider the propriety of forming a railway from Maxworth, Bucks, to Worcester, with lines to Rugby and Oxford, and also from Worcester to Dudley and Wolverhampton, at a rent equivalent to 4 per cent. upon the cost of construction, with an equal division of surplus profits between the company and the shareholders in the new lines. Mr. Glyn took the chair, and stated that the capital required to carry out the project would be 2,500,000*l.* The total revenue at present derived from the traffic amounted to 226,539*l.* per annum. Deducting from this 35 per cent. for working expenses, would yield to the proprietors a net revenue of 147,250*l.* Several proprietors objected to the extension of the line, as it would violate a contract recently entered into between the London and Birmingham and Grand Junction lines, for the mutual protection of both companies. This and other objections having been overruled, a resolution authorising the directors to apply to Parliament for an act to construct the lines, and delegating to them the necessary powers, was unanimously adopted.—Surveyors have been engaged during the past week in taking ground plans of the new line of railway between Windsor and London. It is proposed to erect the station in Peascod-street, nearly opposite to the Star and Garter, and carry the line close by the Bachelor's Acre, cross the New

Road near the Savings Bank, and thence to the rising ground in the Long Walk, where it will admit of travelling on to Shaw Farm by the Frogmore estate, occupied by the Duchess of Kent, Old Windsor, Egham, Staines, and ultimately to join the South Western line between the Woking and Weybridge stations. According to this plan the Frogmore road would be done away with altogether, and the Frogmore estate, belonging to the Crown, annexed to the Home Park, which would be very desirable to Government, now that Windsor has become the principal residence of the Sovereign.—The Leeds and Selby Company have wound up their affairs by declaring a dividend of 2*l.* 1*s.* 3*d.* per share for the period from the 30th June last to the present time. The company hereafter will be incorporated with the York and North Midland. The last named company is to pay 210,000*l.* for the 2100 original shares of 100*l.* each; and with this sum the Leeds and Selby have at their disposal, from bonus arising from sale of moveable stock, for mortgages, for rent due, by savings effected in interest on mortgage, &c., the sum of 232,799*l.* 14*s.* 4*d.* The disposable funds of the company are to be appropriated as follows:—From the principal money, amounting to 225,000*l.*, the sum of 105*l.* 18*s.* 9*d.* per share will be paid to the shareholders, being equal to 222,468*l.* 15*s.* from the 2100 shares, of which the original capital stock of the company consists, leaving in the hands of the directors 5661*l.* 16*s.* 9*d.* for the discharge of the ascertained debts of the company, and the balance of 332*l.* 3*s.* 7*d.* to cover any remaining liabilities which may hereafter appear, and subject to such liabilities to be disposed of by the directors at their own discretion.—The Porthcawl and Duffryn Llynfi Company have declared a dividend of 3½ per cent., and the progress of affairs is said to be highly satisfactory.—A meeting of the Newcastle-upon-Tyne and North Shields Company, was held last week, at which it was resolved to agree to the following proposals:—1. To the extension of the Newcastle and North Shields Railway from North Shields to Tynemouth; 2. To a railway, or communication by tunnel or otherwise, from the Conduit Head, near the terminus of the railway at Newcastle, to the quay, near the Folly Wharf; 3. To the union and consolidation of the Newcastle and North Shields Company with the Newcastle and Berwick Company. The meeting was numerously attended, and the object of the proposed union and consolidation being to take in a portion of the Newcastle and Shields line, in the route from Newcastle to Berwick-upon-Tweed, and thence to Edinburgh, according to the survey and plan of Mr. Stephenson, the proceedings created considerable interest.

IRELAND.

Dublin.—The Roman Catholic members of the new Board of Charitable Bequests have all been appointed. Sir Patrick Bellew, Bart., Lieutenant of the county of Louth, has been selected as the second lay commissioner, and it is said that Mr. Redmond O'Carroll, barrister, has been appointed Roman Catholic Secretary of the Board.—The general assembly of the Presbyterian church in Ireland, last week presented an address of congratulation to Lord Heytesbury on his appointment as Lord Lieutenant. In his reply his Lordship says:—"As Her Most Gracious Majesty's representative in this country I can have no other wish than to secure to each the free exercise of his religious opinions and worship—to disseminate in as wide a circle as possible the advantages of moral as well as of general instruction—and to contribute in every possible way to the development of that industrial prosperity of which so many encouraging symptoms are daily manifesting themselves in every part of this beautiful kingdom."—The weekly meeting of the Repeal Association took place on Monday, Mr. Somers, M.P. for Sligo, in the chair. Mr. O'Connell commenced the proceedings by advising that no person should speculate in the railways now in progress throughout Ireland who could not afford to be out of his money for 3 or 4 years. He then read a letter he had received from Mr. J. A. O'Neill, in which that gentleman defended the character of the French people from the unjust attacks which he considered Mr. O'Connell to have made indiscriminately upon them at the last meeting. Mr. O'Connell said, he must have been misreported if such appeared to be the effect of his address. He never said that the entire French people were immoral and irreligious. At the same time he could not go the length of saying, with Mr. O'Neill, that they were all moral and religious. There was a strong infidel party in France—a party who not only had no religion themselves, but who hated and execrated all who had any. There were, however, among Frenchmen as fine qualities as amongst any people on earth. Basely ungrateful should he be if he did not recollect how they treated the Irish Catholic gentry during the existence of the penal laws. At the commencement of the French Revolution he had no less than 72 relatives officers in the French army, three of whom had risen without a friend to the rank of General. He was, therefore, grateful to the French people. He admired the religious portion of them, he admired the chivalrous Christian gentry of France, but he hated and denounced French infidelity, and the sneering mode in which the infidel party assailed religion and the clergy. The *Constitutionnel* had gone the length of hiring Eugène Sue to write libels against the Catholic clergy. The *National* followed in its track, and it was against them and their admirers that he had levelled his indignation and his hatred. The hon. gentleman concluded by moving the insertion of Mr. O'Neill's letter on the minutes, which was agreed to. A report on the formation of Repeal reading-rooms was then brought forward and received, after which Mr. O'Connell adverted to the necessity of a new University for Ireland, and of the remodelling of Trinity College, Dublin. Some donations from America were announced, and Mr. O'Connell then proceeded to make the speech of the day.

He began by describing the principle of their action in reviving the agitation for Repeal, which was only to end with a Parliament in College-green. That principle denied the right of obtaining any political advantage by force, violence, or crime. He was the apostle of peaceful exertion, and the preacher of moral combination. As such he had invited the Federalists to join them; but instead of joining them they had deceived them. They were good-natured people enough, but they were not genuine Irishmen, for they thought that Irishmen ought not to govern themselves, and the love of fatherland did not burn brightly in their bosoms. He now declared that he expected no aid from them. The English newspaper of the Dissenters, the *Patriot*, alleged that he was looking for Repeal, not in order to obtain it, but in order to coerce England to do something in the way of justice for Ireland. That was a total mistake, and he wished the people of England to understand that there was nothing equivocal in his looking for Repeal, and that England could offer nothing short of Repeal which he would accept of. Having again hurled his indignation and defiance against the Whig writers of the English press, and in particular of the *Examiner*, by whose rascality, he said, the people of England had lost the confidence of Ireland, the hon. and learned gentleman proceeded to establish the first of ten propositions, to the effect, that the Union was no contract, but had been forced on the Irish nation by force and fraud. His second proposition was, that the Union had produced the most disastrous results to Ireland, and his principal proofs of it consisted of the decay of Irish manufactures and the statistics of the population. He then proceeded to substantiate his 3d proposition,—that if the Union were a real one, Ireland would have got at least 175 members instead of 100, and entered into details to show, that according to the population of Ireland she was entitled to more than 200 members; and that, taking population and revenue together, she was entitled to 175, ending the subject by declaring that the paucity of Irish representatives was one of Ireland's greatest grievances. The 4th, 5th, 6th, and 7th propositions related to the Parliamentary franchise, the limited nature of which Mr. O'Connell described as a crying injustice, and to the Irish Municipal Reform Act, which he declared to be miserably defective, particularly as regarded the franchise, which was so high as to exclude about three-fourths of those who would in England be burgesses. On coming to the 8th proposition, stating that the people of Ireland were obliged to contribute to the support of two churches, he said, that although he had already been addressing them for an hour and a quarter, he wished he was only beginning, for this was a subject of such importance that it demanded a dissertation in itself. In England and Scotland, he observed, that the State temporalities belonged to the Church of the people, but in Ireland they belonged not to the people, but to a small remnant of the people. He did not want the State temporalities of the Irish Church for his own Church, because he considered that an alliance between it and the State would be the greatest misfortune that could befal it. But he wanted what they had in England, and what they had in Scotland—he wanted fair play and justice. On the 9th proposition, viz., that a gross fiscal robbery was inflicted on Ireland by the Union, he dwelt only for a moment; and on coming to the 10th, that the Union enormously augmented the disastrous effects of absenteeism, he expressed his gratification that it was the last, observing in reference to it, that if they had a Parliament of their own, they would be able to tax absentees to the extent of 75 per cent., or even 80, in order to compel them to reside in Ireland, and that for the principle of taxing absenteeism they had a precedent in the income tax of Sir R. Peel, who hunted out the Irish absentees residing in England, and made them pay that tax. The hon. gentleman concluded by urging the absolute necessity that existed for an absentee tax, which he said a domestic legislature would not hesitate to impose, and then alluded to the evils consequent on a distant and remote legislature. On concluding, Mr. O'Connell moved that the ten resolutions on which he had spoken be referred to a committee, to prepare an address to the people of England, founded upon them.

After some further business had been disposed of, Mr. O'Connell announced the rent for the week to be 493*l.* 5*s.* 6*d.*

Limerick.—There is at length a prospect of a reconciliation between the Poor-Law Commissioners and the Limerick Board of Guardians. The Commissioners have made the first advance towards an adjustment in a circular addressed to the Limerick Guardians, in which they express regret at the late misunderstanding, and state that the Guardians will find, on the resumption of their duties as a Board, that the most anxious desire of the Commissioners will be to co-operate with them in the administration of the law for the relief of the poor in every way, and to every extent compatible with the obligations of their official duties.

Miscellaneous.

Miss Martineau on Mesmerism.—In the last *Athenæum* Miss Martineau continues her letter upon mesmerism, an abstract of the first part of which we gave last week. The present communication is devoted to the case of a young girl, who, while under the mesmeric influence, had visions, and predicted events in an extraordinary manner. Miss Martineau gives this girl a high character, and seems to think her quite different, from the truthfulness and consistency of her statements, from the usual run of somnambules. The first occasion of her being mesmerised was while suffering severe pain in the head and inflammation of the eye. The mesmerist was Miss Martineau's maid, who, it will be remembered, operated on the lady herself, and it is related that after being mesmerised the pain and inflammation ceased, and the general health of the patient improved so wonderfully as to attract very general notice. While in this state of trance, the patient described the disease of her eye as structural, which will prevent its being entirely removed. It seems that when awoke from this trance, the girl had no knowledge of what she had said, except on one occasion, and then she said she had been dreaming of what she had heard in church regarding the nature and destiny of man. This girl had the power of telling when she would awake from her sleep, which she said to be a common power with those under mesmeric influence. We pass from Miss Martineau's introduction to this case to the peculiar circumstances attending it. She says:—"It soon became evident that one of her strongest powers was the discernment of disease, its condition and remedies. She cleared up her own case first, prescribing for herself very fluently. It was curious to see, on her awaking, the deference and obedience with which she received from us the prescriptions with which she herself had just furnished us. They succeeded; and so did similar efforts on my behalf. I cannot here detail the wonderful accuracy with which she related, without any possible knowledge of my life 10 and 20 years ago, the circumstances of the origin and progress of my ill health, of the unavailing use of medical treatment for five years, and the operation of mesmerism upon it of late. One little fact will serve our present purpose better. Soon after she was first mesmerised, I was undergoing my final severance from opiates—a serious matter to one who had depended so long and so desperately upon them. As I have said, I got through the day pretty well; but the nights were intolerable, from pain and nervous irritations, which made it impossible to rest for two minutes together. After four such nights, I believe my mesmerist's fortitude and my own would have given way together, and we should have brought the laudanum-bottle to light again but for the bright idea, 'Let us ask J.!' She said at once what my sufferings had been, and declared that I should sleep more and more by degrees, if I took—what was as contrary to her own ordinary ideas of what was right and rational as to mine—ale at dinner, and half a wine glass of brandy in water at night. I refused the prescription till reminded—'Remember, she has never been wrong.' I obeyed; the fact being kept secret between us two, in order to try, every evening, J.'s knowledge and opinion. She always spoke and advised, in a confident familiarity with incidents known only to us two, and carried me steadily through the struggle. I lost my miseries, and recovered my sleep, night by night, 'till, at the end of the week, I was quite well, without stimulant or sedative. Nothing can be more remote from J.'s ordinary knowledge and thought than the structure of the human body, and the remedies for disease; and, though I was well aware how common the exercise of this kind of insight is in somnambules—how it is used abroad as an auxiliary to medical treatment—I was not the less surprised by the readiness and peremptoriness with which a person, in J.'s position, declared, and gave directions about things which she is wholly ignorant of an hour after, and was, during the whole of her life before." Miss Martineau also relates the circumstance of children under mesmeric influence having the power to discourse about the Scriptures without having any previous knowledge of them, *if only mesmerised by a clergyman!* The patient stated in the course of a sleep, that the light she saw was beyond what was to be seen on earth, that it was produced by the three powers of the soul, the mind, and the vital powers of the body. She then stated that the mind died, the body died, but the soul lived, being self-existent, and independent of either. Being asked the relation of the soul to God after this statement, the patient was somewhat perplexed, but said it was by him re-united to the body, at the same time expressing a strong *mesmeric* disbelief in this truth. This point was carried no further, the mesmerist, at the critical moment, *changing the ideas* of his patient, a faculty on his part, which is described as the most wonderful in the whole process. The last revelation of this patient is, however, scarcely less remarkable. Miss Martineau says:—"The next evening (Monday, October 14) J. did not come up as usual to our *séance*. There was affliction in the household. An aunt of J.'s, Mrs. A., a good woman I have long known, lives in a cottage at the bottom of our garden. Miss A.'s son, J.'s cousin, was one of the crew of a vessel which was this evening reported to have been wrecked near Hull. This was all that was known, except that the owner was gone to Hull to see about it. J. was about to walk to Shields with a companion to inquire, but the night was so tempestuous, and it was so evident that no news could be obtained, that she was persuaded not to go. But she was too much disturbed to think of being mesmerised. Next morning there was no news. All day there were flying reports—that all hands were lost—that all were saved—but nothing like what afterwards proved to be the truth." In the evening, when the girl came to be mesmerised, Miss Martineau interrogated her on the subject, no tidings having then arrived:—"J. was presently asleep, and her mesmerist, knowing the advantage of introducing subjects on which the mind had previously been excited, and how the inspiration follows the course of the affections, asked, as soon as the sleep was deep enough, 'Can you tell us about the wreck?' J. tranquilly replied, 'Oh! yes, they're all safe; but the ship is all to pieces.' 'Were they saved in their boat?' 'No, that's all to pieces.' 'How then?' 'A queer boat took them off; not their boat.' 'Are you sure they are all safe?' 'Yes; all that were on board; but there *was* a boy killed. But I don't think it is my cousin.' 'At the time of the wreck?' 'No, before the storm.' 'How did it happen?' 'By a fall.' 'Down the hatchway, or how?' 'No, he fell through the rigging, from the mast.' She presently observed, 'My aunt is below, telling them all about it, and I shall hear it when I go down.' My rooms being a selection from two houses, this 'below' meant two stories lower in the next house. She continued talking of other things for an hour longer, and before she awoke, the gentlemen were gone. After inquiring whether she was refreshed by her sleep, and whether she had dreamed ('No,') we desired her to let us know if she heard news of the wreck; and she promised, in all simplicity, that she would. In another quarter of an hour, up she came, all animation, to tell us that her cousin and all the crew were safe, her aunt having returned from Shields with the news. The wreck had occurred between

Elsinore and Gottenberg, and the crew had been taken off by a fishing-boat, after two days spent on the wreck, their own boat having gone to pieces. She was turning away to leave the room, when she was asked—'So all are saved—all who left the port?' 'No ma'am,' said she, 'all who were on board at the time; but they had had an accident before—a boy fell from the mast, and was killed on the deck.' Besides having no doubt of the rectitude of the girl, we knew that she had not seen her aunt—the only person from whom tidings could have been obtained. But, to make all sure, I made an errand to the cottage the next morning, well knowing that the relieved mother would pour out her whole tale. My friend and I encouraged her, and she told us how she got the news, and when she brought it to Tynemouth, just as we knew before. 'How glad they must have been to see you "at ours," said I.' 'O yes, ma'am;' and she declared my landlady's delight. 'And J.,' said I. 'Ma'am, I did not see J.,' said she, simply and rapidly, in her eagerness to tell. Then presently—'They told me, ma'am, that J. was upstairs with you.' Two evenings afterwards J. was asked, when in the sleep, whether she knew what she related to us by seeing her aunt telling the people below! to which she replied, 'No; I saw the place and the people themselves—like a vision.'" The letter of Miss Martineau is not yet finished, and its continuation is looked for with some curiosity.

Law.

COURT OF EXCHEQUER.—(Sittings in Banco).—*Mallan v. May.*—In this case, which was argued some time since, the Court having taken time to consider, The Lord Chief Baron now delivered judgment in favour of the defendant. The case came before this Court at the instance of the Vice-Chancellor, in order to obtain its opinion as to the proper meaning to be attached to the word "London," in an agreement between the plaintiffs and the defendant, wherein the latter bound himself not to practise as a dentist "in London." On the one hand it was contended that the prohibition was co-extensive with London and Westminster both, but on that of the defendant it was confined to the boundaries of the city of London, properly so called. Upon this question the Court had come to the opinion that the contract ought to be construed according to the primary and proper sense of the language used in it, there not being anything in the context which necessarily implied the contrary. For these reasons the certificate of this Court would be returned to the Vice-Chancellor in favour of the defendant, the Court determining that "London" meant the city of London, and that no action lay against the defendant under this agreement for carrying on his profession in Great Russell-street, in the county of Middlesex.

MIDDLESEX SESSIONS.—On Thursday *Mrs. Jane Tyrwhitt*, wife of C. Tyrwhitt, Esq., of Charles street, Berkeley-square, was tried at these Sessions, on the charge of stealing, at the Soho Bazaar, a microscope, value 2*s. 6d.* The witnesses for the prosecution deposed that they saw Mrs. Tyrwhitt take the microscope from the stand, and that she dropped it when charged with the theft. The prisoner pleaded not guilty, and numerous witnesses of the first respectability bore the highest testimony to her character. After a long trial the jury found her *Not Guilty*, and the verdict was received with loud cheering, both in the Court and by the crowds collected outside the Sessions House.

MIDLAND CIRCUIT, WARWICK.—*The Stoneleigh case.—James Leigh*, 30, *Thomas Leigh*, 34, *Thomas Flowers*, 37, and *William Watts*, were charged with having violently assaulted, with intent to do some grevious bodily harm and damage, one William Freeman, and others. Our readers are aware, from what appeared in our columns a short time since, that a band of men, under some supposed claim of right, proceeded to Stoneleigh Abbey, the seat of Lord Leigh, near Coventry, and by forcible means, during the absence of that noble lord, proceeded to break into the house and take forcible possession of the same. From the speech of counsel for the prosecution, and from the evidence, it appeared that for some years past many claimants had sought to dispossess the present possessor of Stoneleigh of the beautiful estates known as the "Stoneleigh Estates;" but that in the year 1829, one of these claims, which had come before the House of Lords, was solemnly adjudicated upon, and disallowed; still the noble lord has not been free from molestation. The family of the name of Leigh who laid claim to these estates, and which claim was adjudicated upon in 1829, came out of Gloucestershire, the Leighs who were the promoters of the late outrage came from Lancashire, and are persons in a humble sphere of life. The case against these four prisoners occupied the time of the court upwards of eight hours, but the facts may be briefly narrated as follows:—It would appear that on the 21st October one John Haycock, whose duty it was to go to the post-office, at Kenilworth, to fetch his lordship's letters, and carry them to Stoneleigh, met a party consisting of twenty-nine men and two women, among whom were the four prisoners. This party was walking on the footpath towards Stoneleigh. One of them said, "The first man who mislests me I will kill him." That man had a stick which he struck on the ground. Haycock seeing this, hurried on to the abbey by a short cut. The party proceeded to one of the lodge gates, and demanded entrance by James Leigh, which was refused. The gate was then broken in pieces by James Leigh, and the party entered the park with a "Hurrah," and passed one Denser, the inspector of the county police force, who was standing at a place called the Old Gateway, which is about ninety yards from the abbey. Denser proceeded to what is called the corridor door, having placed himself at its right hand, and Hancocks, a police constable, being on the left side, James Leigh came between them and kicked the panel of the door in. A rush was then made at the door, and Hancocks and James Leigh were carried from the place at which they were standing. Denser at the time was in his uniform, his top coat being buttoned over it. Hancocks had his uniform on and no great coat. Leigh asked him who he was for? There was no answer, and Leigh took a heavy bludgeon from his breast and struck Hancocks on the arm, and subsequently gave him several blows, which felled him to the ground and for a time rendered him senseless. Denser also received a blow on the head, and then struck Leigh and drew blood. The party having broken in the door, they passed into the abbey. Before passing into the abbey, one William Freeman went to the assistance of the police, and was beaten about the head so that his life was despaired of, and even up to this time his life, according to the evidence of the medical witnesses, is not out of ultimate danger. When they entered the house, the party gave a sort of hurrah. They were armed with bludgeons, and one man carried an axe. Having got into the house, they barricaded the door with tables, chairs, &c., and Mr. Jones, his lordship's solicitor, who was at that time at the abbey, finding how matters stood, got upon the roof of the house, and letting himself down by a ladder, proceeded on horseback to Coventry, from whence he returned with assistance. In the meanwhile the alarm bell had been rung, and his lordship's tenants and neighbours had assembled on the lawn, to the number of between 200 and 300 persons. The party in the house, finding they were likely to come into collision with such fearful odds, intimated that if nobody molested them they would give up their weapons and yield themselves up in custody, and they were shortly after transferred into the custody of the police, taken to Leamington, examined by the magistrates, and committed. These facts having been elicited, together with many others not necessary to relate, and the four prisoners having been fully identified as having taken an active part, the learned counsel intimated that that closed the case for the prosecution. Mr. Temple addressed the jury for the prisoners. His speech was chiefly directed to persuade them that the capital part of the charge had not been made out, viz., the intent to do grievous bodily harm and damage. The parties undoubtedly had done wrong: he was not there to say they had not. They had acted under a mistaken view, believing, with many others, that the fact of taking possession would further most materially the views of the claimant. In that they had erred, but in respect of their going to Stoneleigh-abbey with a deadly intent—an intent to do grievous bodily harm and damage to any one—that he denied. Mr. Justice Patteson summed up, taking occasion to advert to the belief prevailing in many minds to the effect that, if possession was once obtained, no matter by what means, the parties setting up a claim of right would have placed that claim in a better position, and exposing the absurdity of such a belief. With reference to the distinction between the more serious part of the charge and the minor offence, that also was clearly explained and left for consideration, his lordship putting it in three ways—first, as to the felony; secondly, as to the assault; thirdly, as to their being guilty of either. The jury found all four guilty of the assault. Sentence deferred.—On the next day, the same prisoners, with 19 or 20 others, were put upon trial for a riot and assault. The evidence on both sides was the same as that adduced at the previous trial. Several of the prisoners put in a written defence, stating that they had been given to understand that James Leigh was going to take possession of the great Stoneleigh Abbey estates by some novel means, and that being desirous of seeing the same, they accompanied him to the abbey, but without any evil intent—that they very much regretted the step they had taken in going there at all, which had been productive of such mischief to themselves, their wives, and families, and pledging themselves to abstain from further acts of violence and annoyance to Lord Leigh. The learned judge summed up, and the jury returned a verdict of guilty against all the prisoners upon the eleventh count, alleging forcible entry; James Leigh, guilty of common assault upon Hancocks and Denser, and Flowers guilty of a common assault upon Joseph Freeman, and all not guilty of riot. His lordship then desired the four prisoners, who had been convicted the previous day, to stand forward. The present, he said, was a case of great aggravation, and he would have them believe what he said to them, namely, if William Freeman or any other person had died, he did not see how it would have been possible to have denied that the offence committed would have been murder. Considering the violent nature of the affray, he must teach them a severe lesson, and to James Leigh, who had acted as ringleader throughout, he should award an imprisonment of 18 calendar months, with hard labour; to the other three an imprisonment of 12 calendar months and hard labour: while the remaining 24 prisoners his lordship sentenced to an imprisonment of three months each. There was another indictment for trial, but the counsel for the Crown thought sufficient had been done to vindicate the law, and it was not proceeded with.

BIRTHS.—On the 19th ult., at Fermo, the COUNTESS GIGLIUCCI, of a son and heir—21th ult., at Stanton House, Wilts, the lady of the Rev. J. A. TRENCHARD, of a daughter—25th ult., at Craigdarroch, Dumfriesshire, the lady of J. G. JARVIS, Esq., late Captain of the 52d Light Infantry, of a daughter—28th ult., the lady of the Rev. E. F. CHAMPNEYS, of a daughter—28th ult., in St. James's-square, the lady of C. SUMNER, Esq., of a son—29th ult., at Porchester gardens, Bayswater, Mrs. STOKES, of a daughter—29th ult., the lady of H. BAKER, Esq., of 11, Upper Gower-street, Bedford-square, of a son—29th ult., at 34, Mecklenburgh-square, the lady of R. LUSH, Esq., of a daughter—2d inst., at 24, Wellington-terrace, St. John's Wood, Mrs. MARCHANT, of a daughter—2d inst., at Greenham Lodge, Berks, the lady of A. J. CROFT, Esq., of a daughter—2d inst., at 2, College-terrace, Islington, Mrs. J. F. ADAMS, of a daughter—2d inst., at Slades-place, Deptford, Mrs. W. SANDOM, of a daughter—3d inst., in Tavistock-square, Mrs. J. PLUCKNETT, of a daughter.

MARRIAGES.—On Thursday, at Chandos House, by the Catholic Vicar Apostolic, and afterwards at St. George's, Hanover-square, the BARON NIEUMANN, Austrian Minister at this Court, to the LADY A. SOMERSET, eldest daughter of the Duke of Beaufort—30th ult., at Tattingstone, Suffolk, J. B. BRYCE, Esq., of Duffryn, Glamorganshire, High Sheriff for that county, to ALICIA G. BUSHBY, second daughter of the late W. Bushby, Esq., of Great Cumberland-place—30th ult., at St. Nicholas Church, Brighton, T. PLEWS, Esq., of Bucklersbury, to MARY A. S. RIDLEY, eldest daughter of Mr. S. Ridley, of Brighton.

DIED.—On the 25th ult., Mr. W. WILLIAMS, son of the late Mr. T. Williams, author of "The Cottage Bible," &c.—27th ult., of inflammation of the lungs, J. BROOKE, Esq., of Shepley Hall, near Manchester, aged 57—27th ult., at 2, Sydney-place, Bath, W. H. HOUGH, Esq., aged 66—28th ult., at his residence, in London, Colonel Sir J. H. SEALE, M.P. for Dartmouth—28th ult., at her house, Green Park, Bath, Mrs. C. HARRISON, formerly of Brambling House, near Canterbury, aged 91—29th ult., at Tenby, Pembrokeshire, G. BROWN, Esq., of Crygybor-ion, in the above county, and formerly of Windsor Castle, in the Island of Jamaica—On Thursday last, at his seat, Lartington Hall, Yorkshire, H. WITHAM, Esq., High Sheriff of the county of Durham, aged 65—29th ult., suddenly, Capt. T. WALLACE, of the Madras Army, second son of J. Wallace, Esq., of Gloucester-place, Portman-square—29th ult., after a short illness, the Hon. R. O. CAVE, M.P., of Stanford Hall, Leicestershire, and of Castle Otway, in the county of Tipperary—29th ult., G. DURANT, Esq., of Tong Castle, in the county of Salop—2d inst., A. P. ARBUTHNOT, youngest child of G. Arbuthnot, Esq., 4, St. George's-terrace, Hyde Park, aged nearly eleven months—2d inst., E. SOLLY, Esq., of Bedford-row, aged 69—4th inst., at the Vicarage, Kentish Town, the Rev. J. GRANT, M.A., aged 72.

BUTTER MADE IN TEN MINUTES.—Much time and labour will be saved by the use of the SUSSEX CHURN, manufactured solely by GREEN and HALE, late Attwood, Wimble, and Warner, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream by placing the Churn in a pan of hot or cold water, which insures the butter coming in ten or twelve minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 00	0	1	2	3
To Churn	2½lb.	4lb.	7lb.	14lb.	28lb.
Price with pans	18*s.*	20*s.*	25*s.*	33*s.*	40*s.*

Delivered (carriage paid) to any part of London.

N.B.—Pans for making clouted cream.

London Agents:—Benham, 19, Wigmore-street, Cavendish-square; Bailey, 71, Gracechurch-street; Yates, Arthur-street East; Deanes, London Bridge. Export Agents, Barnes and Co., 109, Fenchurch-street.

DRAWING-ROOM CLOCKS.—A. B. SAVORY and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days and strike the hours and half-hours. Price 4 guineas, 7 guineas, and 10 guineas each, and upwards. The performance is warranted.

A Pamphlet, with detailed lists of Prices, and illustrated with sketches, may be had on application, gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

READ the following TESTIMONIAL in favour of PARR'S LIFE PILLS, which is sufficient to convince the most prejudiced person that they are all that is required to conquer disease, and consequently prolong life:—"To T. Roberts & Co.—Sirs,—I beg to hand you the following testimonial, which I have just received from Mr. Williams, Union-street, Nottingham.—Yours obediently, G. BATTERS, Chapel-bar, Nottingham.

"Sir,—Printing is a great blessing to mankind, for now I am enabled to make known, through you, a perfect cure, by taking PARR'S LIFE PILLS, of extremely bad Indigestion, a Bilious disorder, and Sick Headache, which I have been subjected to for years; and money enough has been paid to physicians and surgeons, which now would have been a little fortune to me. I wish every fellow-creature clearly to understand that I was wonderfully relieved by taking one box of PARR'S LIFE PILLS. Accident threw a testimonial in my way of a miraculous cure of a bilious attack and sick-headache. The second box enabled me to go about my business with spirit and alacrity; and by taking two or three more boxes, I am happy to add my humble testimony of a perfect cure of that dreadful disorder—Bilious and Sick Headache—which rendered me, before I took PARR'S LIFE PILLS, unfit for business. Considering the loss of time and pain, persons would find that one box of PARR'S LIFE PILLS is worth, instead of 1*s.* 1½*d.*, as many guineas. May all persons make trial of PARR'S LIFE PILLS, is the sincere wish of, yours thankfully,

"To Mr. G. Batters. M. WILLIAMS, Union-st., Nottingham."

PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground, on the Government Stamp.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their establishments, 22, Regent street corner of Jermyn-street); or 45, Moorgate-street, City. New Goods plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the Kingdom and abroad free.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON AND CO., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own Manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co.," under a crown. Old articles replated and gilt.

WANTED, a SMALL GREENHOUSE, complete, with Hot Water Apparatus, in good condition. Any party having such a one to dispose of may address, with lowest price, to A. B., 69, Aldersgate-street.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A respectable Married Man, aged 38 years, who understands the duties of his profession, Land, and Stock. His wife, the Laundry or Dairy. Most satisfactory testimonials of 3 years' character can be given.—Direct to A. B. C., Mr. Cutbush, Nurseryman, Highgate, Middlesex.

AS GARDENER.—B. P. DRUMMOND, Gardener, Gwernant Park, is about to leave his present situation, of his own accord, and will be disengaged on the 1st of January. He would be glad to treat with any Nobleman or Gentleman, where several men are kept; he has had nearly thirteen years' practical experience in all the various departments of modern horticulture; served in the Botanical Nurseries, and the Experimental Gardens, Edinburgh; also Flower Gardener and Foreman in the extensive private gardens of the Earls Grey and Minto. He is under thirty, and unmarried. Unexceptionable reference as to character and abilities can be given.—Direct as above, Newcastle Emlyn, S. W.

TO SEEDSMEN AND OTHERS.

AS CLERK and ASSISTANT in a Seed Warehouse. A respectable Young Man, who writes an excellent hand, and has a good knowledge of the Seed and Plant Trade. An unexceptionable character will be given by a respectable firm, whom the Advertiser has recently left.—Direct to Y. Z., Messrs. Flanagan and Co., Seedsmen, opposite the Mansion-house, London.

TO AGRICULTURISTS, &c.

AS MANAGER or SUPERINTENDENT of a FARM and STOCK.—An active Man, turned 50 years of age, of respectable connections, wishes to obtain a Situation as above, or in any way that is respectable. Employment, and that only, is the object of the Advertiser. Salary no object. Can give the most satisfactory reference as to character, &c.—Direct to Mr. KEYS, 6, Gray-street, Manchester-square.

AS BAILIFF, an Unmarried Man, 28 years of Age, a native of North Britain; has been practically engaged in Farming in all its branches for the last 12 years; is perfectly conversant with all the latest improvements in Land-draining, Road and Fence making, the breeding, feeding, buying, and selling of Stock. Having been always accustomed to an active life, has no objections to make himself generally useful. Good references as to character, &c. can be produced. Direct G. J., Mr. W. Skirving, Nursery and Seedsman, 14, Queen-square, Liverpool.

The Newspaper.

SATURDAY, DECEMBER 14, 1844.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN-BASINS IN IRON, &c. 70, STRAND, LONDON.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

All these Wools, spun expressly for this House, are remarkable for their Quality, and present, beyond all comparison, the largest and best assorted Stock in the Kingdom. Berlin Patterns, and every other Article, whether of British or Foreign manufacture, used in Decorative Needlework.—WILLIS's Wool Warehouse, 186, Regent Street.

News of the Week.

FROM France we learn that the adjudication of the new loan took place on Monday, when it was taken by Messrs. Rothschild at a price much higher than was expected. The Ministerial Papers congratulate the Government on this subject, and regard the high price obtained for the loan as a fresh proof of national credit, at the same time expressing the belief that, as the English Three per Cents. are above par, similar French securities may shortly be expected to reach the same position. Accounts from Tahiti, received this week, supply fresh materials to the Opposition prints, and, from their angry comments, there is no doubt that the occurrences in the Pacific will give rise to much discussion in the approaching Session. It is evident, however, that the hostility of the Opposition on this exhausted topic arises from the absence of a more important grievance. The Government, it is said, are prepared to withstand the attack, supporting itself on the King's visit to this country, the bombardment of Tangiers and Mogadore, the battle of Isly, the marriage of the Duke d'Aumale, the success of French diplomacy abroad, and finally, on the advantageous loan just negotiated. The Duke and Duchess d'Aumale arrived at Marseilles from Naples on the 6th inst., and were received with great enthusiasm by the authorities and inhabitants of that city.—From Madrid we learn that the protracted debate on the Reform Bill has at length been brought to a close in the Chamber of Deputies, and is now under the consideration of the Senate. The amendments made by the Deputies involved no material change of the Government scheme, and it is expected that the measure will pass through the Senate without any important modification. The executions at Logrono, announced last week, have been followed by similar acts of severity in various parts of Spain. Another son of Gen. Zurbano has been shot, together with several of his followers; while other parties supposed to be disaffected towards the present Ministers, have either been executed without trial or banished from the kingdom. Nothing certain is known of Zurbano's movements, but it is supposed by many that he is concealed in Madrid, and has not succeeded in escaping into France. Gen. Prim has not yet left Spain for the scene of his banishment, but great efforts are making by his friends to have him transported to Havannah or Porto Rico instead of the Marianne Islands, on account of his health, which has been seriously impaired by the late events.—In Switzerland fresh disturbances have occurred on the subject of religion, and the canton of Lucerne is in open insurrection. A collision took place on the 4th between the insurgents and the troops, in which the former were defeated, but fears are entertained of a general rising of all the Protestant cantons against the Jesuits.—We have advices from the West Indies to a late date by the mail-steamer Avon, which reached Southampton on Thursday having been due for many days. The accounts from the islands are not of much importance, the principal news being confined to the loss of the Actæon steamer, the fourth which this unfortunate company has lost since its establishment a few years back.

At home, there is little to require special notice in this place, beyond the formal prorogation of Parliament to the 4th Feb., then to meet for the despatch of business.

Home News.

COURT.—Her Majesty and Prince Albert, the Duke and Duchess of Saxe Coburg Gotha, the Duke of Wurtemberg, and the infant royal family, left Windsor on Saturday morning for Claremont. On Sunday, the Queen and her royal visitors attended Divine service at Claremont, Archdeacon Wilberforce officiating. On Tuesday, the Prince attended the funeral of the Princess Sophia, and on Wednesday the royal party returned to Windsor Castle. On Thursday, Her Majesty held a Chapter of the Order of the Garter, and in the course of the forenoon the Queen and Prince Albert, accompanied by the Duchess of Saxe Coburg Gotha, and Duke Ernest of Wurtemberg, and attended by the Earl of Hardwicke, Lord C. Wellesley, and Sir E. Bowater, went in pony carriages to Frogmore, where the gentlemen of the party partook of the diversion of skating.

Funeral of the Princess Sophia.—The remains of her late Royal Highness the Princess Sophia Matilda of Gloucester lay in state on Monday, at the Ranger's house, Blackheath. On Tuesday the funeral of the Princess took place, with the usual ceremonies, at St. George's Chapel, Windsor. The procession left Blackheath at 1 o'clock, the hearse bearing the royal arms, and drawn by eight horses, escorted by a troop of Dragoon Guards. It proceeded through Peckham and over Vauxhall-bridge, through Hyde-park, to the Paddington terminus of the Great Western Railway, where it arrived about 5 o'clock, having taken upwards of four hours to traverse the distance from Blackheath to the railway. The hearse and mourning coaches were then transferred to a special train, which conveyed them to Slough in 46 minutes. Another procession was then formed, which advanced by torch-light to Windsor, the line being kept by the Royal Horse Guards. The body arrived at St. George's Chapel about half-past 8, and was received by the Lord Chamberlain, Garter King at Arms, and the Dean and Chapter of Windsor. The Countess of Grainsborough officiated as chief mourner, and the Dean of Windsor read the funeral service, after which Garter King at Arms proclaimed Her late Royal Highness's style, and the body was deposited near the Sovereign's stall. Prince Albert attended the funeral, and sat in his stall. The Prince wore the uniform of a Field Marshal, with the ensigns of the order of the Garter and the Golden Fleece, and a mourning scarf.

Order of the Garter.—The Queen held a chapter of this Order on Thursday at Windsor Castle. The Knights present were Prince Albert, the Duke of Cambridge, the Duke of Rutland, the Duke of Wellington, the Marquis of Anglesey, the Marquis of Exeter, the Duke of Richmond, the Duke of Buccleuch, the Duke of Buckingham, the Duke of Beaufort, the Duke of Cleveland, and the Marquis of Salisbury. The officers of the Order present were :—The Prelate, Bishop of Winchester; the Chancellor, Bishop of Oxford; the Registrar, Dean of Windsor; Sir C. Young, Garter King of Arms; and Sir A. W. Clifford, Gentleman Usher of the Black Rod. After the usual ceremonies had been gone through, H.R.H. Ernest II., reigning Duke of Saxe Coburg and Gotha; Earl de Grey, the Marquis of Abercorn, Earl Talbot, and the Earl of Powis, were elected Knights of the Garter.

Death of the Earl of Limerick.—His lordship died on Saturday evening, at his seat, South Hill-park, near Bracknell, Berkshire. The deceased nobleman was born on the 8th January, 1758, consequently had nearly completed his 87th year. He succeeded to the barony of Glentworth on the demise of his father in 1794, was elected a representative peer for Ireland by the act of union, created Earl and Viscount Limerick in 1803, and inrolled amongst the peers of the United Kingdom by the title of Baron Foxford, in 1815; married Alice Mary, only daughter and heiress of Henry Ormsby, Esq., of Cloghan, county of Mayo. His lordship is succeeded in his titles and estates by his grandson, the Hon. William Tennison Pery, now Earl of Limerick, who is at present in Australia.

Parliamentary Movements.—In consequence of the death of Lieut.-Colonel Sir J. H. Seale, Bart., the representation of Dartmouth has become vacant. Two candidates are now in the field, Mr. Joseph Soames, the extensive ship-owner, on the Conservative side, and Mr. Moffatt, a London tea-merchant, on the liberal interest.—The death of Mr. Otway Cave has created a vacancy in the representation of Tipperary, and it is said that the Repeal party intend to bring forward the Hon. G. Hely Hutchinson as a candidate.—It is supposed that Lord Rosse will succeed the Earl of Limerick as one of the Irish representative peers.

Diplomatic Changes.—A Ministerial paper states that Sir Henry Pottinger is shortly to replace Sir Stratford Canning as British Minister at Constantinople.

Foreign.

FRANCE.—The "adjudication" of the long-talked-of loan of 200,000,000 francs took place on Monday at the "Ministère des Finances." The only bidders were Messrs. de Rothschild and Saint-Didier and Bandon, the representatives of the Receivers-General of the taxes of France, Messrs. Hottinguer and Co., Messrs. Durand, and Messrs. Baring. The price tendered by the first-named company was 84f. 75c., and the latter 83f. 95c. The loan was, therefore, awarded to Messrs. de Rothschild and the Receivers-General.—The Paris journals discuss two letters published in *L'Afrique*, which go to show that the French Government will be obliged to make another warlike demonstration against Morocco, to compel the fulfilment of the late treaty in respect of Abd-el-Kader, whose continued vicinity to Algeria began to cause uneasiness, real or affected, to the French authorities. Private letters state, that the French Government had ordered prompt and decisive measures to insure the full execution of the late treaty between France and Morocco, and that "the constant intercourse by messengers, at least, between M. Guizot and Marshal Soult, remarked by the journals, was entirely occasioned by the last accounts from Algeria.—A file of the *Océanie Française*, a newspaper established at Tahiti, by the Governor, Captain Bruat, has been received at Paris, and the contents are duly noticed by the Opposition prints, preparatory to the approaching session, in which the occurrences at the Society Islands promise to give rise to much angry discussion. The file extends from the 5th of May to the 6th of June. The number of the 12th of May gives a long account of the proceedings of Lieutenant Hunt, of the Basilisk, during the interviews between the Chiefs and Queen Pomare, and asserts that the details are all authentic. They are however of little interest, being chiefly confined to alleged acts of misconduct on the part of Lieut. Hunt, and especially to his remissness in not taking notice of the birth-day of Queen Victoria on the 24th May, while the French batteries commemorated the occasion by the usual complimentary salutes. The *Débats* quotes a letter from Tahiti, stating that the Chiefs of Wallis's Islands and of the Island of Fontana are henceforward under the protectorate of France; this step, which was applied for several months back, being consented to by the French Government. The Governor of Tahiti has, in consequence, despatched a vessel to these islands to notify that they were to be occupied; and the protectorate of the Gambier Islands has also been announced.

The *Débats* publishes a long article on the Charitable Bequests Bill, passed during the last session of the British Parliament, which, it says, "may be considered as a first step towards an understanding between the Catholic clergy and the British Government. The greatest and the most serious difficulty of the situation of Ireland has always been the condition of her national church. The Catholic clergy seeing a hostile Church prosperous, and enriched with her spoils, whilst they were depending for the means of existence on the voluntary contributions of a people as poor as themselves, were compelled to remain at the mercy of the popular passion, and in natural and permanent hostility with the Protestant Government. Mr. Pitt, with his provident genius, well understood that the union between the two countries would never be secure so long as the Catholic clergy remained outside the pale of civil society. For that reason he proposed, together with the emancipation of the Catholics, an annual stipend for the Catholic clergy. His plans failed in consequence of the obstinate intolerance of the sovereign. At a subsequent period a compromise had nearly been effected. The Government offered, the Catholic bishops publicly accepted, and the Court of Rome consented to a stipend. But since then a change has been caused in public opinion by the agitation of the Repeal of the Union, and last year the Bishops again declared officially that they were resolved not to accept any salary from the State. It became necessary, therefore, to find some means which, without placing the clergy under the influence of the Government, would nevertheless, in the course of time, render them independent. But the existing laws rendered the reconstitution of the Catholic church property impossible, because they would not permit donations in perpetuity to be made for its benefit. It was to remedy this state of things that the Ministers presented, during the last session, the Charitable Bequests Bill, the effect of which was to re-establish the right of the Catholic clergy to property acquired by mortmain. The Catholic clergy would commit a great fault if they refused the conciliatory offers made to them. They are offered more than the clergy of France, or even of Belgium possess, inasmuch as their civil quality is admitted, and as they are privileged to enjoy property acquired by mortmain. It is their independence that they should now endeavour to acquire, and if they obstinately refused every arrangement they would give the Government and the Protestant people of England the right to say Ireland wishes not for peace."

The *Débats* contains a long and angry article on the election of Mr. Polk as President of the United States, a result which it believes has been produced by fraud, and by the votes of some thousands of Irishmen, whose rights of citizenship are at least questionable. It proceeds to examine what will be the effect of the election, and after considering the divided opinions of people in America, and especially of those who supported Mr. Polk on the two great questions which at present divide public opinion—namely, the revision of the tariff of 1842, and the incorporation of Texas, it gives its opinion that, from the division amongst Mr. Polk's own supporters upon these questions, nothing will probably be done, and that the probability is that things will remain pretty much as they are. "This time," it says, "the question was more clearly than ever a struggle between the north and the south—between the free and the slave States, which have opposite interests. Of all the characteristics of this election, this is perhaps the most annoying. In fine, this election, by the very choice which it has made, appears not a fit one to resolve the difficulties in which the States have been placed for the last eight years. For such a result, a firm and able hand like Mr. Clay's would have been necessary. It has brought forward in relief the tendencies which may become dangerous to the repose of the States, and even for the maintenance of the Union. As to the great questions of the Custom-house Tariff and Texas, there appears little probability of their being soon settled. But the election of Mr. Polk having opened the field to many intrigues, and having set public affairs adrift, to be acted upon by accidental causes, and passing unexpected influences, it is impossible to foretell with any certainty what may occur in America during the next four years, in regard to the conduct of public affairs."—The vast number of robberies and assassinations which have recently taken

place in Paris—some of them even in the most public streets and boulevards, have drawn public attention at length to the inefficient state of the police of that capital. A trial which has recently taken place has brought to light the existence of a gang of regularly organised assassins and robbers, who have existed for eight years, and who have been carrying on their nefarious trade without being discovered by the police. Fifteen have now been convicted and sentenced to different degrees of punishment, which will relieve society of their presence for a good many years; but this result has been obtained, not by the exertions and intelligence of the police, but by a quarrel among themselves, which induced one of them to give a clue to the authorities of the practices and haunts of his companions. This is the fourth gang of the same kind that has been discovered within the last few months, and, curiously enough, the police had not the merit of bringing one of them to justice. In every case one of the rogues (generally the greatest) turned King's evidence, and betrayed his companions. Such a state of affairs is by no means creditable to the Government, and as regards the public it has created the greatest alarm.—The *Sémaphore de Marseille*, of the 6th instant, announces the arrival in that city, on the preceding evening, of the Prince de Joinville and the Duke and Duchess d'Aumale. The Princes were received on landing by the Mayor and municipal body, and conducted to the triumphal arch, where all the civil and military authorities had assembled, and were admitted to present their homage to the august party. The whole city was illuminated. A deputation of the young ladies of Marseilles waited on the Duchess immediately after her arrival at the Hotel d'Orient, to welcome her to France; and at 10 o'clock at night the Princes repaired to the theatre, where they were enthusiastically received. The King and royal family left St. Cloud on Monday, and took up their residence for the winter at the Tuileries. The official prints mention that the French Court have gone into mourning for six days, for the Princess Sophia Matilda.—The weather continued to increase in severity in Paris. It was believed that, should the temperature continue to fall for three days more, the Seine would be frozen over. It at present is floating down a large quantity of ice, and towards the Pont Royal a compact body is beginning to form. Skating has been going on for several days on the basins in the Tuileries, but in consequence of the facility afforded by the railroads, it is considered fashionable to proceed to Versailles to enjoy that exercise. The continuance of the frost has permitted several sledges to make their appearance in the Champs Elysées and on the Boulevards. They are handsomely fitted up, and the horses covered with leopard's skins, and their heads richly adorned with plumes present a curious appearance. The intensity of the cold is severely complained of in the northern provinces. The frost arrived so suddenly, that a quantity of beet-root which had not been housed is completely destroyed, and is only fit to be thrown amongst the farmers' manure. Navigation is completely suspended, and a number of families, which were employed on the canals and rivers, are deprived of the means of support. The *Courrier Français* publishes the following extract from a letter, dated Macon, 6th inst.:—"The winter has commenced with intense severity, and at an unusually early period. During three days the frost has been so severe that the Saone is frozen over and the steam-boats have been compelled to suspend their courses." The Havre journals state, that in consequence of the severe cold, the length of time for sentinels to remain under arms has been reduced to one hour. On the nights of Saturday and Sunday last the thermometer marked 10½ degrees centigrade at Havre.

SPAIN.—We have accounts from Madrid to the 6th inst. In the Chamber of Deputies the debate on the reform of the Constitution was brought to a close on the 4th. The clause as to the Queen's marriage, while it appears to yield to the general feeling in Spain that none of the members of the family of Don Carlos should become the husband of the Queen, is so drawn up as to hold out hopes to both parties. The Queen is forbidden to marry any person who is excluded from the succession to the throne, but by the new Reform Bill the family of Don Carlos is not in that position, for the 54th article states that—"The persons who shall be incompetent to govern, or who shall have incurred the loss of their right to the throne, shall be excluded from it by a law; so that, in fact, it will require a further act of the Legislature to exclude Don Carlos and his family. In the debate of the 1st, an amendment was carried for the suppression of the clause of the Constitution which prevents the Queen from quitting the kingdom without the consent of the Cortes; and on the 2d, the paragraph respecting the Regency, whereby the Sovereign's nearest relation is to be Regent during his minority, was carried by a large majority. The bill was introduced in the Senate on the 5th inst.—The mother of General Prim had arrived at Madrid, and solicited an audience from Her Majesty, which she had not, however, yet obtained. Her object was to demand that her son, whose health was seriously impaired, should be transported to Havannah, or Porto Rico, instead of the Marianne Islands. The *Castellano* mentions that the General was taken so ill at La Carolina, where he arrived on the 28th ult., that he was unable to proceed on his journey. General Pedro Ramirez passed through Cordova on the 26th, on his way to Cadiz, whence he was to be transported to the Canary Islands.—Another son of General Zurbano has been executed at Logrono, with his companions. This event is announced in the official *Gazette*, which publishes a despatch from the Captain-General of Burgos, notifying the executions of Feliciano, second son of General Zurbano, Jose Baltanos, his secretary, and Francisco Hervias, an inhabitant of Escaray. The despatch affirms that they had not voluntarily surrendered, but that they had been captured by the Queen's troops. Ten more of Zurbano's followers, who had surrendered, have been condemned to between six and ten years of the Presidios. It is to the disclosures made by Zurbano's sons that the *Castellano* ascribes the apprehension of M. Gamboa, General Iturbe, the advocate Oyneley, and of a number of other persons, who have been conducted to Logrono. The Opposition print, *El Eco*, quotes a letter from that town, according to which Zurbano's country house has been levelled to the ground, the furniture burnt, and the cattle killed. 200 persons were seized at Saragossa on the 26th ult., 80 of whom have been thrown into prison. A council of war has been instituted for the prompt trial of the insurgents of Hecho and Anso. Colonel Ostega, General Prim's Aide-de-Camp, left Madrid on the 3d, under an escort for Cadiz, whence he is to be transported for two years to the Havannah. The journals also mention the arrest of M. Gamboa at St. Sebastian, and that General Castanada was about to be seized at Terre-la-Vega, when he was apprised of the approach of the Queen's troops, and succeeded in escaping. Colonel Rengifo and other officers had just been brought before the Madrid Council of War for a conspiracy, and Colonel Infant had him arrested at Algesiras on the charge of having plotted in favour of Espartero. Navarro, a renowned leader of a band of smugglers, was executed on the 28th at Lucerna. The Marquis de Casa-Irujo, the new Ambassador at our Court, left for Paris on the 2d, on his way to London.

GERMANY.—Letters from Berlin state that to the four or five plans of colonisation hitherto proposed—Texas, the Mississippi, St. Thomas, Brazil, and the Mosquito shore—another is now added, situated on the west coast of Africa, which causes much attention, because the Elector of Brandenburg has acquired possession of a spot on that coast. This is Cape Mount, half way between Sierra Leone and the North American negro colony, Liberia, bounded on the south and east by Little Cape Mount, and on the north-west by the river Sugari. This spot was formally ceded, on the 23d February, 1841, to the present proprietors, Geo. Clavering Redman and Theodore Canot, under the protection and assistance of the British naval force, in order to abolish the slave trade, by means of a lawful commerce. The owners have already erected dwelling-houses and other buildings, and built two ships. Mr. Redman is now in Berlin, and is endeavouring to gain friends for the establishment of a colony. He particularly invites attention to the ample revenue of the rich soil, and of commerce, and likewise to the gold mines, which might be worked to advantage, no mining operations ever having been carried on in that country.—A remonstrance and petition of the members of the sixth General Synod, held at Anspach, for the purpose of demanding the redress of several wrongs complained of by Protestants, have been presented to the King of Bavaria. The petitioners complain that the Royal Commissioners appointed to preside over the General Synod, following the instructions that had been given them, and which prescribed that no petition should be deliberated upon that they had not themselves first approved, had retained 63 petitions, in which their griefs were particularised. After arguing the grounds of their right to deliberate and petition, they proceed to say, "If, then, they have the right of deliberating upon the internal affairs of their Church, and of submitting, through the intermediation of a superior consistory, the result of their deliberations to His Majesty, for the purpose of receiving His Majesty's decision, it is impossible that the two Royal Commissioners can have the right of retaining petitions addressed to the General Synod concerning the internal affairs of the Church, for it would amount to an authority to annul and annihilate the constitutional right belonging to the General Synod."—In spite of every measure of precaution taken by the government, the epidemic amongst animals which is raging in many parts of Germany, has broken out in a village on the Bavarian frontier, called Viechtach, and a sanatory cordon has been established round it.—The *Gazette of Konigsberg* publishes a proclamation, addressed to the students of the university of that city, urging them to abolish the practice of duelling, as had done the students of Heidelberg, and to establish courts of honour for the settlement of their quarrels. Similar steps towards this object had previously been taken on the occasion of the commemoration of the foundation of the university, but without success. Konigsberg is one of the cities of Germany where duels are frequent.

ITALY.—Letters from Rome of the 24th ult., state that Government have now under their serious consideration the introduction of railroads in the Roman States. A project has also been laid before them by a company of French capitalists to light the streets of Rome with gas. Some sensation has been caused by the intelligence received from Ancona, regarding a murderous attack, made in the open streets of that city, on Mr. Roux, Intendant-General of the Duke of Leuchtenberg's estates in the Roman territory. M. Roux has received five severe wounds, and lies dangerously ill, although hopes are entertained of his recovery. The season at Rome bids fair to be very gay, from the influx of visitors already arrived, consisting of many families of distinction, from England, Russia, and Germany. The hunting stud of the Earl of Chesterfield has also arrived, but an unfortunate accident which had caused the death of Mr. Bertie, while on a hunting excursion in the Campagna, has thrown a gloom over the sports of the field.

SWITZERLAND.—Letters from Berne of the 6th inst. state, that the Council of State had received intelligence of a revolt at Willisa, and had instantly given orders to three battalions of infantry, three companies of carabineers, two of artillery, and a squadron of cavalry, to march to the frontier of the canton of Lucerne. It was inferred, from the adoption of this measure, that the Government of Berne intended to support the opposition to the Jesuitical party at Lucerne, and avenge itself for the moral defeat which it had experienced in May last, during the anti-Radical reaction in the Valais. On the 6th the troops had already commenced their march. An insurrection, however, took place in the Canton of Lucerne, on the 4th inst., but the insurgents were defeated in their attempt to obtain possession of four pieces of cannon, guarded by the troops of the Canton. Private letters express fears that a general rising of all the Protestant Cantons against the Jesuits was imminent.

RUSSIA.—An imperial ukase decrees a loan of 12 millions of silver roubles to be applied to the construction of the railway between Moscow and St. Petersburg. The Bank of St. Petersburg is charged to realise this loan. Every inscription will be for 500 silver roubles, and the interest, which is to run from the 1st Aug. last, will be paid every six months at St. Petersburg. The sinking is to begin in 1846, and a special fund of 125,000 silver roubles for the first year, and 300,000 for every following year is to be applied to it.—Russian literature has just lost one of its most distinguished members; the celebrated fabulist Kryloff died on the 20th ult., in his 78th year.

SWEDEN.—We learn from Copenhagen that the King, whilst waiting for the legislative modification of the criminal code, has issued an ordonnance modifying the application of corporal punishment as far as the army is concerned. His Majesty abolishes altogether the punishment of the stick, which was both cruel and brutalising, and substitutes for it a few blows on the back with the flat part of the sword, rather by way of degradation than otherwise, or in certain cases a certain number of stripes with a rod, never to exceed 25.—The frigate Gession returned last week from the Mediterranean, bringing from Rome the remains of the works of Thorwaldsen, the late eminent Danish sculptor, and several other artistical collections. Many masterpieces which belonged to Thorwaldsen, and the existence of which was unknown, have been found, it is said, in a vault beneath his house.

TURKEY.—A Constantinople letter of the 20th, in the *Augsburgh Gazette*, informs us that a serious misunderstanding had taken place between Abdullah Pacha, the Governor of Trebisond, and the English Consul at that place. The Governor, in consequence of some pique against the Consul, had ordered 2000 blows to be inflicted, for some real or supposed offence, upon a young Greek, who was under the Consul's protection; and the victim had already received 800, and was almost dead, when the Consul reached the spot, and insisted on the remission of the remainder of the sentence. The letter adds, that Sir Stratford Canning has ordered an inquiry into the circumstances, and declared that if the Consul's account be substantiated, he will demand not only the dismissal of the Governor, but some signal chastisement.

WEST INDIES.—The Royal Mail steam-packet Avon arrived at Southampton on Thursday, bringing the mails from Tampico to October 26; Havannah, November 10; Demerara, November 3. She has brought on freight, it is believed, the largest amount ever shipped from the eastern ports of Mexico in one bottom, viz., 2,078,739½ dollars, part on account of Mexican dividends; 600⅝ oz. of gold, &c.; 2697 oz. of silver in mass; 99 lb. 4 oz. of platina and plata brita; 108 serons of cochineal, &c. She has also brought 17 passengers, with the crew of the late steamer Actæon, belonging to this Company, which vessel was lost on the 20th October, about nine miles northward of Carthagena. The Actæon was rounding the Punta Canoa, at 8 in the morning, when she struck upon a sunken rock, supposed to be the Negrillo, but which, according to the chart, should have been nearer the land than the ship then was. Immediately she struck, the captain, with the view of lightening her, ordered the boilers to be blown off, but without effect, till about 30 minutes afterwards. A swell of the sea then lifted her off, when it soon became evident that, in spite of every exertion, she could not be kept long afloat. Sail was then made to force her on shore, or into shallow water, but she went down in 6½ fathoms. The captain, officers, and crew, behaved with the most praiseworthy courage. Every one was calm and collected, and the orders of the captain were obeyed with readiness and punctuality. He was the last to leave the ill-fated vessel. All hands were safely got into the boats, and steered for Carthagena, from which they were about 9 miles distant. They landed in safety, and were hospitably received by the Authorities. As soon as danger was apparent, the mails were taken out, and duly placed in one of the boats, in charge of the mail officer. That gentleman, in his anxiety to do his duty, lost the whole of his wardrobe, and other effects. There were three passengers on board at the time of the disaster. It was very fortunate that at the moment of the wreck taking place, the weather was moderate, as an hour previously it had been blowing a gale. The Actæon makes the fourth vessel lost since the establishment of the Royal Mail Steam Company, being a quarter of the number of steam-ships it has afloat. They are the Medina, the Isis, the Solway (in which so many lives were sacrificed), and now

this unfortunate ship completes the number. The Actæon, however, was the smallest of the four, being only 600 tons burden. Her value, exclusive of stores, &c., was about 25,000*l*. She plied between the various islands for the intercolonial mails.—The Jamaica papers come down to Nov. 8. They state that the most important movement in the local Legislature of late had been a proposition to establish an Island Loan Bank. The immigration question was becoming one of less prominence than it had been, but it was rumoured that a motion would be made in the House of Assembly for bringing 5000 coolies to the island. It is stated in the Dominica papers that much alarm exists in Martinique, a revolt of the slaves there being apprehended. Disturbances were still rife in St. Lucia. The death of the Bishop of Olympus (the Rev. Dr. M'Donnell) was rumoured in the island of Trinidad. The Demerara advices come down to the 3d ult. The prevalence of dry weather, which was complained of as an annoyance in the towns, was extremely favourable to the advancement of rural production. From appearances it was judged however that a change was at hand, and that rains too copious for getting in the crops were to be expected. In the meantime the disposition of the negro labourers for work became a subject of anxiety. A degree of apathy or quiescence was observable among them, but it was understood this was only preliminary to a strike for higher wages, when, through the setting in of the rains, their services would be pressingly required to preserve and get in the crops undamaged, a labour of speed and urgency under such circumstances.

Parliament.

HOUSE OF LORDS.

Thursday.—This being the day to which Parliament stood prorogued, both Houses met *pro formâ*.—The Lord Chancellor, the Earl of Haddington, and the Earl of Dalhousie, took their seats as Lords Commissioners in front of the throne, when the LORD CHANCELLOR directed the Deputy Usher of the Black Rod to summon the Commons to hear Her Majesty's Commission read for the further prorogation of Parliament.—Several Officers of the House of Commons appeared at the bar, upon which the Commission was read.—The LORD CHANCELLOR then, in the usual form, declared Her Majesty's Royal will and pleasure that Parliament should be further prorogued to Tuesday, the 4th February next, then to meet for the despatch of business, and the Parliament was prorogued to that day accordingly.

CITY.

Money Market, Friday.—Consols for the account closed at 100¾; Red. Three per Cents., 100½; New Three and a Half per Cents., 103; Bank Stock, 208½; Exchequer Bills, 56 to 58; India Bonds, 73 to 75 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—T. ROSE, Nursling, Hampshire, brick burner—J. T. GIBBENS, Eaton, Buckinghamshire, grocer—J. BRETT, Bury St. Edmunds, Suffolk, currier—J. AYLING, Leeds, cabinet maker—S. BUCKNELL, Hendon, Middlesex, J. MARTIN, [illegible], High-street, St. Leonard, Shoreditch, tallow chandler—C. MARLTONE, Cambridge, milliner—W. S. DRURY, Chester, ironmonger—E. NEEDHAM, jun., Little Houghton, Lancashire, clogger—J. BEALE, Cadoxton, Glamorganshire, grocer—W. S. RENDLE, Penzance, Cornwall, tea dealer—C. SPREZEM, Wynnatt-street, Clerkenwell, and Old street, St. Luke's, victualler—W. ATTWATER, Devonshire street, Queen-square, dyer—R. STOCKERS, Ramsgate, cabinet maker—S. LIBBIS, Stratton St. Mary, Norwich, innkeeper—J. FORSTER, Armley, Leeds, cloth manufacturer—B. and T. R. CROSS, Newcastle-upon-Tyne, cartwrights—G. HARROLD, Birmingham, merchant—A. FRANCIS, Halkin, Flintshire iron founder—H. BENTLEY, Liverpool, commission agent—T. BERESFORD, Lincoln, dealer—S. PERSONS, Manchester, paperhanger.

Metropolis and its Vicinity.

Meeting of the Bishops.—The *Times* of yesterday states that the Archbishop of Canterbury has announced his intention to summon a meeting of the Bench of Bishops, in consequence of the schism which at present agitates the Church of England, in order to deliberate and determine upon the rubrical observances to be enforced throughout the various dioceses of England over which his Grace has jurisdiction. It was originally intended that the meeting of the prelates should be held at Lambeth Palace, in the approaching Ember Week, previous to the ordinations, but the death of the mother of the Bishop of London has caused the postponement of the contemplated meeting. As yet it is therefore undetermined whether the meeting shall take place about the period of the annual convocation of St. Paul's, or early in January. The issuing of the recent pastoral letter of the Bishop of Exeter has caused excitement among the laity, and the *Times* states that it is, therefore, not improbable that an early day will be determined upon by their Lordships, so that the controversies relative to the gown and surplice, and the weekly Offertory, may be finally disposed of. In connexion with the above subject, it states that meetings of the rural deans of the various archdeaconries are now being assembled, and minutes of their proceedings will be forwarded to their respective Bishops, in which will be explicitly stated the manner and form of celebrating Divine service in the different parochial churches, as well as the compliance with the rubric by the clergy in their deanery. It is currently reported, with some degree of authority, says the *Times*, that the Archbishop of Canterbury will propose a conciliatory course to be pursued relative to the observance of the rubric, so that a due regard may be paid to the scruples of the laity relative to innovations in the Church service which may give offence to the congregation. In this measure, it is also said, the Archbishop of York fully concurs.

The Weather and the Parks.—The first snow storm of the season occurred on Sunday night. From an early hour in the morning the thermometer denoted extreme coldness, and between 7 and 8 o'clock the first indications of snow appeared. Within one hour it fell rapidly, and in the outskirts of the metropolis, more particularly at Islington, and the northern districts, the ground was speedily covered, but it soon melted, and had nearly disappeared on Monday night. The ice in the Parks was sufficiently frozen over on Saturday to afford amusement to the skaiters, although by no means in a safe condition. Many thousands, however, ventured on the ice, both on Saturday and Sunday, but several serious accidents ensued. On Sunday afternoon, while about 6000 persons were skaiting in St. James's Park, the ice gave way and 7 or 8 persons were immersed in 11 feet water. The men of the Humane Society succeeded in rescuing them, and had scarcely done so when the ice gave way in another part, precipitating several persons into the water. Nearly a dozen were rescued, but as it was getting dark, it was supposed that some still remained beneath the ice. The drags were therefore employed for two or three days, but without effect, and it is now believed that no lives have been lost.—On Monday some curiosity was excited by large flocks of wild-fowl, which alighted on the banks of the river in Battersea-fields, in the neighbourhood of Fulham, and amongst the osier-beds opposite Wandsworth. The wild-ducks and sea-gulls were also numerous. The weather generally has been unusually severe during the last fortnight, and M. Arago, the French astronomer, appears likely to be correct in his prediction that this winter will be the severest known in Europe for many years. The thermometer on Thursday night marked 21, being one degree lower than it has been this season. The barometer is falling rapidly, and there is a keen squally wind from the east, with every appearance of a fall of snow. The river is covered already with floating ice.

Late hours of Business.—Several meetings have been held during the last month in the metropolis, at which resolutions were unanimously passed strongly condemnatory of the late hour system, and expressing the opinion that were the shortening of hours to become universal, the result would be as favourable to the characters of the employed as to the pecuniary interests of the employers.

The Bank Robbery.—No clue has yet been obtained to the discovery of this robbery, which remains in all respects as much a mystery as ever. A proposition however has been submitted by Mr. Hobler, the solicitor to Messrs. Rogers and Co. for cancelling the whole of the stolen notes. The matter has been submitted to the consideration of the Government through Sir J. Graham, the Home Secretary, and it is said that the suggestion has not only been favourably received, but is very likely to be acted upon. It is also stated that more than one plan of action has been submitted by which to defeat the object of the robbers, who by the early and efficient means already adopted have been prevented from taking a single step since the commission of the robbery. The subject has excited a good deal of attention in the city, as well as with the banking firms of the metropolis in general, for it is felt that if Mr. Hobler's plan were once to be adopted by Government, there would be an end to bank-note robberies at least; and although in some cases it might be attended with inconvenience in individual cases, the public benefit would be so great and general, that no one would complain of its operation. In this particular case it appears that there could be no inconvenience at all, as it is well known, that to the present time not one of the stolen notes has been put in circulation. It has been asked in commercial circles where the matter has been discussed, "How is it that such a plan was never thought of before?"

The Bank of England.—On Wednesday, William Burgess, the Bank clerk, was brought before the Lord Mayor for final examination. The evidence was completed by the production of two gentlemen, who deposed to facts not previously substantiated, and the prisoner was fully committed for trial at the next Sessions of the Central Criminal Court.

Court of Common Council.—A Court was held last week, at which a report was read from the Finance Committee, recommending a grant of 200*l*. to the Rev. J. E. Tyler, in aid of a new church in the parish of St. Giles's-in-the-Fields. Sir P. Laurie opposed the motion, on the ground that in the present state of the Church, the Corporation have no security that the new building would be devoted to the doctrines of the Church of England. Let the Court, he said, follow the precedent set by the Bishop of London at Tottenham, and, like him, adjourn the consideration of this matter for twelve months. Suppose that the minister had a partiality for crosses, candlesticks, and the frivolous innovations which prevailed in some churches, to the offence of all true Protestants, would the Court be ready to vote away its funds in aid of such an object? He hoped not. He trusted that until the Church became again pure and rational—divested of the ceremonials of turning, and bowing, and scraping, this Court would not contribute to it one shilling of its funds. With these views, he moved as an amendment, "That the question be adjourned for twelve months, until the Bishop of London had given his decision upon the application made to him by the parishioners of Tottenham." Mr. Deputy Corney seconded the amendment, and said, that in consequence of the adoption of the Puseyite principles in the Bethnal-green churches, they were only attended by less than half the congregations they were capable of accommodating. The Lord Mayor, after some discussion, stated that the Report could not be received, as there was some technical irregularity. A long and angry dispute arose as to the power of the Lord Mayor to stop discussion by such a decision, in the midst of which the Lord Mayor left the chair. The Council, however, appointed another chairman, and resolved that the Lord Mayor's conduct was subversive of the rights of free discussion, and interfered with the privileges of the Court. On Thursday another Council was held, at which the question of the grant towards the new church in St. Giles's was resumed. Several gentlemen addressed the meeting, dwelling strongly on the fact that in the present state of the Church, the Corporation had no security against the introduction of Puseyite doctrines, and Sir Peter Laurie's amendment, that the consideration of the grant be deferred for 12 months, was carried by an overwhelming majority, only five hands, in a meeting of 150 members, being held up against it. It was also resolved, by a majority of 30 to 26, that the freedom of the city, with a silver cup of 100 guineas value, be presented to Sir R. Sale for his services in India; and it was resolved, by a majority of 36 to 27, that a similar compliment be paid to Sir W. Nott. The opposition was not to the conferring the freedom of the city on these officers, but to the presentation of the silver cups, as involving a grant of money for military services.

The Emperor of Russia and the Poles.—In consequence of petitions presented to the Emperor of Russia, during his stay in this country, 12 Polish refugees obtained permission to return to the kingdom of Poland, on condition that they would submit themselves to a legal trial for their past conduct. To these conditions, communicated to them by the Russian Consul-General, they voluntarily agreed, and received a passport and free passage to the Continent. Three of these individuals, viz., Franz Wolanski, Michel Pietraszewski, and Vincent Macianowski, even before they reached the frontiers of Poland, expressed their intention to come to London, shaved off half the hair of their head, pretending that they had escaped from a convoy transporting them to Siberia. Michel Pietraszewski has already left Cracow for this purpose. The authorities have given notice of this fact, in order to prevent the British public from being imposed upon by these individuals, should they carry out their purpose of deceiving benevolent persons in this country by their false statements.

Meeting of the Medical Profession.—On Saturday evening a very numerous meeting of the medical profession was convened by requisitions at the Freemasons'-square Rooms, signed by upwards of sixty general practitioners resident in Westminster and Marylebone, with a view to the adoption of some measure for the protection of the interests of the profession, and also to co-operate with the Apothecaries' Society in resisting the measure recently introduced by Sir J. Graham. The room was filled with gentlemen holding the highest rank in their profession. Mr. Pennington, of Portman-square, was called to the chair, and resolutions concerning the Bill were unanimously adopted.

The Syro-Egyptian Society.—The first meeting of this Society was held last week at their rooms in Mortimer-street, Cavendish square. Dr. Lee took the chair, and briefly referred to the objects of the Society. It was founded, he said, to bring together those who had travelled in, and directed their attention to the antiquities of Egypt, Nubia, Abyssinia, Arabia, Palestine, Syria, Mesopotamia, and Asia Minor. He referred to Dr. Young as one who had done valuable service in tracing the antiquities of those countries, though he had not visited them; complimented the lady travellers, many of whom had given interesting and valuable information as the result of their travels; and pointed out the advantages not only in a philosophic, but even in a commercial point of view, from rendering the history of these countries more familiar to the people. To illustrate the latter remark, he observed that Herodotus, Pliny, and Strabo alluded to the canal communication now so strenuously insisted on by the French. The Secretary, Dr. Yates, next delivered an inaugural address, in which he gave a popular sketch of the history of these countries, their religion, monuments, hieroglyphics, &c.

The Soap Duties.—The minutes of a general meeting of the London and Country Soap Association, held on the 28th ult., have been printed and circulated. The resolutions passed at this meeting [illegible] the manufacture of 50,000 tons of soap per annum, were to the effect that excise on the article of soap was the chief cause of its remaining in so stationary and unsatisfactory a state, as it occasioned an increase in the cost of making amounting to 8 or 10 per cent., and prevented the introduction of improvements. At the same time, according to these resolutions, the duty is most difficult to collect on an article so readily manufactured, and only stimulates to illicit manufacture, and therefore in the opinion of the meeting, the tax ought to be repealed.

Election of Chief Rabbi.—The election of a successor to the late Dr. Herschel, Chief Rabbi of the London Jews, took place last week. There were 3 candidates. The election fell on the Rev. Dr. Adler, who had 121 votes. Dr. Hirschfeld obtaining 13, and Dr. Hirsch 2.

Re-opening of St. Peter's Church, Cornhill.—This church, which has been thoroughly repaired, will be re-opened for Divine service on Sunday next, the 15th inst. The carved work of the screen and pulpit is elaborately finished, and the general appearance of the church renders it one of the most attractive of Sir Christopher Wren's productions.

Fire at St. Peter's Church, Bethnal Green.—On Monday morning a fire broke out in one of the Bethnal Green new churches, dedicated to St. Peter, situate in an open space about midway on the south side of the Hackney-road, and but for its early discovery the whole of the edifice would have fallen a sacrifice. By the exertion of the firemen the flames were subdued, although the damage done was very serious; for, in addition to the injury to the side pews and gallery, the fire made its way through the roof. The building is insured.

Dinner to Sir H. Pottinger.—On Wednesday a public dinner was given to Sir Henry Pottinger by the merchants of London, in Merchant Tailors'-hall, which had

been granted by the Company for the occasion. Previous to the dinner, an address, signed by upwards of 70 of the principal merchants of the city of London, was presented to Sir H. Pottinger in the ante-room, by Sir G. Larpent, Mr. Abel Smith, and most of the gentlemen who had subscribed their names. At the dinner, Mr. Abel Smith, M.P., presided, supported by several members of the present and late ministries, by the leading city authorities, and by a large number of noblemen and gentlemen. "The health of Sir Henry Pottinger" was, of course, the toast of the evening, and was received with enthusiastic cheering. In reply,—

Sir H. POTTINGER said that, "Having lived long in India, they would perhaps allow him to apply to his present position the Indian saying, that 'there is no rose without a thorn.' The rose in his case was the testimony of their approbation and kindness; the thorn was his inability to express the fullness of gratitude he entertained towards them. He must ask them to remember how he had lived the greater part of his life. For forty years he had been absent from his native country, and though he had often attended public assemblies, everything he had seen was so totally different to what he then beheld, that he was almost bewildered at what he saw; therefore they must make due allowance if he did not express himself as the occasion required. There were one or two points that he desired to notice in reference to the proceedings in China. In the first place, he wished to mention with gratitude and approbation the extraordinary ability and science, and combination of good qualities, in the naval and military departments, which had far exceeded his most sanguine expectations, though he was prepared to expect that British valour and skill would do all that could be accomplished. At Nankin the troops had surmounted the most extraordinary difficulties, and had done what was considered by the Chinese to be utterly impossible. With respect to the opening of the trade with China, he believed the treaty included everything that was favourable to England and to other nations. After the time that had elapsed since the ratification, he was still of opinion that, in all the main features of the treaty, no amendment could be made. Everything had been so arranged as to be mutually beneficial to the Chinese and English. An erroneous impression had gone abroad as to the value of Hong-Kong, compared with other islands that we might have claimed. Among these the island of Chusan was named, but taking into consideration the population, and other circumstances, he was still of opinion that Hong Kong was the more suitable for the purposes of a British settlement. He begged to repeat his grateful thanks for the honour they had conferred on him, and he trusted they would make allowances for the imperfect manner in which he had expressed his feelings. He felt they were met there to do honour to him, that he was 'the observed of all observers,' and he could only say he trusted they would believe him sincere when he thanked them from the bottom of his heart." Sir W. Parker returned thanks for the navy, and Gen. Shadd for the military employed in China. Lord Aberdeen returned thanks for Her Majesty's Ministers, and congratulated himself on the circumstance that that great meeting possessed nothing of a political character. There were assembled men of all parties, united with the object to do honour to one who had well deserved of their common country. He might venture on this occasion also to rejoice that he met there some of those with whom, though differing on many points, he cordially concurred on this. He congratulated his Noble Friend (Lord Palmerston) who preceded him in office, for having been the means of obtaining for this country the eminent services of Sir Henry Pottinger. Although his Lordship had not been so fortunate as to receive those communications of success which had come to him (Lord Aberdeen), he must have watched the whole course of Sir Henry's conduct with lively interest. He had been for three years in correspondence with Sir H. Pottinger, and he believed that in that time no man ever arrived from China without bringing fresh reason to be deeply sensible of his merit and of his just claims to the gratitude of his country. It might be readily imagined that, in a country like China, so different in all respects from this, and even from any of which we have knowledge, that, with every desire of the Government to assume authority and to give assistance, yet much, very much, must depend on the management of the person on the spot appointed to administer their instructions. He believed, from the experience he had had, that there never was a man on whom the Government and country could more safely place confidence than on Sir Henry Pottinger. When difficulties arose, as they often did, unforeseen and unexpected, by his ability, firmness, perseverance, and energy, he was able to meet and overcome them. His Lordship concluded, amidst loud cheering, by again expressing the gratification he felt in bearing testimony in that meeting to the transcendent ability of Sir Henry Pottinger.—The Chairman then proposed "The Health of Lord Palmerston, as the Minister who had planned the expedition to China."—Lord Palmerston said nothing could be more interesting than to see the chief men of a great metropolis like this assembled to render just honour to the merits of a fellow-citizen who had conferred essential benefits on his country. Expressions of public gratitude were not only among the best rewards a man received when returning from foreign service, but they were among the most powerful incitements to the performance of duty. It was a source of satisfaction to him, as well as to his Noble Friend, that there was nothing of a political character in this meeting. His Noble Friend had congratulated him and his former colleagues on having chosen so able a servant of the public. Sir H. Pottinger had been appointed in consequence of the distinguished services he had previously performed, and though it had been his (Lord Palmerston's) duty to propose the individual, he had not had the pleasure and advantage of a personal acquaintance with him. He had been selected in consequence of the high character he then bore, and events had shown that he had not only sustained his former reputation, but had, if possible, increased it. Lord Palmerston, in conclusion, complimented the naval and military forces in China, and praised the hearty co operation of the native with the British troops; and expressed his satisfaction at the honourable, liberal, and generous terms of the treaty concluded with the Chinese. The other toasts that were proposed were the East India Company, the health of the Chairman, the Governor of the Bank of England, and the East India and China Association.

The Offertory at St. George's, Hanover-square.—The *Times* of Thursday contained an announcement that on Sunday last the Bishop of London preached a sermon at St. George's, on behalf of the Visiting Association of that parish, and advocated the claims of the charity with his usual earnestness and eloquence, when, to the surprise of the congregation, it was found, on leaving the church, that no collection was made. It stated that the Bishop's intimation that the collection should be made from pew to pew while the Offertory service was read from the communion-table, was in opposition to the practice which had invariably been followed in that church; and, as the churchwardens did not feel justified in departing from the custom sanctioned by the congregation, the consequence was, that no collection was made, and the charity did not receive the slightest pecuniary advantage from his Lordship's advocacy. It appears however, from a contradiction published in the same journal yesterday, that the bishop merely reminded the congregation of the importance of assisting the district Visiting Society, and that it was not intended to make any collection on that occasion.

Anti-Corn-Law-League.—On Wednesday the League held an extraordinary meeting in Covent Garden Theatre, on account of the number of farmers who are now in town to attend the Cattle-show. Mr. Wilson took the chair, and the meeting was addressed on the usual topics by the Hon. C. P. Villiers, Mr. Cobden, and Mr. Bright.

The Westminster Play.—The first of the usual Christmas plays, which had been postponed from Monday on account of the death of the Princess Sophia, was performed on Wednesday night by the Queen's scholars of Westminster School. The comedy selected this year is the *Eunuchus* of Terence, which was received with great applause by a very numerous audience. The play was repeated on Thursday with the same success.

Metropolitan Association for Improving the Dwellings of the Industrious Classes.—A public meeting was held on Wednesday at Exeter-hall, for the purpose of passing certain resolutions connected with the sanitary condition of the dwellings of the industrious poor. The meeting was, considering the inclement state of the weather, numerously attended. The Marquis of Normanby presided and opened the proceedings in a speech of great length, pointing out the necessity of some earnest efforts to improve the social condition of the poorer classes. Sir R. Inglis moved, and Mr. Hawes seconded, the first resolution, "That the neglect of the precautions which are necessary to secure the health of towns, such as sewerage, drainage, a due supply of water to the interior of dwelling-houses, and an effectual system of cleansing, is the cause of sickness, suffering, and a high rate of mortality to all classes, and that it more especially increases the destitution, and leads to the physical and moral deterioration and the degradation of the people." The Right Hon. R. L. Shiel, after expressing his gratification at seeing Sir R. Inglis present, and co-operating with them in a cause which united men of all parties, moved the second resolution, "That although private voluntary exertion may do much to lessen some of the evils arising from the want of sanitary precautions, yet there are others and by far the most important, which can be remedied only by legislative interference." This resolution was seconded by the Rev. W. W. Champneys. Sir W. Clay moved and Mr. Grainger seconded the third resolution, "That every improvement in the sanitary condition of a locality, is uniformly attended with a diminution of parochial expense, and that the adoption of effectual and general remedial measures will be less costly than the continuance of the destitution, sickness, premature death, widowhood, and orphanage occasioned by this neglect." The Hon. W. Cooper moved and Mr. Slaney seconded a resolution for the formation of a permanent Association to carry out the objects of the meeting; and Dr. Southwood Smith read a petition founded on the resolutions, which it was proposed to present to Parliament. Lord Shelburne supported the petition, which was put and carried, together with a resolution that the Marquis of Normanby be requested to present the same to the House of Lords, and Lord Ashley to the House of Commons. A subscription was then opened, and a committee appointed to carry the resolutions into effect.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Dec. 7; West Districts, 138; Northern, 164; Central, 187; Eastern, 216; Southern, 283; Total, 988. Weekly average for the last five years, 946.

Provincial News.

Badminton.—On Saturday last, while the Marquis of Worcester was out hunting, and galloping across a field near Petty France, in the vicinity of Badminton, an accident occurred which threatened the most serious if not fatal, consequences. The fore feet of his horse hitched in a cart-rut, and the animal fell forward, and turned a complete somerset with the Marquis under him. Notwithstanding the violence of the fall, his Lordship escaped with but slight injury.

Bedford.—The local papers state that since the recent sale at the Auction Mart, the Marquis of Bute has disposed of his Luton Hoo estate to a gentleman of the name of Wall. The consideration money is stated to have been 130,000*l.*

Brecon.—On Friday a poor man, who gains a living by selling butter and other provisions in Cardigan and Carmarthenshire, was murdered by a man who had taken a passage in one of his carts from this place to Lampeter. The son of the murdered man was with his father, but the murderer advised him to get into the front cart, and let him cover him with straw. The lad soon fell asleep, and the stranger then shot the father in the head with a pistol, and robbed him of all his money, amounting to about 70*l.* A man named Thomas of Llansowel has been apprehended, and having been identified by the lad, has been committed for trial on the charge of wilful murder.

Bristol.—The Great Britain left Cumberland basin on Wednesday, and will remain at King-road for a short time, whence she will make a few experimental trips; after which she will proceed to the Thames. The passage through the locks was attended with great difficulty, and was not accomplished until some of the masonry had been removed.

Cambridge.—On Friday evening this town and University were alarmed by a cry of fire from the Pitt Press, the University printing-office. Prompt means, however, having been resorted to, the fire was got under before much damage had been done. The accident was caused by some boards having been placed on the top of the chimney to prevent it smoking, and the collected soot became ignited.

Carmarthen.—During the last week the health of Sir William Nott has not been so satisfactory as during the preceding week. The sudden change in the weather seems to have tried the General, and his medical attendants appear not to be sanguine as to his perfect recovery. The Bishop of St. David's has visited Sir William frequently at his residence at Carmarthen.

Croydon.—On Saturday a meeting of the agriculturists of Surrey was held in this town, for the purpose of taking the malt-tax into consideration, and of adopting measures to obtain its repeal. Several gentlemen addressed the meeting, and resolutions were passed to the effect—1. "That the malt-tax in its operation was unjust in principle and oppressive, as pressing most heavily on the labouring classes, who were in consequence prevented from obtaining that beverage which was most requisite for their wants;" and 2. "That the malt-tax having been submitted to for a very long period after the termination of the war, when it was understood it would cease, the meeting were of opinion, seeing that taxes upon property to the amount of 16 millions had been abolished, and that a moiety of the duty on foreign wines had been taken off, that the time was come when this tax upon the comforts and necessities of the people should at once cease." A committee was also appointed to carry out the objects of the meeting.

Deal.—Mr. Bush, the civil engineer, who about two years ago sunk a caisson on the Goodwin Sands, with the view of constructing a lighthouse, to be called "The Light for all Nations," has at length established in his caisson upwards of 20 feet of the iron shaft, or column, on the summit of which the lighthouse will be placed. It is now above high-water mark, and it is expected to be finished and ready to be illuminated by the 1st January. This shaft penetrates through the various iron chambers of the caisson, and is firmly sustained in its perpendicular position by two iron blocks of great strength. It is also further secured by iron stays, or braces, bolted to the outer part of the caisson, and attached to the top as well as centre of the column. The new light will have an elevation of 33 feet above high-water mark, and the lighthouse will be approached by a light iron spiral stair, which winds round the exterior of the column, and is an octagon of about 10 feet in diameter, surmounted by a plate-glass lantern. The colour of the light is to be a pale blue, which will distinguish it from any other in the locality of the Goodwin. It appears that the caisson, which is 30 feet in diameter, has remained undisturbed in the position in which it was sunk, when the untoward accident occurred of the American bark being driven against it, shortly after Mr. Bush had partially fixed it, which completely frustrated his original plan of making the superstructure of solid masonry. The caisson is, however, to be filled up with blocks of stone and concrete; and the Naval Authorities of Deal have reported to the Admiralty that they expect main land will be formed, the caisson forming a nucleus for accomplishing this desirable object.

Exeter.—The changes introduced by the Bishop in the performance of the Church Service appear to have produced great excitement in all parts of this diocese. On Sunday last the first infringement on the popular feeling took place in St. Sidwell's church, where the ceremony of christening was performed in the midst of the Service. In every one of the parish churches the sermon was preached in a surplice instead of a gown, and several of the congregation were so offended at this innovation, that they quitted the church the moment they saw the Minister so attired, enter the pulpit. It is said that the churching of women will be in future performed in the midst of the Sunday morning's service, and a very strong feeling exists among the laity as to the impropriety of such a custom. One of the canon residentiaries, Dr. Bull, has published "A Letter on the Rubrics and the Canons," in opposition to the views taken of them by the bishop; and the lay members of the church are not backward in expressing their opinions. On the 6th inst. the parish of St. Leonard, in this city, had a public meeting, in which it expressed its deep sense of the great inexpediency of introducing into the Exeter churches any of those innovations which had been introduced elsewhere, and of the serious injury which they were calculated to inflict upon the Church "in her highest and best interests, by alienating the veneration of the laity, and by driving from her communion many of her most attached and conscientious members." On the preceding day the parish of St. Lawrence also met for the purpose of entering its protest against the doctrines contained in the Bishop's pastoral letter. The resolutions which it passed disapprove of the use of the surplice as "a precursor of many dangerous innovations," and condemn the revival of the Offertory, declaring that they will not contribute to any forced collection, and trusting that the churchwardens will "firmly decline to join in, and as far as they can, prevent its re-establishment." They conclude by stating—"That a large majority of the parishioners having, through all the years, circumstances, and inducements of Dissent, steadily adhered to the Established Church, no language can convey their unfeigned sorrow and deep regret on perceiving the Bishop of this diocese seeking to reintroduce into the services of that Church forms and ceremonies obnoxious to the laity, which, if carried out and increased on, can only lead to priestcraft and superstition in their worst forms, as well as be the means of

driving the well-thinking portion of the congregation to other places of worship than those to which they have been for many years accustomed." The united parishes of St. John, and St. George, have since unanimously adopted resolutions to the same effect, and a public meeting of the inhabitants will shortly be convened.

Hertford.—An inquiry has taken place before the magistrates in this town respecting an incendiary fire at Bardolph's farm, Watton, belonging to Mr. Abel Smith, M.P. The fire broke out in the straw shed, and destroyed farm buildings to the value of 1500*l.*, and crops to the value of 1200*l.* A man, called Wade, a labourer in the employ of Mr. Kimpton, the occupier of the farm, was apprehended on suspicion, and on Friday was committed to take his trial at the next assizes.—On Monday night, a fire broke out on the Parsonage farm at King's Walden, near Stevenage, occupied by Mr. G. Roberts, an eminent agriculturist, and a member of the committee of the Herts Agricultural Society. The damage done is estimated at 2000*l.*, but the property is insured. Incendiary fires have also occurred this week at Mr. Betto's farm at Lilly Hoo, and at a farm on the Bedford-road, about a mile from Hitchin.

Hurst.—On Friday a meeting of the householders of this parish took place at the Church-house. The meeting was convened by Mr. Leveson Gower, in consequence of having received a communication from the perpetual curate, the Rev. Mr. Cameron, announcing the course it was his intention to pursue in future, in reference to the changes he had lately introduced into the Church service, which have created a universal feeling of dissatisfaction among the parishioners. This meeting took place in consequence of the matter in dispute having been referred to the Bishop, whose decision it was understood would be final in the case. Mr. Gower was called to the chair, and read a long letter from Mr. Cameron, giving the substance of his communication to the Bishop of Oxford, in which he proposed to abandon the weekly offertory for the present, but to retain the practice of reading the prayer for the Church Militant, and concluding the service at the altar with a prayer after the sermon. Mr. Cameron also proposed to erect alms-boxes at the entrance to the church, in order to afford those persons who supported the offertory an opportunity of contributing their alms without offending the rest of the congregation. The Bishop's letter was also read, in which his Lordship "fully coincides" in Mr. Cameron's views, "under the present state of things." A series of resolutions were then proposed by Mr. Walter, proprietor of the *Times*, three of which were carried, rejecting the compromise contained in the Bishop's letter, stating that Mr. Cameron had disingenuously represented the case, and calling upon the Bishop to interfere and settle the disputes now pending in the parish. Another resolution was afterwards proposed, requesting the chairman to write to the Bishop, to appoint some person to inquire into the feeling of the parish upon the subject, in order that he might thereby be enabled to judge of the true nature of the matter in dispute. This latter resolution seems to have been adopted from the circumstance that Mr. Cameron did not represent the opinions of the churchwardens in his letter to the Bishop, as he might have done.

Leicester.—A man named John Wall, of Oadby, framework-knitter, has been apprehended on the charge of attempting to kill his mother, father, and brother, by administering arsenic to them, in order, it is supposed, to obtain possession of 300*l.*, to which himself, his brother, and sister were entitled on the death of their mother. Rumours were afloat in the meantime that he had been concerned in another attempt of the same character, by which he sought to rid himself of the expense of maintaining an illegitimate child of his wife's, by the same means, and it was ascertained on inquiry that a few weeks prior to the attempt on the life of his father, mother, and brother, the child had been taken suddenly ill, under suspicious circumstances. An examination has taken place before the magistrates, but the evidence being incomplete on both charges, the prisoner has been remanded for further inquiry.

Liverpool.—A splendid new steam-ship, called the Cambria, arrived at this port from the Clyde on Thursday, and will take her place in the British and North American mail line, running between Liverpool and Boston, on the 4th January next. The Cambria is built on the same model as the Hibernia, the swiftest vessel of the line.—The local papers state that Mr. Wooley, the Bristol merchant who figured so ridiculously at Union Hall some time since, after having been hoaxed into a marriage with Mary Ann Morgan, by the contrivances of a Miss Bryers, is now living at Liverpool with the latter personage. They state that they arrived in this town about six months since, purchased the good-will of a public-house, and that Mr. Wooley, from being a Bristol merchant, has become a publican.

Manchester.—The local papers mention that Sir H. de la Beche and Mr. Thomas Cubitt, the engineer, have been appointed, under a royal commission, to conduct a scientific inquiry into the causes of the late disastrous fall of a mill at Oldham, and also into those of the fall of a gaol near Oxford; and to ascertain and make generally known facts and laws with respect to materials used in building, especially cast-iron beams and cast-iron pillars. These gentlemen visited Manchester last week, and after making various inquiries, proceeded to Birmingham.

Portsmouth.—Orders have been received from the Commander-in-Chief, addressed to the Lieutenant-Governor of this garrison, Sir H. Pakenham, to inspect the defences of this garrison, and of the entire coast, and to report to Government the expense of putting them into a complete state of repair to provide against any emergency. It is said that Sir Hercules has from time to time reported to the Duke of Wellington the state of decay into which the fortifications of this important fortress have been suffered to fall, and it is consequent upon those reports that the present commission is instituted. It is also said to be the intention of Government to remount the walls with guns as of old; the stone and earth-work will be strengthened, the moats and drawbridges rendered serviceable, the forts on either side the harbour and approaches repaired and strengthened, and the towns of Portsmouth, Portsea, and Gosport, put into a state of efficient defence. The round tower on the right, and Blockhouse fort on the left side of the entrance to the harbour, the Sallyport and other gates of entrance will also be properly fortified, and Southsea Castle will once more assume its impregnable appearance.

Plymouth.—The experimental brig squadron, comprising the Firebrand, steam-frigate, 8, Captain Corry, commanding the squadron; Daring, 12, Commander Matson; Osprey, 12, Commander Patten; Mutine, 12, Commander Crawford; Espiègle, 12, Commander Thompson; Flying Fish, 12, Commander Harris; Waterwitch, 8, Commander T. Francis Birch; Cruiser, 16, Commander Fanshawe; and Pantaloon, 8, Commander Wilson, arrived in the Sound on Friday, and in the order above written. The sailing qualities of the vessels forming this squadron is one of deep interest, especially to professional men; but until the official details are published, the exact result of the late experiments cannot be known. It is said, however, that the Daring, constructed by the celebrated yacht builder, at Cowes, Mr. White, with the wind before the beam, had a decided superiority over all the others, and that even the Flying Fish, the production of the Surveyor of the Navy, has been outdone. With the wind abaft the beam, the Daring has not any particular advantage, being frequently inferior to the Espiègle, constructed by the Naval School, the Mutine, constructed by Mr. Fincham, and the Surveyor's Flying Fish. It is also said that the contention for the next place, with the wind before the beam, was between the Espiègle, Waterwitch, and Flying Fish.

Windsor.—One hundred and eighty pairs of blankets, the gift of the Queen, will be distributed among that number of poor families of Windsor, at Christmas. A liberal supply of meat, bread, and plum-pudding will also be given away to the poor of the town, at the same time, by command of Her Majesty and Prince Albert.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2055*l.*; Bristol and Gloucester, 1006*l.*; Eastern Counties, 3634*l.*; Edinburgh and Glasgow, 2063*l.*; Great Western, 13,281*l.*; Grand Junction, 6963*l.*; Glasgow, Paisley, and Ayr, 1472*l.*; Great North of England, 1557*l.*; London and Birmingham, 13,693*l.*; South Western, 5021*l.*; Blackwall, 708*l.*; Greenwich, 819*l.*; Brighton, 3896*l.*; Croydon, 366*l.*; Liverpool and Manchester, 4316*l.*; Manchester, Leeds, and Hull associated, 6385*l.*; Midland, 8640*l.*; Manchester and Birmingham, 2975*l.*; Newcastle and Carlisle, 1668*l.*; Newcastle and Darlington, 1031*l.*; Preston and Wyre, 307*l.*; South-Eastern and Dover, 4035*l.*; Sheffield and Manchester, 678*l.*; Yarmouth and Norwich, 175; York and North Midland, with Leeds and Selby, 2259*l.*—Such have been the exertions made during the recess of Parliament to extend the system of railways in the United Kingdom, that no less a number than 220 notices and plans of new railways were, on the 30th ult., deposited at the offices of the Board of Trade. The preparations necessary were so great, that the engineers, solicitors, surveyors, lithographers, and engravers connected with these schemes have been for the last fortnight wholly employed in getting ready and furnishing the proper forms to comply with the requirements of the legislature.—A meeting of the South-Western Company was held on Saturday, to receive a report, detailing the various projects contemplated by the directors. These projects are as follow:—1. A branch from the Nine Elms terminus to the vicinity of Hungerford and Waterloo bridges and the Thames, and from Wimbledon to Epsom. 2. From Weybridge to Staines and Windsor. 3. From Woking-common, by Guildford, Godalming, and Chichester, to Portsmouth and Fareham, including the purchase of the Guildford Junction Railway. 4. From Hook Pit Farm, on the main line to Mottisfont on the Salisbury branch, and from Salisbury to Sherborne, and Yeovil to Dorchester and Weymouth. 5. From Basingstoke to the Great Western Railway at Didcot and Swindon: and also to amend and enlarge certain powers of the company under their existing Acts of Parliament. The report stated, that the necessary surveys, notices, and deposits have been made and given according to the standing orders of Parliament with respect to all these lines, except that from Weybridge to Windsor. With respect to the Hungerford and Waterloo Bridge Extension, the report stated that the directors had made arrangements with the parties who originally contemplated the continuation of this line in connection with a railway to Richmond, the effect of which is that the South Western Company will construct the line from Nine Elms to Waterloo and Hungerford Bridges, and the branch to Richmond will be undertaken by a separate company, and join the South Western at Wandsworth. The directors had resigned their contemplated junction of the London and Brighton line at Croydon with their own railway at Wandsworth, in favour of the Brighton Company. The directors again intend to renew their application to Parliament for a branch to Epsom, feeling confident that it can be worked cheaper than any other, is shorter, has better gradients, and will be connected with the best London terminus. The lines from Weybridge to Windsor the directors have been obliged to postpone for the present year. This project is designed mainly with the view of completing the communication between Chertsey and London, and of affording to Staines, Egham, Windsor, and their neighbourhood, the most direct communication with the southern coast, either by the present mail line to Southampton and the west, or by the projected line from Guildford through Winchester to Portsmouth, the Isle of Wight, Brighton, &c. The directors some weeks ago purchased the Guildford branch, granted last session, the confirmation of which they now asked. After alluding to the various "direct Portsmouth" lines now before the public, the directors went on to state that they had joined in the promotion of a line commencing at Woking, adopting the Guildford branch, and passing through Godalming, and near Midhurst and Petworth to Chichester, from which city to Portsmouth and Fareham the line will be the same as already sanctioned by the company. A company has been formed for the execution of this work, and the capital has been subscribed under the guarantee of the South Western to work and lease the line in perpetuity, at such a rent as will give the shareholders 4 per cent. on their subscriptions, and an equal interest in the surplus profits. By the proposed Hook Pit branch, on the main line between Andover-road station and Winchester, to join the Salisbury branch at Mottisfont, the distance between London and Salisbury will be shortened nearly eight miles. They further reported that they had caused surveys to be made of a line from the Salisbury branch to Dorchester, Weymouth, and Poole; and on the necessary capital for the line they propose to guarantee in perpetuity a return of 4 per cent., and a moiety of the surplus earnings. From Salisbury, also, they have caused a line to be surveyed to Sherborne and Yeovil, which will provide for all the northern parts of Dorsetshire, considerable portions of South Wilts and East Somerset, and give all these districts their shortest road to London and the east, including the readiest communication with the ports of Southampton and Portsmouth. With respect to the lines from Basingstoke to Newbury and the Great Western, the directors had failed in an attempt to bring about an arrangement with the Great Western Company, and they, therefore, felt that they had no alternative but to undertake the schemes themselves, recommending that the capital should be provided by the Company. The report was received, and resolutions empowering the directors to raise the necessary capital were adopted. A resolution was also carried to the effect that the Cornwall and Devon Central scheme would be of material advantage to the South Western Company, and that the directors should be authorised to give such support to it as they should deem expedient.—On Monday the line connecting Coventry, Kenilworth, Leamington, and Warwick, by the London and Birmingham Railway, with London, was opened to the public. The line is about 9 miles long, and 120 miles from the metropolis. It has been constructed under the superintendence of Mr. Robert Stephenson, and is a single line, has cost about 170,000*l.*, and has taken about 18 months to construct. The directors of the London and Birmingham made an experimental trip over it on Monday week, accompanied by General Pasley, the Government inspector, who expressed his satisfaction with the works. On Tuesday the line was opened for traffic, at moderate fares, and the event celebrated by a public dinner at Leamington.—Another of the sufferers by the recent collision on the Midland line of railway expired on Tuesday morning. His name is Bolesbridge, and he was the landlord of the Three Horse-shoes inn, Nottingham. The injuries he received at the moment of the accident were comparatively trivial, and up to Sunday last hopes were entertained of his complete restoration. On that day, however, unfavourable symptoms became apparent, and he died, after lingering in great agony about 30 hours. The borough coroner has issued summonses for an inquisition on the body. The imminent danger of another sufferer by the collision, Mr. Roberts, of Leicester, a commercial traveller, may be judged of by the fact, that a quart of brandy has been administered to him every day since the accident, to prevent death from exhaustion. It will be recollected that this sufferer underwent an amputation of the leg and other severe operations. The other sufferers are progressing favourably. The trial of Mr. Lightfoot, for manslaughter, is expected to commence this day (Saturday), before Mr. Justice Patteson.—About 1 o'clock on Wednesday morning, a serious accident occurred on the South Eastern Railway. The part which leads from the Bricklayers' Arms to the main railway from London-bridge to Newcross is constructed on wooden piers, of the nature of a viaduct. A heavy luggage train was passing over this part of the road, when an explosion took place, and the engine was thrown completely down from the road, by which the engineer was killed, and the stoker so severely injured that the injuries will probably be fatal. The extent of the mischief, however, and its cause, owing to the darkness of the night, could not be correctly ascertained, but in the course of the day it was found by Gen. Pasley and others that the boiler had burst, owing to some defect in the copper, and that the violence of the explosion had forced it and the tender over the viaduct. The destruction of property was considerable, and had the train been one devoted to the transit of passengers instead of luggage, the result would probably have been most disastrous.

IRELAND.

Dublin.—The Charitable Bequests Act is likely to cause considerable embarrassment to Government. Mr. O'Connell has spoken at great length against it at several meetings which have been held in Dublin, and Archbishop M'Hale has issued a lengthy address to his clergy denouncing it in the most unqualified terms. In consequence of this opposition, it is said that Dr. Kennedy, Roman Catholic Bishop of Killaloe, has resigned the office of commissioner under the Act, and it is said that the other Catholic bishops will follow his example. Government have appointed Dr. Henry, of Armagh, the Presbyterian commissioner.—Mr. Grey Porter has published his long-promised pamphlet on Federalism, in which he advocates many of Mr. O'Connell's favourite schemes, proposes the formation of a national militia, and suggests that all measures relating to Ireland should be submitted to the Irish members before they be brought into the Imperial Parliament.—The weekly meeting of the Repeal Association took place on Monday. Mr. Grattan, M.P., was in the chair, and addressed the meeting for nearly an hour, on a variety of topics, beginning with that of the State Trials and their consequences: He made particular reference to an address which he said had been signed by 1,600 persons, and presented to Her Majesty, praying for inquiry on the subject. To that address no favourable answer had been returned—an observation which the hon. gentleman commented on in very strong language, and in a very vehement manner. The English, he said, must turn out the Tories, or be content to lose Ireland: for, in the words of Mr. Burke, they had violated the law and produced anarchy. Yes; thirteen of the best judges of the land, and three of the law lords, had declared that they had violated the law by the state prosecutions; and yet up started the Prime Minister in his place in the House of Commons, and announced that he was ready to vindicate his atrocity. He Mr. Grattan came forward, therefore, to join in demanding inquiry into the late state prosecutions against O'Connell and his fellow martyrs, in order to prevent that anarchy which was sure to follow in any country subject to such acts of gross injustice as the present Tory Ministers were inflicting on Ireland. As another proof that Ireland was treated as a conquered country, the hon. gentleman alluded to the Charitable Bequests Act, which he denounced as a covert plan to separate the Catholic clergy from the Catholic laity of the country, similar to that against which Mr. Burke had deemed it necessary to guard the people in 1795. In the Church to which he belonged there was already a schism. It was divided into Wesleyans, and Baptists, and Independents, and Calvinists, and Trinitarians, and Presbyterians, and Puseyites. He apprehended that the Protestant Church would be overthrown in these countries, and therefore warned the people of Ireland against sanctioning any measure or any proceeding which would have the effect of introducing a schism into their long-treasured and much-abused Church. Her Majesty's ministers, not satisfied with the political mischief which they were doing in Ireland, now sought to discord the country in religious dissension and strife; but he hoped the people would disappoint them.

The minutes of the last proceedings having been read—

Mr. O'CONNELL briefly addressed the meeting on the subject of the registry in the city of Dublin, congratulating the Repealers on their continued and increasing majority over the Conservatives. His next topic related to the disturbances which existed in certain parts of Ireland. He was the decided enemy of those outrages, and in his opinion no palliation could be offered for them. He was deeply grieved to state that in the counties of Cavan and Leitrim Whiteboy disturbances had lately taken place to a most formidable extent. It was quite manifest to him that the infatuated wretches concerned in those outrages were misled in their zeal by designing knaves, who, he had no doubt, were the latter enemies of Ireland. Nothing but the continuance of such atrocities could retard Repeal; and their source was the more manifest, as a better feeling had lately sprung up amongst all classes in the county of Cavan than had existed during the last half century. The Catholic clergy and the Repeal Wardens had remonstrated in vain against those proceedings, and the Association should therefore take some decided step. He accordingly moved the suspension of the standing order, for the purpose of proposing that Mr. Steele, head pacificator of Ireland, be sent down to Cavan to use his best exertions to put an end to these disturbances, and, if necessary, to bring the offenders to justice.

The motion having been carried, and some routine business transacted—

Mr. O'Connell rose to address the meeting, and commenced by offering an excuse for not reporting as he had promised on the 10 propositions relating to the Union, which he had laid before them at the last meeting. His excuse was that the committee met only in the evening, and he had been too busy every evening since to attend. He promised that he would bring all his attention to this subject immediately on his return from Waterford, and their report would be preceded by a distinct enunciation of the axiom that their struggle was founded on moral means alone—on total absence from tumult, outrage, or the shedding of a drop of blood in effecting their object. He had demonstrated in the carrying of emancipation that moral force was sufficient; and much as he valued national independence he would abandon his attempt to attain it, sooner than consent to sanction a crime. During their struggle for emancipation they encountered obstacles, and of course in their present struggles they had to meet obstacles too. They had a large portion of the English and the Scotch, and the Irish, and the French press, opposed to them, and amusing and misrepresenting himself. The French press had begun the quarrel, and he answered by accusing Louis-Philippe of being a tyrant and usurper, not on account of any deficiency in his title to the throne, which rested on the will of the people, but because he had violated the conditions annexed to his accession. He had guaranteed perfect freedom of the press, freedom of trial by jury, and freedom of education; and he had violated all these solemn engagements. The hon. gent. then went to complain of what he termed the misrepresentation of the English press. The *Morning Advertiser* accused him of inconsistency, and stated that he had given up Repeal for Federalism: but he asked any impartial man to read his letter of October 4, and say he had given up one iota of the Repeal. Dr. Maunsell, in his recent pamphlet, admitted that: *Tait's Magazine* also admitted it; and one of his bitterest enemies, the *Examiner*, took the same view of the expressions used by him in that letter. The *Irish Chronicle* had come out upon him with charges of inconsistency, mixed up with a good deal of calumny, but he was far too old a bird to be caught with chaff. Once for all, he declared that he treated these imputations of inconsistency with the utmost contempt. He had been a thousand times accused of it in his struggle for emancipation, whenever he found it necessary to alter or modify his plans—in fact, whenever he found it necessary to go round the rock instead of attempting to go through it. He then read an article in the *Examiner*, accusing him of being regardless of the truth, and advancing several proofs in support of the accusation; asking him, for instance, whether, when he told the people of Ireland they would have Repeal in six months, he believed his own words? whether there was a Liberal of whom he had not given two characters? and whether he ever asked himself if there was any truth in such character at the moment he was giving it? The first question he denied. When going to prison he asked the people to promise to keep the peace for six months. They kept their promise, and he would keep his promise that they should get the Repeal. The second question he admitted. He had often given two characters of the same man, of Lord Stanley and Lord J. Russell, for instance; but why, or under what circumstances? In this way—that when they did good he praised them, and when they attempted to do mischief he had not hesitated to denounce their conduct. And yet this was made the ground of an atrocious and insolent calumny against him by a writer in the *Examiner*, a miscreant who, while he (Mr. O'Connell) had been labouring for his country, was grovelling in a garret. He had brought his country under the notice of the whole civilized world—he had made known her wants, her sufferings, her fidelity, her religious perseverance, and all those high qualities which distinguished her people; and was this the recompense he was to receive from a nameless scoundrel scribbler in London? He had already replied to him in the severest language, and what other could he have used towards a base calumniator of that kind? He had called him a miscreant, a cowardly, and a foul liar. He repeated those epithets, for they were surely the ones, unless, indeed, the language could supply him with harsher, in which case he would adopt that, those terms were too mild. Oh, the writer of that article was a base, a brutal, and, he knew, a bribed wretch, for associating him in that way. He did not care whether he was bribed or not. If he were a rascal for nothing, he only proved himself the greater scoundrel. He proclaimed every word of his accusation to be false and unfounded. The next publication which Mr. O'Connell referred to was the second pamphlet of Mr. Grey Porter, several passages of which he read, and moved that they be inserted on the minutes as worthy of the deepest consideration of all, and in particular of the British Minister and the British people, and as tending to show that Ireland, Catholic Ireland, was too strong and too determined to be any longer a pitiful province. He objected at the publication of this Protestant pamphlet, but observed, in reference to some passages of rather a physical force character, that the Association would mitigate and modify the over-zealous of their Protestant fellow-patriots—such patriots as Mr. Grey Porter and their worthy chairman, Henry Grattan. The plan which Mr. Porter offered, of requiring every Bill brought in to the British Parliament for Ireland to be submitted to the Irish members, was not very practicable, but they owed him the deepest gratitude for his advice; and would feel pleasure in adopting it, so far as consistent with their principles.

After some routine business, the rent for the week was announced to be 333*l.* 3*s.* 3*d.*

The Provinces.—The accounts from several of the provinces are filled with lamentable details of the disorganised state of the country. In King's County last week, two young men, named Shepherd, were murdered in a cruel manner by a party of men, who surrounded and took them by surprise while working on a farm belonging to the Rev. Ralph Coote.—On Tuesday week, as Mr. Samuel M'Kerin was sitting in his parlour praying, near the road leading from Branchfield to Sligo, he was shot by some assassin through his window, and so near was the murderer to his victim, that the shot carried away a portion of his head, and stretched him lifeless on the instant. Mr. M'Kerin was a Protestant, an inoffensive, respectable, industrious farmer; had not taken land, or in any way disobliged his neighbours. On the same night an attempt was made to assassinate Mr. Patrick Curren, a substantial farmer, who lives on the road from Clara to Moate, at a place called Gurteen. The back wall of his house abuts on the edge of the road. Through a small window in this wall a shot was fired by some person standing on the road.. He was rising from a seat before his fire, when one ball passed through his right shoulder, and several slugs wounded him about the arm and breast, but not severely. It is thought he had been covered, but the act of rising suddenly saved his life. On the same day, a man named Shea was murdered by his own son, at Kilvemnon, near Callan, who fractured his skull with a stone, and afterwards with a spade, and killed him on the spot.

SCOTLAND.

Edinburgh.—We have on former occasions noticed certain disputes in the Scottish Episcopal Church, in which clergymen who have received ordination in England have gone to Scotland and set the Bishops at defiance on matters of essential discipline, because of their English ordination. Some time ago the Bishop of Aberdeen found it necessary to excommunicate the Rev. Sir W. Dunbar; and a recent case of schismatical proceeding at St. Jude's, Glasgow, induced the Bishop of that city to address the Bishop of London on the subject. His lordship in reply says:—"My opinion as to the obligation which binds an English clergyman, desirous of officiating in Scotland, to seek for authority to do so at the hands of the Bishop within whose diocese he is to officiate, and to pay him canonical obedience, has long been made known in that country. I retain my opinion unchanged. As to the jurisdiction which, it appears, some persons suppose me to possess, as Bishop of London, over English clergymen residing in Scotland, I absolutely disclaim it. Were I to pretend to any such jurisdiction, I should be intruding into a province which does not belong to me; and any attempt to exercise it would be productive of schism and confusion. If I possessed any authority over Mr. Miles or Sir William Dunbar, I should exert it for the purpose of inducing them to return to the spiritual allegiance which they owe, while in Scotland, to the fathers of the Church in that country. The duty of paying that allegiance I urged very strongly upon Sir W. Dunbar, when he quitted the diocese of London to take charge of a congregation in Aberdeen. The refusal of it must lead to disorder, and to a weakening of the Church, at a time when all her energies are needed to resist the assaults of those who are equally hostile to the Scotch and English branches of Christ's Holy Catholic Church, as possessing the apostolical inheritance of episcopacy."

Glasgow.—We understand that the directors of the East India Association of this city have agreed to an address to Sir Henry Pottinger, and that two of their number, who are deputed to present the same, are also charged to invite Sir Henry to a public dinner. The proposal appears to be most favourably received, and gives promise of a large and most respectable meeting.

Aberdeen.—The Harbour Commissioners having invited Mr. Smith, of Deanston, to visit Aberdeen, for the purpose of asking his opinion as to the best mode of rendering the sewerage of the city available for the purposes of agriculture, a number of gentlemen in the town and vicinity resolved to embrace the opportunity of testifying their respect for Mr. Smith, and their high estimation of the valuable services he had rendered to the interests of agriculture, by inviting him to a public dinner. The chair was filled by Captain Barclay, of Ury, one of the most spirited agriculturists of the country, who was supported by Mr. Smith, Dr. Fleming, of King's College; the Lord Provost, Rev. Mr. Wilson, North Church; Mr. Kilgour, Bethelnie; Mr. Patrick Pirie, Colonel Lindsay, &c. Mr. Boswell, of Kingcausie, and Mr. Forbes, of Blackford, officiated as croupiers.

Theatricals.

DRURY LANE.—Mr. Balfe had his benefit on Saturday evening, when his new opera, "The Daughter of St. Mark," was followed by the ballet of the "Peri." The house was excessively crowded, and the dress-boxes were full of company. Mr. Balfe on his appearance in the orchestra, was received with loud applause. The opera was followed by a very pleasing interlude. The curtain rose and Mr. Bunn appeared, leading forward Mr. Balfe. The manager addressed the audience, and after eulogising Mr. Balfe's character and talents, stated that a public subscription had been entered into for the purpose of presenting the composer with a testimonial, that it had been considered that he should receive it in the presence of the public who had bestowed it, and that he should therefore leave the receiver alone with the givers. On this he retired; and a scene rising discovered tastefully arranged, a superb tea and coffee service of silver plate. Mr. Balfe (on whose entrance the whole audience had risen to greet him), then expressed his gratitude to the subscribers, while the house literally rang with acclamations. The list of subscribers to this testimonial comprises the Duke of Devonshire, the Marquis of Conyngham, the Earl of Westmoreland, Baron Dimsdale, Sir A. Barnard, Sir H. Webb, &c. We may here observe, that so great has been the success of "The Daughter of St. Mark," that Mr. Balfe will realise 1000*l.* by the sale of his copyright.

Miscellaneous.

Miss Martineau on Mesmerism.—A third letter from Miss Martineau appeared in the *Athenæum* of Saturday last. It relates almost exclusively to the account of the young girl, whose extraordinary revelations we noticed last week. During one of her mesmeric sleeps, Miss Martineau says that she has both written and made sketches. She says—"Though usually disdaining to try to read with the eyes shut, &c., she has twice written when desired (complaining, when her eyes were fast shut, and her chair was almost in the dark, that she could not see well, meaning that there was too much light), and once she drew a church and a ship, about as well as she might have done it with open eyes. She drew the ship in separate parts, saying that she would put them together afterwards. In this latter case her eyes were bandaged, as she complained it was so light she could not see; and then she complained that the pencil given her would not mark, and tried to pull out the lead further, not being satisfied till her strokes were distinct. Nothing," says Miss Martineau, "is more obscure in our experiment with J., and, I believe, in most mesmeric cases, than the extent and character of the *rapport*, on which so much depends. One singular evidence of *rapport* between J. and her mesmerist I have witnessed under such unexceptionable circumstances as to be absolutely sure of it. When J. was dancing, and taking this room for a ball-room, she took her mesmerist for her partner, allowed herself to be conducted to a seat, &c., assuming a ball-room air, which was amusing enough in one who has her eyes sealed up, as motionless as if they were never again to open. Being offered refreshment, she chose some mesmerised water, a glass of which was on the table, prepared for me. It seemed to exhilarate her, and she expressed great relish of the 'refreshment.' It struck us that we would try, another evening, whether her mesmerist's will could affect her sense of taste. In her absence, we agreed that the water should be silently willed to be sherry the next night. To make the experiment as clear as possible, the water was first offered to her, and a little of it drank as water. Then the rest was made still in her hands, silently willed to be sherry; and drank it off, —half a tumbler full—declared it very good; and, presently, that it made her tipsy. 'What was it?' 'Wine—white wine.' And she became exceedingly merry and voluble, but refused to rise from her chair, or dance any more, or go down stairs, for she could not walk steady, and should fall and spoil her face, and moreover frighten them all below. I afterwards asked her mesmerist to let it be porter the next night. J. knew nothing of porter, it seems, but called her refreshment 'a nasty sort of beer.' Of late she has ceased to know and tell the time:—'can't see the clock-face,' as she declares. The greatest aptitude at present seems to be for being affected by metals, and for the singular muscular rigidity producible in the mesmeric sleep. When her arms or hands are locked in this rigidity, no force used by any gentleman who has seen the case can separate them; and in her waking state she has certainly no such muscular force as could resist what has been ineffectually used in her sleeping state. The rigid limbs then appear

like logs of wood, which might be broken, but not bent; but a breath from her mesmerist on what is called by some phrenologists the muscular organ, causes the muscles to relax, the fingers to unclose, and the limbs to fall into the attitude of sleep. During these changes, the placid sleeping face seems not to belong to the owner of the distorted and rigid limbs, till these last slide into their natural positions, and restore the apparent harmony. Not less curious is it to see her inextricable gripe of the steel snuffers, or the poker, detached by a silent touch of the steel with gold. When no force can wrench or draw the snuffers from her grasp, a gold pencil-case or a sovereign stealthily made to touch the point of the snuffers, causes the fingers to unclasp, and the hands to fall. We have often put a gold watch into her hands, and when the gripe is firm, her mesmerist winds the gold chain round something of steel. In a minute or less occurs the relaxation of the fingers, and the watch is dropped into the hand held beneath. While grasping these metals she sometimes complains that they have burnt her. I have said nothing of Phrenology in connection with Mesmerism, though it is thought by those who understand both better than I do, that they are hardly separable. I have no other reason for speaking of Mesmerism by itself than that I am not qualified to give any facts or opinions on phrenological phenomena induced by Mesmerism. The only fact I have witnessed (probably because we do not know how to look for evidence) in the course of our experiment was amusing enough, but too isolated to base any statement on. J. appeared one day to be thrown into a paroxysm of order, when that organ was the part mesmerised. She was almost in a frenzy of trouble that she could not make two pocket-handkerchiefs lie flat and measure the same size; and the passion with which she arranged everything that lay awry was such as is certainly never seen in any waking person. This fit of order was curious and striking as far as it went; and this is all I am at present qualified to say."

The Troglodytes.—The Paris *Globe* states, that during the course of lectures on natural history delivered by M. Geoffroy de St. Hilaire at the Jardin des Plantes, the lecturer presented to his auditors several individuals (not living) of the Pithesian race, known by the name of Troglodytes. If we consider the organisation of these beings, their form, their facial angle, the disposition of their eyes, we cannot but be struck by their resemblance with the human face. The Troglodytes, as their name indicates, live, in fact, in caverns in the forests of Nigritia, or in huts covered with leaves. The negroes call them "men of the woods." They are classed by scientific men amongst the monkey tribe. To see them it might be doubted whether they are not negroes reduced to the state of brutes, or whether negroes are not themselves Troglodytes of a superior race.

Local Legislation.—The *Gazette* has lately extended to the extraordinary length of seven sheets, and is almost entirely occupied with "notices" for Railway Bills; among which, some others of greater interest are not unlikely to escape observation. The New Zealand Company are to apply for enlargement and amendment of the powers conferred by their charter, and for the granting to them of "further and other powers, rights, and privileges;" and also "for regulation of the conveying of lands in the Colony to and by the Company." Several Inclosure Bills are mentioned—one for Nottingham. There appear to be projects for erecting a new bridge over the Floating Harbour in Bristol; for enabling the London and Birmingham Company to raise more capital; for the improvement of the harbours of Harwich and Lowestoffe (in connection with railways); for regulating further the Police of Birmingham; for giving small debt courts to Devonshire; for the further improvement of Bridgewater, Newcastle, &c. Among the plans connected with the metropolis may be mentioned that for forming an embankment along the Thames from Vauxhall to Battersea, one for building a suspension-bridge at Hungerford-market, and one to annex so much of the garden, ground, and buildings belonging to the Hon. Society of Lincoln's-inn as are locally situate in the parish of St. Giles-in-the-Fields, to the vill or township of Lincoln's-inn. Also to stop up the present thoroughfare for carriages, horses, and cattle along the eastern side of Lincoln's-inn-Fields, to form a new footway, of the width of 20 feet, adjoining the iron railing inclosing the garden of Lincoln's-inn-Fields on the eastern side, to inclose the remaining portion of the carriage way along the said eastern side of Lincoln's-inn-Fields, and to annex the same to that part of the garden, ground, and buildings belonging to the Society, and to the said vill or township. There is also notice of a bill to improve the streets, squares, &c., in the parishes of St. Margaret, St. John, and St. George, Hanover-square, in the city of Westminster. New streets are also projected from Westminster to Pimlico, abolishing the "Almonries" and other low places in Westminster; and from Lothbury to London-wall, with some colonnades, and other minor improvements. Notice is also given of an intended application for a railway (called the Grosvenor Railway) to commence in the parish of St. George, Hanover-square, at or near the entrance from the Thames to the Grosvenor canal, and then passing over the Thames by a bridge near to the Red-house, Battersea. It is intended that this railway should join the South-Western Railway, and connect it with the Brighton Railway near Godstone stone bridge.

Constitutions in Spain.—In thirty years, Spain has four times changed its constitution. She has had, 1. The Constitution of Bayonne, granted by Joseph Napoleon, July 6, 1808. This constitution was prepared by an assembly of 91 notables, convoked at Bayonne. It was composed of 146 articles.—2. The constitution of 1812, sanctioned at Cadiz, March 19, 1812, by the Constituent Cortes. It was in vigour until May 4, 1814, Ferdinand VIII., on his return to Spain, having refused to accept it. It was re-established on March 7, 1820, until September 29, 1823. It was revived for the third time on August 15, 1836, when it was in some degree modified. It was the most democratic of all those that Spain has had. It was composed of 384 articles, of which a great number were purely matters of form.—3. The *Estatuto Real*, decreed by Queen Christina, April 10, 1834. It was composed of 50 articles, and was in force only to August 14, 1836. And, 4. The Constitution of 1837, voted by the Cortes of July 18, 1837. According to this last constitution, the Cortes are composed of 386 representatives, of whom 241 are deputies and 145 senators, chosen by the queen, out of 345 names submitted to her. Besides the 241 voting deputies, the electors name 134 supplementary ones. The deputies are elected for three years, and the senators for nine.

THE LAY OF THE LABOURER.

[From Hood's Magazine, for November.]

A spade! a rake! a hoe!
A pickaxe, or a bill! [mow,
A hook to reap, or a scythe to
A flail, or what ye will!
And there's a ready hand
To ply the needful tool,
And skill'd enough, by lessons rough
In Labour's rugged school.

To hedge, or dig the ditch,
To lop or fell the tree, [field,
To lay the swath on the sultry
Or plough the stubborn lea,
The harvest stack to bind,
The wheaten rick to thatch:
And never fear in my pouch to find
The tinder or the match.

To a flaming barn or farm
My fancies never roam—
The fire I yearn to kindle and burn
Is on the hearth of home:
Where children huddle and crouch [days,
Through dark long winter
Where starving children huddle and crouch
To see the cheerful rays,
A-glowing on the haggard cheek, [blaze'
And not in the haggard's

To Him who sends a drought
To parch the fields forlorn,
The rain to flood the meadows with mud,
The blight to blast the corn—
To Him I leave to guide
The bolt in its crooked path,
To strike the miser's rick and show [wrath.
The skies blood-red with

A spade! a rake! a hoe!
A pickaxe, or a bill! [mow,
A hook to reap, or a scythe to
A flail, or what ye will!
The corn to thrash, or the hedge to plash,
The market team to drive,
Or mend the fence by the cover-side,
And leave the game alive.

Ay, only give me work,
And then you need not fear
That I shall snare his Worship's hare,
Or kill his Grace's deer—
Break into his Lordship's house,
To steal the plate so rich,
Or leave the yeoman that had a purse
To welter in a ditch.

Wherever Nature needs,
Wherever Labour cans,
No job I'm shirk of the hardest work,
To shun the Workhouse walls;
Where savage laws begrudge
The pauper babe its breath,
And doom a wife to a widow's life
Before her partner's death.

My only claim is this,
With labour stiff and stark,
By lawful turn my living to earn,
Between the light and dark—
My daily bread and nightly bed,
My beer and grog of beer—
But all from the hand that holds the land
And none from the overseer!

No parish money or loaf,
No pauper badges for me,
A son of the soil, by right of toil,
Entitled to my fee.
No alms I ask, give me my task:
Here are the arm, the leg,
The strength, the sinews of a man,
To work, and not to beg.

Still one of Adam's heirs, [birth
Though doomed by chance of
To dress so mean, and to eat the lean
Instead of the fat of the earth;
To make such humble meals
As honest labour can,
A bone and a crust, with grace to God,
And little thanks to man!

A spade! a rake! a hoe!
A pickaxe, or a bill!
A hook to reap, or a scythe to mow,
A flail, or what ye will!
Whatever the tool to ply,
Here is a willing grudge,
With muscle and limb—and woe to him [grudge!
Who does their pay, be-

Who every weekly score
Docks labour's little mite,
Bestows on the poor at the temple-door,
But robb'd them over-night.
The very shilling he hoped to save,
As health and morals fail,
Shall visit me in the New Bastile,
The Spital or the Gaol!

Indian Surveys.—A survey to the westward of the Arabian coast, under Commander Sanders, and another of the Malabar coast, under Lieut. Montriou, are directed. Dr. Cantor will accompany the former as naturalist. The allowances formerly granted to officers on survey, as some compensation for their extra fatigue, exposure, and labour, both bodily and intellectual, &c., were—for captains, Rs. 500; for commanders, Rs. 300; second surveyors, or first lieutenants, Rs. 250; for lieutenants and pursers, Rs. 180; the medical officer was allowed, Rs. 180; and midshipmen and clerks, Rs. 60. These, it is in contemplation, to reduce one-third.

A "Fair" Pun.—I remember (says Lord Eldon) I was coming away from the Queen's drawing-room in my full dress as King's Counsel (Lord Clarendon, then Mr. Villiers, was with me), and we came into the room where the milliners were collected to see the fashions. Said I, "Why Villiers, I think that all the prettiest women are here." One of the girls, and a most amazingly beautiful creature she was, stood up, and said to another, "I am sure that gentleman is a 'Judge.'"

Novel Feat.—A Plymouth correspondent furnishes the following aquatic novelty:—"A great deal of curiosity and surprise has been manifested during the past week by those who have witnessed the manner in which one of the officers of the Caledonia flag-ship, now lying in Hamoaze, comes on shore. He descends the ship's side to the water's edge, puts on a macintosh dress, and inflates it with air by means of a small pair of bellows. He then steps into the water, and immersed nearly up to the breast, with two small paddles very rapidly works himself on shore. As soon as he lands he takes off his dress, and throwing it across his arm, it being very light, attends to his duty or his pleasure as it may be. On Monday last he landed twice at the dockyard in the way described; and he now laughs at the idea of taking a boat. During the time the Caledonia was in the Sound, he left the ship in a similar manner, and unattended by a boat, landed at the Admiral's-hard, Stonehouse, a distance of three miles. He carries the bellows with him in case of too rapid an exhaustion of air. It has been told me that during the trial-cruise of the ships in the Channel, he passed by this extraordinary means from one ship to the other. I cannot vouch for this fact, but the truth of the rest may be relied on. Should it be generally adopted, it will be a very amusing trip for half-a-dozen to take round the Eddystone Lighthouse."—*Standard.*

The "Retribution" Steam Frigate.—This noble steam-ship of war is now lying in the basin of the East India Docks at Blackwall, where she has attracted a good deal of attention from nautical and scientific men, and has been visited by many persons capable of estimating her merits. She is a remarkably fine vessel, and a perfect model for ships of her class and build. She is of 1611 tons burden; her length, between perpendiculars, is 220 feet, her extreme breadth 71 feet, the depth of the hold being 23 feet 4 inches. She has not got her masts stepped, nor her armament on board, but her paddles and engine are fixed. The engine has been manufactured at the establishment of Messrs. Maudslay and Field, Lambeth. It is constructed after the patent of those gentlemen, called the patent double cylinder marine steam engine, and is of the collective power of 800 horses. The diameter of the cylinder is 12 feet; the length of the stroke 8 feet, and the number of strokes 15. The diameter of the wheel is 33 feet, the breadth 13 feet, draught of water 7 feet, the length of the engine-room 75 feet. The great saving of space by the introduction of these engines is one of the principal advantages obtained by their use. The Admiralty have adopted them in several steam-ships of war besides the Retribution, and there is one on board the Rattler Archimedean steam-ship.

New Life Boat.—A new life boat, invented by Lieut. Walter, R.N., was submitted a few days since to the authorities of Woolwich Dockyard, by order of the Admiralty. The inventor attended and explained the nature and advantages of the materials of which she was built. It appeared that the keel, gunwales, and alternate ribs, only have been constructed of oak, the planking and stems being of the Kamptulicon, or flexible material composed of cork and India rubber formed into planks by mechanical means. The shape of the boat was greatly admired, and deservedly, as its appearance is very pleasing to the eye. Both ends are alike, in outward form somewhat resembling the boats used in whale fishing, and it is constructed to pull and sail very fast, and to surmount the heaviest seas. Sixty-five men entered the boat after the lugs were unscrewed to let the water in to represent her being filled by a heavy sea, and she still possessed a buoyancy by the aid of air-boxes equal to about 3½ tons, exclusive of the buoyancy of the boat, which only weigh 2½ tons, although 34 feet in length and 12 feet in breadth, and capable of carrying on an emergency 100 persons. The advantage of submitting new inventions to practical men was fully shown during the experiment, Commodore Sir F. Collier having suggested to Lieut. Walter, the propriety or adding pontoon pipes and an iron keel outside to render it impossible to upset the boat under any circumstances, and which the inventor intends to apply before any further experiments are made with her.

Law.

ARCHES COURT.—*Faulkner* v. *Litchfield and Stearn.*—A faculty was in this case granted, with the consent of the churchwardens and the vicar, to repair the church of the Holy Sepulchre of Cambridge. The minister, the Rev. Mr. Faulkner, disapproved of the erection of the stone altar and a credence table in the church. The Consistorial Court of Ely confirmed the acts, and from that decision an appeal was promoted to this court. After hearing Dr. Bayford and Dr. Phillimore, the learned judge having said in the course of the pleadings that he should probably go to Cambridge to see the altar, Sir H. Jenner Fust said that, of course, he could not be expected to give judgment at the present moment. He considered the question for his decision to be, whether the structure which had been erected was or was not a "communion table." He could not say when he could give his opinion, but it would be as soon as possible. He must ask counsel for a list of the authorities they had quoted, and he feared that he must borrow some of the old books they had referred to.

YORK.—*William Potter*, aged 20, a jobbing bricklayer and labourer, was found guilty, on very clear evidence, of having on the 9th Nov. last, at Wistow, in the West Riding, feloniously and maliciously set fire to the dwelling-house of Wm. Nettles: he was also further charged with having on the same day at Wistow set fire to a barn in the occupation of William Dixon. Another man, named Gorton, had in the first instance been charged as an accomplice, and both had been committed by the magistrates. In consequence of an application made, however, to the Court a few days ago, Gorton was admitted approver, and upon his evidence the case for the prosecution mainly depended. The verdict of Guilty having been returned, Mr. Justice Coleridge, in a very solemn address, passed sentence of death, holding out no hope of any remission of the sentence.—*John M'Kann* was charged with the wilful murder of one Benjamin Gott, a musician in a band employed in a procession of the Orange Lodges at Bradford on Whitmonday. Another count in the indictment charged him with manslaughter. This case must be even yet fresh in the recollection of our readers, as it created at the time of its occurrence considerable excitement. Five other persons, named Rogan, O'Brien, Donovan, Quin, and Power, who had been concerned in the matter, were tried at the last assizes, and were convicted of manslaughter; but in consequence of some legal objections being raised to the form of the indictment, judgment was respited, and those persons are still in custody. M'Kann at that period was not apprehended. The evidence was quite clear, and the jury, without hesitation, pronounced the prisoner "Guilty of manslaughter." Sentence was deferred until the opinion of the 15 judges could be had upon the legal objections before referred to.—*John Strachan Maddison*, late Superintendent of the Rural Police, was tried on the charge of having, on the 12th

of June, in the city of York, feloniously embezzled 17*l*., the property of Geo. Swann, Esq. The prisoner, in the discharge of his official duties, appropriated to his own use certain subscriptions to the police force, which he was bound to pay into Mr. Swann's bank, and then absconded to Dundee, where he was found in the situation of Procurator-Fiscal. The defence was, that the prisoner intended to return the money, and had only used it in order to enable him to perform his duties; that he did not leave York until his salary was stopped, and then he was without the means of repaying. The prisoner had an excellent character given him, and the Jury found a verdict of Guilty, with a recommendation to mercy, on account of his previous good character. Sentence deferred.—*Wm. Kendrew* was charged with the wilful murder of Mr. W. Inchbald, the farmer, of Low Dunsforth, on the 28th Sept., and *John Kendrew*, his brother, was charged with feloniously harbouring the other prisoner, knowing him to have been guilty of the murder. The particulars of this case were fully noticed at the time. The evidence was wholly circumstantial, but the Jury had no doubt as to the facts, and returned a verdict of Guilty against the first prisoner, and acquitted the second. Sentence of death was then passed on William Kendrew. The brother was then charged with stealing a gun, supposed to be the one with which the murder was committed. Found Guilty, and sentenced to seven years' transportation.

MIDLAND CIRCUIT, DERBY.—A family of labourers, called *Swan*, were tried for being concerned in the Glossop burglaries, which have caused of late much excitement in this county. They were all found Guilty except two. Three of the brothers were sentenced to be transported for life; the father and mother to be transported for 10 years, and the daughter to imprisonment and hard labour for one year.

ASSIZE INTELLIGENCE, CHESTER.—*Forgery.—John Kenyon Winterbottom* was placed at the bar charged with having had in his possession a certain bill of exchange for 500*l*., and that he had forged to that bill the names of Elizabeth Isherwood, Anna Maria Isherwood, Miriam Isherwood, and Anna Magdalene Isherwood, the executrixes of the late Mr. John Isherwood, of Marple-hall, with intent to defraud them. He was also charged with uttering the said bill, with intent to defraud the trustees of the Pelican Life-office, with intent to defraud John Jackson, and also with intent to defraud Messrs. Robarts, Curtis, and Co., bankers, of London. Each indictment charged him separately with forging the names of the respective endorsers, and also with uttering. The prisoner pleaded not guilty. This case excited a great degree of interest in consequence of the accused having occupied a most respectable station in the county, having twice served the office of mayor of Stockport, and held the situation of clerk to the magistrates of that borough. The prisoner was defended by Mr. Jervis, M.P., and Mr. Welsby, who were brought down from London on special retainers for the purpose, as was also Mr. Bond Hughes, the celebrated shorthand writer, to take *verbatim* notes of the proceedings. The Attorney General for the Palatine, in stating the case to the jury, intreated them to dismiss from their minds all prejudices arising from the discussion of the case out of doors, and to decide the case solely in accordance with the evidence which would be laid before them. He was placed in a most painful position, having known the prisoner all his life, and could not have believed he would be guilty of the offence with which he was charged, as he had always thought him as honourable a man as any in the country. The prisoner had been for many years previous to 1839 an attorney and banker in Stockport, and was the confidential adviser of the late Mr. John Isherwood, of Marple-hall. In the year 1814 Mr. Isherwood effected a policy of insurance on his life for 3000*l*., the prisoner transacting the business for him. When the policy was effected, it was placed by Mr. Isherwood in a box at Marple-hall, where it was supposed to be kept until his death, which took place in May, 1839. After his death the prisoner went to the agent to the Pelican Life-office in Manchester, produced the policy of assurance, having, it was supposed, taken it from the deed-box of Mr. Isherwood, to which he had access when attending his funeral. He informed the agent of the death of Mr. Isherwood, and asked for the requisite certificates to be filled up. There he subsequently produced the certificates, and on the 20th December, 1839, called with them and the probate of the will of the late Mr. Isherwood. The agent proposed to pay the amount of the policy by a bill at seven days' sight, and the prisoner obtained a stamp for that purpose. The bill was then drawn by the agent and handed to the prisoner, he at the same time being told that it must not be indorsed by the parties by procuration, or it would not be paid by the office. On the 3d of January, 1840, the bill was paid by the prisoner into the Stockport Bank, and shortly after that period he received considerable sums from the Bank. When paid into the bank it had the names of the ladies mentioned in the indictments on it; but as he should only proceed on the one charging the prisoner with forging the name of Anna Magdalene Isherwood, now Mrs. Lloyd, he (the Attorney-General) would confine himself to that case. The bill was subsequently transmitted to Messrs. Jones, Loyd and Co. in London, and the acceptance of two of the trustees of the Pelican office. It was paid by Messrs. Roberts and Co. In May, 1840, application was made by Mrs. Lloyd to the prisoner, for the amount of the policy, when he said it was necessary, before the money would be paid by the office, that there should be a Canterbury probate obtained to her father's will, as well as a Chester one. To other applications, he said the money was safe in London, and the office would pay interest for it. However, in August, 1840, it was discovered that the prisoner had received the money, and Mr. Bush was sent down to investigate the matter, and he, finding that the prisoner had absconded, took means to secure his apprehension, and got advertisements issued, offering a reward of 200*l*. for him. He could not be found, however, until the month of September last, when he was accidentally met with by a man of the name of Paine, on the north shore at Liverpool, when he was apprehended. A number of witnesses were then called to prove these facts, after which Mr. Jervis took several objections to the indictment, on the ground that the prisoner was indicted for forging the names of each indorsee separately, whereas the whole indorsement was only one transaction, and the bill was not complete until all the names were signed: that there was a variance in the different counts, the title of the Pelican-office not being correctly described, and that the bill itself was not a negotiable instrument, until accepted; and, therefore, there could be no fraud in uttering it. Mr. Welsby followed on the same side. Baron Gurney said the point was one of too great nicety for him to decide, and he would, therefore, reserve it for the consideration of the judges. Mr. Jervis then addressed the jury on behalf of the prisoner, contending that there was so much doubt in the case that they could not safely convict. It was manifest that the prisoner, being the confidential adviser of the family, considered that he had authority to receive the money, and to endorse the bill, and therefore the utmost extent of his guilt was a breach of trust. He implored them, therefore, under these circumstances, not to consign the prisoner, by their verdict, to slavery, and his wife and children to infamy. The learned Judge briefly summed up the case, and the Jury, after a few moments' consideration, pronounced a verdict of Guilty. His Lordship ordered judgment to be respited. There were three other indictments, charging the prisoner with forging the names of Anna Maria Isherwood, Miriam Isherwood, and Elizabeth Isherwood; and Mr. Jervis said he apprehended the prisoner was entitled, in some way or other, to be discharged from those indictments.—The Judge: Oh, no, certainly not.—Mr. Jervis: Will your Lordship take a note that I made the application?—The Judge: Yes.—Mr. Jervis then applied to the Judge to allow the officer of the court to furnish a copy of the indictment.—The Judge: I have no objection.—*Mary Gallop*, a young woman, aged 20, having the appearance of a servant, was placed at the bar, charged with the wilful murder of her own father, Richard Gallop, at Monk's Coppenhall, on the 2d November, by the administration of arsenic. The particulars of this case were given at the time; it will, therefore, be sufficient to say that the prisoner was found guilty and sentenced to death.—*Edwin James Port*, a quack doctor, aged 49, was placed at the bar on a charge of killing and slaying Mary Harris, at Birkenhead, by the application of white arsenic to her right breast, which produced a sore or ulcer and a mortal sickness, on the 11th October last, of which she died on the 24th of the same month. The evidence proved that the prisoner had advertised himself as possessing a cure for cancer, and had obtained some repute by his alleged cures. The learned Judge, in summing up, observed that if the prisoner had treated deceased without due care, knowledge, and skill, and by that had even hastened her death a single day he was guilty of manslaughter. It was a melancholy thing that persons without education should take upon themselves the administering of dangerous medicines; but if they did so, and death ensued, they must take the consequence. The question the Jury had to try was, whether the prisoner caused or hastened the death of the deceased by the ignorant, careless, or improper administration of medicine. If they were of opinion he had done so he was guilty; if they had any doubt they must acquit him. The Jury retired for about 40 minutes, and then returned a verdict of Not Guilty. Immediately on the verdict being pronounced there was a general burst of cheering from all parts of the Court, which was with difficulty suppressed. The Judge addressing the prisoner said, "Take care of yourself for the future. You may not be so fortunate another time."

CHELMSFORD.—*Sarah Johson*, aged 14, was found guilty of maliciously and feloniously setting fire to a stack of straw, value 40*l*., the property of her master, William Bacon, in the parish of Hempstead, and Mr. Justice Williams sentenced the prisoner to be transported for 15 years.—*Leonard Lambert*, 23, *William Hurrell*, 29, *Elisha Hurrell*, 24, and *William Taylor*, 25, all described as labourers, were indicted for feloniously writing and delivering a letter to James Miles, threatening to burn and destroy his property. Mr. Justice Williams having summed up, the Jury, after deliberating a considerable time, acquitted Elisha Hurrell and Lambert, and returned a verdict of Guilty against the others.

HOME CIRCUIT, MAIDSTONE.—*The Murder at Dover.—James Clark*, 60, *John Clark*, 28, *William Clark*, 30, and *William Smith*, 23, were indicted for the murder of Samuel Conchman, at Charlton, in the borough of Dover. The case occupied the court a great many hours, but the facts upon which the charge was made against the prisoners lay in a very small compass. It appeared from the statement of counsel, and the evidence, that deceased was one of the police-constables of Dover, and was engaged in that capacity at the time he lost his life on the 8th September. It appeared that, on the afternoon of that day, a number of disorderly persons had been quarrelling together, and there was fighting going on for a considerable time, the older prisoner, the other two, who are his sons, and a third son, named Thomas, being actively engaged in the disturbance. Deceased interfered, but was very much abused, and some of the prisoners were heard to make use of very bad language towards the police, and to threaten that some of them should be done for before night. The disturbance continued until eleven o'clock, when deceased, and another constable named Smith, laid hold of the prisoner James Clark and one of his sons, with a view to take them into custody, when Thomas, the other son, interfered, and said that he would take his father, who was at this time very drunk, home, and he did so. The two constables were then pushed about and assaulted, and Thomas Clark was seen to come out of his house with a large bludgeon partly concealed by his side, and without saying a word he raised it, and with both hands struck the deceased a tremendous blow across the face with the stick. The blow literally smashed the deceased's face, and he fell to the ground as though he had been shot, and died almost immediately afterwards. The man, Thomas Clark, who was no doubt the actual cause of the death of the deceased, absconded immediately after the occurrence, and has not since been heard of, and the prisoners were charged as accessories with the murder, from their having been present during the affray, and from the threats they had made use of. In addition to this it was proved against the prisoner Smith that while deceased was lying dead upon the ground, he jumped up with a gesture of exultation and exclaimed, "There, you've got it—you are no good." These facts were shown in evidence, but there was an absence of any distinct proof that the prisoners were actually present when the fatal blow was struck, and the only evidence that tended to show they were aware of the fatal result that had taken place, was the fact that immediately after the death of the deceased one of the prisoners said to the other, "Come along, my dear brother, let us bolt, we have done something to be talked about." Mr. Horne addressed the jury on behalf of the prisoners, and having alluded to the more material portions of the evidence, contended that it was not sufficient to warrant the jury in convicting the prisoners of the serious offence with which they were charged. Mr. Justice Williams summed up, and the jury, after a consultation of nearly two hours, returned a verdict of Not guilty.

BIRTHS.—On the 7th inst., at Farnham, Surrey, the lady of the Rev. H. R. JULIUS, of a daughter—7th inst., at Upper Tooting, Mrs. A. MORTIMER, 23, Burton Crescent, of a daughter—7th inst., in Montague-place, the lady of W. PENNINGTON, Esq., of a daughter—7th inst., at 4, Albion-place, Lonsdale-square, the lady of A. C. BROWNLESS, Esq., of a son—8th inst., at Broughton Rectory, Hants, the lady of the Rev. H. LEE, of a son—8th inst., at Upper Clapton, the lady of E. PARSON, Esq., of a son—9th inst., the lady of H. ADAMS, Esq., of Somers-street, Hyde Park, of a son—9th inst., at Birdhurst, Croydon, the lady of J. W. SUTHERLAND, Esq., of a daughter and son—9th inst., at the Vicarage, Milton Ernest, Beds, the lady of the Rev. C. C. B. POWNALL, of a son—10th inst., at Witham House, Essex, the lady of J. H. PATTISON, Esq., of their fourth son—10th inst., at Warwick-square, Kensington, the lady of H. TUPPER, Esq., of a daughter—10th inst., at Eton College, the lady of the Rev. C. O. GOODFORD, of a daughter, still-born—11th inst., in Park-lane, the lady of W. PRIDEAUX, Esq., of a daughter—11th inst., at Dulwich, the lady of E. RAY, Esq., surgeon, of a son.

MARRIAGES.—On the 28th ult., in the British Embassy, at Florence, E. CRESWELL, Esq., of Gibraltar, to MARY FRASER, second daughter of the late Rev. W. Fraser, rector of North Waltham, Hants—3d inst., at St. Andrew's Church, Plymouth, the Rev. E. GODFREY, son of the Rev. D. R. Godfrey, D.D., to EMILY C. PAYNE, eldest daughter of the late Capt. R. Payne, Deputy Commissary General of the Bombay Army—10th inst., at Rockbeare, F. D. DALY, Lieutenant-Colonel of the 4th (Queen's Own) Light Dragoons, to SARAH A. BIDGOOD, only daughter of H. F. Bidgood, Esq., of Rockbeare-court, Devon—10th inst., at St. John's, Holloway, T. R. DUTTON, only son of T. D. Dutton, Esq., of Althorp Lodge, Garratt, Surrey, to G. S. DUERDIN, daughter of W. Duerdin, Esq., of Tollington Park, Middlesex—11th inst., at St. George's Hanover-square, the COUNT DE JARNAC, eldest son of Viscount de Chabot, K.C.H., and nephew of the Duke of Leinster, Premier Secretary to the French Embassy, to the Hon. GERALDINE A. FOLEY, second daughter of the late, and sister of the present Lord Foley—10th inst., at Langley Marsh, Bucks, B. L. JEMMETT, Esq., M.D., London, of Grenada, in the West Indies, to CATHERINE KINGSLEY, youngest daughter of the late T. Kingsley, Esq., of the Grove, Camberwell—11th inst., at St. Luke's, Chelsea, RICHARD HOUGHTON, son of W. Houghton, Esq., of Longdon, Staffordshire, to PENELOPE M. SCOTT, daughter of J. Scott, Esq., of the Admiralty, Somerset House.

DEATHS.—On Monday, in childbed, at her residence, Adelaide-crescent, Brighton, the LADY E. PARSONS, the wife of the Hon. Lawrence Parsons—On Wednesday last, the DOWAGER LADY FLOYD, relict of the late General Sir John Floyd, Bart., at Paris—7th inst., at South-hill Park, the Right Hon. the EARL OF LIMERICK, aged 87—8th inst., suddenly, at South-hill Park, while on a visit to the late Earl of Limerick, M. TUPPER, Esq., F.R.S., of New Burlington street, London, aged 65—18th Sept., of fever, at Shikarpore, in Scinde, aged 31, Brevet Capt. W. TIMBRELL, of the Bengal Horse Artillery, son of the late Captain James Timbrell, of the East India Company's Naval Service—10th Oct., at Balicherries, near Petoctar, Bombay, F. H. DENYS, Lieutenant of the 1st Light Cavalry Lancers, son of Sir G. W. Denys, Bart., of Stratford-place—14th Oct., at Meerut, Capt. D. MELLISH, of the 10th Bengal Cavalry—5th inst., at her son's residence, Fittleton, Wilts, ANN BATES, widow of the late Isaac Bates, Esq., of Kennington, Surrey—5th inst., at his daughter's residence, Bletchingley, Surrey, SAMUEL POPE, Esq., aged 73—8th inst. at Midway-terrace, Exeter, the Rev. J. TOTHILL, rector of Huttisleigh, Devon—9th inst., at his residence at Greenwich, J. WADMAN, Esq., late of Abingdon-street, Westminster—9th inst., at his residence, in the Old Kent-road, after a long and painful illness, J. WATSON, Esq., aged 66—9th inst., at Peckham, SARAH SCOTT, relict of James Scott, Esq., aged 78.

Price SIXPENCE, free by post SEVENPENCE.

The Lancet,

Of Saturday last, DECEMBER 7, contains:—

A COURSE OF LECTURES on ORGANIC CHEMISTRY, delivered during the Winter Session, 1844, in the University of Giessen, by JUSTUS LIEBIG:—Cyanogen and its Compounds continued—Cyanuric Acid—Remarks on Isomerism—Cyamelide—Hydrocyanic Acid.

WANTED, a MAN and his WIFE, in the capacities of GARDENER and LAUNDRESS. They must thoroughly understand their business, and unexceptionable references will be required as to character and ability in their respective capacities. The Gardener's is a single-handed place. Wages for the Man and his Wife, 1*l*. 10*s*. per week, with good residence and garden rent-free; the residence unfurnished, with the exception of fixtures; and all the utensils and other requisites for washing found, except firing, soap, starch, and candles.—For further particulars apply by letter, post-paid, to T. S., Bradwell Lodge, near Maldon, Essex.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man, aged 44, who perfectly understands his business in Ground-work, Kitchen Garden, Framing, Greenhouse, &c. &c.; can be well recommended from the gentleman he has just left.—Direct W. C., Mrs. Millington, High-street, Highgate, Middlesex. Can wait one week for letters.

AS PROPAGATOR, OR PROPAGATOR AND FOREMAN.—A young Man with unexceptionable character.—Direct to J. S. R., Mr. J. Salter's Nursery, Bath; or Post-office, Enfield, Middlesex.

TO SEEDSMEN, &c.

A RESPECTABLE YOUNG MAN wishes to obtain a Situation in a SEED WAREHOUSE; Salary not so much an object as further knowledge.—Direct to W. A. R., care of Mr. Clark, Seedsman, Bishopsgate-street Within.

Agnodier		Pompone
Antonine d'Ormoise		

Also strong plants of Climbing Roses (Evergreens), at 6*s*. per dozen. These Roses will make shoots upwards of 6 feet long in one season, and are very suitable to cover unsightly fences, walls, stems of trees, &c.

Descriptive Catalogues forwarded upon prepaid application. Plants gratis, to compensate for distant carriage.

Hedenham, Dec. 21.

THE ARBORETUMS, QUEEN'S-ELMS, BROMPTON, NEAR LONDON, AND EAST COWES PARK, ISLE OF WIGHT.

RAMSAY BROTHERS, Landscape Gardeners, Contractors for Planting, Earthwork, Road-making, Forming Ornamental Waters, and Improvers in general of Landed Property.

Plans and Estimates submitted, and works contracted for in any part of the kingdom.

Messrs. R. invite Noblemen and Gentlemen to an inspection of their choice stock of Ornamental Plants, which have been selected for the Lawn, the Parterre, and the Shrubbery, and now growing at Queen's-Elms, one mile from Hyde Park Corner.

ROSES, HARDY HERBACEOUS PLANTS, AND HOLLYHOCKS.

WM. JACKSON and Co. beg to offer Collections of the above from their select Stock on the following very reasonable terms:—

100 Dwarf Roses in 50 named sorts, for 20*s*.
100 do. do. 100 do., fine sorts, 35*s*.
100 do. do. 100 do., very fine sorts, 50*s*.
20 Beautiful Scotch Roses, with names, 10*s*.
25 Standard Roses, including the fine Moss and Hybrid Perpetuals, 40*s*.
50 Do. do. do., 75*s*.
100 Showy Herbaceous Plants, in 50 named sorts, for 25*s*.
100 Do. Do. 100 do., 35*s*. and 40*s*.
50 Very fine showy do. do., in 50 do., 20*s*.; including several new and beautiful species and varieties.
100 Fine proved Hollyhocks for 35*s*.

The above are well grown; the Dwarf Roses on their own roots, and from the same stock as those which gave such general satisfaction last season. Plants given to compensate for long carriage. Catalogues will be forwarded on receipt of two postage stamps.

A remittance or reference respectfully solicited from unknown correspondents.—Cross Lanes Nursery, Bedale, Yorks., Dec. 21.

UNDER THE PATRONAGE OF HER MAJESTY.

J. G. WAITE, Wholesale Seedsman, 1 & 4, Eyre-street Hill, Hatton Garden, London, returns his best thanks for the very liberal support he has hitherto received, and begs to call the attention of his friends and the public in general to the following reduced scale of prices of a small portion of his very extensive stock:

		£	s.	d.
Waite's Queen of Dwarf Peas	per quart.	0	7	6

A splendid new variety, growing only 1 foot high, producing a larger pod than any of the same habit; the seed is quite distinct from all others, and larger than any Dwarf Pea in cultivation. It has been grown at the Royal Gardens at Frogmore, and approved of as a new variety, and also at Her Majesty's table, for its superior flavour.

Beet, Waite's Blood-red	per cwt.	8	8	0

And all other kinds of seeds, too numerous to insert, at equally low prices.

The above prices are for cash only. Catalogues are now ready, and can be had on application as above.

BEECHWOOD MELON.—"MUMMY WHEAT."

H. SILVERLOCK has to offer packets containing Six Seeds of this Melon at 2*s*. 6*d*., and 36 grains of the Wheat, at the same price per packet. They will be forwarded by post, free, on receipt of an order for 5*s*.—Nursery, Chichester.

FINE STRONG PLANTS OF SUPERB SEEDLING CINERARIAS, all well trussed, and forward for Winter and Spring Flowering, saved from the very best Blues and other fine choice named varieties, at 6*s*., 9*s*., and 12*s*. per doz. Packets of ANAGALLIS BREWERII & SUPERB CINERARIA SEED, 2*s*. 6*d*. each.—Applications, including post-office orders or stamps, will be immediately and carefully executed. Direct to Michael Brewer, Senior, Nurseryman, Cambridge.

NAPOLEONA IMPERIALIS.—A few Plants of this beautiful Shrub, lately described by Dr. Lindley, in the "Botanical Register," may be purchased, price Five Guineas each, by application to Messrs. Thos. Gibbs and Co., the Seedsmen to the Royal Agricultural Society of England, corner of Half Moon-street, Piccadilly, London.

ADDRESS TO THE PLANTERS OF ENGLAND.

TRUE HIGHLAND PINE-TREE.—My Lords, Ladies, and Gentlemen,—The time has come when all those who have waste lands at their disposal should plant them. Of this I am fully persuaded, and I beg you will allow me to explain on what grounds this opinion is founded. England, generally, is a treeless wooded country yet, strange though it may appear, it has not been planted with any view to meet its most urgent wants. If the poor farmer require an outhouse built for his cattle, he cannot have it because there is no deal-wood in the neighbourhood: he builds it therefore of walls, or of any other rubbish he can lay hold of. Instead of having plenty of fir wood on all hands to fence young hedges, planted like other things on the common surface of the ground, military-like fortifications have been raised to divide fields, occupying as much good land as is contained in three of the largest counties of Britain: it is on those banks ineffectual attempts have been made to grow hedges. After the 1st of March, when the Royal Agricultural Society's Prize on fences shall have been awarded, a great proportion of the hedges throughout England will be reconstructed by planting them on the plain surface; and the question will then arise, "Where is the wood to protect them in their young state to come from?" Turning to the railways which are now being formed in every county in England, another and greater question arises as to the supply of wood which will be required in *their* construction. Go up, I am told, to the Lebanons of our island—those immense forests in the north of Scotland—and there hew down as many trees as will be required. From those, however, I find we must expect but a limited supply. Like the famous Mount of old, they are already overrun with the axe, and a continuance of the present rate of demand for a few years more will reduce the trees upon them to a mere remnant. It is not the original numbers required for sleepers which will effect this change, but it is the incessant demand, *ad infinitum*, for timber to replace that which is already laid down, or may be for the future laid down in additional lines. Look at it how we may, the state of our country at the present crisis proves that our immense and almost measureless tracts of what is generally called waste land were not created to be a scene merely of unproductive solitude. The rains with which they are refreshed, and the fostering sunshine that rests upon them, might have taught us that Providence had designed them to contribute in some way or other to the wants of man; and though Nature has been unable to lead us to comprehend her lesson, so simply brought before us, necessity has at length compelled us to look to those districts where only a sufficient quantity of timber can be raised to meet our increasing wants. Now, then, is the time to plant! wherever there is a waste piece of ground, moor, or mountain, let it be forthwith invested with trees, for every year, for many years to come, will unquestionably bring with it an additional demand for timber. Thus far on the necessity of planting. Allow me next to bring under notice the sort of tree I would recommend to be planted, which is the chief aim of this Address. That tree is the TRUE HIGHLAND PINE, for introducing which, I had the honour, along with my brother, of receiving the Highland Society's prize. It is admirably fitted, in every respect, to take possession of all the uplands throughout England. It will grow freely on all soils suitable for the common Pine: its wood is very durable: and for railway sleepers it is unrivalled. Brindley, the celebrated engineer, considered its durability equal to that of the Oak; and Dr. Smith states, in the *Transactions of the Highland Society of Scotland*, that he has seen some of it taken down after it had been 300 years in the roof of an old castle, as fresh and full of resin, as newly imported timber from Memel, and that it was actually worked up into new furniture. "Such," says London, "is the durability of this wood, that while the bog timber of the Birch is often found reduced to a pulp, and the Oak cracks into splinters as it dries, the heart of this Pine remains fresh, embalmed in its own turpentine."

My Lords, Ladies, and Gentlemen,—Allow me to add a word or two on the merits of this tree as a landscape ornament. In this respect it rivals, if not excels, the Cedar of Lebanon. It has, at any rate, a much better ramification than the Cedar; for, as Sir Walter Scott observes, it assumes in a great measure the bold and contorted figure of the Oak. In illustrating the Seats of Norfolk (and the remark is applicable to all England), it frequently occurred to me that advantage had not been taken of prominent situations by investing them with grand evergreen trees; for so soon as November comes, our parks lose almost all that weight of grandeur for which they are so celebrated in summer-time. Their solemnity ceases with the fall of the leaf, but were they ornamented with this Pine, its broad umbrageous canopy remaining green during winter, the change consequent upon the approach of winter would be much less observed, and our country residences would at all times be surrounded with the dignified accompaniments so consistent with their character.

The importance of this subject will, I doubt not, be accepted as an apology for my thus venturing to express my opinions so plainly on matters of English practice. My suggestion as to the improvement of park and pleasure-ground scenery by introducing the Pine in question is offered with the greatest deference, being fully persuaded that in matters of this description England has been always distinguished for its refined taste. I am ready to dispose of the Highland Pines at the following prices:—

Single Plants, strong and well rooted . . . 6*d*. each.
Strong Plants, 18 to 20 inches high . . . 5*s*. per 100.
Strong Plants, 15 to 18 inches . . . . 30*s*. p. 1000.
Smaller-sized Plants for exposed situations 10*s*. to 20*s*. p. 1000.

I have the honour to be, My Lords, Ladies, and Gentlemen,
Your most humble Servant,
JAMES GRIGOR, Nurseryman, Norwich.

PERFECTION IN PEAS.—FRASER'S SHANLEY MARROW.

F. FRASER, Nursery and Seedsman, Lea Bridge-road, Essex, in offering his friends and the public the above Pea begs to assure them it has no rival, its quality being as far superior to Knight's and all other Marrows as those surpass the commoner Peas. Its height is about 5 feet, a prodigious bearer, and continues in season much longer than the usual kinds. The stock on hand is very limited. Price 7*s*. 6*d*. per quart. A remittance expected to accompany orders from unknown correspondents.

WILLIAM MAY begs to offer the following at the very moderate prices below quoted, Catalogues of which may be had.

100 Hardy Shrubs and Ornamental Trees, in 50 sorts, for 42*s.*; 200 do. do., in 100 sorts, for 80*s.*

100 sorts showy Hardy Herbaceous Perennial Plants, for 42*s.*; 200 do. do. do., 80*s.*

100 Roses in 50 good sorts, for 25*s.*; 100 do. do., in 100 fine sorts, 42*s.*; 50 do. do., in 50 extra fine sorts, 30*s.*

100 select Double Hollyhocks, for 42*s.*; 12 do., extra fine, named, for show, 20*s.*

100 Gooseberries, approved varieties, in 50 sorts, for 16*s.*; 100 do., in 100 fine sorts, for 20*s.*

Seeds of Hollyhocks, from double flowers, in packets, 200 seeds, 2*s.* 6*d.*; 500 seeds, 5*s.* each.

Seeds of Pansies, from finest named sorts of 1844, packets, 2*s.* 6*d.* and 5*s.* each (seeds post free).

Forest and Fruit Trees, Greenhouse and Stove Plants, Florists' Flowers, Garden Flower Seeds, &c., comprising in each department all the leading novelties in present cultivation.

Hope Nursery, Bedale, Dec. 1844.

HUNT'S IMPROVED HYACINTH POT and SUPPORT, from 1*s.* 6*d.* each. The largest stock in London of Patent and other Garden-pots and Stands, from 15*s.* to 150*s.* per dozen, in Wedgewood's and other wares, for Drawing-rooms, &c.—29, Queen's-row, Pimlico.

CORNISH KIDNEY POTATOES.—THE EARLIEST OF ALL EARLY POTATOES. It is remarkable that this valuable sort should be so little known and cultivated in England. It is grown to some extent in the West of Cornwall, AND HAS BEEN PRODUCED IN THE OPEN GROUND DURING THE LAST TEN YEARS, FROM THE 15TH to 18TH OF APRIL, (on an average.)

Upwards of three hundred acres are annually grown in the neighbourhood of Penzance; and thousands of baskets are sent, by steamers, to supply the London and Bristol Markets.

The growers obtain them so early, that they are enabled to procure an excellent second crop on the same land.

It is a most valuable sort, and should be grown in every garden where early vegetables are required.

Sold in Hampers, containing 2 and 3 gallons, at 5*s.* and 7*s.* each, package and carriage free to London or Bristol, which will be forwarded on receiving a Post-office order, on application to WILLIAM E. RENDLE, Union road Nursery, Plymouth, December 21, 1844.

HERTFORD NURSERIES.

E. P. FRANCIS having received various Testimonials from Gentlemen, &c., as to the excellence and superiority of SNOW'S WINTER WHITE BROCOLI, advertised in the *Chronicle* last season, begs now to inform the Nobility, Gentry, and Public, that it may be obtained at the Hertford Nurseries, Messrs. Noble, 152 Fleet-street, Messrs. Wrench, London-bridge, and Messrs. Flanagan, Mansion House-street, at 2*s.* 6*d.* per oz.

E. P. F. begs further to recommend to those persons who have not yet obtained it, SNOW'S HYBRID GREEN-FLESH MELON, which was awarded a Knightian Medal at the Chiswick Show in May last, and which cannot be surpassed for hardy habit, most abundant bearer, and superiority of flavour over every other Melon exhibited at the same time. To be obtained at the Hertford Nurseries only, in sealed Packets containing eight seeds, 3*s.* 6*d.* each.

Also, E. P. F. begs to introduce to Public notice, SNOW'S HARDY MATCHLESS GREEN COS LETTUCE, which has been proved by several growers to be superior in flavour and sweetness to any other Lettuce grown, very crisp, very hardy, requires no tying up, and is fit for use three weeks earlier than the common Green Cos, in sealed Packets, 1*s.* 6*d.* each.

E. P. F. has also received from Mr. Snow a few Packets of his HORTICULTURAL PRIZE CUCUMBER, each Packet containing 7 seeds, 2*s.* 6*d.* per packet; also a small quantity of his very fine CHINESE PRIMULA Seed, of the white and purple kinds, and all saved from beautiful fringed varieties, in Packets, 2*s.* each.—Dec. 21, 1844.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford street. — Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price of cloth, 7-8ths of a yard wide, thin, 2*s.* 6*d.* per yard.; stout, 3*s.* 1 yard wide, 3*s.* 6*d.* Price of Fluid (for renewing the cloth after lengthened service), 4*s.* 6*d.* and 2*s.* 6*d.* per bottle. Manufactured only by N. W. TANNER, Chemist, Exeter: and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

LAND TO LET.—Most desirable and important opening to those now engaged in the Nursery Garden Business, or who have a knowledge of it. From THREE to NINE or more ACRES of LAND, where the soils are peculiarly suited for the purpose, and in a most eligible situation, close to the suburbs of Ipswich, may be hired at a moderate Rent, there being now no Nursery Grounds anywhere near Ipswich, except on a very limited scale. All the Land may be had at once, or it may be taken by degrees. The character and qualification of any proposed tenant would be strictly examined. If requested (probably) the assistance of some capital might be given; and also that of an industrious and prudent Partner, with Capital, as well as other advantages.—Apply to Mr. F. HARVEY, Tower Church Yard, Ipswich.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER HEATING APPARATUS.—J. PORTER begs to announce that, in addition to the many other and valuable purposes for which Galvanised Iron is peculiarly applicable, he is now manufacturing Tanks and Gutter for Vaporising, and Pipes for heating by top and bottom-heat, Hothouses, Pineries, Conservatories, &c. J. P. has also to state that, having secured the assistance of parties of the greatest skill and experience, he is prepared to furnish Plans and Estimates for Heating and Ventilating Horticultural Buildings, Public Edifices, Private Houses, Churches, Warehouses, Manufactories, &c., accompanied by references to executed works. J. P. does not profess to offer any one particular form of Boiler as the best, to the exclusion of every other, but adopts those which will insure the greatest share of efficacy and economy, in each particular case.—Grove Patent Galvanised Iron Roof and Fence Work, Southwark, second carriage turning to the right from Southwark Bridge.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Dec. 21, 1844.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT

Is particularly applicable as a Substitute for Slate, Zinc, Tilese, Thatch, and other articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non-conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Ropewalks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

TESTIMONIAL.

London, Nov. 1, 1844.

H. C. BOWDEN, Esq., Agent for McKIBBIN'S Roofing Felt.

It is with much pleasure I add my humble testimony to the superiority of your Felt over any other preparation of the kind with which I am acquainted. This Testimony I give with the greater cheerfulness from the many reports I have heard in its favour, and from the likelihood of its being used extensively in Agricultural purposes. I shall not fail to notice it in my Lectures when on the subject.

(Signed) JOHN ROBINSON, M.B., Senior Lecturer on Chemistry, &c., as applied to Agriculture and Rural Economy in this Kingdom.

Sold in Sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet).

Apply to H. C. BOWDEN,
Agent to the Manufacturers,
No. 18, East India Chambers, Leadenhall-street, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Building, Bunhill-row, London.

THE BEST AND MOST DURABLE ROOFING, FOR BUILDING AND GARDEN PURPOSES.

By Her Majesty's *Royal Letters Patent.*

THE PATENT ASPHALTE FELT for ROOFING,
AS IMPROVED BY
THE ORIGINAL INVENTOR AND PATENTEE,
AND NOW IN USE AT
THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT CHISWICK,
Can be had only by applying to
THOS. JOHN CROGGON, 2, INGRAM-COURT, FENCHURCH-STREET, LONDON.

The above Material has been used and approved of by the Nobility, Gentry, and Agriculturists generally, as a ROOFING and COVERING to SIDES of FARM BUILDINGS.

Its advantages are—The Felt is perfectly impervious to rain, snow, and frost, and being a non-conductor, it has been proved an efficient PROTECTIVE MATERIAL TO PLANTS.

The price of the Felt is ONLY ONE PENNY PER SQUARE FOOT, being much less than half the expense of Slates, Tiles, &c., and from its LIGHTNESS, WARMTH, and CHEAPNESS is particularly well suited for Hothouses, &c. A discount allowed to the Trade. THOS. JOHN CROGGON, 2, Ingram-court, Fenchurch-street, London.

Patent Asphalte Felt Works, Dec. 21, 1844.

THE FILBY RASPBERRY.—On or about July 18, 1843, Mr. HENRY YOUELL came to the garden at Filby, and requested me to give him some fruit of the above Raspberry, to send to Dr. LINDLEY. Mr. H. YOUELL and myself then looked over the Canes, and gathered some; he said that about two dozen would be sufficient. He then consulted me upon the best way of packing them, and I recommended him to pack them in cotton wadding or wool; to this he assented, observing that he thought it would be the best method.

Signed, WILLIAM CRISP, Gardener to Rev. G. Lucas.
Filby, Dec. 10, 1844. Filby, near Yarmouth.

LANDSCAPE GARDENING AND GARDEN ARCHITECTURE.

MR. GLENDINNING, since his residence near the Metropolis, has had the honour to be consulted by a number of Noblemen and Gentlemen in the improvement of their Parks and Gardens, and in the construction and heating of Horticultural Buildings in the most ECONOMICAL as well as effectual manner. He has now made such arrangements as will enable him to devote his particular attention to these important subjects; and Noblemen and Gentlemen desirous of consulting him, are respectfully requested to address him at Chiswick Nursery, near London.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 21, 1844.

MEETING FOR THE TWO FOLLOWING WEEKS.

FRIDAY, Jan. 3 Botanical . . . . . 8 P.M.

THE next point in POTATO-GROWING, which the experiments before us were intended to elucidate, is the effect upon the crop of destroying the blossoms. As the reasons for this operation have been already given at p. 427 of the present Volume, we need not repeat them here. The results are all that we need occupy ourselves with.

Our own opinion was in favour of the operation; and upon the whole, we think that the new evidence before us confirms the correctness of our views. "Falcon" says, "I have no doubt, from experiment, that taking off blossoms, *at a proper time*, is an advantage. It should, however, be so done, as not to give the plants an opportunity of throwing out fresh flowers, which will exhaust the tubers; the best time is just before the formation of seed-vessels. If the flowers are taken off too soon, the plants may exert themselves to propagate their species *before the tubers are strong enough to consume the extra nourishment provided by the destruction of the blossoms.*" This is sound good sense, and want of attention to it may account for some statements adverse to the inferences drawn from his experiments by "Falcon."

A gentleman at Norwood gives the following result:—

No. 1,	only 9 yards long . .	47½ lbs.; flowers on
2	12 yards long .	41½ lbs.; flowers off
3	do. . . .	30 lbs.; do. left on
4	do. . . .	30 lbs.; do. taken off
5	do. . . .	43 lbs.; do. on

This experiment would at first sight seem to show that taking off the blossoms is actually prejudicial, for the greatest weight was obtained from Nos. 1 and 5, in which the flowers were left on; but it is to be remembered that they were *outside rows*, and therefore must be left out of consideration. Of the inside rows, which alone can be justly compared with each other, the greatest result was from No. 2, in which the flowers were removed. It is true that this conclusion is nullified by No. 4, in which the crop was the same as when the flowers were left on; but we cannot receive such an instance, especially in an experiment conducted on so small a scale, as conclusive against the practice. More so is a statement by "F. H. S.," who says, "I caused all my Potatoes to have the flowers removed—reserving, however, one row as a means of comparison, which was allowed to bloom. On lately taking up the whole, I had this single row, with one on either side of it, weighed and measured, and we were unable to perceive any difference, either in point of weight or quality, in the three rows thus compared. They were all of the same description, and planted at the same time."

In opposition to this is the following statement, by "J. W.," a correspondent near Romsey:—

"Having followed your recommendation, of taking off the flowers of the Potato when in blossom, I wish to add my testimony to the advantage derived from doing so, by assuring you that the crop of Potatoes far exceeded that of former years, both in size and quantity. I had the blossoms left on one row, and *the crop was very inferior, both in size and quantity.* I prevailed upon a poor neighbour to follow the plan, and the result was the same; and I hope next year to induce others to try it."

This is all the information we have received upon this point of Potato cultivation. It is much to be regretted that the experiments were not made upon a larger scale, and the results, in some instances, reported with more exactness. At present we see no reason to alter our expressed opinion, that pinching off the Potato flower is a considerable advantage. May we hope that some intelligent cultivators will put the question to rest another year, by trying the experiment comparatively on a larger scale, and furnishing us with the actual weights they may obtain?

Connected with this subject is another that we pointed out as worth inquiry, namely: whether it may not be useful to top or pinch off the ends of the shoots of the Potato at a particular season, (see p. 293). The idea was that this might give the plants a greater tendency to form tubers by stopping them in their onward course. The only trial that we know of is one of our own. Bread-fruit Potatoes were planted in rows 2 feet 3 inches apart, 6 inches deep, and 7 inches asunder in the rows. They produced at the following rate:—

	tons.	cwt.	lb.
Stems not topped . . .	14	15	90
Stems topped	11	18	84
Against the experiment . .	2	17	16

If we are to judge from this apparently decisive result, the experiment is not worth repeating. But the following trial goes the other way.

Bread-fruit Potatoes were planted singly 2 feet 10 inches apart each way. Their produce was at this rate:—

	tons.	cwt.	lb.
Stems topped	5	6	56
Stems not topped . . .	4	1	0
In favour of the experiment .	1	5	56

Now, from this we infer that when the Potato plant grows extremely vigorously, topping is a decided advantage, and the reverse when it grows slowly. This year the Potatoes, on the land where the experiment was tried, suffered much from drought; were, by it, checked more than enough, and topping became prejudicial by adding to the mischief. But where, from having a great deal of room to grow, the effect of the drought was hardly felt, and the haulm became very strong, topping produced the result that was looked for in the remarks made at p. 293. If, then, in a dry year like this, it proved advantageous, under any circumstances, how much more may be expected from it in our ordinary rainy summers!

We therefore submit that the question is not determined adversely to our anticipations; but that the probability of Potato-topping being a good system is so much increased as to render it worthy of more extended inquiry, whenever, and from whatever cause, the Potato haulm is very rank.

BY the kindness of a friend we have been supplied with information relative to the HEAVIEST GOOSEBERRY of 1820. It weighed 25 pennyweights; was the "Roaring Lion," and was grown by Mr. Fardon, of Woodstock. Therefore, our Nottingham friend, Mr. T. Gibson, still retains the "championship" of Gooseberry growing.

NEW METHOD OF GROWING THE MUSHROOM (*Agaricus campestris*).

PASSING over the various modes of forming or making the beds, which I consider to be of minor importance, I proceed to direct attention to the failures which afterward take place, and which so frequently disappoint previous expectations. The principal cause of these failures I attribute to the very imperfect methods of supplying water to the beds which are in action.

The principal requisites for the successful culture of the Mushroom are heat, light, air, and a damp atmosphere. In the first place, with me, the dung is collected fresh from the stables, particularly from horses that are fed upon dry food, such as corn and hay. It is thrown into a shed to dry, a little before it is made into beds; my boxes are trellised at the bottom, which allows the heated air to penetrate through the mass of dung easily; a little hay or rough litter is spread over the bottom of the box, in order to prevent the dung from passing through the trellis work, and every two or three inches of dung that is added is beaten hard with a wooden mallet, until the layers reach within 1½ inch of the top of the box. As soon as the heat of the dung falls to a proper temperature, I insert large pieces of spawn into the bed at the distance of about eight inches square. I rarely make use of spawn less than 12 months old, and the less that it is broken I find that it produces the better crops.

In about a week or 10 days afterwards, I finish off the beds with green turf 1½ inch in thickness, making the beds in my boxes in all about 9 inches in depth. I beat down the turf very firmly with the back of a spade in finishing; afterwards I have no farther trouble, except in paying attention to the fire, and in admitting fresh air as it may be required. The house is heated by open tanks, which run through the centre of it, and which return again into the boiler, giving out a sufficient quantity of moisture for the necessary development and growth of the Mushroom. During night the Grassy turf becomes copiously loaded with moisture; and should the following day prove fine, I never omit giving abundance of fresh air by the door-way. The temperature of the house ranges from 60° to 65° during the day, and at night it is frequently allowed to fall as low as temperate.

The great advantage of growing the Mushroom upon fresh Grassy turf is obvious to any one accustomed to its cultivation. I have been in the habit of growing it, and with great success, upon coal refuse for the last two years, and at present I have two boxes at work, one covered with coal-dust, the other with turf; the produce of these shows the relative advantages of the two methods, for although those from the coal-dust are large and of good flavour, they are decidedly inferior in both respects to those produced by the Grass-covered beds; indeed, such is the superiority of the latter, that if the Mushrooms from both beds were gathered and mixed indiscriminately, any one could, without difficulty, select those grown upon the turf from those raised on the beds covered with the small coal.—*John Hankin, Gardener to Capt. Mitford.*

DISEASES OF PLANTS.—No. VIII.

[ANTENNARIA.]

THE parasites which form the subject of the present notice agree with the fruit moulds (*Mucor*) in having the reproductive organs contained within a vesicle, either formed from one of the joints of the stem or springing from the side of it. This vesicle, however, differs materially in being itself composed of a number of minute cells, which give it a reticulated appearance, and above all, in the curious fact that a new individual is produced within it immersed in gelatine, which, when its envelope bursts, increases gradually till it attains the stature of the parent plant. This is a mode of fructification analogous to that of the curious fresh-water Alga called Hydrodictyon, which resembles a netted purse, at first closed, but at length open at either end; the tubes, of which the meshes are composed, at first contain a mass of granules, which, in process of time, are, by some mysterious law, disposed in pentagons and become grafted to each other by their extremities, and then increasing gradually burst the general envelope, each joint of the original net thus giving rise to a new one.

Antennaria Robinsonii.

1. Portion of full-grown plant.
2. Portion of a joint in which the granules have commenced to dispose themselves in pentagons, the rudiments of the new plant.

But not only is the plant rapidly increased by this ready formed race of new individuals, but every portion of the thread easily vegetates, and even the little cells of which the wall of the fructifying cyst is composed are themselves also viviparous, and hence these parasites overrun with their black soot-like, or woolly masses, the leaves and shoots of such trees and shrubs as are subject to their attacks. In some species the threads form little more than a black velvety down, covering principally the young shoots, disfiguring and very materially injuring them; in others they produce a cloth-like felt, completely investing the whole plant, and in one case the threads are much elongated, and anastomose, so as to form a black spongy mass. They exist in various parts of the world. In Scotland young Pines are very subject to be attacked by Antennaria pinophila. In Perthshire especially they have been observed to be much injured by it. In the South of Europe the arboreal Heaths and Cistuses are frequently covered in consequence with a dense black coat. One species, which is figured above, runs over the fronds of Ferns in Juan Fernandez; Mr. Gardner gathered a species investing trees in Brazil; and in the Antarctic Expedition Dr. Hooker observed one very general, on the species of Dracophyllum, especially D. macrophyllum, and the same species apparently has been gathered in the Swan River district of Australia, and in South America. All alike prove injurious, by clogging up the stomates and veiling the young shoots and leaves from the influence of light, which is so essential to the health of vegetables. In a specimen from Perthshire, sent by a gentleman of the name of Drummond to Sir W. J. Hooker, in 1840, and submitted to me, I find other parasites intermixed, but all of nearly the same colour and producing the same injury.

The dark olive-green coat, which is so common upon Orange-trees in Madeira, and which may be observed also on them and other plants in our conservatories, and on various trees, especially Plum and Lime, in the open air, must not be confounded with the Antennariæ, being of a very different construction, however similar in appearance. Of this we shall have to speak when we come to the Mucedines. The productions now before us do not, it would seem, like them, spring from any glutinous deposit on the leaves or stems, as is the case with the mould of Plum-leaves. At least, nothing

of this kind has been observed at present. Those who have an opportunity of observing the parasite on young Pines, from its first appearance, would do a benefit to science by recording their observations, without which it is impossible to suggest any remedy.

One or two allied genera occur, in tropical countries, which have precisely the same habit, but they are not of sufficient importance to demand our attention here.—*M. J. B.*

BREWING.

Having observed several inquiries respecting brewing, the answers to which appear to me to be very wide of the mark, and thinking that a mode which I have practised without a single failure for many years, and all through the summer, even in the hottest weather, may be usefully made known to those who are ignorant of it, I am induced to send it; premising that the mode is well known in Berkshire, and no doubt in other counties; and that, although I am well acquainted with, and practise occasionally the general method of brewing by cooling and working with yeast—and when I do so, I use the thermometer and saccharometer—in the mode I am now about to recommend, I dispense with both those instruments, with the coolers, and with the working tubs, and the beer is made and casked all in one day; in short, this mode is commonly called "brewing red hot." But first, let me tell the "Farmer's Daughter," and all others, that two things are indispensable to the process; and the first is, that the copper, mash-tub, under-back, and casks, should all be as clean as a milk-pail or a wine decanter; and secondly, that it is useless to attempt brewing in any way, if the cellar is not of a tolerably even temperature, say from 45° to 60°; if it rises above the latter in summer, it is of no use to brew, for the beer will not keep.

I will suppose, then, that the brewer has three 18 gallon casks (for I am going upon a very small scale); I send one to the best public brewer who may live conveniently near, to be filled with good clear beer of moderate strength; this will cost from 15*s.* to 18*s.* Get from a first-rate maltster, 3 bushels of best pale malt, ready ground, and 3 lbs. of the best Farnham Hops (and here I may say that, according to taste, the Hops for each bushel of malt may vary from half a pound to two pounds). Boil the water (soft, if you have it clean, but it signifies little) and run it into the mash-tub; wait ten minutes, and put in the malt; mash it well in the usual way, cover it up, and let it remain four hours; before you draw it off, have, in some vessel near, a copper-full or two of water, nearly boiling; draw off the first wort, and put it into the copper with the Hops, and set it boiling; then take a clean watering-pot, dip out the hot water that is handy, and water the grains in the mash-tub, keeping the mash-tub tap running till you have sufficient to fill up the copper; this drains the grains as effectually as three mashes, if well done, and it should be very gradually, and take half an hour at least; the copper must then be watched till it beats pure, as the brewers call it; boil an hour and a half; rake out the fire, draw from the cask of beer one-third, and put it into one of the other barrels, and another third into the second—you need not be very nice about the exact quantity; thus, each cask will be one-third full. Then, I need hardly say, very carefully put the hot liquor, Hops and all, stirring it up, that the Hops may be equally divided, into the casks, and your brewing is done. You will, however, have kept back enough to fill the casks, as the liquor sinks in them from evaporation, and about two gallons in a large pitcher, to fill up for three weeks or a month, because the fermentation will be more like that of wine, than beer in the usual way, and is sometimes so slight, as to be hardly perceptible: you may tap it at the end of a month. When the first cask is empty, clean it well out; draw off three gallons of the second cask, and brew another bushel of malt, as before; and so go on brewing a bushel at a time.

Now, the principle of this process is, that the old beer supplies the place of the yeast; some people tun upon grounds, and some tun the hot liquor into an empty cask, in which case it is longer in coming round, for want of ferment, but is equally good. When brewed very strong, this sort of beer is apt to be more heady; but I prescribe for the working-man, who wants no strong beer. Of course, the process must vary much, according to the size of the copper and other circumstances, in each individual case, which one set of directions will not embrace. If the copper is very small, there must be two or three mashes (the first two or three hours only) instead of the one mash which I recommend, and the sparging with the watering-pot. In conclusion, this method will enable the honest, hard-working gardener, who dreads the dawdling process of the usual plan of cooling and working, to brew his own beer.—*H., T. C. O., Oxford.*

THE ROSE-GARDEN.—No. XXIII.

(*List of Roses continued from page* 831.)

STANDARDS AND DWARFS.

Hybrid de Luxemburg, Clair's Four Seasons, Triomphe d'Ange, Brown's Superb, Globe White Hip, Common Noisette, Scarlet Perpetual, Gloire, Camellia Rouge, Heloise, Noisette pulchella, Lodoiska, Rien ne me Surpasse, Reine d'Espagne, Renoncule rouge.

Village Maid.—Growth formal, no scent, but stripes of slaty hue; singular.

Fringed Province.—Growth as the Cabbage, but buds beautifully, crested with moss.

Du Roi.—Well known to all.

Yellow China.—Long, oval, and singular in the bud; not always to be kept healthy.

Crimson odorata.—Scent fine, but growth far from vigorous, and rather delicate.

Yellow Briar. Scarlet sweet ditto.—Flower of a brilliant scarlet; this class, however, and many others, are uncertain in their growth, cannot always be retained, and from their natural habits of dying off in parts, are amongst the most uncertain as to eventual success.

Harrisonii.—Colour bright yellow; appearance not commendable.

Bengale elegans.—Very old Rose, but profuse in flower, and vigorous.

Noisette cerise. Celestial.—Delicate in colour, beautiful in shape, and by some held in the highest estimation; the wood is vigorous, and must be left very long in the shoot to insure flowers.

DWARFS—BEAUTIFUL BUT DELICATE.

To be worked on slight stems, those of a year's growth being preferable:—*Tea Hymène, Tea fragrans, Tea gracilis, Tea odorata, Tea Hamon, Taglioni. Tea Lyons, Tea Hardy, Tea Caroline, Rose de Siam, Tea Hardy.*

The six last new Roses, though in the writer's possession, have not been seen by him in flower, and he is not acquainted with their habits:—*Chromentella, La Reine, Charles Souchet, Comte de Rambuteau, Madame Souchet, Tea Devoniensis.*

The above List contains many Roses that have been but recently grown, as well as many that have been long cultivated. It has been the object of the writer to give the names of those which he admires most, without reference either to long standing or novelty; but amongst the large collections now made, there are very many desirable, though not here mentioned. The cultivator is recommended, therefore, to choose the periods of flowering, both in spring and autumn, to visit the best nurseries convenient to him, mark the trees he means to have (not merely ordering the plants to be sent), and be persuaded into buying none that he does not very much admire. By visiting several nurseries, he will be inclined to reject some Roses, which only rise in his estimation because a peculiarly favourable situation had given the plants unusual health and beauty, and choose others which had suffered in appearance from an opposite cause, but which he will find, on second examination, well worthy his best regard. He will get many hints he would not otherwise have obtained, and if he purchase with reference to real beauty only, whether of flower, foliage or growth, he will find his success satisfactory, and his outlay moderate. If novelty, uncombined with these advantages, form any part of his object, almost every nurseryman can, from time to time, add to his collection. He must not be disappointed if he find some of his Roses do not flower as well with him as elsewhere, very much depending upon the nature of the soil that supports them; he must, however, be careful as to one thing, which is, if his plants be placed on Grass, not to let the turf be put round them the first year, as it absorbs all the rain that falls, however much it may be, and starves the trees.

The advantages of free-growers are, that at almost every season they will afford buds fit for use, and many of them continue to bloom and look handsome till the end of autumn, and the number of shoots from a single bud are unlimited; thus forming a head the first season, and restoring the activity of the whole tree, in a short space of time. They are not, however, quite so easy to keep in order as the other sorts, and they are more apt, on first coming into leaf, to attract the aphides, that little terrible insect, the scourge of the Rose, and for which no adequate means of destruction is known; though destroying, by the hand, at the commencement of the season, is the most effectual means of keeping down. As it is not only inconvenient and tedious to make use of the fingers for the purpose, as well as difficult to remove the insects without crushing them upon the shoot, which invariably either retards or stops its growth, the readiest method is to brush them off with a common painter's brush, made of bristles, the hair of which viz. that part which is below the binding, is about an inch and a half long, and the same in circumference. Lay the shoot along the palm of the left hand, and pass the brush from the bottom of the infected part upwards, and with a very little practice you will be able to clear a plant of its tormenters, without injury either to the bloom or to the tenderest shoots to which the brush is applied, in a space of time which would at first appear impracticable.—*A. H. B.*

Home Correspondence.

Disease of the Larch.—Observing in the *Chronicle* (p. 796) some remarks by "Ruricola," on an insect which infests Larch-trees in spring, I am induced to mention that in the month of March, 1841, a small flock of Siskins (Carduelis spinus) frequented this neighbourhood for a short time, and that their food during their stay partly consisted of an insect very similar to that described by "Ruricola;" indeed I have no doubt but it was the same. These insects were to be found on the young branches of the Larch, especially around the base of the leaf-buds. Observing the birds feeding on a tree of this species, I shot one, and on examination discovered that they had been devouring these curious little insects, which appeared to me to resemble very much the plant-lice. This is one among many instances of good done to the gardener or forester by insectivorous birds.—*A. J.*

The Potato.—In the cultivation of the Potato, which you are bringing prominently into notice, should not some reference be had to the elevation of the land on which the experiment is made? For instance, Stockton-on-Tees and Birmingham are situated very differently; the one is nearly on a level with the sea, the other 500 feet above it, I believe, and in the heart of England. Both these places have been quoted by you. I know that the difference of elevation of 50 or 60 feet does much to the human constitution.—*C. W.* [We attach no importance to this point, so far as the cultivation of the Potato is concerned.]

Liquid Guano.—Exhaust the guano, in the first instance, by steeping it in water. This will give liquid No. 1. Then add 1 per cent. of borax to the water in which it is steeped, and try the effect of that. If you should be astonished, do not be surprised.—*Timothy Pickle.* N.B. You may use the borax at first, if you like.

Autumn-planting Potatoes.—More than 20 years ago, I heard my labourers (in Ireland) talk of an old and general custom of their forefathers, of leaving the seed of the future crop in the ground, and splitting with their spades the larger Potatoes, when they were digging out the crop of the current year. It is a very common thing in Ireland to leave ridges of Potatoes undug till the ensuing spring, either from some unfortunate circumstance befalling the owner of them, or from their being so bad a crop, as not to be worth the trouble of digging. Now, scarcely any of them have more than a covering of four inches, and many of them not more than an inch, yet their suffering from frost has rather been the exception than the rule. By an agricultural survey of the county of Wicklow, I saw some years ago, it appeared there is a strip of bog near the sea, in which they plant the White Kidney, in the month of September, and supply the Dublin market with them in the month of May following. They are, however, treated with a double allowance of manure, and well covered—say with from four to six inches of the boggy soil. In the county of Tipperary, 18 years ago, I planted Potatoes (whole ones, called Quarries), in September, and dug them in May, but the winter was very mild. I planted five or six years ago in Donegal, in the winter, Potato sets that had sprouted in the house (a warm room), preserving the sprouts on them, and began to dig them of very good size on the 18th June; the crop was a heavy one. In this country, where Potatoes occupy about one-third of the tillage lands, a furrow cannot be turned in spring without meeting with innumerable Potatoes, that have been all winter left in the ground, at a depth scarcely ever exceeding four inches, and very few of these are found injured by frost. I feel, therefore, assured that little danger is to be apprehended from frost in an autumnal planting, and especially where the seed is deeply buried; and I think either in autumn or spring planting, they will be more productive when deeply set. I would never wish them to be less than six inches deep; and although it is undisputed that frost acts more powerfully on wet, than on dry ground, yet I have no recollection of having found Potatoes suffer more in moist ground—I will not say absolutely wet—than in dry; but I do recollect an instance, 15 years ago, at a time when a disease called the rot prevailed very generally in the neighbourhood, and destroyed more than half of the Potatoes in the country, that I planted in the autumn some Potatoes in dry, and moist—I might say wet ground; the seed in the dry ground all perished from the rot, while near half of those in the moist ground survived. I have frequently planted in the autumn and winter without suffering loss by it, and I should never hesitate so to do. It is no doubt, if possible, advisable to plant before the Potatoes are exhausted by growing out in the spring; yet, should planting be necessarily delayed till late in the spring, I think unsprouted seed might be obtained by burying the Potatoes intended for seed, three feet under the ground. We know that there are certain depths at which seeds will not germinate, and I believe Potatoes will not at three feet under the surface. To test this, a few days ago I sank a pit more than three feet deep, and put into it about 12 stone of Potatoes, and covered them with three feet of clay level with the rest of the ground, and have planted Cabbage over them. I propose planting Potatoes in the open field about Christmas, and in May I will open my pit and plant one-half of the Potatoes that are in it; the remaining half I will leave till autumn, when I expect to take them out as good and as fresh as they are to day. A difficulty in planting Potatoes in the autumn may be alleged in the farmer not having manure then for them but this I hold is easily got over; the manure may be taken out at any time, and spread on the surface—the leaves of the plants will drink it up. Let large sets from large Potatoes, be planted, and the roots will want none of it: fine strong shoots will come up even from among stones.—*James M. Goodiffe, Granard.* [Our readers must remember that this interesting communication relates to the mild climate of Ireland.]

Brown's Liquid for Destroying Mealy-Bug, &c.—This seems to answer the same purpose as Hereman's Vegetable Dilutium, and apparently without injuring the plants; but whether or not it destroys scale on plants, requires some time to prove.—*D.*

The Mealy-Bug.—A friend of mine took a situation a few years ago, where the vineries were very much infested with mealy-bug; he has since succeeded in almost entirely extirpating these pests, by persevering in the use of the following mixture, and by (as long as was prudent) keeping the foliage syringed with a weak solution of soft soap. The mixture was as follows:—2 lbs. of soft soap, 2 lbs. of flowers of sulphur, 1 lb. of roll tobacco, half a gill of oil of turpentine, and 2 oz. of nux vomica (the latter in powder). The soft soap and sulphur should be mixed together with warm water, stirring them well together; the roll tobacco must be cut, untwisted, and boiled by itself for an hour and a half in a

saucepan, keeping the lid on, then strain it, and add the liquor to the sulphur and soft soap, next adding the nux vomica, and then the oil of turpentine. The liquid when mixed together should make in all about five gallons. It should be applied with a painter's brush as soon as the leaves are off the Vines, and again just before the Vines begin to break; after dressing the Vines well with the above, some clay should be mixed with a portion of the mixture, to the consistency of good thick paint, and used for the purpose of stopping all cracks and holes about the Vines.—*W. Jones, Beddington, Surrey.*

Protection of Crops from Hares and Rabbits.—I would state, for the information of "J. M.," that I was once a fellow-sufferer, and tried various means, such as trapping, shooting, &c., to no purpose, although I thinned their numbers, to use a Yankee phrase, "pretty considerably." Still I found that the actual culprits were not destroyed, for the work of devastation still went on, although not to the same alarming extent as formerly. The case in point is as follows:—I had cut and plashed a very fine withy coppice, which broke remarkably well, and for the first year was allowed to remain undisturbed; but this peace was of short duration, for, in the second winter of their growth, the enemy was at work, and most effectually too; for whole rods in many places the beautiful young shoots were browsed off, as though a whole herd of forest colts had been turned in; and, although many of the shoots were from 5 to 6 feet in height, the hares had bitten them off 3 feet from the ground. To put a stop to such dreadful havoc, I adopted the following plan:—Knowing their aversion to the smell of tar, I circumscribed the scene of devastation with rope-yarn, first clearing away all rubbish, such as Brambles, high Grass, &c., making a clear space for operating; I then fixed stumps into the ground, at the distance of 12 feet apart, to which was affixed the yarn, in two lines, the lower one 6 inches from the ground, the upper about 18; there is no fear of either hares or rabbits jumping over (unless pursued), as they invariably crawl through or under any obstruction to their progress. To render the plan more effective, I occasionally applied the tar-brush, thereby causing a strong scent of tar constantly in the locality. By this plan I saved my crop, and now make it a standing rule never to have a copse unfurnished with the above preventive. I advised a neighbouring farmer to try the same plan with a piece of Carrots he had sown in the very heart of the game preserves, and of which the rabbits particularly are very fond: he did so, and with the like effect, assuring me, at the time of lifting the crop, that he believed there was not a single root or top touched. I would strongly urge "J. M." to try this plan, feeling confident he will succeed, at the same time impressing upon him the necessity of a frequent application of the brush, as the tarry smell is their chief abhorrence.—*Quercus II.*

Steeping Seeds.—In March last, some Pink-seeds were steeped in a solution of sulphate of ammonia, another parcel in nitrate of soda, and a third in a mixture of lime, salt, and hen's-dung. A quantity of Pink-seed was sown at the same time, in the usual way. The seeds in sulphate of ammonia grew very quickly, and are now the largest plants of this year's sowing. Those in nitrate did no good, three only surviving; and those in the mixture failed altogether.—*G.*

Roses.—I beg to mention a mode of managing Standard Rose trees, differing widely from the one formerly in vogue, and one which is very much admired here. I never prune or cut back the head of the tree, but merely thin out the very small weak wood, leaving all the strong and medium sized shoots to grow to their full extent. I have observed that in most varieties the medium-sized wood blooms the most freely, and treated in this way my trees are literally covered with flowers, resembling in their profusion and luxuriance the wild Dog Roses of the hedgerow. I do not recommend this plan where Standard Roses are planted among beds of American plants, although, in my opinion, such is a most desirable situation for them; in such circumstances, however, the size of their heads would of course greatly depend on the nature and growth of the plants among which they were placed. When Standard Roses are planted singly on lawns or in avenues, nothing in my estimation can be more unsightly than the unnatural looking mop heads into which they are generally pruned, and which will not produce a hundredth part of the bloom as when managed as above described. I remove the soil over the roots once in three years without disturbing the trees, and I replace the old soil by a little loam and manure, which I find very much invigorates the trees and renders them capable of bearing their large heads, which almost conceal their naked stems.—*J. L. Snow, Swinton Gardens, Bedale.*

Baskets round Flower-beds.—Some men are gifted with a propensity of finding fault, without indulging at the same time in giving reasons upon which their criticisms are founded; your correspondent "Argus" is identified with this observation. If he will explain clearly upon what principle, in his opinion, wicker-work, or, indeed, fancy edgings of any kind, are altogether out of place when surrounding flower-beds, I shall undertake, in reply, to give reasons why these, and similar ornamental accompaniments, are in perfect propriety—indeed demanded in such situations.—*R. G.*

The Late Frost.—The frost commenced with us on the night of the 5th, with some severity, as the annexed statements will show; our mimimum appears higher than what is given as observed at Chiswick in the last *Chronicle*, 21° Faht. being the lowest observed here on the night of the 6th; it may be as well to remark that the barometer has been high during the continuance of the frost, having during the greater part of the time been above 30 inches; and at 9 P.M. of the 7th it stood at 30·274; it began falling, however, on the 11th, and reached its minimum on the 14th at 9 A.M., standing at 29·450. The wind during the whole of the period has varied from N. E. to S. E., and has occasionally been high and piercingly cold, but no snow has fallen, and only a slight sprinkling of sleet.

HEIGHT OF THERMOMETER.

	Max.	Min.	Mean.
Dec. 5	38°	28°	33°

— 16	38	33	35½

As the frost appeared yesterday to be breaking up, I wished to ascertain to what depth it had penetrated in my garden, which lies tolerably exposed to the S.W., and is surrounded by a high hedge, and a wall on the other three sides; it consists of a stiffish loam, on a gravelly subsoil; and beneath this latter is a thick bed of stiff yellow clay. On inserting a three-pronged fork, the soil broke up in lumps or cakes, of the depth of 4½ inches, below which it was perfectly free from frost, as the temperature indicated by the thermometer, inserted at the following depths, will show:—

At 6 inches deep . . . 34° Fahr.
At 12 do. do. . . . 36½° do.
At 24 do. do. . . . 39° do.

whilst the temperature of the air at the time was 38° Fahr. It may be as well to state, that the place I selected for the experiment was about the centre of the garden, and as far removed as possible from any object likely to have an influence in modifying the effects of the frost. —*W. Lucas, The Mills, 1 mile N.E. of Sheffield, Dec.* 7, 1844.——I yesterday examined, together with my gardener, the depth to which the late frost had penetrated here, and we found that our light garden-soil was frozen to 6 inches deep, while the stiffer soil of the fields was frozen to 8 inches. From this it appears that loose soil is less affected by cold than that which is more compact, probably on account of the additional portion of air which it contains. I understand that you had a fall of snow in town, previously to the departure of the frost; the thaw did not commence with us until early on yesterday morning, when some rain fell, and the frost has gone rapidly ever since.—*Oswald Mosley, Rolleston Hall.*——At Hampstead (the Green) the frost penetrated to the depth of 7¼ inches. Soil, strong loam, on clay.—*W. K., Dec.* 16.

Management of Bees.—Having tried, during a period of 27 years, all the different systems of bee-keeping possessing any merit, and having found in each defects prejudicial to the welfare of the bees, I have directed my attention towards establishing, if possible, a sound and advantageous system. All wooden hives or boxes are objectionable. They are too hot in summer, and are too cold in winter; besides they retain moisture, which is injurious to the comb and health of the bees. I consider ventilation to be not only unnecessary but injurious; for the higher the temperature inside the hive is, the greater is the draught. Bees are very uncomfortable and irascible in windy weather, or if blown upon. At all times they may be seen anxiously stopping up every hole which they can find, particularly those, if any, in the upper part of the hives. This, therefore, speaks against ventilation. The natural heat of the hive is conducive to the health and activity of the bees, no instance to the contrary being known. It is only when the warmth of the external air somewhat assimilates to that of the hive, that they come out cheerfully. I have known a very high degree of summer heat drive bees apparently from their hives, and upon examination the honey and wax was more or less liquefied on account of the hive being exposed to the direct rays of the sun. This is a very serious evil, but one which is remedied by colonies of my construction. The following objects carried out are essential to the profitable keeping of bees; viz., large well made straw hives to contain strong stocks, having no other opening than that at the bottom, and having no metal in any part of them, that being a conductor of heat. The best possible protection against mice and every kind of insect. Easy access by the bees to the glasses, &c., for working in, and facility for removing the latter: the whole to be impervious to the weather, heat, cold, and wet. For effecting these ends, I would recommend a straw case, worked with split cane, 3 feet 9 inches in length, 16 inches in height, and 14 in width, inside measurement. At 3 inches from the bottom, a floor of ½ inch deal should be fixed on supports at each end, and two bridge-shaped pieces should be placed at 14 inches from the ends. This case should stand on a wooden bottom 2 ins. in thickness, 18 ins. in width, and 50 in length, a little cement or mortar being put all round. For the purpose of preserving the case, I sew canvass on the outside, and size and paint it green, every spring giving it a fresh coat. A circular hole should be made in the middle of the floor 10 inches in diameter; on this should be placed early in April a large last year's swarm in a new bell-shaped hive. Two or three convenient holes, 3 inches in diameter, must be also made in the floor on each side of the stock-hive, and fitted with thick bungs. A door-way should be cut in the bottom at 12 inches from each end, 2 inches in width, and 3-8ths of an inch in depth; and a small appropriate piece of something should be nailed under each doorway for resting boards on. The doorways should be nearly closed in August with slips of wood, and opened again in April. The stand should have four legs, and each leg should rest in an iron or flower-dish containing water, with a little oil on the top of the water; over the top I tie canvass to keep out moths, spiders, &c.; a neat span-shaped painted wooden roof should cover the whole well over. In the first summer the bees will probably only fill the space under the floor, but if they appear, by collecting about the entrances, to want room, a small glass may be placed over one of the holes, first removing a bung by turning it round. Early in April is the proper time to commence putting on glasses, and when they are quite filled with honey fresh glasses should be put on, and in a day or two the full ones may be removed by drawing a fine wire under them, and replacing the bungs. These hives will last for many years, and will yield in good summers one cwt. of honey, with but little trouble. Every three or four years the inside stocks should be examined by fumigating with fungus, and any old comb used for breeding should be removed. When additional stocks are required the glasses should not be put on until the bees have swarmed: at night the young swarm may be put into a straw case. I do not find that the queen quits this hive to breed in the glasses, nor do I ever find bee-bread in them. Early in November I close the doorways with mortar, leaving a quill as a passage for air: and it is advisable, at the same time, to hang a piece of sacking in front until early in February, in order to prevent any warmth from the sun from affecting the stock. By bee-keepers pursuing this system, they will establish really valuable colonies. The cask-hives made by Mr. Sholl, are defective, and must cause disappointment at the royal Apiary at Windsor, where some have been placed. The awkward metal entrance, when the bees can alight upon it, will in summer burn them, and in winter cramp them; and the bottomless cases, when filled, cannot be removed on account of their being fixed down with comb.—*G. L. Smartt, Enfield.*

Icehouses.—As this is the time to fill these, I cannot help sending a plan of one which I made in my park. It has never failed for these last ten years, and may be erected at a very trifling expense, provided there is at hand some straw and Ash poles: the great secret lies in the curved pipe, which is always air-tight. Line the side of the well when you put in the ice with dry Barley straw, break the ice small, and ram it tight. No bricks or lime are used. I have given the plan to all my neighbourhood, and it has never failed. The erection did not cost me 30*s.* altogether.—*G. W. Gent., Moyn's Park.*

A, Well, 8 or 10 ft. deep, by the side of ditch deeper than Well.
B, Faggots, bottom of Well.
C, Curved Lead Pipe, 5 or 6 feet long 1½ inch diameter.
D, Earth from the Well, to make it higher.

Ice.—In last week's Paper, I observe that "J. Greenshields" is this year watering his ice, in putting it up in a heap, and that he considers the plan a bad one. For my own part I can testify to the contrary. After the ice is well pounded, and put on the heap, or in the house, as the case may be, on each successive layer, after being well beat by paviour's mallets, I apply water from a fine-rosed watering-pot: the water thus applied freezes the whole into a solid body, and is the best safeguard with which I am acquainted. I have adopted this plan with the most beneficial results for several years. Last winter I filled a house during a fall of rain, and applied water as usual; the ice kept uncommonly well, and at this time (Dec. 17), there is yet a plentiful supply.—*J. D. Mc.D., Ireland.*

Singular Effects of a Storm.—I beg to give a short account of the singular effects produced by a storm that swept over this on the 3d of August last. It commenced to blow from the south-west, veering on to the south and south-east, blowing a complete hurricane, stripping the fruit-trees completely both of fruit and leaves. Of the forest-trees, many were blown up at the roots, and broke in two; the leaves that remained became scorched, and dropped off from the sides affected from the different quarters from which the wind blew. But shortly after they dropped, vegetation assumed a re-action as it were, and set forth fresh shoots and leaves; the Apple and Pear-trees had a general blossom, which remained on the trees until the middle of November. Several Lilacs, both Purple and White, broke into a general bloom, and four Laburnums of large size were fully covered with their

beautiful racemes of golden flowers, which remained until the end of November. It might be remarked, the clusters were not quite their usual length; but it was quite a novelty to behold such a general bloom at that season of the year. I communicate this as the singular effects produced on vegetation by extremes in certain localities.—*W. M. Melville, Stradey Park, Llanelly.*

Pine Growing at Thornfield.—In reply to Mr. Fullam's inquiries (p. 834) I would mention that I have tried the same practice as that of Mr. Dale for upwards of a period of nine years, and I imagine that I have during that time made some important improvements on the system, the results of which have been published in periodicals at different times. I would further state, for Mr. F.'s information, that I believe the most essential points of my present practice of cultivating the Pine-apple are entirely my own; and in order to satisfy Mr. F. of this fact, I beg to refer him to pp. 81, 82, 83, and 84, of my Treatise on the Pine, where he will find a system mentioned differing very materially from any other that has ever been published. If Mr. F. has read my book, he will perceive that I have established a practice whereby succession plants and succession houses are superfluous; previous to this, such a practice was possibly not even thought of. In conclusion, I may mention that I have so studied the real habits of the Pine, that I have rendered superfluous the routine of shaking out, potting, and repotting, &c.; and even where the pot system and fermenting materials are in use, such practices are unnecessary, except in the case of an accident occurring.—*Joseph Hamilton.*

Notes on American Plants.—I have read with interest the Notes on American Plants, by Mr. Reid, and I quite agree with him respecting Gerardia quercifolia, but not altogether as to G. flava; it being only a biennial, it would be a bad time to take up plants of it in June to send to this country. I have sent plants of it from Canada in autumn, but they did not succeed. I imagine that seeds are the only means by which plants of it can be obtained in this country. Regarding Asclepias tuberosa—amongst the many thousands I have seen of it, none were of a dazzling scarlet, but were from a pale to a bright orange; and with respect to A. quadrifolia, from Mr. Reid's description of it I imagine that he must allude to variegata. Convallaria racemosa (*Smilacina*, Pursh.), I do not consider a showy plant, certainly not so much so as Convallaria (*Polygonatum*, Pursh.), multiflora, or latifolia; the latter I have seen in Virginia, on rich alluvial land, 4 feet in height. Houstonia cœrulea I have grown many years ago as a greenhouse perennial; it requires to be frequently parted, and should be planted in small pots in a sandy soil, and when kept near the glass should be placed on a shelf in front of the greenhouse; it forms a very pretty plant. Of Liatris, the species are certainly not all natives of the southern States; the following are found in Canada, viz., pilosa, scariosa, and squarrosa. There are many beautiful plants in North America that I have not seen in cultivation in this country; among these I may mention two, viz., Bartsia coccinea, and Batschia canescens, which is pretty—it is found in Canada; and Puccoon, of the Indians, which is also a very handsome plant.—*B.*

Vegetable Instinct.—It has been to me a frequent source of thought and observation, in the animal kingdom, where to draw the line of separation between instinct and reason. The instances are so numerous in which they seem to mix with each other, and become so amalgamated in the same individual, that it seems next to impossible to assign to one a distinct character from the other. In the whole organic world—the animal and vegetable kingdoms—beginning at man and gradually descending the scale through all its gradations to the zoophytes which connect the two, and from thence to the lowest forms of vegetable life, the Lichens and Algæ, we find in each the power of adapting circumstances by which they are surrounded, so as to contribute to their benefit in a greater or lesser degree. Now this power, when possessed by man, naturalists have defined as *reason*, in animals *instinct*, and in vegetables, *adaptation*. But I imagine that, in many instances, vegetables will be found to possess the property in a degree not inferior to many animals. It would appear that this power does not decrease with the scale of animal life, as many of the lower animals possess it in a much greater degree than some far above them in the scale of organisation. The sloth and tortoise are familiar instances of the one, while the ant, the bee, and a host of subjects in the insect world, may be selected as illustrations of the other. In the vegetable world we have much which, if it is not instinct, deserves a higher title than adaptation of parts to existing circumstances. Physiologists say, that the cause of plants confined in partially illuminated places, directing themselves to any aperture admitting light, is owing to the organ or tubes of the stem next the light, being, by its action, contracted in consequence of the greater evaporation of fluids, thereby pulling, as it were, or forcing the extremity of the plant in the direction of the light. This may be correct. But if a plant in a growing state is placed in a totally dark place, in a situation contrary to its natural growth, the young branches will invariably be found to *erect* themselves. Again, by what influence, except that of mutual support (they only adopt it in the absence of any other), should direct climbing plants to cling to each other till by their united strength they raise themselves in the air? Look at others which do not twine, but support themselves by bending the leaf-stalks around any object with which they may come in contact. The Maurandyas offer an illustration of this. If a shoot of one of these be directed where there is no support, no bend in the leaf-stalk will take place, simply because it would be useless. But if, after it has grown to a considerable distance in this way, a support be placed near it, its after growth will exhibit the hooked leaf-stalk, which it will use for its support. Southey has made an instance, of what I term vegetable instinct in the Holly, a subject of poetry. In allusion to the fact of its lower leaves being prickly, while the upper ones are pointless, he says—

"Below a circling fence its leaves are seen
Wrinkled and keen;
No grazing cattle through their prickly round
Can reach to wound.
But as they grow where nothing is to fear,
Smooth and unarm'd the pointless leaves appear."

Another familiar instance, among the thousands constantly presented to us in the vegetable kingdom, occurs in the Sagittaria sagittifolia, a plant common to our rivers and streams, in the peculiar construction of the leaves, which, while they remain below the surface of the water, are merely flattened petioles; but, on their being elevated above the surface of the water, a true leaf is formed on the point of the petiole, capable of performing the functions of exhalation and transpiration—processes only requisite or capable of being performed by leaves when submitted to the full action of the atmosphere. The following is a remarkable instance of vegetable instinct, of which I made a note at the time:—In the centre of a conservatory stood a number of plants, and amongst them a Hibbertia volubilis, which had reached the extremity of its support, and continued growing until it required an additional one. At some distance—about a yard—stood another plant with a support considerably longer than that of the Hibbertia, and much above the surrounding plants. As the point of the Hibbertia continued to progress in length, it directed itself towards the vacant support, around which it entwined. Now, was the aiming at this particular spot mere chance, or was it instinct? I imagine that all analogy supports the latter. The former instances mentioned may be considered as general ones in the vegetable economy, whilst the latter may be looked upon as accidental. Although, however, somewhat in love with the subject, I am not quite enthusiast enough to rely on the statement of a writer on Vegetable Economy, who describes a species of Mimosa as being so sensitive as to nod its branches at the approach of a stranger!—*Walter Wakefield.*

Stem roots of Ivy.—In your answer to "Philokipos," in last week's *Chronicle*, it is said, "This plant does not derive much nourishment from the roots by which it is attached to walls; by no means enough to render the branches independent of the roots in the earth." I remember well when a boy, having a very large and old plant of Ivy pointed out to me growing against a wall, just after one turns up out of the High-street, Winchester, towards the barracks, the main stem of which was entirely cut off from the ground, so that there was a considerable space between the plant and the earth, and it appeared to thrive perfectly, suspended as it was against the wall, and deriving its nourishment, I presume, through the small roots from the branches.—*Winton.* [In this case it will probably be found that the Ivy had thrown true roots into the mortar joints of the masonry on which it was growing.]

Effect of Frost on Glass.—I have observed an appearance on the windows of my greenhouses during the late frost which struck me as remarkable; at least, I never happen to have noticed it before. The frost on these windows has taken the shape of leaves, much laciniated, and all of nearly the same shape and size. Opposite to the windows, and about 4 or 5 feet from them, are rows of Chrysanthemums and Oak-leaved Geraniums; the deposit of frost is not very unlike these in shape, but seems to me to resemble that of the Acanthus more than any leaf with which I am acquainted. This appearance of the frost has been constant, and if it disappeared by thaw during some hours of the day, it has invariably been renewed. I am wholly ignorant of the cause, or whether this appearance is common, or how far in any degree it may depend on the form of the leaves in the greenhouse. Being at a loss for any explanation, it has occurred to me to ask whether it can be attributed to some agency of light, such as, from very different causes, is observed in what are called photographic drawings. This mere conjecture may be quite groundless. I am quite at a loss, and if any one can assist me, either with any solution of my difficulty, or with any statement of similar appearances (for they may perhaps be very common), they will much oblige—*Ruricola II., Dec.* 14.

To preserve Gooseberries and Currants from Birds.—If the "Laird o' Cockpen" will twist some bright red worsted plentifully in and out and across amongst the branches of his Gooseberry and Currant trees, he will find this expedient, "simple though it stand there," an effectual preservative against the enemies he complains of.—*Haud ignota loquor.—Theta.*

Vitality of Seeds.—This season I have had my attention turned to some plants growing upon soils that have recently been brought to the surface of the earth, but had formerly lain long in a dormant state. It is common in this part of the country, when old clay pastures are broken up, to have a crop of Charlock; and the finer that the surface of the soil is broken, the more abundant are the plants. In a pasture field, which lately was furrowed and drained, a plentiful crop of the common Dock appeared upon the top of the drains, after they were filled in. This season a piece of ground was broken up, that had been for ages in a wild state, producing little else than Furze; the soil was composed principally of decomposed basalt—since the Furze was cleared, and the soil disturbed, a most luxuriant crop of mountain Groundsel has appeared. In another place, the same year, where a deep ditch was cut through peat, plants of Bidens tripartita have appeared, and I could not discover any plant of it growing, upon what might be called the old surface. The Rev. Mr. White makes the following observations:—"The naked part of the Hanger, at Selborne," says he, "is now covered with Thistles of various kinds. The seeds of these Thistles may have lain probably under the thick shade of the Beech trees for many years, but could not vegetate till the sun and air were admitted. When the old Beech trees were cleared away, the naked ground in a year or two became covered with Strawberry plants, the seeds of which must have lain in the ground for an age at least. One of the slidders, or trenches, down the middle of the Hanger, close covered over with lofty Beeches, near a century old, is still called Strawberry Slidder, though no Strawberries have grown there in the memory of man. That sort of fruit did once, no doubt, abound there, and will again, when the obstruction is removed." Perhaps something new may be added to the Flora of Britain, if attention was paid to the various plants that spring up when earth is disturbed, and brought to the surface; and perhaps a better opportunity never occurred than at present, for observing these things, when so much cutting for railways, and draining of land, is going on.—*Peter Mackenzie, Stirling.*

Societies.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Dec. 5.—At this, the Winter General Meeting, there was a fine display of competition fruits, especially Pears and Apples; the show of Chinese Chrysanthemums was brilliant; and the specimens of culinary vegetables were first-rate. The following Premiums were awarded:—For the two best bunches of retarded Grapes, the kind being White Muscat of Alexandria, the Silver Medal to Mr. J. Young, gr. to Mrs. H. N. Ferguson.—For the best six sorts of Pears, fit for the dessert at this season, there were ten competitors; and, after a very careful examination and trial, the Silver Medal, as 1st Prize, was again voted to Mr. Young, for Gansel's Bergamot, Swiss Bergamot, Beurré Diel, Beurré d'Aremberg, Easter Beurré, and Crassane.—A 2d Prize was awarded to Mr. Gardiner, gr. to the Earl of Stair, for Althorpe Crassane, Old Crassane, Marie Louise, Beurré d'Aremberg, Easter Beurré, and Gansel's Bergamot.—For the best six kinds of table Apples, there were seven competitors; the Silver Medal, as 1st Prize, was assigned to Mr. M'Donald, gr. to Lord Willoughby d'Eresby, for Cellini, Calville Blanche d'Hiver, Drummond Castle Pearmain, Delaware Pippin, old Nonpareil, and Golden Pippin; and a 2d Premium to Mr. Young, for Borsdorffer Hollow-eyed Pippin, Ribston, Blenheim Pippin, Scarlet Nonpareil, and common Nonpareil.—For Chinese Chrysanthemums, twelve varieties, the Silver Medal was awarded to Mr. Addison, gr. to the Earl of Wemyss, for Princess Maria, Marchioness, Vesta, La Superbe, Gem, Theresa, Clustered Yellow, Lucidum, Queen, Marquis, Formosum, and Minerva; and a 2d Premium to Mr. Young, for Queen, Gem, Marquis, Princess Maria, Minerva, Superb Clustered Yellow, Surprise, Victory, Madame Pompadour, Lucidum, and Virginius.—The culinary vegetables for which Premiums were on this occasion offered, were Brussels Sprouts and Leeks; and there were ten competitors in the former, and nine in the latter. The 1st Prize for Sprouts was voted to Mr. Lyall, gr. to Sir J. Hope, Bart.; a 2d Premium to Mr. Douglas, gr. to Sir T. D. Lauder, Bart.; and a 3d to Mr. Lauder, market gr., Musselburgh.—The 1st Prize for Leeks was awarded to Mr. Douglas; the 2d to Mr. Macauslane, gr. to Admiral Sir D. Milne, G.C.B.; and the 3d to Mr. Thom, gr. to Captain M. Innes.—At this meeting was a magnificent specimen of Luculia gratissima, in full flower. It was from the hothouse at Milbank, Canaan, and the Silver Medal was voted for it to Mr. Reid, gr. to Professor Syme.—For a dish of the ripe fruit of Passiflora edulis, and a basket of large roots of Tropæolum tuberosum, a Premium was awarded to Mr. Thomson, gr. to W. Keith, Esq.—For remarkably large and fine samples of the Marie Louise Pear, some from wall-trees and others from low standards, another Premium was assigned to Mr. Lockhart, gr. to Colonel Hope.—A basket of ripe Quinces from a standard tree at Blair Castle, under the management of Mr. Mitchell, excited much interest, that fruit being little attended to in Scotland.—Mr. Lauder sent specimens of the Vicar of Winkfield Pear.—Miss Cowan presented beautiful fruit of the Lady Apple of New York.—Mr. Wilson sent some very large Apples, considered to be the Scarlet Pencaitland Pippin; and Mr. Macdonald communicated specimens of the small Black Borsdorffer Apple, and of the large Cellini, forming a fine contrast when placed together.—Messrs. P. Lawson and Son exhibited samples of nine choice kinds of kitchen vegetables, grown at Golden Acres, including an improved triple-curled Savoy, and a very dark crimson Beet, both new to Scotland.—Mr. Murray, gr. at Taymouth Castle, sent specimens of a very large Winter Radish, the seed of which had been brought from Bohemia by the Marquis of Breadalbane, and which is now known by the name of the Breadalbane Winter Radish; Mr. Foulis, gr. at Fordel, a dish of the tubers of Oxalis Deppei, remarkable for their large size; Mr. Lothian, gr. to Mr. Campbell, a collection of vegetables cultivated with guano, sea-weed, and other substances, illustrative of the comparative value of different special manures; and Mr. Paterson, architect, very large Leeks from his suburban garden.—On the centre table

was placed, in a large flower-pot, a growing specimen of a marked variety of Portugal Laurel, from Ormiston, in East Lothian; and, alongside of it, a branch of the common Portugal Laurel, for comparison. This Ormiston variety is distinguished by being of a dense habit of growth, having thick coriaceous leaves of a dark green colour on the upper side. On some tables were arranged specimens of 178 sorts of Apples, and of 80 Pears, the produce of the Society's own garden.—Dr. Neill, Secretary, read reports from Mr. J. M'Nab, the Curator of the Society's Garden, regarding an economical cold pit for striking hard-wooded exotics, now to be seen in full action in the grounds; concerning newly-introduced varieties of Strawberry, among which the Deptford Pine received a high character, and the Ballyfairy Seedling (of Scottish origin) was also recommended; and regarding recently-introduced varieties of Raspberries, among which the Fastolff was preferred, the climate of Scotland not having proved sufficiently good for the Victoria, nor for the Black American Raspberry, sent by Mr. Buist from Philadelphia. The Secretary also read communications from Mr. R. P. Drummond, of Gwernant Park, South Wales, on the Culture of the Pine-apple, and on Growing Chinese Chrysanthemums to a very large size; from Mr. J. Wallace, on the Management of the Orange tribe at Duuemerle, where fourteen kinds are cultivated for their fruit; and from Mr. Martin, Biel Mill, on the Utility of the Sweepings of a Deer-shed in making up Cucumber-beds.—Mr. M'Intosh, of Catherine-street, Edinburgh, presented a sample of his transparent waterproof linen, proposed as a substitute for glass, which after having been exposed to the atmospherical influences for many months past, seemed still in a very perfect condition.—At this meeting the Hon. Lord Murray was chosen a Vice-President; Professor Dunbar, J. Edmond, Esq., W. Craufurd, Esq., and J. Kennedy, Esq., of the Council; and W. Steele and G. A. Esson, Esqrs., of the Garden Committee. All the other office-bearers were re-elected. Seventeen new members were enrolled.

LINNEAN SOCIETY.

Dec. 17.—R. Brown, Esq., in the chair. A paper was read from Mr. Hogg, containing criticisms on a recent work by M. Laurent, of Toulon, on the Hydræ and Sponges of fresh waters. This work, which had been presented to the Society by the author, was one of the most complete on the subject, and was illustrated by numerous coloured engravings of the various species of animals on which it treated. Mr. Hogg stated that the author of this work had not acknowledged certain observations which he had made on the locomotive power of the germinules of the Spongilla fluviatilis, (the River Sponge,) and which were published in the Transactions of the Linnean Society for 1838. In the same paper he had pointed out the close resemblance between the movements of the sporules of the Ectospema clavata of Unger. M. Laurent had noticed both these facts, but had not mentioned that they were the discovery of the author. The author then went into several details, in order to prove, in opposition to Dr. Grant, and other distinguished comparative anatomists and naturalists, that the sponges ought rather to be considered plants than animals.—Dr. Lankester exhibited a specimen of a fungus, apparently the Agaricus inornatus, from the external membrane of the pileus of which, a second pileus, with its gills uppermost, was developed. The second pileus was immediately over the stipes, and seemed to result from an extension of the growth of that organ, carrying up with it through the external membrane of the first pileus the internal or gill-producing membrane.—A specimen of the flowers, fruit, and inner bark of the Lagetta lintearia, or Lace-bark tree, brought from Jamaica by Mr. Wilson, was presented by Sir W. J. Hooker. The leaves of this plant almost always fall off in drying, except they are gathered when young.—Mr. Robert Heward presented five species of Isoetes, from Algeria, two of which were terrestrial, and the whole had been characterised by Bory de St. Vincent.

SOCIETY OF ARTS.

Dec. 11.—A paper was read on the Hydraulic Ram, by Mr. Roe, a model and diagram accompanying the communication. The machine consists of a rectangular body, at one end of which is the supply-pipe from a reservoir of water collected from a running stream. At the top of the body, at one end, is a circular pulse-valve—at the bottom end, a spherical air-chamber having a circular neck, into which is inserted a pipe leading into the cistern to be supplied with water. The action is as follows:—The water entering the body of the ram with a pressure in proportion to the area of the supply-pipe and fall, closes the pulse-valve, and immediately enters the air-chamber through a valve in its neck. The air in the chamber being compressed, causes the neck-valve to be closed, and thus liberates the pulse-valve. When the air in the chamber is sufficiently compressed, some of the water therefrom is forced into the pipe leading to the cistern. The same action is continued as long as the ram is supplied with water from the head. The son of the celebrated Montgolfier introduced a small valve into the neck of the air vessel, to supply it with fresh air, but the author is not prepared to say that it is successful in practice. By this machine, with a 10 ft. fall, a column of water, 150 ft. high, may be raised at the rate of 5 quarts per minute—thus giving one part raised to 11 wasted. There are many situations where small streams, now running to waste, might be rendered available for the supply of houses with water, at a very small cost.

Miscelianeous.

The Geological Society.—We have great satisfaction in announcing the appointment of the Rev. Mr. Ansted as a successor to Professor Forbes in the important office of Librarian to this Society. Mr. A.'s late work on Geology is a guarantee of his perfect fitness for the difficult task he has undertaken. We understand that the Society has determined upon the publication of a Quarterly Journal of Geology, of which Mr. A. will be the Editor.

Sidney.—We extract from Simmonds's "Colonial Magazine" for December, the following, being the average quantity per acre of agricultural crops produced annually in New South Wales during the last ten years, viz:—Wheat, 14 bushels; Maize, 17⅓ bushels; Barley, 15⅓ bushels; Oats, 13½ bushels; Rye, 13½ bushels; Millet, 4⅓ bushels; Potatoes, 2½ tons; Tobacco, 7 cwt.; and Hay, 1⅓ ton.

Mr. Linden's Plants.—We understand that this enterprising traveller, who has just returned from Cuba with a large quantity of valuable plants, which have been sent to Brussels, intends to offer them for sale in the ensuing spring. The plants in question were partly collected in that island, and partly in the unfrequented regions of Merida and Cauca.

Tara Palms.—There is a system in some parts of India, of planting these in the trunks of decayed Peepul trees. The first which I saw I supposed had been sown there by accident; but I soon found that the practice was frequent, and that the Peepul thus treated had generally the greater part of its branches and all the top cut away, to favour the intruding plant, which stands as if it were in a rude flower-pot. The hollow part of the tree must, I suppose, be previously filled with earth. A very excellent fence is thus obtained for the young Tara-plant; but I conclude that they are not Hindoos who thus mangle and violate the sacred tree of Siva.—*Bishop Heber's Indian Journal.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

The usual mode of inducing shy blooming plants to produce flowers is to cramp them in small pots. We have no such control, however, over Orchidaceous plants, for, if we attempt to confine their roots, we disarrange their economy, and endanger the existence of the more delicate species; but as most of them will exist in a dormant state for many months, if moisture is withheld from their roots, we can thus compel them to alter their natural time of growth to suit our own seasons. Spring and autumn growth should, therefore, be discouraged by these means, with all the shy-blooming kinds. The experiment should commence now by keeping them as cool and dry as they can bear for two months, and in spring by increasing the heat as the season advances, but still withholding water till early in the summer, and then giving it only when their buds are ready to start. (*To be continued.*)

Conservatory.—For the last three months great expectations were entertained by many cultivators, that a new race of beautiful Achimenes would be originated to decorate the conservatory late in the autumn, by crossing A. picta, which seeds freely, with the pollen of hirsuta and pedunculata, which appear to have the nearest affinity, but in many cases the experiment has failed. This may, however, be owing to the lateness of the season when the experiments were begun; therefore it must be resumed earlier next season. We all know of Mr. Knight's experiment in seeding Potatoes that refused to do so by ordinary cultivation. The same process may be tried with this family; it is to prevent them forming underground tubers, and thus to compel the energy of the plant to expend itself in the formation of seeds. At this season, when forced flowers are introduced, no air should be given to this house, not even in the finest weather that we experience at Christmas.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out door Department.

In reply to "M. D.," p. 813, I would say that calendarial notices must necessarily be general, and therefore, their application must depend upon the persons for whom they are written. Far be it from my wish that "M. D." should leave the leaves, so as they would be a nuisance to his employer. These things must, however, be left to the common sense of readers. In reply to the question, "What would have been the result of plants planted in such a way (with the holes filled with fresh leaves), after a summer like the past?" I would answer that in the case of plants so planted twelve months back, some of them 6 feet in height and as much in diameter, they have grown splendidly, and are now beautifully studded with flower buds; they required but little water, though planted on sand, as the leaves absorbed it from the earth by capillary attraction; and as for being blown out of the ground, they never moved an inch from the position in which they were first placed, though they were exposed to the four winds of heaven, as single specimens upon a lawn. The weather during the last fortnight has been very trying for tender plants in the open air, but the wood being well ripened, they have not suffered so much here from 20° of frost as they did last season from 7°. Last year the flower-buds of Magnolia conspicua were killed here in November; at the present time they are as sound as can be desired; Fabiana imbricata is dead, but Ceanothus divaricatus, freely exposed in a pot, is uninjured. Keep the lawn and walks as tidy as possible, and roll them whenever they are dry.

Pits and Frames.—Keep the plants in these structures as hardy as possible, by fully exposing them in mild weather, but do not give them any more water than is absolutely necessary. Remove all decayed or decaying leaves, and keep the atmosphere as healthy as possible.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Carnations.—After the very severe frost we have had, the cultivators of these flowers will be able to appreciate the advice we have so earnestly endeavoured to inculcate—that of the paramount necessity of potting layers off early, so that they may be enabled to withstand frosts like the one we have just experienced, without the frame-lights being constantly closed. As soon as the weather will permit, the stock of layers should be looked over, and carefully cleaned. Give air day and night under the frames, and in fine weather remove the lights altogether. They do not require much water at this season, especially if the soil in which they are wintered is of a close texture. *Auriculas.*—Take care that these plants get *no drip*, and that the covering, whether glass or prepared calico, is perfectly *waterlight*. Attend to the routine laid down in previous Calendars. *Pansies.*—Those wintered in soil of too rich a nature have suffered most. These, with late planted ones, have sustained a severe check. Pansies, in order to stand the severity of the weather, with little or no covering, ought not to be of too gross a habit. Look over seedling-beds, as the roots of many will be thrown out by the frost; these must be carefully re-planted. *Tulips* will now each succeeding week be getting nearer to the surface; some slight protection will be necessary where they are grown for exhibition, in order to prevent all possibility of injury to the embryo bloom. Hoops over the beds, on which mats may be thrown, will be sufficient. Where the roots are not of so much consequence a few leaves will prove equally efficacious. *Pinks* may be sheltered with small pieces of Spruce Fir-boughs stuck round the beds. In snowy weather rabbits and hares devour them with avidity where they happen to be exposed to their depredations. Continue to turn over, and make composts at every opportunity.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Where a supply of Pines is required throughout the year, it is sometimes necessary at this season to subject some of the fruiting plants to a high temperature to start them into fruit. If a few of these most likely to fruit soon can be put into a house or pit by themselves, where a temperature of from 65° to 70° can be maintained by night, and 72° by day, with about 85° of bottom-heat, it will bring on the fruit. The other plants can then be kept at a moderate temperature till the end of January; this will prolong the succession of fruit, and be much better than subjecting many plants to a high temperature at this dull season.

Vineries.—By the time the "shows" appear, let the temperature by fire-heat range from 55° to 60°. Look to the bending down of any long shoots of last year, in order that the buds may all break. Keep the atmosphere as moist as possible.

Peach-houses.—Attend to the directions given in former Calendars.

Cherries.—In some gardens portable glass cases, of a steep pitch are employed for forcing Cherries trained on hot walls. This is an excellent mode of forcing for early crops, as the steep pitch of the roof enables it to transmit the rays of the sun more directly at this season.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN

Fruit tree Borders.—As there is comparatively not much of importance to attend to at this season, a good opportunity is afforded for renovating old borders, or forming new ones. The first thing to be attended to, after removing unfavourable soil, is to render the border dry by forming a drain in front, the top of the drain being deeper than the bottom of the border, giving that bottom a good declination from back to front, and then rendering it impervious to the roots of trees by any of the methods previously referred to, of which we would prefer grouting with lime and gravel as the best and cheapest. The forming of this hard bottom might be dispensed with in favourable circumstances, particularly if there was no necessity for cropping the borders, as then, by mulching the surface, the roots would be encouraged to rise to the top. From 1½ to 2 feet would be depth enough of good soil, where healthy fruitful trees, in opposition to mere luxuriance, was the object, giving the greater depth to Pears, Plums, Vines, &c., and the lesser depth to Peaches and Nectarines. The next thing is the obtaining a good supply of hazel-coloured loam, if it can be procured, which will answer admirably of itself for Apples and Pears; for Plums, if kept somewhat adhesive; for Cherries, if sand or road drift is added for the tenderer sorts; for Peaches and Nectarines with the addition of about one-third of road drift or sandy matter, and a little leaf mould, if the soil is naturally adhesive, and for Apricots, with less sand than for Peaches, and of a greater depth. For Figs, it will be advisable to restrain the extension of the roots, to keep the tree growing from one stem instead of suckers, and to supply necessary nourishment by mulching. For Vines, the same soil will suit well, but it must be incorporated with calcareous matter, such as limerubbish, &c., and well manured with broken and bruised bones, in preference to hot-bed or other manure, as being more lasting in their effects, and because the latter, when buried deep, becomes effete for all useful purposes, by being placed beyond the decomposing influence of atmospheric agency. The addition of brickbats and large lumps of porous sandstone interspersed in the border, so as to keep it open, will be an advantage.

Celery and other Vegetables.—Now that the frost has left us, look over and remove all parts that have been much affected, which will not only preserve what is left from rotting, but free the garden from an unpleasant nuisance. Owing to the change coming so gradually, and being unaccompanied by sunshine, vegetables have suffered less than we might have expected. *Hand Lights.*—These now in general use in most gardens, consist of cast-iron frames with moveable tops. They are certainly very useful for almost numberless purposes. The great drawback to the more frequent use of them is, their first expense, and still more troublesome expense for repairs, as, independent of all regulations to the contrary, the appearance they often present would indicate that there must be some strong attraction between their sides and the tool, or foot of the workman. To lessen these sources of annoyance, the bottom part of the frame might consist of wood or zinc, without much impairing its general efficiency; or, better still, small wooden boxes might be substituted, having a sliding sash, glazed with small squares, such as may be seen at Mr. Weeks's and other builders, and which, so far as I recollect, were recommended by Mr. Forsyth some years ago. *Clay Burning and Charring Refuse.*—This will also be found a favourable opportunity, in the case of very adhesive soils, for burning the most retentive part of it; using for this purpose the prunings of bushes, trees, and any other rubbish. The scattering of the burned part will greatly ameliorate the working of the soil; or, if it be deemed preferable, such prunings, along with Cabbage stems, old tan, sawdust, &c. may be charred, and then the produce will be a useful top-dressing for Onions and other crops. *Routine* as in former Calendar.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Continue, when the weather is frosty, to fell trees whose bark is of no value. Oak trees with the bark on may also be felled now when extreme durability is desired, the winter months being the most suitable time for the operation; frosty weather is best for clearing the woods of timber and spray. Cut away Briers, Thorns, Furze, and other injurious stuff from young maiden plants springing up in brakes or thickets of undergrowth, and train them in the way they should grow.

Coppice.—See last week's Calendar.

Young Plantations.—The thinning out of Larch and other Firs, and clearing away the produce, may be proceeded with. The present is fine weather for such operations, which can be done now much more expeditiously than when there is snow on the ground.

Hedge row.—In weather like the present, plash, cut, and fell useless and injurious trees. Reduce overgrown hedges into narrower compass, and scour out ditches.

Nursery Work.—Operations in this department are nearly at a stand-still while the present frosty weather lasts.—*W. B.*

VII.—COTTAGERS' GARDENS.

If the cottager wishes to have a dish of Seakale towards the beginning or middle of February, now is the time to make preparation for obtaining it. If a small quantity of leaves can be collected for the purpose of mixing with a little stable dung or other litter, which will cause a gentle fermentation to take place, there will be little difficulty in effecting this object. Let the roots be covered with tolerably large flower pots; any old partly broken pots or other material that will keep the manure off the tender shoots are suitable for the purpose. On these shake a sufficient depth of fermenting material to raise a heat of from 50° to 60°. The heat may be less, but should not exceed 60°, or the stems will be weakly and drawn. In the same manner Rhubarb may also be produced early; but in the case of the cottager possessing a warm, dark room or cellar, where potted roots can be placed, Rhubarb may be produced with greater certainty, and with less trouble. At this season, under the constantly varying weather, little can be done in the kitchen-garden. In light dry soils, however, a

small sowing of the Early frame Pea may be made; they will come in a little earlier than those sown in spring. Raspberries, and all kinds of fruit trees, may now be pruned. With regard to the former, which produce their fruit entirely on the previous year's wood, the old shoots should be removed, and four or five of the strongest of the young ones tied up in their places, cutting clean off by the root all the rest of the young shoots. After they are tied up to the stakes, shorten them to 4 feet in height. In exposed situations, a good way of training Raspberries is to tie the points of one-half of the shoots on the stools respectively with each other, thus forming arches, which have rather a neat appearance. Those Cottagers who possess a frame, containing a few choice plants, should keep a sharp look-out for insects; for in winter, the plants being comparatively inactive, cannot readily put forth fresh leaves to compensate for any destroyed. Keep everything inside the frame as dry as possible, and give air every fine day, when not too cold.—*J. Mc H.*

State of the Weather near London for the week ending Dec. 19, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th, 1827—therm. 58°; and the lowest on the 24th, 1830—therm. 10°. The average temperature of the night of the 25th is lower than that of any night throughout the year.

Notices to Correspondents.

Back Numbers of the Gardeners' Chronicle.—So many Back Numbers are now out of print, that we think it will save all parties trouble if we publish a list of those which may still be had. Any subscriber who will forward to our publisher Post-office stamps equivalent to as many Numbers as are required, shall have them sent free by post:—

1841:—1, 6, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 52.

1842:—4, 6, 8, 11, 18, 30, 42, 43, 47, 48, 49, 50, 51, 52.

1843:—10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 50, 51, 52.

Achimenes.—*H. G.*—The Exhibition Committee not having stated the depth of the pans in which these plants are to be grown, we have no authority for doing so. It is, however, obvious that the word is to be taken in its common acceptation, and as distinguished from a *pot*. We apprehend that a pan is a vessel much broader than deep; and a pot on the contrary is much deeper than broad. A vessel which shall be of equal breadth and depth, or nearly so, is neither a pot nor a pan. As to the sorts of Achimenes, you will see that *6 species* are required. If gardeners are so ill advised as to exhibit varieties of A. rosea, or longiflora, as species, they will be disqualified. The species of Achimenes are, 1, rosea; 2, coccinea; 3, pedunculata; 4, longiflora; 5, multiflora; 6, hirsuta; and 7, picta. All can be easily had except multiflora, which is not much worth growing, and is not required to make up the number.

to find his questions noticed along with other information relating to Bees, in due time for him to begin his apiary.*J. W.*

Bignonia jasminoides.—*Z.*—It was a mistake of one of our correspondents to suppose that there are two sorts of this plant. There is but one. The difference lies in the skill of the cultivator.

Books.—*T. J.*—Newman's book is published by Audot, 8, Rue de Paon, Paris.——*H. M.*—There is no book on Entomology fit for gardeners. The best articles we have are those which appear in this Journal. Study them, and you will know as much as is practically useful.

Calceolarias.—*A Constant Reader.*—Kinghorn's Duchess of Sutherland and Professor Wilson; Standish's Guercino, Celebration, and Illumination; Green's Zebrina.*——*J. M.*—Green's Prince Albert, Miss Antrobus (improved), Alba coccinea maxima; Barnes's Bridesmaid; Holmes's Prince of Wales, and Standishii.*

Cinerarias.—*C. J. R.*—Red Rover, Captivation, Henderson's No. 7, and Regina Victoria.*

Creepers.—*Northwood.*—Cut back the withered branches of such plants as Clematis—but not till the spring, when they are beginning to shoot.

Cement.—*A Constant Reader.*—Do not use iron cement at all; it is a very bad material in some respects, though useful in others. Its badness consists in the difficulty of ever getting it out of a joint into which it has been introduced, and thus apparatus cannot be used again, if it requires to be taken to pieces. Its use consists in its excellence as a cement. But the same excellence is found in rope untwisted, smeared with red-lead and oil, and driven by iron tools into the joints; and that sort of cement may be, of course, removed by burning.

Filbert trees.—*A. W.*—Filbert trees will not bear well as underwood in plantations, except, perhaps, in peculiar situations, such as those in which the wild Hazel grows naturally, on steep banks facing the sun. A loamy soil, not too deep, is proper for them. They require pruning; but the mode must be varied according to the soil and situation. Your trees, 3½ feet high, ought to bear the second year after removal.‖

Forest trees.—*J. D.*—Leave the shoots to become trees; there is little fear of their blowing off at the stool. When branches grafted on large arms of fruit trees are blown off, the cause of such an accident is quite unlike anything that can occur to strong shoots from the stumps of forest trees.

Fruit-trees.—*W. D.*—The following will probably succeed in the north of Scotland, if you keep their roots near the surface:—Apples, dessert—Oslin, Early Red Margaret, Pitmaston Nonpareil, Wormsley Pippin, Ribstone Pippin, Baxter's Pearmain, Court of Wick, Claygate Pearmain, Pearson's Plate, Braddick's Nonpareil, Scarlet Nonpareil, Sturmer Pippin, For kitchen use—Dumelow's Seedling, Tower of Glamnis, Keswick Codlin, Hawthornden, Bedfordshire Foundling, Round Winter Nonesuch, Mère de Ménage, Northern Greening, Royal Russet, Waltham Abbey Seedling, Yorkshire Greening, Rymer. Pears—Hessel, Gratioli (of Jersey), Winter Nelis, Althorp Crassane, Knight's Monarch.‖

Game.—*D. C. L.* says—"In your answer to a correspondent who complains of his plantations being injured by game, you say that he has no remedy; and you speak of the hardship of the Game Laws. I beg to observe that everybody may destroy rabbits on his own land; as to hares, if they are so numerous as to do the mischief your correspondent complains of, he may catch enough to pay for a game certificate; where, then, is the hardship?"

Glass.—*G. S. L.*—The objects of using sheet glass are these:—1, security against hail, which is afforded by its thickness and elasticity; 2, good appearance, large squares of glass being handsomer than small ones; 3, increased light, the opaqueness of laps being avoided. It is obvious that the two last objects are best attained by having the squares as large as possible; and we do not think the first will be interfered with: of that, however, we have at present no direct proof. If you have small squares of sheet glass you have more expense in the glaziers' labour than if you have large ones. At Chatsworth the squares are nearly 4 feet long in "the great Conservatory." We should, however, think that for general purposes 18 inches are enough.

Greenhouses.—*Anon.*—The use of hollow walls in greenhouses is partly to keep them warm, and partly to keep them dry. They also should be rather cheaper than solid walls. They have no other advantage. When a room has had the dry-rot, nothing is gained by flooring it with Oak—for dry-rot fungi will attack one kind of wood as readily as another; and as for Oak, just think of what happens to ships. If you can get the timber thoroughly soaked in sulphate of iron, or corrosive sublimate, or chloride of zinc, any of those substances will protect it; but it must be thoroughly impregnated.

Heating.—*Z.*—If you take the lids of troughs off, in a *greenhouse*, in winter, you will kill or spoil all your plants. A *greenhouse* should be kept dry in winter. Give greenhouse plants a moist atmosphere when they are about to grow, and in full growth, and at no other time.——*A Beginner.*—By all means use iron troughs with moveable lids. Use one row only of such troughs. It is plenty. Certainly, glass frames for guarding the Vine border are much better than anything else; and you will not want pipes.

Indian Cabinet.—*E. M.*—If you will refer to p. 798 you will find an answer to your question.‡

Insects.—*Z.*—We never heard of such an insect as Tentania aurata, and imagine it must be a misprint. We hope some one acquainted with the species will be able to give us its correct name, and the family to which it belongs. *R.*——*H. R. S.*—Thanks for the worms: they are, we believe, the Gordius argillaceus. *R.*——*W. S. S.*—The dirty gummy exudation on your Rhododendron leaves may be caused by insects, but we can find none on the specimens sent. If you can detect any, and will inclose them in a pill-box, we will tell you their name. *R.*

Manure.—*T. D.*—The must or marc of a cider-mill is of very small value. Throw it to the dunghill; it will be of a little use there, and there only.

Misletoe.—A correspondent reminds us that we did not name the Whitethorn as one of the trees which this plant affects. We beg to supply the omission now. There is nothing which the Misletoe prefers to Whitethorn, Apples, and Crabs.

Names of Fruits.—*C. H. W.*—1, Dumelow's Seedling: 2, Court of Wick; 3, 9, Rymer; 4, Dumelow's Seedling; 5, King of the Pippins; 7, Dutch Mignonne; 8, Beauty of Kent; 10, Fearn's Pippin; 11, Uvedale's St. Germain.‖——*A Constant Reader.*—1, Keswick Codlin; 2, Hollow-crowned Pippin; 4, Kentish Fill-basket; 5, London Pippin; 6, Pomme de Neige; 7, Crimson Queening; 8, Luccombe's Seedling; 9, Northern Greening; 10, Margil; 11, Stagg's Nonpareil; 13, Ross Nonpareil; 14, Syke House Russet; 15, Pearson's Plate.‖——*J. F.*—1, Blenheim Pippin: 2, Rhode Island Greening; 1, Glout Morceau; 2, Colmar; 4, Crassane.‖——*C. W. K.*—1, 8, 10, Pomme de Neige; 2, Ribston Pippin; 3, King of the Pippins; 4, Blenheim Pippin; 5, Gravenstein; 6, Braddick's Nonpareil; 9, Margil; 11, Scarlet Nonpareil; 12, Easter Pippin.‖——*J. M., Cheshire.*—1, Stagg's Nonpareil.‖——*W. G. H.*—Your Apple is the Newtown Pippin, and a fair specimen for this climate.‖——*M.*—Your Apple is the Turk's Cap.‖

Names of Plants.—*Constantine.*—1, Polypodium vulgare; 2, Ceterach officinarum; 3, Rumex sanguineus.§——*A. M.*—Ophiopogon spicatus; if you wish for correct names you should send good specimens. How is anybody to judge correctly of such a morsel as you sent before?——*G. W. H.*—Some species of Trichosanthes, a poisonous gourd; the species not determinable from such a bit as you have sent. The Fox Grape is Vitis vulpina, and derives its name from the foxiness of its ripe berries; some persons like the taste, we think it particularly disagreeable.——*S. W.*—Apparently the smooth variety of Rosa Carolina; certainly not R. lucida. ——*N. Mitchell.*—Ceanothus azureus.——*A Constant Reader.* The double dwarf Almond (Prunus japonica).——*E. C.*—Pitcairnia flammea, not staminea.——*B.*—Oncidium sanguineum. ——*C. W. K.*—Eulophia macrostachya.

Natural Classifications.—*A Student.*—We have your paper in type: but neither we nor our printers can decipher some parts of it. Will you give us your address, and read the proof yourself?

Pears.—*W. Bartlett.*—The gable end of a house, 27 feet by 20 feet high, is an excellent situation for Pears. If the soil is good the roots will thrive very well beneath the paving bricks. Marie Louise and Glout Morceau are suitable varieties to plant.‖

Pelargoniums.—*I. M.*—Matilda, Luna, Sir R. Peel, Erectum, Pulchellum, and Duke of Cornwall.*

Rainwater.—*R. B.*—For conducting-pipes zinc is useless. Lead has the evil of contaminating the water, and the purer the water the more the mischief. We should have said use cast-iron pipes; but since you do not like them, you must take refuge in glazed earthenware.

Roses.—*J. C. Clinch.*—If you put your Tea Roses under a north wall, without protection, you may reckon upon losing them, if the winter is severe. But if you protect them well with straw, they will, probably, take no harm there, especially if a sheltered place can be found. You are well advised not to plant them under a south wall; they ought to be kept back in the spring.

Saraxis.—*F. W.*—Pot them now in stiff loam, not clay, in pots thoroughly well drained. Check them in winter by keeping them cool, and give them a little bottom-heat, if you can, when they begin to grow in earnest. These rules will bring you good flowers.

Stables.—*Equus.*—We would place a loft over a stable, if it was possible to do so, because of its convenience, and because, as the ceiling will then be of the same temperature, or nearly so, as the stable itself, the steam from the horses will not be so likely to condense upon it. We have, however, put your question in the hands of a friend conversant with such matters, and his answer is this:—"We do not understand how a loft should preserve a stable from damp, nor how, under all circumstances, it should cause warmth. An inclosed space, whether it be a loft or merely the triangle of the roof, will produce a more equal temperature in the apartment beneath than when the rafters themselves form the ceiling, even though they be plastered. A stable or a chamber which is immediately under a roof will always be cold in winter and hot in summer. The ventilation of a stable is best effected by a wooden trunk six or eight inches square over the head of each horse, rising above the roof, and terminating in a cowl, or in a cap, so as to prevent the possibility of a downward current. To insure this, there must of course be provision for admitting fresh air at some place not liable to give the horses cold; and such a place is much more easily found in a large than in a small stable. The comfort of the horse is much promoted by paving each stall with a comparatively small descent from head to heel, but with a considerable fall from each side to the centre. Above all, let the floor of the stable be higher than the surrounding earth, especially on a clay soil."*A.*

The Naturalists' Almanack.—We have received from a gentleman who claims the authorship of this production, noticed at p. 815, an angry letter, complaining of the manner in which it was criticised. We had no idea that so estimable a naturalist as Mr. —— was concerned in writing it, and we have too much regard for his reputation to make matters worse by publishing his letter. Upon looking to the work in question we must say that we agree with the writer of the critique in the opinion he expressed about it. Our correspondent excuses himself for the meagreness of the information it contains, by his "being limited to a certain number of pages;" and he denies the truth of the critic's complaint that his nomenclature of insects is such that "our best Entomologists are sometimes puzzled to know what the insects are to which the names belong." The first excuse is inadmissible; and with regard to the second, we will only ask where the English reader will find the following genera:—Euthalia Anthocaris, Steropes, Tephrosia, Chariptera, and Argo? They do not occur in the works of Curtis or Stephens, and have never come under our own observation.

The Weeping Hawthorn.—*H. I.*—This is Cratægus oxyacantha pendula; it in no way differs from the common Thorn, except in its habit being more pendulous. There is no distinct species with that habit or name.¶

Transmutation of Corn.—Our kind correspondent, under date, Cork, Dec. 13, will see by our statement last week, that the information had been previously obtained. Everybody is liable to such things; and no people more than Editors of Newspapers. There is no harm done after all.

Verbenas.—*C. I. R.*—Youell's Princess Royal, white; Girling's Boule de Feu, orange scarlet; Amethystina, lilac; Melindres superba, scarlet; Catleugh's Ne Plus Ultra, rose; Ivery's purpurea perfecta.*

Vines.—*A Subscriber, Limerick.*—For a Peach-house, and as a succession, Black Hamburgh, Royal Muscadine, Black Prince. The Victoria Vine is considered the same as the Black Hamburgh.‖——*Walter.*—The White Muscat of Alexandria has not been surpassed in point of flavour by any new introduction yet known. You may therefore plant 2 of it in your hothouse; 1 White, and 1 Black Frontignan; 1 Black Prince; 2 Black Hamburgh; 1 Black St. Peter's.‖——*F. G. C.*—2, Black Muscat of Alexandria; Black Damascus, White, Black, and Grizzly Frontignans; or, as these three ripen about the same time, if you omit the White, according to the conditions of your request, you must plant another White Muscat of Alexandria in addition to the one you had previously determined on.‖

Vine-borders.—*M. C. D.*—Pebbles buried in the earth cannot warm it, but they assist in keeping it drained and pervious to the air; and if by that name you intend fragments of sandstone, they are useful as a means of retaining moisture in dry weather. Be sure to keep your border *sloping at the bottom towards one corner*, and have there a drain to carry off the superfluous moisture.

Walnut Trees.—*T. R. H.*—The distance at which these should be planted ought not to be less than 30 feet. In rich soil, 60 feet would not be too much. "Juglans," p. 798, estimates 160 trees to an acre, or 16½ feet distance each way, on land worth 2*l.* rent per annum; but this, as you observe, is certainly far too close. The French allow from 30 to 72 feet distance, according to the soil.‖

Weeds in Manure.—*A. W*—The best way of destroying the seeds of weeds in manure heaps is to mix the latter, in turning over, with such substances as will induce fermentation, and consequently heat, and germination of the seeds; for in the absence of light the vegetation of these beyond a certain stage must cease.‖

Miscellaneous.—*W. A. C.*—Your Oranges seem to be suffering from want of warmth, and probably also from the soil not being rich enough. Perhaps, too, they are overwat at this season. At all events, bottom-heat, and very str rich manure, will recover them. It is possible that they may have been a little sunburnt; but syringing would not have prevented that.——*An Old Correspondent.*—Send out your seeds in a thin canvas bag, and get somebody to hang it in his cabin. If you cannot do that, put the bag in a deal-box and insure its being kept in a cabin. If it is sent below, the seeds will for the most part die. Portulacas, Impatiens, Convolvuluses or Ipomœas, Cockscombs, Balsams, Globes, and all sorts of what are called *tender annuals*, are the most suitable for Jamaica.——*A Subscriber.*—A suitable soil for Pears is good, rather strong loam, from the surface of an old pasture. It may be moderately enriched with manure, which should be well mixed with the soil. Cucumbers will succeed in soil composed of three-quarters light rich earth, the surface spit of old pasture lands, one-eighth well-decayed leaf-mould, and about the same quantity of rotten dung. Collect leaves now, and lay them up in a heap in the compost-ground to rot. When well decomposed they form an excellent ingredient in compost for many purposes.‡——*Constantine.*—Rub the mouldiness off the bottom of the bulbs of your Hyacinths, which are otherwise doing well. Put a lump of charcoal into the water. In this way the mouldiness may be prevented.‡——*J. Watson.*—In gathering Mushrooms it is of no consequence whether you pull the stalks up with them or cut them close off. Either of the two ways will do equally well.‡ ——*Amidas.*—Ceratylis signifies having horns (*vide* Lexicon). Leschilus belongs to the ♀ of Orchidaceæ called Vandeæ. ——*W. Cov.*—Take a camel-hair pencil, and with it brush the pollen out of the anthers, and apply it to the stigma. That is the meaning.——*A. A.*—We are sorry we cannot encourage you in your poetical aspirations.——*gobey.*—We prefer the first of the two methods. In cutting in close to your buds, you must use some mechanical means of preventing them being blown off by the wind, and for that purpose you had better tie a slender piece of stick to the budded branch, and then fasten your bud to that as it lengthens. Do not cut back till your buds have made a fair start.——*L.*—Tree leaves may be collected into a heap now; let just as much light earth be thrown over them as will prevent them from being blown about by the wind. In this state let them lie until May, and then turn them over, and mix them well. They will be rendered into mould fit for use by next spring.‡——*Tamarisk.*—Your question cannot be answered briefly. We will give you a reply, before long, in a Leading Article.——*C. I. R.*—You had better apply to a nurseryman for six of the most distinct varieties of Antirrhinum.* —— *Globosa.*—Thanks; your descriptive list is under consideration.*——*J. D., a Subscriber.*—There are practical difficulties in the way of the suggestion made, or it would be adopted.

*** As usual, many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

FARM WANTED, to contain from 50 to 100 Acres. or thereabouts, of good light soil, of 1½ to 2 feet deep, with or without a residence. If within 20 miles of London and near a railroad station it would be preferred. Particulars to be addressed to A. B., Mr. Wacey's, Old Jewry, London.

The Agricultural Gazette.

SATURDAY, DECEMBER 21, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Dec. 26—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Jan. 1—Agricultural Society of England.
— — Highland and Agricultural Society.
THURSDAY, Jan. 2—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Dec. 23—West Hereford. Fairford. Wenlock.
Dec. 24—Yoxford.
Dec. 24—Framlingham. Rayleigh. Wickham Market.

IT may be thought by many very ill-timed to bring REMARKS ON HYBRIDISING under their notice in the month of December—we shall not fail to recall the subject to their minds at a more *seasonable* opportunity;—our chief object in introducing it now is to recommend it as one on which attention might be usefully bent during the still long interval which must elapse before its processes can next be applied.

Here let us request the reader to refer to the Leading Articles on the horticultural side, at pages 443, 459, and 587. It is when discussing such topics as these that the farmer and gardener feel themselves to be standing on common ground—the principles of vegetable physiology alike control or assist both: it is on such occasions as this that the usefulness of connecting a *Gardeners' Chronicle* with an *Agricultural Gazette* most strikingly appears. At these pages statements will be found of the natural law on which the process of hybridising depends, and of the many instances in which it has proved a useful instrument in the hands of the gardener. It is unquestionably a process to which—excepting where it has been conducted by the hand of Nature—agriculture has hitherto been but little indebted; and yet, looking at the triumphs which have been achieved by it in horticulture, it is one from which, were it skilfully conducted, the farmer might surely anticipate much benefit. If properties purely *ornamental* have in this way been conferred on some plants, it is reasonable to expect that those which are *useful* may similarly be conferred on others. There is nothing in the principle of the thing more extraordinary in our being able, by any means, to influence the growth of tubers, bulbs, or grain, than in our ability to regulate and increase the size and beauty of a flower: the latter has been frequently exhibited by means of hybridising, in the hands of the gardener, and the former by the same means, we may believe, is equally within the reach of the farmer. But we need not reason on mere probabilities, for we find, on turning to page 443, that the size and quality of *fruits are* capable of improvement by the process: the same truth is illustrated in an article on the cultivation of the Apple, in this day's Paper. And, what is perhaps of still greater agricultural importance, we find, at page 587, that "to render tender plants hardy, to make barren races fertile, to exchange early for late varieties, are all results which have been gained by hybridising, and may therefore be gained again." Now, while we confess that this process, *as an art*, has, so far as we know, been hitherto of little use to agriculture; and that such inquiries as we have made into the history of some of our varieties—for instance, of Wheat and Turnips—in the hope of finding that they had an artificial origin, have ended in disappointment; yet, with *the facts* before us with which the history of gardening abounds, it is impossible to suppose but that hybridising might be made a useful instrument in the hands of the farmer. We know that the practice has frequently been tried, and that difficulties exist in the way of its useful application—difficulties, however, which, if we may reason from the new and improved varieties every now and then springing up in our fields (see p. 740, *b*), do not appear to surround the process when Nature undertakes the manipulation of it: but to all this we shall at *another time* advert.

While our object is chiefly to draw the attention of our readers and *correspondents* to this subject in its more immediate application, we wish also, before concluding, to speak of its results in that portion of the *animal kingdom* with which the farmer is connected. These are well exhibited in such Shows as that which took place at Smithfield last week, and those which occur at the annual meetings of our national and provincial Agricultural Societies Looking at these exhibitions, we may safely adopt the style of a quotation above, and say that—To increase the size of cattle, sheep, and pigs, to improve the quality of their flesh, to promote their aptitude to fatten, to approximate their form to some assumed standard of perfection, to excite the growth and quality of wool, to exchange early maturity for a tedious process of feeding, are all results which have been obtained by hybridising—that is, by attention to what long practice has shown to be the correct art of feeding.

Now, we do not wish here to draw any fanciful analogy between the vegetable and animal kingdoms, and infer from all this that great improvements in agricultural *plants* will yet arise from the skilful practice of hybridising—the probability of this we have already shown; but we may safely assert that the same activity and energy to which the above valuable results are owing, and which have doubtless been in great measure excited in breeders of stock by the annual award of valuable premiums for the best animals of their kind, may similarly be excited and maintained in those whose attention is directed to the improvement of vegetables. The comparative neglect with which the claims of *these* to the patronage of our national Agricultural Societies have been treated, cannot certainly be defended on the score of any alleged insignificance of the subject. Why! it is next to axiomatic, that of the two branches of farming—the *production* of food, and its *conversion* into beef, mutton, &c.—the former is the *more important*;—that cultivation proper, to which we owe grain and other esculents, food for man—as well as roots and forage, food for beasts—is greatly more important than that branch of farming which takes account merely of the breeding and feeding of live stock. One reason of the neglect to which we allude probably lies in the difficulty of fairly estimating the value of vegetable specimens; they depend so very much on their treatment, independently of any *specific* distinctions which they may possess, which alone, it is to be observed, should be the subject of reward. To this question we shall return at some future period; in the mean time, we take the opportunity of laying before our readers the following communication, from the late Sir F. A. Mackenzie, in the spirit of which we entirely agree: it was published in an early Number of the *Gardeners' Chronicle*, for 1842:—

"I am gratified to find that you advocate a cause which I have earnestly espoused for several years, though with but little success. I allude to the paying more attention by our English and Scotch national Agricultural Societies to that subject which is the foundation of all agricultural wealth—grain and roots—or, as many would term it, vegetable produce. I had the honour—no pleasure, as it has turned out a fruitless duty—to be named president of the root and seed committees for the Highland Society, in 1839-40; and in our report of 1839 I specially alluded to the absurdity of allowing so trifling a sum—only five pounds I think—for the discovery of new and superior kinds of grain or roots, whilst hundreds of pounds were voted as premiums for animals whose very existence and superiority depended entirely on the quality and quantity of the neglected roots and grain. Little attention was, however, paid to that report, and I determined that if again named president of that committee—which I was—that I would propose some names of authority to act with me, who might have more weight with our Society's committee of management than I found allowed to my own opinions. Accordingly, I got the names of my two friends, Col. Le Couteur and W. Gibbs, added to our committee, and they both very kindly attended our Aberdeen meeting, and cordially agreed with me in drawing up our report, which expressed more strongly than that of the former year our opinion of the absurdity of giving 20*l.* or 30*l.* as premium to one bull or other animal, whose blood and good qualities could not be spread over any great extent of country, whilst a more perfect or earlier kind of Wheat, Barley, or other grain, or a superior Turnip, Potato, or Carrot, was almost totally neglected; though, were its merits made known by a handsome premium, it would be introduced in a short time over the whole country, benefiting thousands of our agriculturists, and through them the nation. Can such be said of prize bulls, rams, boars, or stallions, except after the lapse of a great many years? And what has been the result of our report to the Highland Society? That a larger premium was offered for a short-horned bull—100 guineas—than had ever been given before, whilst the despicable seeds and roots were left in their former pauper condition, and the opinions of such men as Le Couteur and Gibbs cast to the winds, because they had not the good fortune to be approved by the committee, who, of course, knew better than the sub-committee what was most valuable to the country. Will you have the kindness to admit the above statement into your columns? and pray do not let the subject sleep, as some Societies do who shall be nameless. The hitherto fashion of setting a high value on animals alone would subside, and not constitute the sole object of our Societies; but the public money intrusted to their care would be devoted to those subjects really of greatest value, which I consider to be our 'vegetable kingdom.' It is my intention this year to propose that both our Royal and Highland Societies shall devote at least as large a sum yearly in future to the discoveries of early Wheats and other improved kinds of grain—to superior Turnips, Potatoes, and other roots, as to animals; and I hope for the support of every well-wisher to our rich and prosperous Isle."

AGRICULTURAL EXPERIMENT.

THE dryness of the spring this year being so unfavourable to the action of artificial manures, that even the nitrate of soda, which is not volatile, has failed to benefit the Wheat crop, according to the testimony of an intelligent farmer in this neighbourhood, who had tried it with success through several preceding seasons, I was deterred from prosecuting my experiments with them on a large scale, not only from the fear of loss to myself, but still more, because it would not be a fair test of their value. But there are other questions interesting to the farmer, the resolution of which does not depend upon the seasons; two of these are, Which is the best mode of putting the seed into the ground, whether by drilling it or dibbling it, or sowing it broadcast? and if drilling be adopted as the best, which is the best interval between the rows? Perhaps it will be said that this is to call in question the most elementary principles of Agriculture; that the superiority of the drill over the broadcast system has been demonstrated long ago, and is acknowleged in practice wherever the cultivation of the soil is best understood. This was my own conviction, and it was principally with a view to convince those who still adhered to the contrary opinion, that I determined to give both systems a fair trial. Accordingly, in a field which was very evenly covered with an excellent crop, 4 perches of each were taken for the comparison, and the produce measured and weighed. I subjoin the results:—

	Straw per acre. trusses.	lbs.	Corn per acre. bshl.	gals.	Weight of Bush. lbs.
Drilled Wheat	95	20	60	—	60
Broadcast do.	97	28	61	2	61

The spaces thus measured seemed, as far as the eye could discern, to be perfectly fair samples of the respective crops; but for the sake of greater accuracy two whole lands were taken for comparison; when these, however, were afterwards measured, they were found to be unequal; and I mention this, because the upper portion of the field having been more highly manured than the rest, over a space contained within parallel lines, that inequality gives an advantage to the broader land in the computation of the average. The produce was as follows:—

	Straw p. acr. trusses.	lbs.	Corn p. acr. bls.	gals.	Weight. lbs.
90 perches drilled and harrowed	70	16	48	—	62½
120 do. or ¾ acre broadcast	71	28	49	5	62

Here the quality of the corn is in favour of the drilled, but the quantity of produce is again more from the broadcast; more, however, was sown in the latter case than in the former, 10 pecks instead of 9: it will be observed that the measurement on a large scale reduces the calculation of the average by about one-fifth; but perhaps this is to be attributed to some variation in the soil; for ten other experiments in the same field, comprising altogether more than a quarter of an acre, which is generally considered sufficient for accuracy, give an average of more than 58 bushels per acre, and when the field was sown, the drill was stopped by the wet state of the remainder, which on that account was sown by hand. The results of the next experiment were still more paradoxical, and contradict one of the soundest maxims of good husbandry: it was tried in a field of very inferior quality, the situation being high, and the soil shallow: the quantity measured in each case was 6 perches.

	Straw per acre. truss.	lbs.	Corn per acre. bshls.	gals.	Weight per bushel lbs.
Wheat drilled and harrowed	36	10	26	5	62
,, drilled and horsehoed	39	22	28	2	63
,, drilled and handhoed	40	—	28	7	63
,, drilled but not hoed	40	—	33	1	63
,, broadcast	60	26	45	—	62

So, then, the less the ground was stirred the greater was the quantity of corn which it produced; a conclusion so contrary to reason and experience, that it can only be considered an exception to ordinary rules, and referred to some unexplained cause; but it is again to be observed that the increased quantity of the broadcast corn was obtained at the expense of its quality. In the same field some Wheat was dibbled, but it never came up, and the ground was ploughed up in the spring and resown by hand; but it was too late, and the produce was only 25 bushels per acre: the grain was probably rotted in the cups formed by the dibbles; for the soil over the chalk sometimes forms a most cohesive plaster, through which the rain-water with difficulty percolates. For the same reason another experiment in another field was scarcely a fair trial of dibbled against broadcast Wheat, the best of two portions of the former selected for comparison yielding 8 bushels per acre less than the latter. In the other experiments which I have to mention, the facts were more in accordance with the theory of good cultivation:—

	Straw per acre. trus	lbs	Corn per acre. bshls.	gals.	Weight per bushel lbs.
Drilled Wheat hoed once gave	90	12	54	1	62
,, twice	91	2	55	6	
Drilled Wheat handhoed	88	32	56	7	62
,, not hoed	92	8	58	6	61
,, horsehoed	97	8	60	—	62
,, harrowed	108	32	62	4	62

In the first of these instances a second stirring of the ground appeared to be beneficial; in the second the want

of it diminished both the value and amount of the produce; for hand-hoeing is such an inefficient operation, except for the extirpation of weeds, that little advantage could be expected from it. Intimately connected with these trials is the further inquiry, with what intervals Wheat should be drilled?

	Straw. trusses.	lbs.	Corn. bls.	gals.	Weight. lbs.
At 6 in. apart 4 perches gave per acre	97	28	57	4	62
At 9 " " "	101	4	62	4	61

Here the excess of quantity seems to have injured the quality; but in another field the same effect was produced by a different cause. Four intervals were tried; the produce was—

	Straw per acre trus.	lbs.	Corn per acre bbls.	gls.	Wght. bshl lbs.
At 6 in. hoed twice but not rolled . .	68	32	39	1	61
At 7 in. hoed twice, rolled with 4 horses	77	28	45	6	62
At 8 in. hoed twice, rolled with 2 horses	83	12	46	5	62
At 9 in. hoed twice, rolled with 2 horses	71	6	35	0	61

The portion of ground on which these experiments were tried was taken for that purpose out of its natural course, having borne a crop of Wheat the year before last; in order, therefore, to bring it back into the usual series of crops, it was sown with Clover, which in the three closer intervals failed entirely, but in that of 9 inches was strong and covered the ground. Now, since where two crops grow together the second must rob the other of part of its nourishment, the inferiority in the latter case is no more than might be expected.

Another point which I wished to investigate was the practicability of supplying the defect of substance in grain by the addition of aliment to the growing plant, and so making the worst seed answer the same purpose as the best. Some bad Barley having come up sufficiently well, was manured with phosphate of potash, at the rate of 1 cwt. per acre.

	Straw. trusses.	lbs.	Corn. bls.	gals.	Weight. lbs
6 perches of it gave . . .	37	28	26	5	48
Good Barley without the phosphate	35	10	27	4	50

The seed being so very thin, the hand that scattered it would hold many more grains, and this will account for the greater bulk of straw; notwithstanding which the corn was inferior both in quality and quantity, but not so much as might have been expected; and, perhaps, if some sulphate of ammonia had been added, the result might have been very different; for where it was applied to that part of the field where good Barley was sown, the produce was increased by almost 7 bushels of corn per acre, and more than 7 trusses of straw. The remaining experiments having been made in garden-ground, and consequently on a small scale, it will be sufficient instead of calculating the average of each to give the weights actually weighed, and the quantities actually measured, for the purpose of comparing the results one with another: this will be more accurate. Two adjoining plots of ground being sown, one with tailing Wheat, and the other with good Wheat, in the spring, both were divided into 4 parallelograms, and one in each, comprising a space of 36¾ square yards, was left without any manure except what the whole ground had received the year before as a preparation for Potatoes; the second par. was watered in April with a solution of 2 lb. of phosphate of potash; the third par. with 1 lb. of the phosphate, and 1 lb. of sulphate of ammonia; and the fourth par. with 2 lb. of sulphate of ammonia. All these contained 35 square yards. The produce was—

Tailing Wheat, worst that could be selected.	Weight of Corn. lb.	oz.	Weight of Straw. lb.	oz.	Quantity of Corn. gall.	qt.	pt.
1 Unmanured .	11	6	21	8	1	2	0
2 Phosp. potash .	15	6	25	8	2	0	1
3 Phosp. sulph. .	17	2	27	4	2	1	0¾
4 Sulph. ammon.	19	12	29	14	2	2	1
GOOD WHEAT.							
1 Unmanured .	13	14	24	0	1	3	0
2 Phosp. potash.	17	4	27	6	2	1	0
3 Phosp & sulph.	18	10	28	12	2	2	0
4 Sulph. ammon.	19	2	29	4	2	2	0¾

It appears, then, that although the worst seed is certainly less productive than the best, yet the difference is not so great as might be expected; and that upon soil which is capable in itself of yielding about 30 bushels per acre, when the plant is fed by sulphate of ammonia, there is no difference at all, at least none worthy of notice. The value of this manure is again strikingly displayed, the crop being increased by it at the rate of about 50 per cent. I had expected more from the mixed salts, but that turned out to be not a fair trial. It is impossible to guard against all sources of inaccuracy; and in this case, some rats had burrowed under those portions which were so manured; and when the corn was reaped, 45 of them were killed. The cunning creatures had eaten off the roots of several plants, in order to bring them down, and then gnawed off the ears, and carried them to their nests. The quantity thus destroyed was considerable; but supposing both to have suffered in equal proportion, we must infer that the other manures cannot compensate for the inferiority of the bad seed, though it is enabled by them to produce a great deal more than the good seed left without their assistance.—*L. Vernon Harcourt, West Dean House.*

(To be continued.)

GYPSUM AS MANURE.

Gypsum was not used in agriculture till the latter half of the last century. First, it met with much antagonism; now, however, it is considered everywhere as one of the most superior manures, and if we do not find it acting with equal power in all localities, we may say, that this is not to be ascribed to the gypsum, but to other causes not yet explained. It is true, of gypsum especially, as of many mineral substances generally, that small quantities only are required for improving vegetation, and if it be thought that this be caused by some sort of stimulus which it exercises over the plants, this is not the case, because I have found by many experiments, that it serves them really as food. If it were merely a stimulant, it ought to be assumed that it will improve the growth of all plants, but we see, on the contrary, that it avails those chiefly which contain much albumen, gluten, and legumen, which is easily to be explained by these very substances requiring sulphur for their chemical composition, which is supplied to the plants by the sulphuric acid of the gypsum. That it is really the sulphuric acid which is useful to the plants, we may learn from other sulphuric salts (for instance, sulphate of iron), when employed in small quantities, acting very beneficially on vegetation, as well as from the fact that gypsum will be useful even on calcareous soils.

There are several sorts of gypsum which may be used as manures: there is one of a crystalline granular character (alabaster); others fibrous, scaly, earthy, &c.; there is also one which contains no water, and therefore consists of 58 parts of sulphuric acid and 42 parts of lime. The earthy is mostly mixed with particles of marl, whilst the scaly contains an admixture of a little oxide of iron, bitumen, common salt, &c. The extraneous admixtures at times increase its value as a manure, at others they impair it, which is to be attended to in its selection and use.

Before gypsum is used it is mostly burnt, because it will be then easier converted into a fine powder. By the burning it loses nothing but the water of crystallisation, or the chemically bound water (2½ per cent.). If burnt gypsum be left lying in the air, it will again attract from it as much water as it had previously lost, which becomes again chemically fixed. It is soluble in water: still, 450 lbs. of water will be required to dissolve 1 lb. of gypsum. The property of being pretty easily soluble in water, and so sinking with it in the subsoil, explains why the manure with gypsum is so often to be repeated; because, if at one time only 80 lbs. be used per acre, they ought to suffice longer than we find to be the case, as one crop will not absorb more than 7 or 8 lbs. of gypsum. It does not cause any decomposition in the soil, nor is it changed itself, except if the soil contains much free humic acid, or if it be strewed (as is now often done) over the fresh dung and ploughed in with it, in which case it will sustain a partial decomposition by the carbonate of ammonia, developed from the excrements, so much so, that sulphate of ammonia and carbonate of lime are formed; generally, therefore, it passes (solved in water) in an entire state into the plants. It is generally strewed over the growing young crops, and farmers like it well, if they are yet wet from dew, as it is believed that it will then act as a better stimulus upon the leaves. Still, experience has shown that it will produce the same effect if it is washed off the leaves by rain-water; nay, it has been found that it will, in most cases, improve the growth of Clover (which is mostly manured with it) best, if it be strewed over the field before winter, and harrowed in with the seed. This phenomenon is easily explained by the gypsum finding the sooner in the soil the water required for its solution; and it being now distributed over the whole furrow-slice, it can be easier received by the roots of the plants.

Generally, double the quantity of the Rye used for seed, is employed of gypsum, but there are also soils where only 30 lbs. per acre must be used at once, lest it should over-force Beans or Peas. On some soils gypsum will not act at all, which will be the case if they possess already a sufficient quantity of it. It will be most useful to light soils, as they lose the soonest by the rain-water that gypsum which has been conveyed to them by the dung; whilst clayey soils will retain it longer. At times, gypsum will not produce any effect, on account of the soil being deficient in one or more substances required for the growth of plants; for that such a simple substance as gypsum may act beneficially, the soil must possess all the other substances required for vegetation. There are many places where gypsum once greatly improved the growth of Clover, whilst its application is now without any result. The cause might be, that the soil below the furrow-slice, in which Clover reaches with its roots, does not possess enough of potash, phosphate of lime, &c. Because if a plant, like the Clover, requires fifteen substances for its growth, and if only one is deficient, it is clear that the remaining fourteen will avail it nothing, even if they were abundant. We see, therefore, that gypsum will produce the best effect in such soils where, shortly before, marl has been used, as the soil will have received by the latter many mineral substances, but no gypsum. The addition of gypsum will thus cause the components of marl to act better. The favourable issue, however, of manuring with gypsum depends yet on other circumstances, of which I shall mention the most important. It will act beneficially only in wet, warm years, as in this case the water will not only convey it to the plants, but the heat will assist the assimilation of sulphuric acid; *i. e.* the leaves will only deoxidise the sulphuric acid by the assistance of the solar rays, whereby they exhale the oxygen and retain the sulphur for the formation of albumen, gluten, &c. That this process really takes place in leaves, is to be seen by the gypsum acting very little in wet, dank weather, and that, being strewed over Clover growing in the shade it will avail it nothing at all. If manuring with gypsum is to be useful, the soil must always contain humus, even if it be only 2 or 3 per cent., as the humic acid has also to transfer other similar substances to the roots required for vegetation. If, however, it contains too much of free humic acid, it will decompose the gypsum, so much so, that humate of lime will be formed and the sulphuric acid will be set free, which may then act as a corrosive on the roots of the crop. On that account, a soil very rich in humus must never be manured with too much gypsum, because though the sulphuric acid were to combine with another base, contained in the soil, it would still form therewith a salt easily soluble in water, by which the plants will receive too much sulphuric acid at once.—*From the German of Professor Sprengel.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Farm Servants.—In the following cursory remarks on the management and condition of the farm-servants in this county, I shall advert—1st. To the manner of hiring; 2d. To the amount of wages and mode of payment; and 3d. To their general character and condition. By far the greater part of the regular farm-labour is performed by married servants, usually called hinds. They are hired annually from the 26th May (Whitsunday, O.S.), to the same period of the following year; but there are numerous instances of servants remaining with one master throughout the currency of a lease. Indeed, comparatively few leave their places at the expiration of a single year. When a farmer is desirous of retaining any of his hinds in his service for another year after that which he is then serving, he must inform each of those whom he intends to keep of his wishes at a certain time before the Whitsunday on which their term expires. This day, which is called "speaking time," occurs in the beginning of February, and is general throughout the county. The servants to whom their masters do not "speak" at this period, infer that their services are no longer required, and look out immediately for other employers. Regular hiring-markets are held at Haddington and Dunbar, at which hinds are engaged for the year subsequent to the approaching Whitsunday. Certificates of "industry, sobriety, and fidelity," are generally required from servants before engaging them. The employer has to remove the hind's furniture, &c., from his former to his new abode. Single servants, boarded and lodged in the farmer's house, are hired by the half-year. The hinds are always paid in *kind*, or with the produce of the farm. The following are the quantities of grain, &c., which they receive, and the prices of each article computed according to its market value in February last:—

HINDS' WAGES.

9 qrs. of Oats	value	£9	18	0
2 do., 2 bushels of Barley		3	16	0
1 do., Peas or Beans		1	10	0
Cow's keep		5	0	0
In lieu of Lint (Flax)		1	0	0
Potatoes, 1200 yards along a drill . .		2	0	0
	Yearly value	£23	4	0

In addition to the above, the hinds receive five weeks' meal in harvest, and their coals are carted home free of expense. A farmer's steward, or *grieve*, gets the same quantity of grain as a hind, and generally from 5*l.* to 7*l.* additional, in cash; a shepherd 1*l.* additional, and in some places the privilege of keeping four or five sheep with his master's. There is a little difference in some places in the articles which make up the hind's wages; but their entire value is nearly the same throughout the county, amounting, on an average of years, to about 23*l.* 10*s.* annually, or nearly 9*s.* a week—a sum inferior to what the day-labourer frequently receives; but it must be taken into consideration that the pay of the latter ceases when he is unable to work, in consequence of indisposition, inclement weather, or scarcity of employment; while that of the former is but very seldom subject to such casualties. Unmarried men usually obtain from 3*l.* 10*s.* to 5*l.* the half-year, with bed and board in their master's house. The usual rate of wages for day-labourers is 9*s.* to 10*s.* per week; women and boys get 10*d.* a day in summer, and 9*d.* in winter. The wages of reapers in harvest have, during the last few years, varied from 8*s.* to 12*s.* a week, exclusive of their diet, which is commonly valued at 8*d.* per diem.

Smith work is always executed by contract, and frequently also that of the carpenter and the saddler. A smith commonly receives from 2*l.* 10*s.* to 3*l.*, for upholding a pair of horses in shoes, a plough in irons, and keeping a pair of harrows in order, besides the plough and cart harness, &c., in chains. A saddler, contracting from the commencement to the end of a lease, will uphold a pair of horses during that period in cart and plough harness, plough-lines, cart-ropes, curry-combs, &c., for 25*s.* a year.

The farmers generally prefer having some particular operations executed by piece or job-work. The following operations are generally performed by contract, at the annexed rates:—

Cutting tile-drains, per rod of 18 feet . .	0*s.* 2½*d* to 0*s.* 3½*d.*
Mowing an ordinary crop of Clover and Rye-grass, per square acre	3 6 ,, 4 0
Reaping and binding, Wheat, per do. . .	11 0 ,, 12 6
Ditto, Oats or Barley, per do. . .	10 0 ,, 11 0

The farm-servants of this county, however low the foregoing rates of wages may appear, possess the necessaries and comforts of life in as great abundance as any of their class in the kingdom; and it may well be questioned whether there can be found in any other district more faithful or correct workmen than the hinds of East Lothian. The circumstance which renders their condition so much more comfortable than that of the labourers in many other places is, that they receive *almost the*

whole of their wages in the necessaries of life; they have thus all the necessary articles of food continually at hand, and the quantity of corn and butter which those with moderate families are enabled to sell, provides for other demands. It is evident that the annual money-value of a hind's wages cannot be accurately stated, as this must depend on the market prices of the articles in which he is paid; but it may be observed, that the seasons which are the worst for other labourers are usually the most favourable for hinds; because the surplus corn, of which they can dispose, returns a better price. The numerous advantages arising to farmers and servants from the general adoption of this mode of payment are clearly set forth in the following extract from Somerville's "General View," &c.:—"Wherever labourers are paid in money, if they have the smallest inclination to be extravagant, they are furnished with the means. Having money among their hands, they do not scruple to gratify the present propensity, and live in expectation that pay-day will soon return. They are even laid under temptations to dissipation, though they may have no natural inclination to it; they must often, in procuring necessaries for themselves and their families, have occasion to meet their neighbours, with a little time to spare and a little money in their pockets; they must have a little conversation; that can be enjoyed to greatest advantage in the ale-house; and why may they not enjoy themselves with a trifle of the money for which they have toiled so hard? Thus, love of society at first, and afterwards love of liquor, induces a habit which the prospect of disgrace and misery cannot counteract, and which had probably never existed if the unfortunate beings had been paid for their work in the necessaries of life, instead of being sent to the market with money to procure them. The cottage system, which found many advocates some time ago, was far inferior in every view of the matter, to the manner in which labourers in agriculture are accommodated here. Many of those who laboured to introduce the new cottage system, deserved all praise for the purity of their motives; every friend of humanity will honour them for the generous interest which they felt in behalf of the labouring poor; but if they had understood the condition of the hinds in this county, they would have found out a much better plan for accomplishing their object, than giving to every cottager land to produce his subsistence. A hind here receives as much corn as such a cottager might be expected to raise; his work for his employer is not interrupted, nor himself worn out by extra and excessive labour; he has no care upon his mind, no rent to pay, no bad seasons to dread; for whatever may be his master's crop, he is sure of his full share. If the labourer profit by this system, the employer and the public profit still more; the employer does not pay a man who wastes half his strength at other work, nor rely on a servant who may sometimes disappoint him, by attending to other concerns. The public must gain in the increased quantity of human food produced, for without doubt an acre of land occupied by a cottager will not yield as much, at as little expense, as if it made part of a farm cultivated by a person with sufficient capital. Were all the farm servants over the kingdom paid in kind, it may be safely affirmed, from the experience of the places where this practice prevails, that the advantage would be great to themselves and to the public. The master might probably, in some cases, find it more convenient to give money, but he is far more than recompensed for any trifling disadvantage attending the other mode, by the valuable moral habits which it is calculated to preserve. Every master who properly understands his interest will admit that he had better pay sober, honest, and industrious servants, than have those of a different description almost for nothing. From their being accustomed to pass little money through their hands, many of the farmers' servants in this county acquire such habits of saving, that they lay up a few pounds for old age, or to meet any contingency which may require more than their ordinary income."

The dwellings of the hinds are remarkably clean and comfortable: simple, but well-kept and tastefully arranged furniture, with the invariable accompaniment of an eight-day clock, replenish the interior, whilst the climbing Honeysuckle, or delightful Rose-bush, adorns the exterior. The servants' houses are generally situated a short distance from the farm steading, of which they form a part. Each hind is under the obligation of furnishing his master with an approved servant (either male or female) to work on the farm during the summer half-year, viz., from Whitsuntide to Martinmas; and should he not have a son or daughter sufficiently capable of filling this place, he must engage and maintain in his own house a sufficient *bondage* for the work—a designation which aptly expresses the grievous nature of the obligation; his wife is also required to reap 22 or more days in harvest, in payment of the house-rent.

Friendly Societies or Clubs are established by the farm servants in almost every parish, which have produced incalculable benefit to the labouring class. The affairs of these highly useful Societies are conducted by a committee annually chosen from among the members; the parish teacher generally acting as secretary and treasurer. Each Society possesses different *Funds*, as the *Cow's Fund*, *Funeral Fund*, *Sick Fund*, &c. By contributing a few pence monthly to the Cow's Fund, a member is entitled to receive from 9*l.* to 12*l.* from the Society on the natural or accidental death of his cow, provided the usual remedial measures have been resorted to for her recovery. In like manner, by paying a trifle into the Funeral Fund, on the demise of the contributor his friends or wife receive about 3*l.* to defray the funeral expenses; and an individual regularly subscribing to the Sick Fund is entitled to 10*s.* a-week for a limited period, when disabled from working by indisposition.

It is remarkable that none of the landlords or farmers contribute anything to the support or efficiency of these excellent rural Societies; the servants themselves endeavour to spare a few pence monthly in order to provide against the many contingencies to which their station in life subjects them; but it is evidently the interest as well as the duty of the landowners and tenants, who conjointly pay the poor-rates in Scotland, to encourage Societies whose tendency is to keep the labourer above the necessity of applying for parochial aid.—*T. Sullivan.*

TREATMENT OF FARM HORSES & LIVE STOCK.

I will proceed to detail the feeding of our horses, and the proposed treatment of our cattle and sheep:—They are never turned out, nor do they receive any Grass-hay, or Clover-hay—except a small portion during the interval between green-crops and root crops. In summer they are fed in mangers on Wheat-straw chaff, cut one-eighth of an inch, and Tares, Lucerne, or green Rye, cut also into chaff the same size, adding ground Beans, Oats, or meal with Linseed. In winter, our Carrots, Swedes, and Mangold, will be well washed, passed through Gardner's Turnip-cutter, and again passed through a toothed cutter machine, so as to become what I call root-chaff; it will then be mixed with very fine Wheat, Bean, or Oat-straw chaff, and a little ground Beans, Barley, or Oatmeal, soaked Linseed, steamed Potatoes, and a little salt, varying the food as much as possible to stimulate their feeding. In fact, to sum up, we shall present their food in the form occupying the smallest possible compass and requiring the least mastication. Every half-hour saved in feeding is so much added to their rest—a most important ingredient in fattening. The dry chaff will prevent laxity and flatulence, producing also a sufficient and healthy excitation of the stomach, whilst it will afford to the gastric juices a ready access to every part of the mass of food. This mixture appears by its various constituents perfectly adapted to the formation of bone, muscle, fat, and flesh, all which are essential to the perfect development of a well-fatted animal. On this subject I annex, by permission, the very kind opinion of Mr. C. R. Bree.

Our horses have a plump muscularity and vigorous rotundity, proving what I said before, that their food contains every necessary element; they thrive wonderfully and cost but little—they get their breakfast, dinner, and supper, in perfect quiet. This is better than sending them for a ten-mile walk morning and evening, thus depriving them of six hours' rest; their skins are soft and their coats glossy—their general appearance exhibiting health, strength, and content. In this all visitors to my farm agree. Were it not for their daily labour, I have no doubt they would be excessively fat; therefore I am justified in anticipating a similar result for my bullocks and sheep. The least they plough is one acre per day, seven inches deep for each pair, and occasionally one and a half acres, particularly during harvest. One pair also trench or subsoil-plough one and a half acre per day during harvest, which is great work. I cannot now state exactly what number of horses we shall require permanently. I rent 45 acres adjoining my land, so that the total holding is 173 acres; we shall certainly require six at least on our principle of trench ploughing, and not resting the land. At present, owing to the great arrears of cultivation, and the various operations of subsoiling, stone-carting, &c., we have an additional four, and sharply they are worked too.

For very lean bullocks, the straw-chaff and green feed, or root-chaff, will be better than too rich a diet at first. As they freshen we shall give them richer food, and increase its quality by degrees, adding soaked Linseed, &c. Our horses and cattle will always have access to rock-salt. I apprehend in bullocks as in horses, a change from very poor to stimulating diet would be hazardous without a previous preparation by physic.

As I said in my former letters, there should be warmth, cleanliness, ventilation, and good grooming; bricked floors set in cement and well drained, appear well adapted for cattle generally. They should occasionally be washed down with sulphuric acid and water, or sprinkled with gypsum. This will convert the offensive ammonia into an efficient manure. All stables and cattle-rooms, should have their walls and ceilings lime-washed at least once a year—the mangers occasionally well scrubbed. A harness room in stables is indispensable.

My farm-yard will not look like one, for not much loose straw will be seen—a little straw-chaff may appear here and there, to absorb the moisture and excrement from the cattle; but the soiled part will be removed daily or frequently to the roofed tank, so as to go on the land as rich as possible, fermented, but not washed by rain, or evaporated by sunshine or wind. The rest of my straw, both Wheat, Bean, and Oat, will be converted as chaff into food for my stock, and so go to market in the shape of mutton, beef, or pork—or be forming bone and sinew for my horses. In conclusion, it will afford me very great pleasure to receive hints from competent practical men on the subject of this letter.—*I. J. Mechi*, 4, *Leadenhall-street*, *London*, *August*, 1844.

P.S.—Cost per week of keeping each farm-horse in high condition and full working order:—

	s.	*d.*
Twenty four bushels of Wheat-straw chaff, cut one-eighth of an inch, at 2*d.*	4	0
Twelve bushels of green Tares cut into chaff, at 2*d.*	2	0
Four and a half pecks of Beans, ground into small pieces	5	0
Pollard	1	0
Cutting chaff	1	0
Straw for litter	2	0
	15	0

I value my Wheat-straw at 6*d.* per truss of 36 lbs. or 18*s.* per load of 36 trusses, which is the average price it could be sold for on the farm. My green tares I value at 1*s.* per rod, or 8*l.* per acre. Of course where Lucerne, Clover, or Rye are used, a due regard will be had to preserve the same relative cost. In winter a proportionate quantity of roots will be substituted for green food. I believe it is seldom accurately known what farm-horses do cost. I have asked the question frequently, and received for answer a shrug of the shoulders, or a shake of the head and the words "A great deal too much." A first-rate farmer and clever valuer told me, the farm-horses always consume one-fourth the produce of the farm; that is, 25 acres out of every 100. My own calculation was 20 acres; but he is no doubt right on average lands.

A gentleman writes me, that cutting hay very fine caused fermentation and griping amongst farm-horses, which he attributes to want of mastication; since he had it cut 1½ inch, no such injurious effect has been experienced. On our own farm, during several months' experience, our fine-cut food has caused no injury, probably owing to our using so a large proportion of straw chaff and little or no hay. I beg to refer to my fifth letter for other particulars of my cattle management. I think, generally speaking, a loose box, with just room for the animal to turn in, is better than stalls—although I have not practically compared the two—nor can I say from experience, whether the total absence of light is more injurious to the animal's health than any increase in its fattening. I should consider both light and air are necessary to health. Mr. Warnes's pamphlet (Longman and Co.), contains useful information on fattening cattle. The Rev. J. C. Blair Warren, of Horkesley Hall, near Colchester, applies the close box system with judgment and advantage, and is in other respects a scientific practical farmer.

Extract of a Letter from Mr. C. R. Bree.—With regard to your question about the application of Wheat-straw chaff in the function of nutrition, I have much pleasure in offering you my opinion. Wheat-straw contains very little albumen—according to Playfair none. It therefore can be of no use in supplying the nitrogenous elements of muscle. But as you supply this in your green food, and more particularly in the Beans, its absence in the straw can be of little importance. It will, however, have the same effect when given as you do, as vegetables have when eaten by human beings with meat. It will be useful in the following objects:—

1. In supplying the phosphate of lime to form the earthy part of bone.

2. It will assist in the formation of muscle by supplying the non-azotised portions of that structure.

3. It will supply carbon in abundance. If this carbon is not required for the restoration of waste, it will assist in forming a supply of carbonic acid for the performance of the function of respiration, and the supply of animal heat.

4. By this appropriation it will permit the excess of carbon, taken in with the other food to unite chemically with the elements of water, and thus be deposited in the system as fat. Straw, chemically speaking, differs from hay, in (*A.*) containing little or no albumen. *B.* In containing rather more organic matter. *C.* Hay leaves as much again of ashes after incineration.

I consider your union of straw with green food and Beans as sound in theory. Beans have *per se* too much albumen for animal food; by uniting straw with them you counteract the effects of this excess, and by adding green food, you supply saline matter, which is indispensable to the due performance of the function of nutrition. I think your plan judicious as well as scientific.

Home Correspondence.

Non-interference with Politics.—Before the close of the first year of your Paper, I find you departing from *your own* principle of *non-interference* with *politics*, and giving notice that in your next Number you shall test the merits of the arable and pasture system, on the principle of the labourer having a right to employment, as *his inheritance.* Surely this is a political question: and let me put one question to you on that subject:—Supposing the higher grades of society are determined to eat bread made of foreign Wheat, and drink beer and spirits made of foreign Barley, and that their horses shall eat foreign Oats, and themselves foreign beef, and their ships shall consume foreign provisions—and let me tell you, *this is very largely the case*—under what principle of right or justice can you expect the owner of the land to produce what nobody will use; or, what amounts to the same thing, will not pay for cultivation? Why should the landlord or tenant be obliged to produce Wheat, which he cannot sell but at a loss? And how is the labourer's right to be enforced on owners of the land, whose market is destroyed? Are they to be obliged to sell and mortgage to mill-owners, cotton-spinners, and other trade and craftsmen, all their inheritance, to pay for labour which does them no good, but makes them poorer still? Answer this question, if you please, and not argue pasture and arable on a wrong foundation, or principles that will not bear being tested with truth.—*C. Kent, December* 10.

[The criterion by which we have estimated the propriety of any system of cultivation is not *only* its capability of giving employment to the labourer—as our correspondent appears to think. Our words were as follow:—"We maintain that the merits of any system of cultivation depend not merely on *the profit to the cultivator and the quantity of food* which it produces, but also on *the quantity of employment it provides for the labourer.*"

These are the principles by which we proposed and have endeavoured to test the systems of pasture and arable culture—their *profitablencss*, and productiveness of *food* and *employment*—not one only, but all three. It will be observed that *only such* an additional employment of labourers as will be *profitable* is insisted on as due from the farmer; surely it needs not many words to commend such a sentiment as that to the mind of any one. With reference to our correspondent's allegation, that in considering this subject we are breaking our own rule of non-interference with politics, we altogether deny it. Why! the profits, the produce, and the expenses of cultivation, are the very essence of *agricultural practice*.——Since this was in type we have received a communication on this subject from "W. L." (we are unable to decipher the name, or we would give it at length), which we hope he will excuse our not publishing, as it is not our wish to continue a discussion on the *moral* aspect of this question. Independently of any *duty* in the matter, we may safely rest our case on the *expediency* of the practice we have advocated; and to this, as regards the interest of landlord and tenant, we now invite the attention of correspondents; as, the more clearly this is exhibited, the more, it is probable, will employment from this source be provided for agricultural labourers—a consummation which all must heartily desire, whatever difference of opinion may exist as to the modes in which it may be best effected.]

Experiments on Nutrition.—In reply to your question, in your postscript, I beg to say that an examination of the excrements of the cows, if not of their analysis as given by Boussingault, confirms me in the opinion that the unsuitableness of the food to the digestive organs had much to do with the subsequent emaciation of the cows, for I perceive that with the Mangold Wurzel there was only about 76 lbs. of dry excrement in 14 days, whilst with the Potatoes there was 187 lbs., and with the hay 339 lbs. Now it is a curious fact that the loss or gain of weight bears a very strict relation in an inverse ratio to the amount of dry excrement.

	Weight of Dry Excrement.	Loss of Weight by Cows.
On the Mangold Wurzel diet,	76 lbs.	149 lbs.
		Gain of Weight
On the Hay diet . . .	339 lbs.	111 lbs.
		Loss of Weight
On the Potato diet . .	187 lbs.	72 lbs.

Now, though this relation is somewhat curious, and greatly supports my theory, yet I do not mean to insist that it altogether proves that the loss of weight is *owing* to the deficiency of dry excrement, though I might be as much justified in so doing as M. Boussingault is in asserting that the loss and weakness of the cows are *owing* to the deficiency of fat in the food. Now, if his theory is correct, why should the deficiency of 16 lbs. of fat cause a loss of 179 lbs. weight? or, on the other hand, an excess of about 8 lbs. of fat cause a gain of 111 lbs. in weight? If the animal is to be regarded as a mere chemical machine, the absence of fat and loss of weight ought pretty nearly to correspond. Why, also, should the cows be so emaciated? A horse in preparation for a race may be greatly reduced in weight (losing fat, of course), and yet becomes stronger instead of weaker; so likewise, in a still greater degree, may his jockey. Now, I take it, that, putting out of the question the unsuitable nature of the food, as regards its mechanical properties, the great emaciation which ensued from Mangold Wurzel is more likely to be owing to the deficiency of phosphoric acid in the food than of fat; for whereas, with the hay, it amounted to about 3½ lbs. in the quantity of food consumed in the 14 days; with the Mangold Wurzel diet, in the same period, it amounted to only 1½ lb., or half that quantity. Now, when we consider the importance of the phosphates in the animal economy, that they enter into the composition of flesh and bone, and likewise the brain and nervous system, we cannot be surprised that great debility should arise from their absence in the food, or that this debility should be best removed by giving food in which phosphoric acid largely abounds, such as hay. The same observations may also probably apply to the other inorganic constituents, for we know that there must have been at least double the quantity taken with the hay than with the Mangold Wurzel. The superior feeding properties of Mangold Wurzel have been fully proved, as compared with Swedes, by the careful and well-conducted experiments of Lord Spencer. The practical result corresponded very closely with the chemical analysis of the different roots. The beasts increased both in flesh and fat, and far more than we should anticipate, if we looked to the fat in the food as the only source of the fat in the animal. It is very possible that fat ready formed in the food is much more essential for the formation of butter in the milk, than for the fat in the system; and this may prove to be the case, without destroying the beautiful theory of Liebig, that the fat of the body is formed from the sugar and starch, and other unazotised constituents of the food not consumed in respiration. Certainly, this theory far better explains than the other the variations of the habits and the food consumed, in hot countries and in cold ones, both in man and animals; and it is easier to reconcile it with the fattening properties assigned to sugar and starch.—*W. C. Spooner, Southampton.* [Our readers will have noticed that our correspondent's criticism of Boussingault's experiments (see p. 818), was founded precisely on that view of the subject on which Dr. Playfair himself last week (see p. 842) rested his condemnatory notice of them.]

Gypsum.—If "W. C." will refer to my first short notice on the action of gypsum as a fixer of ammonia, he will be able to ascertain the proper quantity of gypsum required for any given quantity of manure. It appears, from direct experiment, that 100 grains of pulverised gypsum will readily fix between 60 and 70 grains of carbonate of ammonia. It appears also, as the result of calculation founded upon experiment, that every solid yard of manure which is sufficiently decomposed to be put upon land has lost, during the fermentative process, about 4 lbs. of carbonate of ammonia. It will therefore be necessary, in order to fix this ammonia during the period of its generation, to add to every solid yard of manure about 8 lbs. of finely pulverised gypsum. This will explain what I mean by proposing to spread throughout the dunghill a "thin layer of gypsum after every rise of 2 feet of manure." Let the dunghill be about 6 feet high; made up, in the first instance, of manure which has been trodden about the yard till half decomposed. There will then be three layers of gypsum, of which the cost will be less than 2*d.* per yard of manure; and the additional cost of 1 lb. of sulphuric acid for each horse-load, or ton, in the heap will be less than 3*d.* per horse-load, so that the cost for 10 cart-loads, or 20 solid yards, will be about 5*s.* The trade-price of the quantity of sulphate of ammonia, which will be furnished to the land by the gypsum and sulphuric acid in these 10 cart-loads, when entire decomposition and neutralisation has been effected, is about 1*l.* 7*s.* The covering of earth used by "W. C." tends but little to fix ammonia in any case, and will be quite unnecessary now.—*J. B. Reade.*

Hand Threshing Machine.—I have been trying a hand threshing machine, made by an ingenious mechanic in this island, but I find the labour required to work it is very great, as is the case with those I have seen in England. Will you favour me with your opinion as to the effect in lightening the labour of a windlass with rope and compound pulleys; the rope and pulleys mounted on shears 20 feet high over a sunk pit, what weight attached to these pulleys would equal the power of a man? If you think the power applicable, I have one or two plans for obtaining speed. I am now trying a very simple form of drilling machine, which will drop three or four grains of Wheat at stated intervals, as a substitute for dibbling. I have been at some difficulty in getting it put together, from the great stupidity of the people. My drilling-machine unships, and a small hay-tedding machine can be fixed to the same frame, and on removing this I affix my rake, and the frame also is made to carry a tub and drilled box for liquid manure; the shafts which belong to my large roller are removable, and are those I attach to this piece of all-work. It appears to me that this drill will be very useful both for Wheat and Turnips, and that the machine would be a great accommodation to farmers of small means, as the whole is of trifling expense, from its simplicity of construction.—*A Subscriber from the first—Jersey.*

Manure versus *Good Cultivation.*—I am convinced that it is much more important to attend to the latter than to the former of these two means of improvement; and that national, as well as individual wealth, may be more increased by the latter of the two; for I am convinced, that nothing like the full extent of the inherent powers of the soil is taken hold of by our generally too superficial method of cultivation. Good cultivation consists mainly in, 1st. Thorough-draining, which soon changes the nature and texture of the soil for the better, to double the depth that is ploughed. 2d. Deep cultivation with the plough, and not omitting subsoil-ploughing, if it be but four or six inches in depth; a little is better than none. And, 3d. Moving the soil, or fallowing well; giving unremitting diligence to move and pulverise the soil on every opportunity, but more especially in summer and in dry weather; taking care to have a good depth of soil at the finish.—*A Leicestershire Farmer.*

Sea Buckthorn, Rabbits, &c.—I am much obliged by the attention of "M. D. P." to my inquiry. What I was more particularly desirous of ascertaining was, whether the plant in question will grow equally well in inland districts; and whether it is available for any purpose as underwood. Withering states that cows refuse it, but that horses, sheep, and goats, eat it. He does not, however, notice that it is free from the attack of rabbits as "M. D. P." assures us it is. Can "M. D. P.," or any other correspondent, furnish us with a list of plants which are not liable (especially when young or newly planted) to injury from these troublesome pests; and are, at the same time, useful as underwood and cover? Do rabbits attack the Berberis aquifolium? I am told that they never touch the wood Laurel. A list of useful plants, that are certainly safe from these destructive creatures, would be acceptable to planters, as the effects of external applications are uncertain and temporary only; notwithstanding such precautions, some hundreds of fine healthy Hollies, recently planted, were last year entirely destroyed by these vermin in a young plantation, to the great mortification of —*An Old Subscriber.*

Campbell's Corn Steep.—You state that the crop, before being cut, had a very uniform appearance. Did the ear, at the time of being cut, not indicate so unexpected a result as that which you obtained after the crop was threshed? In some of the patches the steeped is only the half of the unsteeped. Now, if the crop had a uniform appearance when growing, surely some defect in the ear must have indicated this great inequality. I steeped to a considerable extent last season. When the crop came forth into ear, the steeped portions promised great superiority; but I was disappointed at harvest, and more so in the yield, as the produce of one ridge sown with steeped seed yielded one bushel less than a neighbouring ridge sown with unsteeped seed. And this happened even while the former evidently yielded the greatest amount of straw, and counted the greater number of sheaves—this in the case of Oats. In the case of Barley the superiority was not only apparent, but real, in favour of the steeped portions. In one of your former Numbers, I observed the description of a method for deterring hares from visiting any particular field, by strewing upon their runs some particular substance offensive to them. Can you inform me what that substance is? —[Tar, we believe]—as I am very desirous of trying it, having my Swedish crop very much destroyed by a neighbouring baronet's hares, who himself has left this country for the purpose of repairing his dilapidated finances, but has left his preserves well stocked, with the effect of impoverishing his neighbours.—*A Subscriber.* [The yield of straw was very nearly uniform in the different lots; the ears were larger and better filled on the plots that were unsteeped.]

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, Hanover-square, on Wednesday, the 11th of December, present—His Grace the Duke of Richmond, K.G., President, in the chair; Marquis of Downshire; Col. Austen; D. Barclay, Esq., MP.: T. Raymond Barker, J. Browne, Esq.; W. R. Browne, Esq.; F. Burke, Esq.; Dr. Calvert; W. B. Canning, Esq.; Rev. T. Cator; Col. Challoner; H. Colman, Esq.; J. Dean, Esq.; Humphrey Gibbs, Esq.; H. J. Grant, Esq.; C. Hillyard, Esq.; W. Fisher Hobbs, Esq.; W. H. Hyett, Esq.; J. Kinder, Esq.; Fielder King, Esq.; J. Parkes, Esq., C.E.; Sir R. Price, Bart.; F. Pym, Esq.; J. Allen Ransome, Esq.; Prof. Sewell; W. Shaw, Esq.; Rev. J. R. Smythies; Manners Sutton, Esq.; E. Tattersall, Esq.; and T. Tweed, Esq.

Pryse Pryse, Esq., of Lodge Park, Aberystwith, was elected a Governor, and the following gentlemen Members of the Society:—

Williams, Matthew Davies, Cwyncinfeilm, Aberystwith, S. W.
Dymock, Rev. Edward, Pexley Hall, Ellesmere, Salop.
Davy, Francis, Topsham, Exeter, Devon.
Lansdale, R., jun., Worsley Hall, Manchester.
Maunsell, Thomas P., M.P., Thorpe, Malsor, Kettering, Northampton.
Cross, William Assheton, Redscar, Preston, Lanc.
Handy, Edward, Sevenhampton, Andoversford, Glouc.
Nesbit, John Collis, 38, Kennington-lane, Lambeth.
Bruce, John, Teddington, Stratford-on-Avon, Warw.
Justice, Henry, Hinstock, Market Drayton, Salop.
Stanway, J. Holt, Brookfield, Manchester.
Renshaw, James, Westheath House, Erith, Kent.
Thompson, John, Woolvers Farm, Reigate, Surrey.
Pryse, John Pugh, Peit-hill, Aberystwith, S. W.
Palmer, William, Green-lane, Feckenham, Worc.
Tomes, Thomas, Norgrove, Feckenham, Worc.

The names of 19 candidates for election at the next meeting were then read.

Agricultural Chemistry.—The Marquis of Downshire presented, on the part of Dr. Hodges, of of Downpatrick, a copy of the Introductory Lecture on Agricultural Chemistry, delivered by Dr. Hodges before the members of the Seaforde and Hollymount Farming Society; intended to convey, in a popular manner, illustrations of the advantages which the Irish farmer might derive from science, the more scientific details being added to the work in the form of notes.

Agricultural Improvement.—The Marquis of Downshire also presented copies of the Transactions, for the year 1843, of the Royal Agricultural Improvement Society of Ireland, and the Report of a Visit to the Gleneask Estate of the Irish Waste Land Improvement Society, containing Analyses of Soils, &c., by Professor Kane; and submitted to the Members present the various plans on which the thorough-draining at Easthampstead Park, in Berkshire, had been conducted.

Mr. Davidson transmitted from Darlington a Treatise on Draining; Mr. Dalgairns, Vice-President of the Royal Guernsey Agricultural Society, a Paper on Leases; Mr. Dean, a Paper by Mr. Arthur Dean, C.E., on the Gold Ores of Merionethshire, and the Igneous and Sedimentary Rocks in North Wales; the Rev. Thomas Cator, a communication on Coates's Herd-Book; Mr. Moffat, a letter on a Wooden Pattern for a Drain-tile; Mr. Mechi, an acknowledgment of inquiries made of him by the Council; and Mr. Rodwell, results in the cultivation of the Italian Rye-grass.

Mr. Agnew, of Manchester, presented proof impressions of his "Scene at Wiseton," and the individual portraits, already published, from his great painting of the Annual Country Meeting of the Society, by Mr. Ansdell.

Mr. Freebairn, of 23, Mornington-place, Hampstead-road, presented a proof impression of the portrait of Earl Spencer, obtained by the ruling-machine applied to Mr. Wyon's original medallion.

For all which communications and presents the thanks of the Council were ordered.

Special Council.—A Special Council was held on Saturday, the 14th of December, present—His Grace the Duke of Richmond, in the chair; David Barclay, Esq., M.P.; Thos. Raymond Barker, Esq.; Henry Blanshard, Esq.; W. R. Browne, Esq.; Col. Challoner; John Ellman, Esq.; C. Hillyard, Esq.; W. Fisher Hobbs, Esq.; W. H. Hyett, Esq.; John Kinder, Esq.; William Miles, Esq., M.P.; Sir Robert Price, Bart.; J. Allen Ransome, Esq.; Prof. Sewell; John Villiers Shelley, Esq.; and R. A. Slaney, Esq.

The Report of the Council to the General Meeting was taken into final consideration and agreed to.

General Meeting.—The December half-yearly meeting was held at the Society's House, in Hanover-square, on Saturday last, the 14th inst., at 1 o'clock,

P.M., his Grace the Duke of Richmond, K.G., President, in the chair. The following members were present:—The Marquis of Downshire, Earl Spencer, Col. Challoner, Dr. Hamel, Rev. James Linton, Sir Robert Price, Bart., Capt. Randolph, Professor Sewell, Rev. J. R. Smythies, Sir Harry Verney, Bart., and Messrs. B. Almack, W. Astbury, John Almack, D. Barclay, M.P., Thomas Raymond Barker, H. Blanshard, W. R. Browne, John Beck, S. Wood Blake, John Beasley, Donald Barclay, Thomas Bennett, H. W. Beauford, Charles Barclay, E. H. Baldock, R. W. Baker, G. Burnard, A. J. Brown, C. R. Colvile, M.P., Henry Colman, John Clover, George Cottam, A. W. Crouch, Robert Cobb, F. C. Cherry, Joseph Druce, Samuel Druce, R. Davey, James Dean, John Ellman, Thomas Ellman, B. Edgington, P. Fearnhead, Thomas Fowler, R. Fulshaw, William Greaves, H. J. Grant, John Griffith, G. Griffin, W. H. Hyett, W. Hankin, W. Fisher Hobbs, W. Holbech, C. Wren Hoskyns, C. Hillyard, H. Holding, Thomas Jones, John Kinder, George Kilby, Fielder King, Thomas Knight, John Kendle, Edward Lawford, William Miles, M.P., Thomas Mount, Richard Milward, W. Marden, Charles North, H. Overman, A. Ogilvie, Henry Paget, Josiah Parkes, C.E., W. H. Potter, H. Price, J. Allen Ransome, R. A. Slaney, Thomas Stone, Albany B. Savile, William Stace, Richard Smith, J. Scales, W. P. Salter, John Villiers Shelley, M. H. Shuttleworth, William Shaw, S. Reynolds Solly, Samuel Solly, W. Skirving, H. Smith, J. Holt Stanway, J. H. Turner, C. J. Tower, Thomas Tweed, John Thompson, W. Trinder, J. C. Thorpe, Thomas Umbers, John Wood, and J. A. Williams.

The Secretary, by direction of the President, read the Report of the Council to the General Meeting:—

REPORT.—The Council have again the satisfaction of reporting to the Members, at their present General Meeting, the effective state of the Society in every branch of its operations, and the continued influx of new members from all parts of the kingdom. The communications of practical results in farming, furnished by correspondents from the various localities of the country, and again disseminated among the Members by means of the Journal; the increasing extent and importance of the Annual Country Meetings, at which not only the agricultural community have the immediate advantages of personal communication and direct interchange of experience on farming topics of common interest to all, but where from year to year specimens of the most approved breeds of cattle are in succession exhibited to their notice, and the rapid improvements now made in the implements of husbandry submitted to their inspection, and their real value brought at once to the test of practical trial: form the leading points on which the Council have to congratulate the Members, as evidences of the progressive advancement of the Society in the fulfilment of its various objects. In the application of science to the improvement of agriculture as an art, the Council are fully aware that the results will only be conclusive and satisfactory in proportion to the perfection of the particular science itself, whose principles are proposed for the regulation of agricultural practice. The laws of mechanics being simple and determinate, their application to the improvement of the principles on which the machines and implements of agriculture may be most economically effected, has been attended with results correspondingly decisive in their character; but while the simple and well-established principles of inorganic chemistry may with confidence be expected to serve as safe guides in leading us to a knowledge of the properties of every variety of soil, and the means of their required modification to particular objects, any new light to be thrown upon agriculture by organic chemistry, a less perfect branch of the science, must as yet be received with greater diffidence, though it ultimately promises the most important results. The Council are convinced that the perfection of agriculture as a science, or farming as an art, is only to be attained by the establishment of scientific principles derived from practice, and their judicious application under the given circumstances and conditions of each particular case of climate, soil, or aspect. While, however, they deem this caution requisite in exposition of the practical objects and character of the Society, they witness with great satisfaction the rapid advances made by the distinguished chemists of the present day in that comparatively new and infant branch of chemical philosophy connected with investigations into the laws of organic matter and the principles of vegetable life; and they have to congratulate the Society on the zeal with which their consulting chemist, Dr. Playfair, has entered this new and valuable field of scientific inquiry, and the kindness with which he has again favoured the members on the occasion of their general meeting, with two highly interesting lectures, elucidating the application of the most recent discoveries of chemical science to the practical operations of agriculture. The Council feel, that if any circumstances could enhance the obligations under which they are laid in reference to these lectures, they would be the readiness with which Dr. Playfair, at a very short notice, and regardless of personal inconvenience, prepared himself for their delivery, and the liberality with which the Royal Institution of Great Britain at once placed their theatre at the disposal of the Society for the occasion. The Society's recent country meeting at Southampton was most successful in every department of its arrangements, and fulfilled the most sanguine expectations of the Council. The extent of the show-yard, and the number of entries for exhibition on that occasion exceeded those of any previous meeting; and the trial of implements, so dependent on circumstances for failure or success, was conducted to the satisfaction of the stewards of that department and the exhibitors whose implements were selected for trial, and proved an object of much attention to the numerous spectators by whom it was witnessed. The success, in a financial point of view, was greatly promoted by the means so liberally placed at the disposal of the Council by the committee of the town and neighbourhood of Southampton, in the contribution of 1000*l.* to the funds of the Society for the purpose of meeting the expenses of the occasion. To the Mayor, corporation, and authorities of the borough, the local committee, the commissioners of police, the occupiers of the trial ground, and the South Western Railway Company, the Society, before leaving Southampton, conveyed by unanimous resolutions their best acknowledgments of the essential services which those parties, by their cordial and zealous co-operation, had respectively rendered to the Council in promoting the objects of the meeting. From the agricultural character of the district in which the next Annual Country Meeting of the Society at Shrewsbury is appointed to be held, the Council anticipate with confidence a result no less gratifying than that obtained at Southampton; and they have already taken the requisite steps in preparation for that meeting, and have also decided that the judges of stock shall be appointed from recommendations made by the members of the Society at large at the General Meeting in May.

The Finance Committee will lay before the meeting the balance-sheets of the accounts as examined and approved by the auditors on the part of the Society. Their chairman will also report to the members the large amount of arrears of subscription discharged during the past half year, as well as the mode proposed for facilitating the future collection of subscriptions. Since the last half-yearly meeting upwards of 300 new members have been elected, and the Society now consists of the following members:—Life Governors, 97; Annual Governors, 208; Annual Members, 6037; Life Members, 470; Honorary Members, 15; making a total of 6827 members on the list of the Society at the present time. The Council have unanimously requested Mr. Pusey to accept the office of a trustee of the Society, vacant by the death of the Duke of Grafton, and have elected Mr. Thomas Lockley Meire, of Cound Arbour, near Shrewsbury, a member of the Council, in the place of the late Mr. Edward Gough, of Gravel Hill, near Shrewsbury. The increasing importance attached by the members to the possession of the Society's Journal, has led the Journal Committee to continue its best consideration of the means by which the distribution of each publication may be effected with the greatest certainty, and least loss of time, among the members throughout the kingdom; and they trust that this desirable object will gradually become attained, as the addresses of members are more accurately known, and the most convenient modes of transmission to them more distinctly ascertained. For the convenience of members availing themselves of their privileges of attending the rooms of the Society, the Council have ordered a catalogue of the library, and an inventory of the implements, models, &c., to be prepared for their reference. Four years having elapsed since the date of the charter, and the bye-laws then framed agreeably with the new powers conferred upon the Society, the Council have been desirous of rendering the experience gained during this period available for the regulation of their proceedings; and they have accordingly made a complete revision of their former bye-laws, and enacted a code of bye-laws and regulations, not only embodying the tenor of such of their special resolutions as had a permanent operation, but rendering the whole more exactly in accordance with the provisions of the charter. A printed copy of these bye-laws was appended to the journal on its last publication, and thus brought under the immediate notice of the members.

The Council, in conclusion, beg to congratulate the members on the present sound and vigorous condition under which the Society is steadily advancing in the gradual fulfilment of its national objects; and, supported as it is by the continued accession of new members, they hope to extend annually its sphere of usefulness.—By order of the Council, (Signed) JAMES HUDSON, Sec.

On the motion of Mr. SAMUEL DRUCE, seconded by Mr. TOWER, this report was unanimously received and adopted. Mr. RAYMOND BARKER, chairman of the Finance Committee, then read to the meeting the following balance-sheets as audited on the previous day:—

I.—GENERAL STATEMENT OF ACCOUNT FROM JAN. 1. TO JUNE 30, 1844.—*Receipts.*

	£	s.	d.
Balance in the hands of the bankers, Dec. 31, 1843	657	11	8
Balance in the hands of the secretary, Dec. 31, 1843	14	2	1
Half-year's dividends on stock	130	16	6
Life-compositions of governors	150	0	0
Life-compositions of members	268	0	0
Annual subscriptions of governors	827	10	0

(Signed) RICHMOND, President.
T. R. BARKER, Chairman of Finance.
C. B. CHALLONER.
THOMAS AUSTEN.
HENRY BLANSHARD.

Mr. BARKER having given an explanation of these balance sheets, and invited the members to an inspection of the various account-books of the Society then lying on the table, in which every detail connected with the items from which those documents were derived, would be found registered, proceeded to report to the meeting the satisfactory manner in which the Finance Committee had continued the revision of the early list of members, and their consideration of the best mode of effecting a still further reduction of the arrears of subscription; when it was moved by Mr. SHELLEY and seconded by Sir ROBERT PRICE, "That the balance-sheets then laid before the meeting, and the statement with which they had been favoured by the Chairman of Finance, should be received and adopted:"—a resolution which was carried unanimously.

On the motion of Sir HARRY VERNEY, seconded by Mr. DEAN, the thanks of the Society were voted to the judges at the Southampton meeting.

EARL SPENCER then rose to propose the thanks of the Society to Dr. Playfair for the two lectures he had that week delivered to the members. Dr. Playfair had apologised for the imperfection of his lectures, occasioned by the short time given him for their preparation, but his lordship was quite sure that the members who attended them would agree with him in thinking that such an imperfection had not been perceived by Dr. Playfair's auditory on that occasion; and that, however interesting those lectures were found to be at the time of their delivery, he had no doubt they would prove still more intelligible and instructive when printed and read at leisure. It was quite true that in the first lecture there were many points of an abstract nature which it required time and consideration distinctly to understand; and he had no doubt, that on careful perusal, the lectures would be found of much greater advantage to the members than might at first be apprehended from the impressions derived on a cursory attendance only at their original delivery.

The MARQUESS OF DOWNSHIRE having seconded the motion, it was carried unanimously.

Mr. MILES, M.P., then proposed that the thanks of the Society should be given to the Royal Institution of Great Britain for the kindness they had evinced in granting to the Society the gratuitous use of their theatre for Dr. Playfair's lectures. He had the very greatest satisfaction in making this proposition. He need not say that whenever the cause of science had been brought forward in England, the Royal Institution had always lent its powerful aid to advance its progress; and he was proud to think that the Royal Agricultural Society of England had met with so effective and congenial an ally in the prosecution of its objects.

Mr. SOLLY, of Heathside, in Dorsetshire, rose to express his gratification at this compliment to an institution of which he had been a member very nearly from its first commencement. It was established for the application of science to the purposes of life. The attention of its founder, Count Rumford, was principally directed to the economy of food and fuel, in aid of the views of an association for bettering the condition of the poor, among whom unusual distress was felt in consequence of inclement seasons. The experiment of Count Rumford, on the means of obtaining greater warmth from the same consumption of fuel, have produced lasting benefits. To the experiment of Sir Humphry Davy in the laboratory of the Royal Institution we are indebted for the safety lamp, which has so much diminished the danger, and consequently the expense of excavating some of our principal stores of coal. By the Board of Agriculture, whose

spirit seems to have been infused into our Society, Sir H. Davy was invited to apply his chemical knowledge to the means of increasing the production of food. His views on this subject have not hitherto been surpassed in utility, although they are greatly undervalued by the disciples of foreign empirics. In the application of electricity to chemical analysis, Sir Humphrey took the lead, after his predecessor Ritter had through his national love of mysticism become bewildered in the mazes of Mesmerism. The prominent position which Sir Humphry attained in this path of science has been nobly maintained by his pupil Farady, who is looked up to by all nations as the first authority in electrolytic science. His idea that electrical attraction and chemical affinity are one and the same, first occurred to Sir Humphry, in consequence of his decomposition of the alkalies by electricity. The exceptions to this rule may admit of explanation, and do not militate against its general application. On this important subject much remains to be investigated. Mr. Solly hailed with great delight the prospect of a permanent connection between the Society and the Royal Institution, for the purpose of examining the nature and composition of the objects of agriculture; but, as a reason for caution against placing unlimited confidence in chemical analyses for the purpose of ascertaining the nutriment essentially required by plants, Mr. Solly mentioned the obvious difference in their nature, produced by difference of soil. This is particularly observable in Grasses, which are frequently refused by cattle when manured by their own dung; but the same cause does not render them distasteful to animals of a different species. In Norway the excrement of horses is greedily devoured by cows. Mr. Solly mentioned that some of the large and more profitable Grasses seem to prefer a great depth of loose soil, particularly of leaf-mould: therefore some of them flourish with the greatest luxuriance on the banks of hedges. This is particularly the case with the Holcus avenaceous, highly recommended by German writers of the last century. Mr. Solly exhibited some remarkable specimens of other indigenous Grasses obtained from hedge-banks in Hertfordshire—the Bromus giganteus and the Festuca elatior—the height of the former exceeded 8 feet, that of the latter was more than 6. This Grass has been particularly recommended for cultivation in the "Transactions of the Swedish Agricultural Society." Mr. Solly then seconded Mr. Miles's motion, which was carried unanimously.

Sir Harry Verney rose, to propose the thanks of the meeting to the Finance Committee and the Auditors of Accounts, on the part of the Society, for their great care of the financial interests of the Society; and the motion being seconded by Mr. Richard Milward, was carried unanimously.

Colonel Challoner returned thanks on the part of the Finance Committee, for the good opinion entertained of them and the auditors. He had the gratification to state, that the accounts were in a state of perfect regularity,—a circumstance of the greatest importance, for unless the financial department be regulated with the utmost precision, no Society could expect to prosper.

Mr. Knight, as one of the auditors, on the part of the Society, returned thanks to the meeting on behalf of himself and his colleague, Mr. Hampden Turner, who on the day previously had with him audited the accounts then laid on the table before the members. He had the satisfaction of bearing his testimony to the extreme accuracy of the accounts of the Society, which were kept in so excellent a state that it had become a most pleasing duty to audit them.

Sir Harry Verney suggested the desirableness of connecting the Society with the different local Societies throughout the kingdom, in the same manner as had been effected with great success by the Royal Agricultural Improvement Society of Ireland, where that Society was proving, not as in England, a boon to agriculture alone, but a national blessing in promoting a good understanding among all parties connected more or less with the cultivation of the soil within the range of its progress and influence.

The noble President would not fail to bring Sir Harry Verney's proposition before the Council on the earliest occasion; at the same time he thought that the movement, in reference to any alliance, such as that proposed, ought to originate with the local Societies themselves towards the Royal Agricultural Society as the central body, whose collected information they already received, and diffused with so much practical advantage throughout their respective districts.

The Marquis of Downshire bore testimony to the value of the local Societies in Ireland, and the united desire now manifested by the owners and occupiers in that part of the kingdom to go on cordially together hand in hand in the great work of agricultural improvement, to which they were invited and encouraged by the example set them in England and Scotland.

On the motion of Earl Spencer, seconded by Mr. Hillyard, a vote of thanks was carried by acclamation to the noble President.

The Duke of Richmond expressed himself grateful for the manner in which the meeting had received the proposition of his noble friend, Lord Spencer. He had at present done little, since he had again come into the office of their president, to deserve thair thanks; but he confidently hoped that he should leave the Society in as flourishing a state as they had then the gratification of finding it. The Society had not only done great good already, but would do still more; and as long as it was supported by the tenants and practical farmers of the country, there could be no doubt of its continued prosperity and success. The noble duke then left the chair, and the meeting broke up.

The Meetings of the Council stand adjourned over the Christmas recess to the 5th of February.

SMITHFIELD CLUB SHOW.

We omitted mentioning in our report last week of this Exhibition, a model of farm-buildings, exhibited by Mr. Croggon, covered with his asphalte roofing, to the value of which, we understand, he has many testimonials.

Miscellaneous.

Fibrous Covering, or Gurneyism.—Fibrous covering requires to be applied in given quantities; if too much was laid on it would, like too large a dose of manure, destroy vegetation; and if too little, it would produce no very sensible action; this was a point of some importance, as an experiment would fail from either of these causes. He thought, judging from the result of experiment, that about 20 lbs. of long straw should be laid equally over a customary land-yard or rood of growing Grass, either in a lay-field or an after Grass. Previously to the next meeting, he hoped they would rake off the covering, and carefully notice the effect produced in the growth of the herbage, as compared to that in the other parts of the field; the nature and kind of Grass should also be carefully examined. Before he sat down it might be well for him to say that about seven weeks since he had covered half a field of Grass of three acres in this manner, and that about a fortnight ago when examined, the increase had been found to be at the rate of upwards of 5000 lbs. per acre over the other part of the field. At the same time the straw was raked off and laid in rows about 12 ft. apart on the field; 115 sheep were now put into the field, with a view to eat it down as quickly as possible. After they had been there about a week, they were succeeded by 26 bullocks to eat off the long Grass remaining, and which the sheep had left; the field was eaten as bare as possible. The same straw was now again thrown over the same portion of the field from which it had been raked; on inspection that morning he had found the action going on under it as powerfully as on the former occasion. He said he thought the sheep, on first raking off the straw, were not so fond of the Grass as they were of that uncovered: but after 24 hours' exposure to the sun and air, he thought they rather preferred it. He had upwards of 40 acres now under the operation, and in consequence of it, he had had Grass when his neighbours had none. He would consider it a personal favour if they would make some experiments on this subject before their next meeting.—*Mr. Gurney, at the June Meeting of the East Cornwall Experimental Club.*

Value of Guano.—Dr. Ure quotes African as varying in composition as follows:—

Moisture	from 21 to 36	per cent.	
Ammonia	„ 5	10	„
Organic matter	„ 35	50	„
Phosphate of lime	„ 23	35	„
Phosphate of magnesia and ammonia	3	6	„
Alkaline salts	„ 1.5	5	„
Sand, &c.	„ 1	2	„

Now, the moisture is worth nothing, so that a sample giving 36 per cent. moisture, will contain but 64 solid guano, and that more or less damaged. Ammonia is the most valuable ingredient, and may be estimated (in comparison with other manures) at 6*d.* to 8*d.* per lb.; so that two samples, in other respects equal, one containing 10, the other only 5 per cent. of ammonia—the first will be worth 2*s.* 6*d.* per cwt., or 2*l.* 10*s.* per ton, more than the other. The ingredient next in value is the phosphate of lime, including that of magnesia, which are here in a much more readily soluble state than in bones; and taking bones to average half their weight of phosphate, may be valued at double the price of bone-dust, that is, taking bone-dust at 18*s.* per quarter of 3 cwt., the phosphates in guano may be valued at 12*s.* per cwt., or 1½*d.* per lb. But these phosphates do not decay; and hence the more the ammonia and organic matters are rotted away, the richer is the remainder in phosphates. For instance, if fresh guano contains 15 per cent. phosphates, and then loses 1-4th by decay, the whole 15 of phosphates remain in the 75 lbs. residue; and 100 of such residue will contain 20. So that decayed guano becomes richer in phosphates as it loses ammonia; the one going, in some degree, to compensate the loss of the other. The organic matters, free from ammonia and nitrogen, are the other elements in the worth of guano, and are the more valuable from their state of intimate composition with the ammonia and phosphates. In this state they may be worth 1*s.* (or more) per cwt. The alkaline salts are in such small quantity, that it may be better to simplify the calculation by omitting them. The value of guano may then be estimated according to its contents, in—1. Ammonia; 2. Phosphates; 3. Organic matter. For example, take two samples of African guano. No. 1 fair; No. 2 inferior; containing as follows, per 100lbs.:—

	No. 1.	*s.*	*d.*	No. 2.	*s.*	*d.*
Moisture (no value)	20			33		
Ammonia, at 6*d.*	8	4	0	5	2	6
Phosphates, 1½*d.*	25	3	1½	30	3	9
Organic matter 1*s.* per cwt.	40	0	4	28	0	3
		7	5½		6	6

Their proportionate values will be about as 7*s.* 6*d.* to 6*s.* 6*d.*: their actual prices depending, of course, on the state of the market, but still bearing the same proportions.—*J. Prideaux, in the Farmers' Journal.*

Drill.—The principle of thin drilling is admitted by every farmer who hoes his Turnips, and every gardener who pricks out his bed of seedling Cabbage-plants. The grain crops alone seem, by some prejudiced persons, to be considered capable of taking care of themselves, and are supposed to be safely allowed to carry on a vegetable agrarian war in their own ranks, during the earlier period of their growth, until two-thirds of them are killed outright, and the rest stunted or predisposed to disease, by their constitutions having been impaired in this desperate struggle for existence. If a farmer were to turn 20 sheep into a field of Turnips capable of fattening only 10, with a view to get the 10 best ones fatted, to the sacrifice of the remainder, some of his relations would, if he were rich, immediately get him declared insane. Yet this is precisely the course taken with his Wheat-plants, by the man who drills above a bushel per acre.—*Maidstone Gazette.*

Notices to Correspondents.

Rural Chemistry.—By E. Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Honorary Member of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, may be had of all booksellers, price 4*s.* 6*d.*

Books.—*Maillus.*—"Johnston's Lectures on Agricultural Chemistry and Geology."

Cape of Good Hope.—*Broadway.*—We are unable to assist you.

Churn.—*Philla.*—The Sussex churn is a fixed barrel churn. It is made of block tin, which is not injurious to the butter.

Coltsfoot.—*Maillew.*—Your only remedy is perseverance in cutting off its flowers in spring, and its leaves in summer.

Decomposition of Manure.—*Subscriber.*—You will, perhaps, effect the decomposition of your compost within the time by turning it over once a fortnight, and shaking it all to fine pieces.

Dr. Yelloly's Forks.—*H.* would take it as a great favour if Mr. Dixon, Witham, would give in our Paper such a description of Dr. Yelloly's forks as would enable him to have some made.

Farm-yard Litter.—*Twitch.*—Couch used as litter will not all perish; such a use of it would render the after application of the manure dangerous.

Fences.—*X. Z.*—Beech makes the best fences on the soil and in the situation you describe. The plants should be 1 foot apart in two rows 24 inches apart. Your question about iron wire cannot be answered, except in the advertising columns.

Flax.—*J. H. Dickson.*—Your article has been received, but we are unable to give it immediate insertion.

Gas, Lime, &c.—*G. B. M.*—Pray excuse a postponement of answers to your questions till next week.

Guano.—*G. B.*—See *Miscellaneous* section.

Gurneyism.—*Melksham.*—See *Miscellaneous* section of this day's Paper. That paragraph contains all we know on the subject. Can any of our Cornwall readers give us the details of this practice?

Horse-beans.—*Cymro.*—*Dibble* the *Berkshire* Horse-bean in any of the deep clay soils you may have. Its produce may be from 4 to 5 quarters per acre. It is not nearly so exhausting a crop as other corn crops. For Bean culture, see an early Number of this periodical.

Paging of the Gardeners' Chronicle.—We have received very many kind suggestions, some will be adopted at the beginning of the year; others cannot, for practical reasons.

Smithfield Market.—*A Subscriber.*—Your letter shall be inserted as soon as possible.

Sundries.—*Anon.*—You may safely grind your stock of bones now; but however much your customers might have reason to be satisfied with the arrangement, your own interest, we apprehend, declares against putting the bone-dust together in large lots. Your sheep-folds should be changed once a day; the first day's experience will tell you how large to make the folds; it of course depends altogether on the nature of the crop. The White Norfolk Turnip should be all eaten by this time; you should next have hybrids till February, then Swedes till April, and lastly Mangold Wurzel.

Sulphate of Magnesia.—*David.*—The use of this salt is one of the best means you have of getting this alkaline earth *into* plants. We cannot say what effect it may have on Sorrel. The suggestion to which you refer was not ours.

Warne's Suggestions for Fattening Cattle.—*Constant Reader.*—Apologies are due both to you and Mr. Sproule for our misapprehension of your meaning. The pamphlet is published by Edwards and Hughes, Ave-Maria-lane.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Dec. 16.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4*s* 4	to	4*s* 6	Best Downs & Half-breds	4*s* 2	to	4*s* 4
Best Short Horns	4 0		4 4	Best Long-wools	3 10		4 2
Second quality Beasts	3 4		4 0	Ewes and second quality	3 0		3 8
Calves	3 8		4 6	Pigs	3 0		4 0

Beasts, 5713; Sheep, 36,970; Calves, 111; Pigs, 362

To day is our annual "Great Market," and one better supplied has not been known for many years. The scarcity of keep during the season, and the general indifferent quality of the supply for several months past, had induced the belief that good Beef would have been scarce on this occasion; in consequence an expectation had been formed by those who made extra exertions to supply the anticipated deficiency, that they would meet with a fair remuneration for their anxiety and outlay of capital; we are sorry to record a serious disappointment. A more splendid collection of cattle we do not remember ever witnessing. Our tabular statement refers to the prices obtained for general average quality. Anything approaching to the quality of Prize Cattle would, in some instances, make rather more, as meeting the fancy of the buyer to make a show; and in some instances very big Beasts were unselling, in consequence of the change of weather, and scarcely made 4*s* 4*d*. A very large quantity was bought by country butchers, so that London is not so full of Meat as might be expected from the numbers exhibited, and opens a little better prospect for the future. During the early part of the day very little was sold; towards the close a little more briskness was observed, but still great numbers were turned out unsold—several of very good quality, but the greater part second rate. The supply of Sheep was very large, and for the most part of good quality. The general trade is very heavy indeed; as with the Beasts, there were several of superior quality amongst the Sheep which made considerably more than stated in our Tables; for instance, we noticed some particularly fine Downs, weighing about 20 stones of 3 lbs, which realised 5*l.* each. Some few lots of old Downs made nearly 4*s* 6*d*; but 4*s* 4*d* per 8 lbs is the more general price. A few lots of Longwools also made 4*s* 4*d*. Second quality were very unsaleable, and many of that description turned out. We had a good show of Veal, but trade heavy at our quotations. Pork-trade was very bad, which is usual at the break of a frost.

FRIDAY, Dec. 20.

Our supply of fresh Beasts is not very large to-day, but with those left over from Monday there is quite enough for the demand. There is a difficulty to dispose of the very big Beasts, although the rather favourable change in the weather has caused a little briskness amongst the good selling qualities;—Monday's quotations are fully supported for this description. Some of the largest Oxen are losing money, even from what was bid on Monday, and we fear they will not all be sold. Trade is very bad amongst the Sheep; those that are not pretty good are scarcely saleable. Ewes make very little money. There has been a great glut of dead Meat since Monday, which makes the butchers very careless about buying to day. The best qualities are making about the same price as Monday. Veal-trade is very heavy; it must be a very good Calf to make 4*s* 4*d* per 8 lbs. Second quality is very low, prices ranging from 3*s* 4*d* to 3*s* 10*d*. Pork-trade is still bad, at the same prices as on Monday.

Beasts, 1339; Sheep, 5150; Calves, 145; Pigs, 384.

41, West Smithfield.

HOPS, Friday, Dec. 20.

This Market continues firm, holders expecting better prices after Christmas is over; there has been some rather extensive sales of bags during the week. Fine Pockets are very scarce.

Pattenden & Smith, Hop-Factors.

WOOL.—British, Friday, Dec. 20.

This Market continues quite as active as we last reported it. The demand for some descriptions of sorted Wools has increased, consequently sales have been effected at improved rates. Manufacturers complain that the prices of goods are far from adequate to the advanced rates of the raw material.

James Perrin, Wool Broker.

POTATOES.—SOUTHWARK WATERSIDE, Dec. 16.

THE contrary winds have continued through the past week, which has prevented the arrivals of Potatoes from all countries, consequently there was only a few small lots in the Market for sale, and they were sold at various advanced prices, the particulars of which we cannot define.

COVENT GARDEN, DEC. 21.— Notwithstanding the unsteady state of the weather the market has been tolerably well supplied with most articles during the week, but trade has not been brisk. Among fruit there has been little alteration since last week. Pine-apples are sufficient for the demand, and are offered at nearly the same prices as quoted in our last report. Grapes have not altered in price; good samples are offered at about 2s. per pound. The best dessert Apples at present in the market are the Ribstone Pippin, Blenheim Orange, and Court of Wick. Of Pears, the principal sorts for table are the Winter Nelis, Glout Morceau, and Passe Colmar. These are, however, not so good as they are in some seasons, being, comparatively speaking, gritty, and not well-flavoured. All kinds of Nuts are scarce. Filberts are very dear, good samples bringing from 140s. to 150s. per 100 lbs. Oranges are plentiful. Among vegetables scarcely any difference has taken place since our last report. Good samples of Seakale and Asparagus are offered at last week's prices. White Broccoli is excellent, and the purple sort is also good. Cauliflowers are scarce. Turnips and Carrots of good quality are selling at the same prices as last week. Celery, although good, has suffered a little from the effects of the frost. Tomatoes may still be had, but they are very scarce. Brussels Sprouts, Savoys, and other winter Greens are good in quality, and the supply is equal to the demand. Cut flowers chiefly consist of Cypripedium insigne and venustum, Luculia gratissima, Euphorbia jacquiniflora, Gnidia pinifolia, Cacti, Camellias, Heaths, Epacrises, Cinerarias, Amaryllises, Acacias, Azaleas, Narcissus, Chrysanthemums, Tulips, and Roses.

FRUITS.

Savory, per bunch, 2d to 3d	Marjoram, per bunch, 2d to 3d
Spinach, per sieve, 3s to 5s	Chervil, per punnet, 2d to 3d
Scorzonera, per bunch, 1s to 1s 3d	Chilis, per 100, 1s to 2s
Salsafy, per bunch, 1s to 1s 3d	

MARK-LANE, MONDAY, Dec. 16.

THE supply of Wheat by land carriage samples this morning was moderate; best qualities were taken off on the terms of last week, but great difficulty was experienced in the disposal of secondary and inferior conditional parcels, of which some quantity remained unsold. Foreign fully maintains its value, but the sale continues limited. We observe no alteration in the value of Barley, Beans, and Peas from this day se'nnight. The quantity of Oats on sale being small, and large arrivals expected, dealers refrained from purchasing; but extreme prices were obtained from consumers and necessitous buyers.

FRIDAY, Dec. 20.

The arrivals of all Corn during the week have been small, and business, both on Wednesday and to-day, very limited. Great difficulty is experienced in realising the English Wheat left over from Monday; foreign is wanted by the millers, who are restrained by its comparatively high value from purchasing. Barley and Beans are unaltered, but the return of frost induces factors to hold their White Peas for an advance. The market continues very bare of Oats, and where sales are effected, a slight advance is obtained.

NOW PUBLISHING, IN QUARTERLY VOLUMES.

THE WORKS OF G. P. R. JAMES, ESQ.

Price 8s. cloth, handsomely printed in medium octavo, and Illustrated.

This new and attractive Series of Mr. JAMES's Works commenced on the 1st of July with the "GIPSY," and was followed on the 1st of October, by "MARY OF BURGUNDY." The future Volumes will be published Quarterly, each containing a complete Work.

VOL. III., CONTAINING THE

HUGUENOTS: A Tale of the French Protestants,

WILL BE PUBLISHED ON THE 1ST OF JANUARY,

And will contain, in addition to the usual Illustration, a new and highly-finished Portrait of the Author; to be inserted as the Plate promised in the First Volume, to form a Frontispiece to the Series.

LONDON: SMITH, ELDER, AND CO., 65, CORNHILL. EDINBURGH: BELL AND BRADFUTE. DUBLIN: J. CUMMING.

PUNCH'S ALMANACK FOR 1845

Will be introduced to the Public on the 24th instant. One of the most prominent features of the ALMANACK will be

A PICTORIAL CHRONOLOGY FOR 1844,

ILLUSTRATIVE OF

THE IRISH STATE TRIALS.
THE PROGRESS OF THE DOG BILL.
THE INTRODUCTION OF THE POLKA.
ART UNION AND FINE ART DISTRIBUTION.
THE RUNNING REIN FRAUD.
VISIT OF THE EMPEROR OF RUSSIA.
THE WAR IN MOROCCO.
AGRICULTURAL ASSOCIATION.
THE WRIT OF ERROR.
THE VISIT OF LOUIS-PHILIPPE.
COMPLETION OF THE ROYAL EXCHANGE.
THE TRIUMPHS OF PUNCH.

In addition to these Artistic wonders, "PUNCH" has also depicted the following

BUBBLES OF THE YEAR:

THE O'CONNELL RENT.
"SHAVING THE LADIES."
CHEAP CLOTHING.
TOM THUMB AT THE PALACE.
TESTIMONIALS TO MANAGERS.
PATENT LIFE PILLS.
CHEAP FURNITURE.
THE AGRICULTURAL PRIZE LABOURER.
BRITISH AND FOREIGN DESTITUTE.
YOUNG ENGLAND'S SOIREE.
THE GREAT UNACCOUNTABLE.
FASHIONABLE PROPRIETARY CHAPELS.

This arrangement will insure Merriment to everybody's Christmas, for something less than the cost of an ordinary Mince Pie, viz., 3d., or 4d. stamped.

OFFICE FOR PUBLICATION, 194, STRAND.

Price SIXPENCE, free by post SEVENPENCE.

The Lancet,

Of Saturday last, DECEMBER 14, contains:—

A COURSE of LECTURES on ORGANIC CHEMISTRY, delivered during the Winter Session, 1844, in the University of Giessen, by JUSTUS LIEBIG:—Cyanogen and its Compounds continued—Metallic Cyanides—Paracyanogen.

FOREIGN DEPARTMENT:—Italy: Scientific Congress at Milan—Indian Corn a cause of Pellagra—Fibrin of the Blood in Inflammation—New Method for the Analysis of the Blood—Scurvy.

ORIGINAL PAPERS:—On the Theory of Menstruation. By G. F. Girdwood, Esq.—The late Cases of Poisoning by Prussic Acid. By H. Letheby, M.B.—A Substitute for Wood Engraving.—Facts and Observations Illustrative of the Nature and Treatment of the Diseases of Women, with Remarks on some Subjects connected with Midwifery. By G. Oakley Heming, M.D., F.L.S.—On the Treatment of Femoral Hernia. By J. Sebastian Wilkinson, Esq.—On the Labours of Grahamised Doctors in the Country. By R. Hodgson, Esq.

BRITISH MEDICAL JOURNALS:—The Origin of Puerperal Fever—On the use of Nitric Acid as an Escharotic in certain Haemorrhoidal Affections—A case of difficulty in recognising the Sex of an Infant—Cases of Fractured Skull.—Death from Impaction of a portion of Barley "Haw" under the Tongue.

CHEMISTRY, PHARMACY, AND MATERIA MEDICA:—Adulterations:—Scammony.

ON SATURDAY, THE 4TH OF JANUARY, 1845,

Will be Published, Stamped for free transmission by post, price Sixpence (to be continued Weekly),

No. I. OF

AN ORIGINAL JOURNAL

OF

FAMILY EVENTS, NATIONAL AND PRIVATE BIOGRAPHY, LIFE AND HEALTH, AND GENERAL NEWS.

TO BE CALLED THE

HISTORICAL REGISTER

UNDER THE SANCTION, AND WITH THE ASSISTANCE, OF VARIOUS

Government Departments.

THE importance to the welfare of society of the three great events of Human Life—

Birth, Marriage, and Death,

has led the Government to establish a Public Department for their Registration. In order to carry out the same views more extensively and usefully, The Historical Register, *under the sanction of the Registrar-General* and *various Public Departments*, will lay before the public, every Week, a comprehensive, accurate, and well-digested Register of such events, and all the interesting circumstances connected with them.

The Conductors of The Historical Register have the satisfaction of announcing, that, to accomplish this object, the most complete arrangements have been organised with the official Registrars of Births, Marriages, and Deaths, throughout England and Wales.

With BIRTH and MARRIAGE the associations are obviously many, important, and interesting; and it is only necessary here to state that The Historical Register will be a most extensive record of such events, and of all matters incidental to them which interest the Public.

With DEATH is associated one of the most important features of The Historical Register, viz.

National Biography

Of all persons, of any distinction whatever, their friends wish for some Biographical Memoir; of all eminent men, the nation requires a Biography: there is, however, at present, no publication which furnishes this information systematically,—which gratifies public curiosity at the time it is excited; and there are very few in which, at any time, are found accounts of more than a mere fraction of the interesting lives which should be recorded. This, therefore, is an entirely new field, which The Historical Register is about to occupy. It will give full and accurate

Biographies of all Public Characters, and shorter Memoirs of Private Persons of Worth and local mark.

Social, as distinguished from *Political* Life, has hitherto had no journal to record and discuss the numerous circumstances tending to its advancement or retarding its progress. The Historical Register will now supply this want.

Historical Events will be recorded briefly, clearly, and impartially; in such a manner that The Historical Register may be referred to hereafter for an accurate statement of the History of the Period.

The *Literature* of the day, so far as it refers to its special topics, will come within the scope of The Historical Register.

The HISTORY and PERSONAL CONSTITUTION of the

Civil Departments of Government

Are now about to be treated for the first time; a History of each Public Department will be drawn up from the earliest period, and the Appointment, Resignation, and Promotion of all Functionaries will be registered from time to time as they happen. These details, of an analogous nature to the contents of the "Army List," will be compiled, *by Authority*, from authentic information.

The general character of The Historical Register will be best understood by a brief enumeration of the subjects which it will comprehend:—

The Registration of the Births, Marriages, and Deaths of the upper and middle classes, on a more comprehensive and systematic scale than has hitherto been attempted.
Biography—General, National, and Private.
Social Condition and Domestic Life.
The Insertion of Abstracts of Wills and Administrations of Public Interest.
Judicial Proceedings relative to Divorce, Pedigree, &c.
The Operation of the Registration Acts.
Life and Fire Insurance.
Public Health; and the various circumstances in respect of Buildings, Drainage, Ventilation, Sepulture, Epidemics, Unwholesome Employments, &c. which affect it. Information will be obtained from official and other sources respecting all Public Works for the Improvement of Towns; the Proceedings of the Health of Towns Commission, and all Societies for improving the Physical Condition of the People. The Weekly Reports of Mortality in the Metropolis, and Quarterly Reports of Health throughout England and Wales, will be published, under the authority of the Registrar-General, in THE HISTORICAL REGISTER.

In addition to the above, its own peculiar topics, The Historical Register will be especially a

FAMILY NEWSPAPER,

In which an ample and impartial Chronicle, *free from political party bias*, will be given of all the important Events of the Week.

It may confidently be expected that The Historical Register will become the especial organ for the announcement and recording of Births, Marriages and Deaths, and the chief public source in which searches after them will be made; thus investing the Journal with great genealogical value for the protection of hereditary rights.

"It is the *Personal*," says a popular writer, "that interests mankind, that fires the imagination, and wins their hearts;" and we beg the reader to bear in mind that it is to the *Personal*, distinguished from the scandalous, that The Historical Register mainly devotes itself.

The Historical Register will consist of 16 folio pages, or 48 columns, stamped for free transmission by post

The Historical Register will be *arranged in four parts, so that it may be read by four persons at one time*, in a form convenient for binding and preservation.

The Historical Register will be published *every Saturday*, in time for the morning mails.—Price SIXPENCE.

☞ The FIRST NUMBER of The Historical Register will appear on Saturday, the 4th of January, 1845.

(Only a very limited number of Advertisements will be admitted.)

*** Announcements of Births, Marriages, and Deaths will be inserted at a very moderate rate, and a copy of The Historical Register will *be forwarded, without charge, to the persons making the insertions.* The clerks of large parishes, with the sanction of the clergy, receive the notices of Marriages in the Established Church; and the various Registrars throughout the Kingdom, with the sanction of the Registrar-General, receive the notices of other Marriages, and the notices of Births and Deaths.

Office for Advertisements and Communications, 7, Catherine-street, Strand, London.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-st., in the precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 21, 1844.

The Newspaper.

SATURDAY, DECEMBER 21, 1844.

CONTENTS:—Cultivation of Hardy Lilies—Pruning Forest-trees—Ornamental Timber—Application of Manures—Landscape Gardening—Management of Grape-Vines—Planting Shrubs—Grafting—Hybridising—Horticultural Buildings—Description of New Flowers—Wonders of the Vegetable Kingdom—Designs for Rock Gardens — Irrigating Lands — Select Fuchsias—Hardy Annuals—Reviews—Practical Gardening, and Management of Hothouses, Greenhouses, and Frames—Horticultural Notes, &c.

Advertisements must be sent on or before the 26th of each month.

The Introductory Number, containing a variety of Original Essays and a Plan of the Work, may be still had, price 1s., of THOS. HOULSTON, 154, Strand, London, and all Booksellers.

WITH 100 PRACTICAL ILLUSTRATIONS.

This day is published, price 15s., handsomely bound in cloth,

THE GARDENER AND PRACTICAL FLORIST, Volume III., containing several hundred Original Papers and Treatises on Floricultural subjects, together with the Garden Practice for the entire Year. A few copies of Vol. I., price 7s. 6d., and Vol. II., price 10s. 6d., may still be had; the Three Volumes, comprising the best Miscellany of Gardening ever published.

London: R. GROOMBRIDGE, 5, Paternoster Row.

HUNTING, SHOOTING, &c.

One very thick volume, illustrated with nearly 600 Engravings on Wood, 8vo. 50s. cloth,

AN ENCYCLOPÆDIA OF RURAL SPORTS: comprising Hunting, Racing, Shooting, Fishing, Coursing, &c. &c. By D. P. BLAINE, Esq.

"A perfect library for all lovers of country sports, for all country gentlemen, and for all persons who delight in the manly and healthy recreations which are afforded to the inhabitants of no country in such perfection as to the inhabitants of the British Isles."—*Times*.

London:—LONGMAN, BROWN, GREEN, and LONGMANS.

FRUITS AND FLOWERS.

MAUND'S BOTANIC GARDEN. On the 1st of January, 1845, this work will contain the commencement of the FRUITIST, a Treatise on useful Fruits, with Engravings.

Persons desirous of possessing the work should order it of their bookseller from the above date, the commencement of the new volume. Price, large, 1s. 6d.; small, 1s. Monthly.

The "BOTANIC GARDEN," as originally issued, contained Figures of Hardy Ornamental Flowering Plants, drawn and coloured from Nature, with popular descriptions, and information useful and interesting to every possessor of a garden; independently of this, there will hereafter be given in each monthly Number as follows:—

1st. A portion of the AUCTARIUM, containing miscellaneous information connected with the cultivation of the Flower, Fruit, and Vegetable Garden.

2d. A portion of the FLORAL REGISTER, with neatly-executed miniature engravings, and detailed descriptions of new flowers, chiefly founded on the works of leading botanists.

3d. A portion of the FRUITIST, a Treatise on Garden and Orchard Fruits, being Descriptions of the best sorts of Apples, Pears, and other fruits, with Engravings of each sort; their qualities will be compared, and management made easy to the most inexperienced cultivator.

4th. A portion of a DICTIONARY in which are explained words chiefly used in Botany and Agriculture, illustrated with Cuts; written by the Rev. Professor HENSLOW.

These several portions form distinct works.

For the "BOTANIC GARDEN," there are published 10 quarto volumes, besides two volumes of Floral Register and Auctarium, to which the purchaser of any six volumes is entitled gratis.

For typographical arrangement and execution, and the correctness and beauty of Engravings, it may with confidence be asserted it is not excelled by any similar publication.

Each volume is in itself quite complete, and may be purchased separately, and others may at any future time be had precisely to correspond in binding. They are bound in handsome emblematically gilt cloth boards and gilt edges, at 2l. each; and the small paper, with less elaborately coloured plates, 25s. each.

For the accommodation of Gardeners and small cultivators, who desire to obtain a knowledge of flowers and gardening, the more fully to enjoy its advantages, a reprint of the early part of the work has been issued, called "The Gardeners' Edition of the Botanic Garden." The plates are partially coloured, and the price but 6d. Monthly.

Of this, two Parts, of 12 Numbers each, are completed, price, in gilt cloth, 7s. 6d. each.

London: R. GROOMBRIDGE and SONS, 5, Paternoster-row.

TO NURSERY AND SEEDSMEN, MANUFACTURERS OF GARDEN-IMPLEMENTS, AND OTHERS.

THE Proprietor of "MAUND'S BOTANIC GARDEN," yielding to the frequent solicitation of parties who require publicity among the cultivators of Flowers and Fruits, has consented to insert an Advertising Leaf or Leaves in his Work, established in 1824, and circulating extensively among the most wealthy and respectable classes of society.

From the 1st of JANUARY, therefore, Advertisements intended for insertion should be addressed to Mr. JOSEPH THOMAS, General Newspaper and Advertising Agent, No. 1, Finch-lane, Cornhill, London, before the 21st of each month.

AGRICULTURAL DRAINING. — THE DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker,

J. DAVIS, Optician, Derby.

CHEPSTOW FARMERS' CLUB.—It is proposed to Present Mr. ARTHUR HALL, Hon. Sec. to the Chepstow Farmers' Club, with a Token of Gratitude for the important services he has rendered to that Society, and as a mark of the esteem and admiration in which his talents and courteous conduct are held by its members; to which all parties desirous of testifying their approbation are respectfully solicited to subscribe.—Subscriptions will be received by Messrs. BROMAGE, SNEAD, and SNEAD.

SEASONABLE FESTIVITIES.—The gaiety that reigns supreme at this festive season, when friends and lovers assemble at the social board, or whirl in the giddy mazes of the dance, induces both sexes to be more than usually desirous of shining in personal attraction, and to devote a greater share of attention to the toilet. It is at this particular season, that the VIRTUES and SINGULARLY HAPPY PROPERTIES OF THOSE AUXILIARIES OF PERSONAL BEAUTY, ROWLAND'S KALYDOR, ROWLAND'S MACASSAR OIL, & ROWLAND'S ODONTO, shine pre-eminent in their power; while the *white* and *swan-like neck*, the *rich luxuriant tress*, and the *Pearly set of Teeth* form admirable trophies of their INESTIMABLE QUALITIES! The august Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence, and the confirmation by experience of the infallible efficacy *of these creative renovating Specifics*, have characterized them with perfection, and given them a celebrity unparalleled. As presents for both sexes, none can be more recommendatory, or more now in general use.

*** Ask for "ROWLAND'S" Articles. All others, under the same names, are SPURIOUS IMITATIONS!!!

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory, at Sheffield, offers the best Meat Dish Covers, as follow.—Cottage Pattern—1 Cover of 20 inches, 3l. 10s.; 1 do. of 18 inches, 3l. 3s.; 2 do. of 14 inches, 4l. 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 inches, 4l. 16s.; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz. Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 Engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

BUTTER MADE IN TEN MINUTES.—Much time and labour will be saved by the use of the SUSSEX CHURN, manufactured solely by GREEN and HALE, late Attwood, Wimble, and Warner, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream by placing the Churn in a pan of hot or cold water, which insures the butter coming in ten or twelve minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 00	0	1	2	3
To Churn	2½lb.	4lb.	7lb.	14lb.	28lb.
Price with pans	18s.	20s.	25s.	33s.	40s.

Delivered (carriage paid) to any part of London.

N.B.—Pans for making clouted cream.

London Agents:—Benham, 19, Wigmore-street, Cavendish-square; Bailey, 71, Gracechurch-street; Yates, Arthur-street East; Deanes, London Bridge. Export Agents, Barnes and Co., 109, Fenchurch-street.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus; and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices to 130, Fleet-street.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their establishments, 22, Regent-street (corner of Jermyn-street); or 45, Moorgate-street, City. New Goods plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the Kingdom and abroad free.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON AND CO, West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own Manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co.," under a crown. Old articles replated and gilt.

MECHI'S ELEGANCIES FOR PRESENTS and USE, manufactured on the premises, 4, Leadenhall-street, near the India-house, London, wholesale, retail, and for export:—Ladies' and gentlemen's dressing cases, in leather, wood, and papier maché, from 100 guineas down to 25s. Writing desks, 25 guineas down to 12s. Work boxes, 20 guineas to 10s. Ladies' cabinet and jewel cases assorted. Tea caddies, the most elegant in the world, 12l. to 6l. each, down to 7s. 6d. Ladies' papier maché work boxes, 1l. each down to 3l. Netting boxes, 3s. to 23s. Card boxes, 5l. 5s. to 11s. Set of tea trays, 25 guineas to 5l. Bottle cases, 30s. each, Companions, 2l. 10s. to 10s. 6d. each. Pole screens, 9l. the pair. Hand screens, 50s. to 20s. the pair. Card racks, 40s. to 25s. per pair. Note and cake baskets, 50s. to 20s. each. Bagatelle tables, 10l. 10s. to 3l. 10s. Leather writing cases, containing a complete dressing apparatus, 15l. 10s. to 5l. 10s. Pearl and fancy card cases, 3l. 10s. to 10s. each. Ivory hair brushes, 4l. to 2l. 10s. per pair. Splendid cases of seven-day razors, 10l. to 2l. 10s. the set. Ivory handled and other highly finished strops, from 25s. to 3s. each. Wharncliffe penknives, sporting knives, and fancy scissors, 3l. to 5s. each. Splendid cases of agate, pearl, and ivory dessert-knives and table knives, from 42l. to 4l. 4s. the case. A rich variety of plate, bronze, gilt, and papier maché and table inkstands, from 6l. to 7s. 6d. each. The quality generally of MECHI'S manufactures, the elegance of their display, and the rare combination of excellence and economy, with a very extensive choice of stock, will amply repay the trouble of visiting his depôt, 4, Leadenhall-street.

READ the following TESTIMONIAL in favour of PARR'S LIFE PILLS, which is sufficient to convince the most prejudiced person that they are all that is required to conquer disease, and consequently prolong life:—"To T. Roberts & Co.—Sirs,—I beg to hand you the following testimonial, which I have just received from Mr. WILLIAMS, Union-street, Nottingham.—Yours obediently, G. BATTERS, Chapel-bar, Nottingham.

"Sir,—Printing is a great blessing to mankind, for now I am enabled to make known, through you, a perfect cure, by taking PARR'S LIFE PILLS, of extremely bad Indigestion, a Bilious disorder, and Sick Headache, which I have been subjected to for years; and money enough has been paid to physicians and surgeons, which now would have been a little fortune to me. I wish every fellow-creature clearly to understand that I was wonderfully relieved by taking one box of PARR'S LIFE PILLS. Accident threw a testimonial in my way of a miraculous cure of a bilious attack and sick-headache. The second box enabled me to go about my business with spirit and alacrity; and by taking two or three more boxes, I am happy to add my humble testimony of a perfect cure of that dreadful disorder—Bilious and Sick Headache—which rendered me, before I took PARR'S LIFE PILLS, unfit for business. Considering the loss of time and pain, persons would find that one box of PARR'S LIFE PILLS is worth, instead of 1s. 1½d., as many guineas. May all persons make trial of PARR'S LIFE PILLS, is the sincere wish of, yours thankfully,

"To Mr. G. Batters. M. WILLIAMS, Union-st., Nottingham."

PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground, on the Government Stamp.

News of the Week.

THE recent news from the Pacific, announcing that France has accepted the Protectorate of the Wallis and Fortuna Islands, is the chief topic of the French Papers, and contrary to expectation it has met with little favour from any political party. The ill success which has attended the proceedings of the French colony at Tahiti has made a deep impression on the public, and although it has been the policy of the journals for party purposes to defend their position in the Pacific, it is certain that both the people and the Government are becoming weary of Protectorates. The Opposition papers at length admit that the acquisition of these remote islands can bring neither honour nor profit to the country, but that the Government is exposing itself to the chance of serious misunderstanding with Great Britain by persisting in such schemes for the extension of territory. The near approach of the Parliamentary Session gives additional importance to this question, and it is evident that the foreign policy of the Cabinet will afford one of the first trials of strength to the great political parties into which the Chambers are divided. The preliminary question, however, will be the choice of a President of the Chamber of Deputies, the Opposition having determined, as last year, to bring forward M. Dupin in opposition to M. Sauzet, the Ministerial candidate, who has already filled the office for the last four years. The Ministry, however, announce that they are anxious to make this election an open question, and it is, therefore, not improbable that a true indication of the strength of parties will not be obtained until the foreign policy of

the Cabinet be brought under discussion. It is believed, however, in well-informed circles, that M. Guizot is sufficiently strong to withstand the struggle on whatever question it may take place, and that his Cabinet is actually more powerful at this moment than it has been at the commencement of any previous Session.—From Spain we learn that Col. Rengifo and his companions, whose arrest on a charge of conspiracy was noticed in our last, had been condemned to death by Court-Martial; but the Queen in Council, touched by the strong appeals made to her for mercy, has spared their lives by commuting the sentence to one of banishment. In Old Castile and the Basque provincee, however, fresh executions are of daily occurrence, and another band of the insurgents was shot last week without trial.—In Germany, according to the Paris Papers, a rumour is current that the King of Prussia has determined to give a constitution to his kingdom. The bases of the new Constitution are said to be settled, but as the German Papers make no mention of this important measure, the report must be received with caution, until it be confirmed from a more authentic source.—The insurrection in Switzerland is completely put down, so far as relates to the outward manifestations of popular feeling by means of an appeal to force. The country, however, is in a state of great excitement, and the two religious parties which divide the Cantons are so exasperated by recent events, that the pacification of the country is daily becoming more difficult. Each party is powerfully supported, and it is believed that nothing short of an extraordinary convocation of the Cantons can produce an effectual reconciliation.—From Turkey we have accounts of the departure of our Ambassador from Constantinople, to give time, it is said, to the Ottoman Ministers for the consideration of various questions at issue between the two Governments, and upon which Sir S. Canning had submitted his *ultimatum*. The departure of the Ambassador in cases of this kind being always regarded as an extreme measure, it had produced a sensation in the Turkish capital; and, although it is now said that the step wss taken as much for purposes of relaxation as for political reasons, it is expected to facilitate the speedy settlement of the existing differences.—From the United States we have the confirmation of Mr. Polk's election to the Presidency of the United States, by a majority of 65 over Mr. Clay. The new Session of Congress was to commence on the 2d inst., and the message of President Tyler, which is looked for with much interest, will probably be received by the next packet.

At home, the affairs of Ireland are again a prominent topic. The opposition to the Charitable Bequests Bill is becoming daily more general, and Mr. O'Connell supports a large section of the Roman Catholic clergy in their hostility to the measure. The Government, however, have succeeded in appointing the Commissioners—including two archbishops, and one of the bishops of the Roman Catholic Church, who have accepted the office, notwithstanding the avowed disapprobation of their brethren. It is a remarkable feature in the official announcement of these appointments that the Roman Catholic prelates are mentioned, with their titles and precedence—the first time that this has occurred, since the passing of the Penal Laws, in any official document emanating from the Queen in Council.

Home News.

COURT.—Her Majesty, Prince Albert, and her royal visitors, came to town on Saturday, and visited the Cattle Show, at the Bazaar in King-street, Portman-square, returning to Windsor in the afternoon. On Sunday, the whole of the royal party attended Divine service in the private chapel of the Castle. On Monday Prince Albert, with his brother, and the Duke Ernest of Wurtemberg, shot over the preserves in the neighbourhood of Cumberland Lodge, and the Queen took an airing in a pony phaeton. On Tuesday morning, the Duke and Duchess of Saxe Coburg and Gotha, and the Duke of Wurtemberg, with their suites, left Windsor for Dover, travelling by the Great Western and South-Eastern Railways, on their return to the Continent. On Wednesday, the Queen and Royal Family were prevented from leaving the Castle by the unfavourable state of the weather. On Thursday, the Queen and Prince walked for some time in the grounds of the Castle, and the Prince afterwards shot in the royal preserves.—The Countess of Charlemont has succeeded the Marchioness of Douro as Lady in Waiting, Viscount Hawarden has succeeded the Earl of Hardwicke as Lord in Waiting. Admiral Sir R. Otway has succeeded Colonel B. Drummond as Groom in Waiting, Lady Caroline S. Cocks and the Hon. F. Devereux have succeeded the Hon. Misses Liddell and Hamilton as the Maids of Honour in Waiting on the Queen. It is stated in the daily papers, that in consequence of the continued indisposition of the Hon. C. A. Murray, Master of the Queen's Household, Her Majesty has desired the Earl of Aberdeen to ascertain whether Mr. Murray would prefer the less arduous duties of diplomatic employment, and, in that case, to offer him an appointment on the occurrence of the first eligible vacancy.

Order of St. Patrick.—There is to be an investiture of the Knights of St. Patrick on the 4th January. It is said that the Marquis of Waterford and the Earl of Rosse are to be the new Knights, in place of the late Marquis of Donegal, and Earl Talbot, who has just received the Order of the Garter.

Diplomatic Appointments.—The Queen has been pleased to appoint W. Gore Ouseley, Esq., now Secretary of Legation at Rio Janeiro, to be Minister Plenipotentiary to the Argentine Confederation; J. F. Crampton, Esq, now first paid Attaché to the Embassy at Vienna, to be Secretary of Legation to the Confederated States of the Swiss Cantons; and Francis Farrant, Esq., to be Secretary of Legation at the Court of Persia.

Colonial Appointments.—The Queen has been pleased to appoint D. B. Viger, Esq., to be President of the Committee of Executive Council of Canada; H. Sherwood, Esq., to be Solicitor-General for that part of the province formerly called Upper Canada; R. Y. Cummins, Esq., to be Accountant to the Surveyor-General's department for the Mauritius; and W. Dudley Ryder, Esq., to be Assistant-Secretary for the Island of Ceylon.

Law Appointments.—The Queen has been pleased to appoint W. F. Boteler, Esq., Q.C., to be Commissioner of the Court of Bankruptcy, in the place of Mr. Serjeant Goulburn, resigned.—The death of Mr. John Moore has caused a vacancy in two appointments held by him in Doctors' Commons: one, the London Seat in the Prerogative Registration, worth about 700*l.* a year, in the gift of the Rev. G. and R. Moore, sons of Archbishop Moore, the registrars of that court; the other, the registrar of the Vicar-General, in the gift of the Archbishop of Canterbury, of the value of 500*l.* a year. Rumour has already pointed to two relatives of Sir H. Jenner Fust, the Judge of the Prerogative Court, as the individuals to be appointed to these offices.

The Church.—The Rev. Dr. M'Caul, rector of St. Ethelburga, Bishopsgate, and Professor of Hebrew in King's College, has been appointed by the Bishop of London a Prebendary of St. Paul's.—The Rev. C. T. Vaughan, rector of St. Martin's, Leicester, and a distinguished and favourite scholar of the late Dr. Arnold, was elected on Wednesday to the office of Head Master of Harrow School.

The Navy.—It is rumoured in naval circles that Admiral Sir Charles Ogle, Bart., is likely to succeed Admiral Sir David Milne, G.C.B., as Commander-in-Chief at Plymouth; and that Vice-Admiral Sir William Parker, Bart., will succeed Vice-Admiral Sir C. Owen, K.C.B., as Commander-in-Chief in the Mediterranean.

The Customs.—A vacancy occurs in the Customs Board by the death of the Hon. Heneage Legge, one of the Commissioners, who died at his residence, near Richmond, on the 12th inst. The Hon. E. Stewart, Deputy Chairman of the same board, is also in a delicate state of health, and has obtained leave of absence for a lengthened period, for the benefit of a more southern climate.

Foreign.

FRANCE.—The Paris papers announce that the Duke and Duchess d'Aumale arrived at the Tuileries on Friday afternoon. The Prefect of the Seine, the principal authorities of the department, accompanied by the Neapolitan Ambassador, went to meet their Royal Highnesses. The young Duchess, on her alighting from her carriage, was received with the warmest affection by the Royal Family, who were all assembled at the foot of tne grand staircase of the Tuileries. The King and Queen of the Belgians, the Minister for Foreign Affairs, and several of his colleagues, were present at this ceremony. In the evening there was a grand dinner of 150 covers at the Tuileries, which was resplendent with the number of lights.—The *Constitutionnel* contains a long article on the recent news from the Pacific, that France had just "accepted the protectorate" of the Wallis and Fortuna Islands—"news," it says, "which has greatly surprised political men of all shades of opinion." This event has been passed over by the *Débats* as one about which "the less said the soonest mended." The *Constitutionnel*, however, says that so impolitic does it consider such conquests, that notwithstanding the official source of the announcement it has difficulty in believing it. As the news, however, has not been contradicted, it is forced to believe in its truth, and accounts for the affair by supposing that this step was taken at the time when M. Guizot was beating the charge in the Pacific to conceal the feebleness of his policy in Europe. It says that if M. Guizot seriously intends to assert the Protectorate of the Wallis Islands, there will be a repetition of the conflicts and disavowals of Tahiti; as in proportion as the French draw near New Holland and New Zealand, the struggle with the Methodist missionaries will become more violent, and the conflict with the British authorities more imminent. It adds, that this possession will probably be found to be within the jurisdiction of the British Consulate of the Navigator's Islands, and that the French will again be brought in contact with that conciliatory personage, Mr. Pritchard. Under these circumstances, the *Constitutionnel* treats as absurd the policy of the French Government, in seeking after the protectorate of islands which can bring neither honour nor profit to France, but expose the Government to acts of humiliation towards England in the subsequent disavowal of its proceedings, or to the chance of serious misunderstanding by persisting in profitless and illusory schemes of extension of territory. The Ministerial *Débats* contains an article condemning in strong terms the observations published in the *Océanie Française*, the paper published at Tahiti by Capt. Bruat, relative to Capt. Hunt, of the Basilisk, and which we noticed in our last. "There is one circumstance stated in that journal," adds the *Débats*—

"Which, if it were true, would have the double inconvenience of not being conformable to any precedent with which we are acquainted, and, moreover, of exposing the French authorities at Tahiti to a species of ridicule which would attach in a certain degree to the Government at home. The commander of the Basilisk is accused, not of a want of respect to the authorities of the island, but to his own Sovereign, the Queen of Great Britain. The *Océanie* announces gravely, that on the day of the anniversary of Queen Victoria the French ships hoisted English colours, whilst their bands of music performed 'God save the Queen,' the Captain of the Basilisk, in the mean time, walking about in undress, as if to protest against the solemnity of the day. This unusual demonstration gives the English journals an opportunity of which they do not fail to seize hold. It is certain that the honours paid to the Queen of England at Papeiti were not rendered to her in any other French port, no more than similar honours to the King of the French in British ports. This sudden enthusiasm for the cordial understanding coinciding with certain unmeasured denunciations directed against the officers of the British navy, affords a ridiculous contrast, and the English naturally consider it singular that foreigners should wish to show themselves more English than themselves, and force them to demonstrations of patriotism which do not suit their taste. It is well to be friendly to the British alliance, but that does not dispense with being logical, and it is perfectly useless to play 'God save the Queen' at the same time that you are doing all in your power to envenom the passions of the two nations. It would have been far better to have made fewer demonstrations in honour of Queen Victoria, and to have abstained from irritating attacks against British officers. Such conduct would have been more dignified and infinitely more rational."

The *Moniteur* of Monday publishes the treaty concluded on Sept. 10, 1844, between France and Morocco. It is given at length in the papers, but it contains nothing that has not already appeared in our columns. In addition to Marshal Bugeaud, the same Paper announces that Louis-Philippe has conferred the title of Duke on Baron Pasquier, President of the Chamber of Peers, and it is said that a similar honour is about to be conferred on Marshal Sebastiani and Marshal Gerard. In September last, Prince de Montmorency-Robecq, being tried before the Court of Assizes of the Seine for distributing seditious emblems, tending to disseminate a spirit of insurrection, was acquitted after a brilliant defence by M. Berryer. The law officers of the Crown then expressed their determination to prosecute M. de Montmorency before the Correctional Police, for having neglected to obtain the authorisation of the Minister of the Interior to sell the busts of Henry V., which he allowed he had got made at his hotel. The case came on on Wednesday before the Tribunal of Correction of Paris, and the Prince de Montmorency, in explanation of his conduct, declared that he had never exposed the busts in question for sale in the ordinary acceptation of the expression, but had privately exchanged them for alms, destined to alleviate the sufferings of distressed legitimists. The King's Advocate maintained that this must be considered a real sale, inasmuch as when an object was given for money, no other term could be applied to the transaction. M. Dufougerais addressed the Court at some length for the prisoner, declaring that, as the object in view was charity, the usual authorisation was not required. After half-an-hour's deliberation, the Court condemned the Prince de Robecq to a month's imprisonment, and 1000 francs fine. It further ordered the objects seized to be confiscated.—M. Bernays, editor of the German journal *Vorwärts* ("Go-ahead"), printed in Paris, was sentenced by the Court of Correctional Police, on Friday, to two months' imprisonment, and a fine of 300f., for publishing his paper without having previously deposited the usual security. It was stated publicly, and believed, that the prosecution was instituted at the request of the Prussian Minister in Paris, in consequence of the appearance in the *Vorwärts* of an article justifying in some measure the attempt of Tschech against the life of the King of Prussia.—The unprotected state of the public against the hordes of criminals at large in Paris, as stated in our last, has excited much alarm there. The *Réforme* states that a number of persons had written to the Prefect of Police in Paris, to inform him that their affairs obliging them to remain out to a late hour of the night, and not wishing to be murdered in the streets, they should hereafter walk armed with leaded canes, poniards, and pistols.—On Monday a serious accident happened on the Versailles Railway. The particulars were not well known, but it was reported that the engine of one of the trains coming from Versailles got into some disorder, and a piece of iron becoming detached from the engine, got upon the rails and caused a serious concussion, which ultimately upset several of the carriages, and detached the engine from the train. The engine then got off the rails, and the engine-driver was seriously injured. No one appears to have been killed. The passengers were a good deal shaken, but none were seriously hurt, as they were all able to make their way to Sèvres on foot.—A fire broke out on the same day in the church of St. Eustache, and completely destroyed the organ, one of the finest in Paris.—On Monday last the English company of tragedians opened their campaign at the Italian Opera, in Paris, and the success of the first night's representation (Othello) was everything that could be wished.

SPAIN.—We have accounts from Madrid of the 9th inst. The Senate had referred the Constitutional Reform Bill to a Committee, which was to report on the subject, but as it was known that the Senate would make no amendment of any consequence in the bill, its proceedings were regarded with little interest. From Old Castile and the Basque provinces fresh executions are reported daily, and General Breton has already shot twelve of the unhappy insurgents in Hecho and Anzo without trial. In Madrid, however, matters are not managed so precipitately. Col. Rengifo, Capt. Garcia, and Dr. Arilla, were condemned a few days ago to death by a court-martial, for a conspiracy which is believed never to have

existed; and eight or ten others were sent to the galleys for the same crime. Col. Rengifo and his companions were to be executed on the 9th, but, on that day, the Queen in council, touched by the appeals made to her for mercy, and especially by one from the whole press of Madrid, conveyed through the editor of the Government print, determined on granting them her royal pardon. They were, however, to be sent to the presidios, or some other protracted punishment, either as prisoners or exiles. The Government at Madrid received letters from Carthagena on the 9th, which stated that an attempt at insurrection had been made in that place by the populace, but that it had been suppressed by the authorities, and that the town was quiet at the departure of the courier. A strange correspondence has been published in the Madrid papers between Mr. Bulwer, our Minister at that Court, and Mr. Cochrane, who some years ago collected subscriptions for the Spanish refugees, by perambulating England as a wandering minstrel. Mr. Cochrane had inserted in the Spanish papers laudatory paragraphs respecting himself; and in some of them it was more than hinted that a cross of distinction should be bestowed upon him by the Government for his services to the Spanish cause. The Spanish Minister intimated that there would not be much difficulty in granting the honour, if Mr. Bulwer, as British Minister, recommended it. A correspondence thereupon took place, in which Mr. Bulwer intimated the insufficiency of such documents as newspaper paragraphs to give Mr. Cochrane a claim to decorations which were only bestowed on persons who had served the country in the field of battle, or whose excellence in science, literature, or the arts, had obtained for them a European celebrity; and he hinted that the laudatory paragraphs referred to were owing to his own exertions, or to those of certain partial friends, who had influence enough with the press to get them inserted. Mr. Cochrane appealed to the journals to declare whether he had solicited the insertion of paragraphs praising himself, and several of them answered in the affirmative. Mr. Cochrane then published all the letters that had passed, most of which were never intended by Mr. Bulwer to have seen the light, and even went so far as to criticise the style of the dinners, &c., of which he had, as an invited guest, partaken at the private table of our Minister. Upon these facts the English public must form their own conclusions, but by the Spanish the affair is universally regarded as a proof of what they call "English eccentricity," while all parties express regret that Mr. Bulwer, who is deservedly popular at Madrid, should have been drawn into this affair at all.

PORTUGAL.—Accounts from Lisbon of the 10th inst., state that the Chamber has been occupied in discussing the best means for establishing penitentiary asylums, and also for reforming the present system of weights and measures, and to reduce them to a more regular and uniform standard. The Government has likewise within these few days brought before the Cortes new proposals of an interesting nature, one of which is the opening of savings banks throughout the kingdom on the same principle as those adopted in England, France, and other countries; another for the formation of an agricultural or auxiliary bank in the corn market, for the purpose of assisting the farmers, and of giving a greater facility to the settlement of their transactions; and another for the regulation of all cases offensive to the public morals and religion of the realm; all of which measures have been submitted to the respective committees for examination and approval.

GERMANY.—The Paris *Siècle* of Sunday says that a report is very current, which it believes to be derived from good sources of information, that the King of Prussia has determined definitively to give a constitution to his kingdom. "Not only," says the *Siècle*, "is this resolution taken, but it has been communicated to the different chancelleries of Europe. The work is not only a project, but it is already finished. The bases of the constitution are settled. All that now is to be done is to promulgate it, and to put it in operation." The *Siècle*, in giving this piece of information, which is very important if true, says, "Before publishing it, and in order not to delude a great number of people who have already been once disappointed in their hopes, we have made minute inquiries, and we believe we can guarantee our information in the terms in which we give it, and with the reserves, which it will be convenient not to lose sight of."—The chapter of canons of the cathedral of Breslau, on the 3d inst., excommunicated M. Ronge, a Catholic priest, in consequence of a letter written by him, attacking the Bishop of Treves, concerning the recent exposition of the supposed shirt of our Saviour.—An alarming fire broke out at Ehingen in Wirtemberg on the night of the 8th inst., which destroyed 48 houses.

HOLLAND.—A Frankfort paper states that, whilst the Emperor of Russia is prohibiting temperance societies, on the ground of the injury which they do to the revenue, by diminishing the consumption of liquors which pay a tax, his brother-in-law, the King of Holland, is doing everything in his power to encourage them. He has ordered that a copy of the rules and regulations of these societies shall be given to every labouring person, in order that he may learn the advantages of temperance.

SWITZERLAND.—Accounts from Switzerland state that the movement in Lucerne is completely put down, but that the country is in a state of the greatest excitement; the exultation of the Jesuit party and the exasperation of the Liberals making the reconciliation of the two parties and the pacification of the cantons every day more difficult. Letters from Lucerne and Berne state that, before tranquillity was restored, two different attacks had taken place—the one in the town of Lucerne, on the part of the Lucerne Liberals, and the other in the neighbourhood of Willisau, made by a body of volunteers from Argau, who had come to assist their friends against the Lucerne Government and the Jesuits. Both attacks, however, failed, and were repulsed with loss by the Government troops, who took 10 or 12 prisoners. The spirit of religious animosity, however, is not quelled, and, as each party is powerfully supported, it is believed that no effectual reconciliation can take place without an extraordinary convocation of the cantons.

RUSSIA.—Letters from St. Petersburgh of the 30th ult., state that the young Prince Dolgorouki, who was sentenced to exile two years ago for having published two pamphlets, one on the reigning dynasty, the other on the genealogy of the Russian nobility, has been amnestied, but on condition that he shall not reside in either of the capitals of the empire. The Government has made great efforts to induce the two young nobles, Golowin and Baturin, to return to their country. They have been residing for some years in France, where they have published articles against the Russian Government; but as they have declared their determination to remain abroad, their property in Russia has been confiscated. The funeral of the Russian poet, Kryloff, took place on the 26th ult., with great pomp, the Emperor defraying all the expenses of the funeral.—A treaty has been concluded between Russia and Portugal, to abolish the alien duty on the property held by their respective subjects. The Emperor has established several decrees to promote the study of the Russian tongue.

TURKEY.—We have accounts from Constantinople to the 27th ult., confirming a report which has appeared in the *Augsburg Gazette*, that Sir Stratford Canning had left Constantinople after having given in his *ultimatum* in the matter of the gross outrage committed by the Pacha of Trebizond on the Greek subject placed under the protection of the British Consul, and the insult offered to the Consul himself. It appears that Sir S. Canning gave in his *ultimatum* to the Porte; and, in order to preclude all hope that his terms would be altered, he took the opportunity of leaving Constantinople for some days to allow the Divan time to consider the course it will take. The departure of Sir S. Canning gave rise to a rumour that the Porte had refused the satisfaction required, but it is now said that his departure was chiefly for purposes of pleasure, and that the Porte will make ample reparation for the outrage of the Pacha. The whole affair was discussed by Sir S. Canning and the Grand Vizier in their conference, and the Ambassador is also said to have availed himself of the opportunity to remonstrate with the Grand Vizier on the general policy of the Government, of which, it was but too apparent, general corruption and cruelty of its subordinates were the fruits. It is also understood that Sir S. Canning has received instructions from his Government to press the settlement of the outstanding claims of British subjects. A vizerial letter on the application of Sir S. Canning, was last week despatched to Rodosto, commanding the immediate transportation to Constantinople of certain Turks, who, without provocation, had beat and dangerously wounded a British subject, but who had been subsequently screened by the local authorities. —Most of the ships of war of the Turkish fleet stationed in the Bosphorus had entered the arsenal, where they were to be disarmed, and remain during the winter. The north wind had set in, and cold and rain had succeeded the mild temperature enjoyed at Constantinople until the middle of November. Frightful weather prevailed in the Black Sea, and the last steamer from Trebizond had had two men frozen on board. The Turkish and Persian Commissioners assembled at Erzeroum for the last year to adjust the differences which had arisen between the two countries, had as yet come to no definitive resolution. —The affairs of Lebanon continue in the same unsettled condition. Two battalions of regular troops entered Jerusalem on the 7th. The presence of those troops had reassured the population of that city, which had been greatly alarmed by the murder of the Governors of Jaffa and Lidda. The English frigate Warspite had arrived at the Dardanelles.

UNITED STATES.—By the Britannia steam-ship from Boston and Halifax, we have news from New York to the 30th ult. The final result of the Presidential election shows that Mr. Polk had 170 votes, and Mr. Clay 105, so that the former had a majority of 65. The second session of the 28th Congress was to commence on the 2d inst., and the President's Message would probably be delivered on the following day. It was expected to reach New York about the 4th inst., in which case we may look for it by the next steamer, which will arrive about the 29th. Speculation was busy as to the manner in which it would touch upon the questions before the country. The New York papers say that attention will be turned chiefly to the topic of Texas, of which the annexation will, it is expected, be urgently pressed. As to the expediency of occupying the Oregon territory, it is supposed there will be very decisive language; and these two topics, connected with the obnoxious proceedings of some British cruisers towards American vessels on the coast of Africa, constitute matter which an unfriendly tone might exaggerate into serious discords. It appears that the new President is of Scottish lineage, and his curious looking name an abridgment of a good old Scotch one. Mr. Polk's father or grandfather is said to have been a Lanarkshire man, of the name of Pollock. In the somewhat peculiar dialect of the upper ward of this county that name is pronounced *Poke*, and hence, probably, the orthography adopted by the Transatlantic branch of the family. In private life Mr. Polk is said to be highly respected; he is a slaveholder indeed, but not, as has been stated in the papers, one of the richest and most extensive slaveowners in the State; he may be worth some 25,000 dollars, a part only of which property is invested in slaves. Mr. Polk has no children. His lady is a consistent member of the Presbyterian Church. It is also stated, that though different opinions are honestly entertained as to his fitness for the Presidency, on account of his political creed, yet, so far as his private life is concerned, he will do honour to the station to which he has since been called.—From Mexico, we learn that the loan for carrying on the war with Texas had been finally rejected by the Congress. The President asked 10 million dollars, referred the matter to a committee, who cut the amount down to six; carried it to another committee, who cut the sum down to three; presented it to Congress, and by 44 to 17 it was rejected altogether. New Orleans papers contain a paragraph from a Texan paper, in which it is said that President Houston has received another communication from Santa Anna, which is said to be of a pacific character. It is further stated that the contemplated invasion of Texas by Mexico is abandoned, and it is added that England and France have offered to obtain an acknowledgment of Texas independence, on condition that Mexico shall have the right to renew the war whenever Texas offers herself to the United States.

CITY.

Money Market, Friday.—Consols for the opening closed 100⅞ ex. div.; Red. Three per Cents., 100⅝; Three and a Quarter per Cents., 103⅝; Bank Stock, 208, Exchequer Bills, 58 60; India Bonds, 73 75 pm.

GAZETTE OF THE WEEK—BANKRUPTS.—L. WATSON, Rickmansworth, Hertfordshire, smith—W. A. W[illegible], Hampstead, victualler—H. C. BAINS, Poole, grocer—J. THOMAS, Newtownards, glass and chinaman—R. BUCKLEY, Crewe, Cheshire, innkeeper—J. P[illegible] and J. M'JANET, Bell's Close, near Newcastle, North[illegible] and cap[illegible] manufacturers—S. PEACH, Nottingham, grocer—J. C[illegible] Wood-street, silk warehouseman—J. MORTIER, Bristol, [illegible]—J. [illegible], Brompton-row, Brompton, plumber—S. KING, Newgate-street, warehouseman—H. B. FOOTHEAD, Fore-street, Cripplegate, wholesale [illegible]—C. SCRATTON, Hartlepool, Durham, coal merchant—H. D. WATKINSON, J. JONES, Manchester, lead merchants—T. HODGSON, Manchester, calico printer.

BANKRUPTCY ANNULLED.—W. C. [illegible], Waltham Holy Cross silk throwster—S. HUDDLESTON, Dunkinfield, Cheshire, shopkeeper.

Metropolis and its Vicinity.

Visit of Her Majesty and the Court to the Cattle Show.—The forty-seventh Exhibition of Prize Cattle annually brought together under the auspices of the Smithfield Club will possess an interest beyond that of any preceding year since the formation of the Society, in having been honoured with the presence of her Majesty and the Prince Consort, together with the royal visitors who have been staying at Windsor Castle. Saturday last having been the day appointed for this purpose, Earl Spencer the President, the Duke of Richmond, and Mr. Pusey were in attendance to receive Her Majesty, who arrived about half-past 10. Her Majesty was handed from the carriage by the Duke of Saxe Coburg Gotha, and graciously acknowledged the attention of the members of the Club assembled to receive her. Prince Albert offered his arm to the Duchess of Saxe Coburg and Gotha, and the other visitors following in succession, the royal party entered the Exhibition, preceded by the President, Vice-President, and Stewards, who, with the Honorary Secretary, Mr. Brandreth Gibbs, and Mr. H. Gibbs, the late Honorary Secretary alone had the honour of conducting them. On entering the inclosure the first animal which attracted attention was the ox fed by Prince Albert. Its symmetry was greatly admired, and Her Majesty having been informed that it had been purchased by Mr. Bannister, the butcher of Threadneedle-street, expressed to Earl Spencer her desire to re-purchase it, and allow it to enjoy the remainder of its days in Windsor Park. This request has of course been complied with. The royal party visited successively the compartments devoted to the cattle, sheep, and swine, remarking particularly those to which prizes had been awarded. The Duke of Richmond's, the Marquess of Exeter's, and the Duke of Bedford's pens of sheep came in for a full share of observation, and the pigs fed by Mr. Fisher Hobbs, the well-known Essex agriculturist, which carried off the first prize, beating Prince Albert, were not overlooked. In the implement department the royal visitors spent a considerable period, and with some of the machines Her Majesty was much interested, seeking an explanation of their construction from the noble personages who surrounded her. Her Majesty appeared greatly interested with the whole Exhibition, and made numerous inquiries as to the probable weight of certain animals to which her attention was called, and the purposes to which many of the newly-invented implements were devoted. Her Majesty remained in the Exhibition three quarters of an hour, and left the Bazaar at 11 o'clock.

The Weather.—Another change took place in the weather on Sunday night, a thaw having taken place with a fall of rain, so that the snow and frost rapidly disappeared. The increased moisture of the atmosphere has been accompanied by another visitation of the dense fogs which make London so miserable at this season. During the whole of Tuesday the metropolis was visited by a thick fog, which caused much inconvenience to the shopkeepers and merchants, some of whom were compelled to light up their shops and places of business for several hours during the day. The parks presented a melancholy appearance, being completely deserted through the sudden change in the weather. The navigation of the river was much impeded by the fog, which

became worse towards evening, accompanied by a drizzling rain. The weather is now again cold, but fine.

The Royal Exchange.—On Wednesday the Royal Exchange, as far as the merchant's area, was thrown open to the public. No one was allowed to enter Lloyd's "room," or any other part of the building, as these severally being private property, are not under control of the Gresham Committee. Public business will not be commenced by the merchants, captains, &c., till the 1st January, and it is supposed that by that time general curiosity will be satisfied. It is expected also that the proprietors of the several shops will then have completed their arrangements to be able to commence business.

Statue of William the Fourth.—On Wednesday the colossal statue of His late Majesty, William the Fourth was raised on its pedestal in King William-street, facing London-bridge. The figure is 15 feet 3 inches in height, and weighs 20 tons. It was cut out of two enormous blocks of granite, and the work has occupied the artist, Mr. Nixon, nearly three years. The dress of the statue appears to be that of an Admiral's uniform, a cloak hanging gracefully over the shoulders. The right hand bears a scroll.

Court of Common Council.—At a court held on Thursday, the report of a committee, recommending the grant of 500*l.* to the committee for erecting baths and wash-houses for the poor, was brought forward and met by an amendment, that the report should lie on the table. On a division, the amendment was negatived by 49 to 41. Another amendment was then moved, that the sum of 200*l.* be granted instead of 500*l.*, which was carried by a large majority.

Parliamentary Committee-Rooms.—It is understood that the Commissioners of Woods and Forests are about to erect, in New Palace-yard, temporary committee-rooms for the House of Commons, and Courts for the Vice-Chancellors, in immediate contiguity with Westminster Hall. The defective accommodation afforded to the committees by private houses in the neighbourhood, with the exorbitant terms demanded for rooms of which the greater portion is inapplicable to such purposes, has suggested this arrangement, which, in addition to its other recommendations, will have the obvious advantage of keeping the business of the House, and of accommodating its members, almost under the same roof.

Reduction of the Three-per-Cents.—A report has been in circulation that the Chancellor of the Exchequer has some plan in view for the reduction of the interest on the Three-per-Cent. Stocks, and that the frequent interviews of late with the Governor and Deputy Governor of the Bank of England have had reference to that subject. The *Times* says "We do not find that it has obtained much credit, if any at all, among the moneyed interest in the City, who are disposed to treat it as a feeler thrown out for the purpose of collecting opinions, whether there would be any chance of succeeding in such a measure. As far as the matter has been discussed at all it may be stated that opinions are against its practicability, owing to the very large amount of stock of that denomination. The rumour in the mean time is creating considerable alarm among a large class of dependents upon the public debt, who believed that they were perfectly safe from any reduction below three per cent.

State of the Poor.—Lord Willoughby d'Eresby has written two letters to the *Times* on the present state and prospects of the poor, which have excited great attention. In these letters his lordship recommends three measures of relief to the attention of Government:—1. Employing the poor on the highways, to be paid by a rate levied on all classes, as at present, the remuneration to be one-fifth lower than the wages of independent labourers. 2. A labour rate, every payer of which may receive the value of his money in labour upon his land, the rate to be a power vested in the Board of Guardians, to be called into operation as the want of employment might render it necessary. 3. The removal of an important feature in the present Poor-law,—the offer of the workhouse to able-bodied labourers as a test of destitution, which, his Lordship says, is but too often employed as a means of coercion and systematic reduction of wages. His Lordship, in reference to the first plan, explains his proposal that the pay for work on the roads should be one-fifth lower than the wages of independent labourers, by expressing his conviction, that an average of wages lower than 12*s.* a-week when wheat is at 60*s.* the quarter, or 10*s.* when it is at 50*s.*, must reduce the labourer to a condition below that in which any member of a civilised state ought to be suffered to remain. Lord Willoughby also says that he recommends a lower rate of remuneration to such labourers, because he wishes the highways to be a provision in the hands of the Board of Guardians against temporary and casual want of work exclusively, and not to interfere with the regular employment given by the farmers. "In my humble judgment," says his Lordship, "the condition of the labourer would be greatly ameliorated by either of the three plans alluded to, or by a judicious combination of them. Allow me to add a few words in illustration of their operation, if combined. In such a case, the ordinary remedy for want of employment would be labour upon the highways. The district surveyor would be most active at those seasons when agricultural employment is always slack, and might be empowered to sell and purchase materials according to the wants of the several districts. Such undertakings as building bridges, raising and lowering roads, &c., would be a resource against any extraordinary stagnation which might occur. If it came under the observation of the Board of Commissioners that any parish in a Union was in the habit of throwing a disproportionate number of men on the hands of the surveyor, the remedy would lie in the application of the labour-rate for a certain period—a remedy which would not need to be often repeated. The labour-rate being in operation, and all the able-bodied men in a parish in full employment, if any man were discharged as incorrigibly negligent and idle, the Board, after due inquiry, would offer him the house, and his support would be transferred from the labour-rate to the regular poor-rate. The same course would be taken with any impracticable character in the employ of the surveyor. It is next to impossible that out-door relief could ever be required. I am by no means an enemy of many of the provisions of the present Poor Law. I am ready to admit that the union workhouse, with an improved classification of its inmates, might become an advantageous refuge to some classes of the unfortunate, and a proper plan of correction to the idle and profligate; but these are no reasons why the more opulent should absolve themselves from the duties they owe to society; and miserably deficient in wisdom and religion must a nation be, which can point out no path except through the portal of a prison to the industrious and unemployed labourer."

Repeal of the Malt-tax.—On Friday a very numerous meeting of tenant-farmers, from various parts of the kingdom, was held at the Freemasons' Tavern, to consider the propriety of agitating for a Repeal of the malt duty. Mr. A. Spottiswoode (the Queen's printer), who was described to be a considerable landowner, was called to the chair, and said, that there were no doubt several gentlemen present who were acquainted with the subject; and he trusted that it would be discussed with that good temper which was essential to its proper understanding. The object, he believed, was to do good to those who naturally looked up to the landowners and farmers for support and assistance, and he would only say that the class to whom he referred had not hitherto received that fair protection to which they were entitled.—Mr. R. Baker, of Writtle, moved the first resolution, as follows: "That the first source of national wealth being the labour of our industrious population, the first object of laws for the regulation of society should be to encourage industry by such enactments as will best secure permanent and profitable employment for those who live by their labour, and unless permanent relief is given by a removal of the taxes, or revision of the currency, they will be unable to effect that object." The resolution he said affirmed a simple proposition, which he apprehended would not be denied, namely, that the industry of the people was the true source of national wealth. That being so, it was essential that productive industry should not be crippled. It was quite clear that those taxes which fell more directly on the productive classes tended very materially to diminish the comforts of the people. The malt-tax perhaps more than any other had that effect. Having examined the subject in all its bearings, he was justified in asserting that the tax on malt was equivalent to the whole rent of the land. Every one engaged in agricultural pursuits, and the poor labourer more particularly, was interested; but he was not disposed to call for a repeal of the tax upon that plea, for he wished that it should be regarded in a wider point of view. That it had a serious effect upon the farmer every practical agriculturist must be well convinced. In his own county, Essex, it required two years' cultivation to grow a crop of barley; but what farmer would think of doing so, subject to the enormous duty on malt? It was owing to this that so much land was out of cultivation. In former times the farmer found his labourers in good home-brewed ale, and paid better wages to his men. No doubt the rate of wages was the first consideration, but it was equally true that the discontinuance of the old allowance of good strong beer had produced much dissatisfaction amongst the labouring classes. That he conceived to have been one of the main incentives to that moral disturbance which had produced the commission of those horrid outrages unhappily too frequent in the agricultural districts. That discontented feeling was, he believed, fairly traceable to a reduced standard of wages, and in no little degree to the discontinuance of the labourer's customary allowance of beer. The labourers were not only worse paid, but they had got worse beer, and less of it. Some gentlemen might say that that was a very trifling consideration, but with the labourers it was a matter of serious complaint. The malt tax affected the tenant farmer most materially. In the fattening of cattle he was compelled to resort to the use of oilcake, the product of foreign countries, so that all the meat produced by the British grazier was opposed in his own market. The tariff had caused great dissatisfaction amongst that class, but if the malt duty was taken off they would have no reason to complain of foreign competition. It was well known that five quarters of malt were more than equivalent to one ton of oilcake; that was one way in which the malt duty affected the farmer. There was another point still more entitled to attention. What was the present position of the British farmer as contrasted with the century in which the French revolution took place? Whilst prices had declined, the cost of production had nearly doubled. Things could not go on thus. The farmers had a right to call on the Legislature to remove that most oppressive impost on the land. It should not be forgotten that the Currency Bill had reduced the then value of land 33 per cent., but of that no account had been taken. Should the present policy be persisted in, it would lead to the ruin of the country. There was only one of two courses to be adopted—the Government must either reduce the taxes, or give the people the means of paying them. As respected the malt duty, we should put it on the shoulders of those best able to bear the burden—upon the owners of property. The poor labourer ought to be exempt from taxation. If it were true that "the poor should never cease out of the land," it was right that they should be protected. The condition of the agricultural labourer had for some time been discussed by the various agricultural associations, but they had done nothing to benefit the labourer. Here and there some strips of land had been set apart for cottage gardens; but to what extent could that benefit the labourer? He was not an enemy to allotments; they were good savings-banks for the man who had constant work; but a working man must look to wages—regular wages, for the wants of a family. If the farmer could not cultivate his land profitably, he could not pay his labourers. If the allotments were let, as they often were, at a rent higher than to the rich occupier, the allotment system could do no good to the country generally. If the malt duty were abolished, the labourer would no longer have occasion to resort to the beershop, for he would be enabled to brew his own beer at one-fourth of the price which he now paid. It was said that the credits given by the Government to the great maltsters encouraged the growth of Barley. That he denied. The only way to promote the cultivation of Barley was to take off the duty. There would then be no want of capital, because, in addition to the encouragement held out to the growers of Barley, the manufacturers would be relieved from all the annoyances of the Excise collections. But if it were supposed that he would be content with the repeal of the malt-tax, he begged to state that the repeal of the malt-tax should only be considered as a step to further concessions. Public opinion would do the rest.—Mr. W. F. Haines, of Monk's-hall, Essex, seconded the resolution, which was carried unanimously.—Mr. J. Ellis, of Barming, Kent, moved the next resolution,—"That it appears by Parliamentary returns, that in former periods the working-classes of the country, both agricultural and manufacturing, enjoyed and consumed three times as much per head of nutritious and invigorating malt liquor as they have done since an enormous duty was laid upon malt, while, on the other hand, the comforts and luxuries of other classes, the consumption of foreign wines and spirits, and of deleterious and demoralising compounds, have greatly increased."—Mr. Fife seconded the motion. He considered that this was a great struggle to be made for the benefit of the labourer; and he only regretted that it was likely to be warmly opposed by those who, with all their pretended sympathy, were reluctant to do anything for the substantial benefit of the poor man. For his part, he would not be content with anything short of a total repeal of the malt duty.—Several other declaratory resolutions were supported by Mr. Ellman, of Surrey; Mr. Knight, of Edmonton; Mr. Penfold, of Fenny Stratford; Mr. Purser, of Copsal, Bedfordshire; Mr. Bennett, of Luton; Mr. Maydwell, of Uxbridge; Mr. Stone, of Leicestershire; and other gentlemen. It was finally agreed that the meeting should use its best endeavours to procure a total remission of the malt duty.

Fatal Accident at Drury Lane Theatre.—On Saturday night a melancholy accident took place during the performance of the "Revolt of the Harem," which has deprived the stage of the best English dancer of the day. In the second act of the ballet, the ladies of the harem are discovered bathing, among whom Zulica, the royal slave, Miss Clara Webster, was one. During the scene the gas placed at the bottom of the stage, or under the sunken portion of it, where the water pieces, or waves, are placed, caught the light drapery of Miss Webster's dress, and in an instant her whole person was enveloped in flames. This frightful event, taking place on the stage, in the sight of the audience, the whole house was in consternation, and screams issued from the ladies in the front of the boxes and pit, who were the first to perceive the accident. The unfortunate young lady rushed round the stage, actually in one blaze, uttering the most heart-rending cries, and in her agony seized on Madame Plunkett's dress, but this lady had the presence of mind to avoid close contact, and thereby saved herself, although her own dress was, for a moment, on fire. Miss Webster at last rushed towards the wing, and was caught in the arms of a carpenter, who with great presence of mind threw her down and rolled himself over her, and thus extinguished the flames, though, it appears, at his personal risk, for his hands and face are said to have been much burnt in the effort. Miss Webster was instantly taken to the green-room, where it was ascertained that her arms, bosom, and face were severely burnt. Surgical aid was without a moment's delay procured, and the young lady, by desire of her friends, was carried to the residence of Dr. Locock, in Hanover-square, and afterwards to her own residence. The accident was of so sudden occurrence that the whole scene did not occupy the space of two minutes. The intensity of Miss Webster's sufferings was very great, but it was hoped that she was in a fair way towards recovery until Monday night, when she gradually sunk under the injuries, and expired on Tuesday morning. An inquest was held on Thursday, at which Mr. Wakley, the coroner, pointed out the necessity of preparing theatrical and other light dresses with a solution of alum or muriate of ammonia, which renders them incombustible. The Jury coincided in these views, and returned a verdict of Accidental Death.

The Late Bank Robbery.—The governor and directors of the Bank of England have authorised Mr. Hobler, solicitor for the banking house of Messrs. Rogers and Co., to issue a circular respecting the late robbery of that firm, calling upon the different houses to whom it

may apply to send into the bank such notes as they may possess of 1000*l.* each, bearing date the 13th of May, 1844, in order that they may be exchanged for others of a different date.

Death of Mr. Corbould the Artist.—We have to record the death of Mr. Corbould, the well-known artist, who died last week under singular circumstances. He had been staying lately at St. Leonard's, on a visit to Lady Chantrey, to whom it is understood he was about to be shortly married; but on Sunday last, he quitted that place on horseback, accompanied by a servant, for Hawkhurst, in Kent, whither he was proceeding on a shooting excursion, his four sons being already there awaiting his arrival. The deceased was seen to ride slowly with his coat thrown open, and the circumstance attracted attention, as sufficient precaution did not seem to have been taken by him against the severity of the weather, the frost being intense. On ascending Silverhill, near Robertsbridge, Mr. Corbould was mortally struck by the cold, and fell in a fit of apoplexy, it is presumed, for the full particulars of the melancholy event have not transpired, though an inquest has been held. The deceased appeared, but an hour before the catastrophe, to be in the best health and spirits.

Singular Discovery in the Tower.—On Saturday the men employed in removing the remains of those interred in the burying-ground on the north side of the parade, in the Tower, preparatory to the erection of new barracks, came upon a coffin, the contents of which consisted entirely of sawdust. The outside coffin, which was made of wood, and had brass handles, contained a leaden one, in which was a shell filled with sawdust. The coffin had been in the ground 61 years, the date being ascertained from the plate on the exterior coffin. This mysterious discovery has occasioned much gossip in the Tower, and numerous are the surmises as to the disposal of the body, which never had been interred, and consequently the funeral, as well as the burial service must have been a mockery.

Collision on the River.—On Tuesday afternoon about half-past 3, as the Sylph Woolwich steamer, which had just left the pier at Greenwich with a number of passengers on board, was standing across the river, opposite the point at Blackwall, she was met by the Orwell steamboat from Ipswich, proceeding to London with the tide and at reduced speed. Although it appears a good lookout was kept on board both boats, it unfortunately happened, in consequence of the dense fog, that the Orwell was not observed by those on board the Sylph, which was unfortunately struck amidships abaft the paddlebox, and literally cut in two. She was immediately towed to the Union wharf, Greenwich, when it was found that one man, a hawker, living in Kent-street, Borough, was killed, having had his arm, leg, and head dreadfully fractured. Another man was taken on board the Dreadnought hospital-ship, and has since died. Four ladies, passengers, were conveyed to the Anchor Tavern, where they were immediately put to bed, and are doing well. A woman and two children were taken to another tavern, and, as there were several passengers in the fore-cabin, it was feared that more deaths would be discovered as soon as the unfortunate vessel could be floated to the shore, as she was lying on Tuesday night with her fore-cabin completely under water. It has, however, been ascertained that there was no further loss of life. An inquest on the two deceased persons was held on Thursday, when the facts above stated were proved by several witnesses; and after a long sitting the coroner adjourned till Monday, for further evidence.

Metropolitan District Visiting Society.—The first annual meeting of this Society was held on Thursday, the Bishop of London in the chair. His lordship opened the proceedings by a long address, detailing the operations of the Society. The report for 1844 was then read. It described the origin of the Association, in the winter of 1843, when very great distress and destitution existed in the metropolis; and it stated that the efforts of the Society had been eminently successful in accomplishing the objects for which it had been instituted, exhibiting a constant progress since its establishment. Viscount Sandon moved, and the Rev. W. Champneys seconded, that the report be received and printed for circulation. Sir R. H. Inglis moved, and the Hon. and Rev. B. Noel seconded, the second resolution, which stated that fifty new Visiting Societies had been established since the Association was originated, and expressed a hope that, ere long, no district in the metropolis would be without its visiting association for relieving spiritual and temporal destitution. The Rev. T. Dale proposed the third resolution, which stated that the objects which the association proposed to accomplish, especially that of bringing the wealthier classes into more frequent intercourse with the poor and needy, were highly deserving of public support and local co-operation, and that the measures already adopted for carrying into effect the charitable designs of the contributors to the fund had been eminently successful. The resolution was seconded by the Hon. W. Cowper, M.P., and like the former ones was carried unanimously. A Committee and Auditors for the ensuing year were then appointed, and a vote of thanks was passed to the Bishop of London for his zealous co-operation.

The Duty on Paper.—On Thursday a meeting took place of the leading paper manufacturers in London and the provinces, for the purpose of organising an application to Government to relieve the trade from the pressure of the present Excise duty on paper. Similar meetings were recently held at Manchester and Edinburgh, and a deputation from Manchester attended at the present meeting to offer their co-operation. Mr. John Dickinson, of the Old Bailey, presided, and the meeting having been addressed by Sir W. Magnay, Mr. Gaussen, Mr. Pewtress, Mr. Laurence, and other manufacturers, unanimously adopted resolutions embodying the chief evils of the tax, and agreeing to a memorial to the Treasury and petitions to Parliament for a repeal of the duty.

Meeting of Middlesex Magistrates.—An unusually numerous meeting of magistrates was held on Thursday, at Clerkenwell, for the purpose of electing a Chairman of the Magistrates to preside over their meetings on what are termed county days, in the place of Mr. Sergeant Adams, who resigned that situation on being appointed Assistant Judge of the Middlesex Sessions. Two candidates were proposed—Benjamin Rotch, Esq., and Henry Pownall, Esq. The election was by ballot, and at its close the scrutineers reported to the Court that the numbers were as follow:—For Mr. Pownall, 70; for Mr. Rotch, 25; majority in favour of Mr. Pownall, 45.

Father Mathew.—On Thursday night a meeting, attended by 2000 persons, was held at Exeter Hall "to consider the claims of the Rev. Theobald Mathew on the sympathy of the British public, in order to relieve him from his pecuniary difficulties." Lord John Russell presided, and detailed the objects of the meeting, which, he stated, was the cause of no party or sect in politics or religion, but was to achieve a great moral good, so happily commenced by the Rev. Father Mathew, the great apostle of temperance. None suffered so much from the vice of drunkenness as the lower orders, a vice which entailed misery and ruin on their families, clothed them in rags, and brought destitution and misery to their domestic hearths. Father Mathew had effected a great moral change in the lower orders of his countrymen, which was truly surprising. But in doing this he had lost sight of prudence—hence his present embarrassment. He (Lord J. Russell) had strictly investigated those reports which stated that Father Mathew had amassed large sums of money, and he was happy to say that they were entirely without foundation. Believing the rev. gentleman worthy of the gratitude of his country, he came forward to assist him in the hour of his difficulties. His Lordship, after advocating the claims of the rev. gentleman at some length, sat down amid great cheering. Mr. Bunn then read the address of the Committee of the National Temperance Society to the British public on behalf of Father Mathew. Admiral Sir E. Codrington moved that the address be printed and adopted. The gallant Admiral said that the sin of drunkenness prevailed all over the globe, but nowhere to such an extent as among that class of men whom he had the honour to command; he believed he might say, that all the punishment inflicted in the navy originated in intemperance, and he might say the same thing of the numerous accidents which occurred on board of ships, such as men falling overboard. The resolution was seconded by Mr. Buckingham and carried. Several other gentlemen addressed the meeting at great length, and a subscription was opened. Letters were read from the Marquis of Lansdowne, Lord Clarendon, the Bishop of Norwich, the Hon. and Rev. Baptist Noel, and others, approving of the object of the meeting.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Dec. 14. West Districts, 176; Northern, 209; Central, 209; Eastern, 268; Southern, 339; Total, 1201. Weekly average for the last five years, 946.

Provincial News.

Brighton.—One of the largest meetings which ever took place in Brighton was held on Monday evening by adjournment from that day week, the adjournment being for the purpose of giving the inhabitants time to read and digest a report presented by a committee at a previous meeting, which recommended the inhabitants to petition the Queen in Council for a charter of incorporation. The meeting was attended by at least 2000. Captain Pechell and Lord A. Hervey, the borough members, were both present, and remained till the close of the meeting, at 1 o'clock on Tuesday morning. A resolution was moved—"That in the opinion of this meeting it will not be beneficial to the inhabitants that the borough should be incorporated, but, on the contrary, highly injurious; and that, therefore, the recommendation of the committee contained in their report presented to the last meeting be not adopted, and that this meeting be dissolved." This was met by an amendment, "That the recommendation of the committee be adopted, and a petition agreed to praying for a charter." The meeting lasted seven hours, nearly the whole of those present at the outset keeping their seats to the end of the meeting, when a division was called for, and there appeared to be two or three times as many opponents as supporters of the incorporation. The proposal to incorporate the town was therefore declared to be negatived.

Carmarthen.—The local papers mention with regret that General Nott is so seriously ill as to create apprehensions of his ultimate recovery. The severity of the weather during the past week, it is believed, has been the chief cause of relapse.

Cambridge.—The Vice Chancellor has given notice that the first prize, in accordance with the will of Sir Thos. Maitland, already noticed in this Paper, will be of the value of 100*l.*, the subject to be "The Necessity for Christian Education to elevate the Native Character in India." The exercises to be sent in before the division of the Easter Term, 1845.

Chatham.—On Saturday three young men, farm servants of Mr. J. Oakley, of Darland, lost their lives in consequence of charcoal being used to warm the room in which they slept. It appears that they slept in a room near the bailiff's cottage, and as they had complained of its being damp, and the weather cold, Mrs. Chaplyn, the bailiff's wife, had been induced to light some charcoal, and place it in a watering-pot in the room, in which there was no fireplace, and the ventilation in consequence was imperfect. The next morning they were found dead. The Jury at the inquest returned a verdict of Accidental Death.

Chester.—On Saturday, a man named James Crowly, son of a farmer at Parnell, in Warwickshire, was apprehended in this city, charged with the wilful murder of William Tilsey, one of his father's farm labourers, as far back as December, 1842. He escaped at the time to the United States, and returned to Chester last March. On being apprehended he confessed his crime, and has been removed to Warwick to take his trial.

Exeter.—Bishop Philpotts has written a letter to one of the rural Deans in his diocese on the subject of the proposed innovations in the mode of performing Divine service. In this letter his lordship approves of the clergy delaying the use of the surplice in preaching until the first Sunday in January, in order, he says, "that you may all be able to satisfy your people that the use of it is adopted by you, not from any preference on your own part, but from obedience to your Bishop—obedience which, at your ordination, you vowed to God that you would reverently pay. My order on this particular is given for the sole purpose of putting an end to party—another word for those divisions which the Apostle deprecates in terms which no Christian can read without a deep sense of the duty imposed on him, &c. You may explain to the people the reason of my ordering the surplice. It is because I must make some order, if there is to be uniformity. I must order either surplice or gown—and the surplice has the authority of the Church, which the gown has not. If there are any so perverse as to deny the Bishop the right to make such an order, and if they threaten to leave the Church on account of it, use with them all Christian persuasion; let them see that it is not really the surplice which is here the point at issue, but it is the right and duty of the Bishop to act on the direction of the Apostle, that 'All things be done decently and in order.' The real question, in short, is, whether there shall be authority or not? Those who say there shall not, must be already separated in heart; and we dare not sacrifice a necessary principle to their pleasure. I have no doubt that calmly stating the matter will suffice with all whom reason can satisfy." In reference to this subject, we learn from all parts of Devon and Cornwall, that the laity of the diocese are determined to resist the introduction of the new forms. Since our last notice of their proceedings, we have to announce that the following parishes in the city of Exeter concur in the measures of those who have taken the lead, and in which similar resolutions have been adopted, with one exception, unanimously:—St. Thomas the Apostle, St. Olave's, Allhallows, St. Stephen's, St. David's, St. Sidwell's and St. James's. In these two last a further step has been adopted. By a majority of 120 to 4 a letter has been addressed to the Bishop, signed by the churchwardens, in the name of the parish, respectfully but earnestly entreating him not to enforce the directions of his pastoral circular to the clergy. The parishioners of Tavistock also, on the 12th, resolved that the Bishop's pastoral letter, to use his own language, is "part of a systematic attempt to bring back our church nearer to the corrupt usages from which it was reformed." They also expressed their disapproval of the contemplated changes, and adopted resolutions strongly urging upon the laity the necessity of making a firm and vigorous stand in defence of Protestantism, the right of private judgment, and civil and religious liberty. A meeting of the clergy of the Deanery of Axminster was held at Honiton on the 5th ult., for the purpose of hearing the Bishop's letter read by the Rural Dean, at which it was resolved, after due and respectful consideration of his Lordship's wishes, to have no future meeting upon the subject, "thinking it better to wait in anxious hope" for some final arrangement from the whole episcopal body. The inhabitants of Plymouth are not backward in resisting the movement. At a meeting last week, the Mayor in the chair, it was resolved almost unanimously that the churchwardens of the two parishes of the borough be requested to convene vestry meetings, for the purpose of taking the opinion of the parishioners on the innovations proposed in the Bishop's letter.

Falmouth.—The local papers state that, on its being recently represented to Sir R. Peel that Mr. Peach, an officer in the coast-guard service, in Cornwall, with a large family and small pay, has for some years past, during the intervals of his duty, made valuable researches in natural history, which he has communicated to the meetings of the British Association for the Advancement of Science; and that he has also made collections in fossil conchology, which have been of much service to the ordnance geological survey of Cornwall; Lady Peel has been pleased to confer on Mrs. Peach a pension for her life, from a small fund under the control of the lady of the Prime Minister, in consideration of the scientific merits of her husband.

Liverpool.—On Tuesday a public entertainment was given to Sir Henry Pottinger for his distinguished services in China. Previous to the banquet, the East India and China Association presented an address to Sir Henry in the Town Hall, and the merchants of Liverpool intimated their intention to present him with a permanent testimonial in the preparation of which they were anxious to consult his own wishes. At the banquet, the Mayor,

James Lawrence, Esq., presided, supported by about 400 gentlemen, including the borough members, and nearly all the leading merchants, brokers, and gentlemen connected with the trade of Liverpool. Sir H. Pottinger in acknowledging the toast of his health was loudly cheered. He dwelt at some length on the terms of the Chinese treaty, and expressed his belief that, if treated kindly by England and all other nations that may resort there, in due time, with God's blessing, the Chinese will enter as widely as any other nation into all our social feelings, and into that intercourse which is so desirable between man and man. Lord Stanley acknowledged the toast of Her Majesty's Ministers, and spoke in the warmest terms of praise of Sir H. Pottinger's services. His Lordship said, in reference to the common opinion of the Chinese character, "I believe, so far as our later experience has gone, that there is no nation which more highly values public faith in others; and up to the present moment I am bound to say that there never was a government or a nation which more strictly and conscientiously adhered to the literal fulfilment of the engagements into which it has entered. I believe it is easy, in the present state of public feeling, to raise jealousies, and to foster anew animosities which are beginning to subside—that an over-anxiousness for success, and an improvident pressing for advantages, may lead to such a conclusion; but I believe, also, and I entertain a confident expectation of it, and I pray that such may be the result, whether under this or succeeding Administrations, for many a long year, that the trade with China, which is now commencing, and in its vigorous infancy, may, if prudently conducted, be made the foundation, not of inordinate speculation and immense gains, followed by corresponding and ruinous losses, but be made the means of extending the blessings of civilisation, of science, of knowledge, of religion—and, along with them all, but only by a prudent course of not shocking the prejudices of those with whom we are brought into contact—it may lay the foundations of a great, a permanent, and a rapid augmentation of British commerce."

Manchester.—On Tuesday, a meeting of the manufacturers, spinners, and other inhabitants of this town, was held for the purpose of memorialising the Lords of the Treasury for the remission of the import duty on raw cotton. The meeting was convened by the Mayor, in pursuance of a requisition signed by upwards of 130 of the leading manufacturers in the town and neighbourhood. The meeting was presided over by the Mayor, and was addressed by Mr. Greg, Mr. Gardner, Alderman Hopkins, and other gentlemen, all of whom expressed but one opinion as to the impolicy of the duty. A memorial to the Treasury on the subject was unanimously adopted, and a deputation appointed to present it.

Oxford.—The Vice-Chancellor of this University has issued a notice in reference to the case of the Rev. Mr. Ward, of Balliol College, whose work entitled "The Ideal of a Christian Church considered," has recently caused so much excitement. The Vice-Chancellor quotes several passages from the work, in which Mr. Ward says, among other things, that "he knows no single movement in the Church, except Arianism in the fourth century, which seems to him so wholly destitute of all claims on our sympathy and regard as the English Reformation," that he believes if "we were as a Church to pursue such a line of conduct as has been sketched in his book, in proportion as we did so, we should be taught from above to discern and appreciate the plain marks of Divine wisdom and authority in the Roman Church, to repent in sorrow and bitterness of heart our great sin in deserting her communion, and to sue humbly at her feet for pardon and restoration;"—"that as well could a student in the heathen schools have imbibed at once the Stoic and the Epicurean philosophies, as could a humble member of our Church at the present time learn his creed both from Prayer-book and Articles;"—that he "distinctly charges the Reformers with fully tolerating the absence from the Articles of any real anti-Roman determination, so only they were allowed to preserve an apparent one;"—that he rejoices to "find the whole cycle of Roman doctrine gradually possessing numbers of English Churchmen;" and that "three years have passed since he said plainly, Roman doctrine." The Vice-Chancellor after quoting these passages at length states, that they appear to be inconsistent with the Articles of the Church and with Mr. Ward's good faith in subscribing his declaration to those Articles on taking his degrees; and consequently that in a convocation to be holden on the 13th Feb., a proposition to this effect will be submitted to the House, Mr. Ward having at the same time an opportunity given him of answering to the charge of having published such passages. If this proposition be affirmed the following proposition will be submitted to the House:—"That the said William George Ward has disentitled himself to the rights and privileges conveyed by the said degrees, and is hereby degraded from the said degrees of B. A. and M. A. respectively." Before the question "Placetne," &c., is put, the Vice-Chancellor will give Mr. Ward an opportunity of stating any grounds he may have for showing that he should not be degraded. Mr. Ward has since published a letter stating that as he is now aware of the course intended to be pursued, he is ready at once to join issue solely on the merits of the case. He avows himself to be the author of the work in question, and expresses his intention of defending himself before those who are to be his judges. He also announces in a letter to Members of Convocation, that he is preparing actively a pamphlet in his defence, and that various arguments against the proposed measure will doubtless be submitted to their notice by others, who differ, perhaps even fundamentally from himself in theological principles. "Under these circumstances," he says, "I claim at your hands, as a matter of the plainest and most imperative justice, not to promise your vote, or from any definite judgment until you shall have had an opportunity of carefully weighing what may be said against the measure."

Portsmouth.—A warm controversy is going on in the daily papers as to the merits of the ships-of-war constructed by the Surveyor of the Navy, one party contending that the recent experimental cruises show the Surveyor's system to be a complete failure, while others defend it as having produced the finest ships in the service. It is difficult to decide on such contradictory statements; and until some official information be published, all the accounts are probably to be received with considerable caution. The *Hampshire Telegraph* states that the Surveyor's new ships, the Queen, 110, Captain Martin, at Sheerness, and the Albion, 90, Capt. Lockyer, on her way from Lisbon to Plymouth, are ordered to be put out of commission; the officers and crew of the former to be turned over to the Trafalgar, 120, built by Mr. Lang; and the officers and crew of the Albion, to the Superb, 80, for which purpose the latter has been commissioned this week at Plymouth. The Queen is to have a piece added to her stern-post, thick at the head, tapering to nothing; a considerable addition made to her gripe, her foremast shifted three feet aft, and her centre magazine altered to the old fashion of one forward and one aft, which will throw a stowage of 60 additional tons of water into the centre of her hold. It also states that directions have been given from the Admiralty that the Prince of Wales, Windsor Castle, and Royal Sovereign, 110 guns each, and Exmouth and Algiers, 90 guns each, all designed by the Surveyor, and constructing, or ordered to be constructed, at the different dock-yards, are not to be further proceeded with, and that the Surveyor's Collingwood, 80, which, as far as Madeira in her present voyage, carried royals the whole way, rolled so much that gunnery exercise was a difficult operation. Commander Matson, of the Daring, has written a letter to Mr. White, the shipbuilder, of Cowes, giving a clear and comprehensive statement of the circumstances under which the sailings took place, from the 26th November to the return of the squadron to port, and throwing more light upon the trial sailings of the experimental squadron of brigs than any other document hitherto placed before the public. Captain Matson states that the Daring is superior to the other vessels of the squadron in almost every point of sailing, having gained, in the words of the letter, after a trial of six hours and a quarter, on the 28th November, on the Waterwitch, 1500 yards; on the Espiègle, 4000 yards; on the Flying Fish, 7500 yards; and on the Pantaloon, five miles.

Sunderland.—The Lords of the Treasury have granted 750*l.*, part of the Parliamentary grant for public walks, &c., to the corporation of this town in aid of a plan for providing a place of recreation for the inhabitants, the only condition of the grant being, that the ground when purchased, shall be legally and permanently secured as a place of recreation for the people. It is intended to purchase and lay out Building-hill. The estimated cost is about 3000*l.*, the remainder of which will be raised by public subscription. The Town Council have resolved to apply to Parliament in 1846 for powers to enable them to light the town with gas. This is already done by a company, but the corporation expect to be able to do so at a cheaper rate, and at the same time to realise as much profit as will relieve them from the necessity of levying a borough-rate.

Windsor.—On Monday evening, after the Queen had retired from the dining-room, a message was sent from the Castle to the lessee of the Windsor Theatre, commanding the attendance of the three German dwarfs, who were engaged to perform at the theatre in the evening and during the present week. This Lilliputian family, Henrick Brockstead, aged 22, who stands 3 feet high; Maria Brockstead, 18 years, 2 feet 8; and their brother Christian, 13 years old, 2 feet 4 inches, and who weighs 16 lbs., immediately repaired to the Castle, attended by their interpreter, Mr. Lewisson, and were ushered into the presence of Her Majesty, who was much amused by their waltzing and performances. The Distin family, consisting of the father and four sons, who have acquired notoriety on the Continent as Sax-horn players, have also performed before Her Majesty at Windsor Castle.—Preparations were made last week for sledge-driving in the Home and Great Parks, in anticipation of a heavy fall of snow. These plans, however, have been frustrated by the thaw, but two beautifully-constructed sledges remain at the Royal Mews for the use of Her Majesty and the Prince, and the infant royal family, in the event of another fall of snow. A set of sledge harness for a pair of grey ponies, which have been broken in with great care, has been manufactured; it chiefly consists of red Morocco leather, with silver-gilt ornaments, to which are appended upwards of two hundred small bells. The whole of the trappings, which are exceedingly costly, have a magnificent effect.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2116*l.*; Bristol and Gloucester, 973*l.*; Eastern Counties, 3584*l.*; Edinburgh and Glasgow, 1901*l.*; Great Western, 13,035*l.*; Grand Junction, 6842*l.*; Glasgow, Paisley, and Ayr, 1419*l.*; Great North of England, 1521*l.*; London and Birmingham, 13,203*l.*; South Western, 4986*l.*; Blackwall, 642*l.*; Greenwich, 766*l.*; Brighton, 3579*l.*; Croydon, 360*l.*; Liverpool and Manchester, 4467*l.*; Manchester, Leeds, and Hull, 6199*l.*; Midland, 8442*l.*; Manchester and Birmingham, 2854*l.*; Newcastle and Carlisle, 1573*l.*; Newcastle and Darlington, 1010*l.*; Preston and Wyre, 316*l.*; South-Eastern and Dover, 3848*l.*; Sheffield and Manchester, 631*l.*; York and North Midland, with Leeds and Selby, 2054*l.*; Yarmouth and Norwich, 174*l.*—The mere enumeration of the proposed Railways, in the Parliamentary Notices of "New Railway Bills for England, Scotland, and Ireland," is of tremendous length—occupying 19 columns of close print. The new railways (or extensions, deviations, &c., of existing ones), for England alone amount to no fewer than 195, those for Scotland to 7, and those for Ireland 23—making a total of 235 Bills that are to be introduced next session for new lines of railway, lengthening, diverging, or otherwise altering and improving old lines, &c. The Eastern Counties Company alone have given notices for seven Bills. There are also a "Hungerford-bridge and Birmingham Junction" to join at Willesden; no fewer than nine lines having a terminus at Manchester; four from Newcastle, four from Oxford; five from South Western extension lines, &c. The capital proposed to be raised for these railways is enormous. Two of the Oxford lines alone would cost, according even to present calculation, 4,000,000*l.* The North Kent would cost 2,200,000*l.*; the London and York, 5,000,000*l.*; the London and Chatham, and North Kent, 1,500,000*l.*; the Leeds and West Riding Junction, 1,200,000*l.*; the Direct Northern to York, 4,000,000*l.*; the Central Kentish, 2,250,000*l.*—An inquest was held at Nottingham last week on the body of Mr. Bolestridge, whose death in consequence of the recent accident on the Midland Counties Railway, was noticed in our last. After several adjournments, the jury returned a verdict of manslaughter against Robert Lightfoot and Jonathan Raven, the station-master at Beeston, and the coroner immediately issued his warrant for the apprehension of Raven. Before delivering the verdict, the following resolutions were unanimously agreed to by the jury:—1. That the management upon the Midland Railway is exceedingly defective, and that the jury cannot too strongly express their disapprobation of the manner in which the engineers, stokers, and guards are selected, and not being considered a requisite qualification that they should be able to read and write, and that a presentment of these and other facts be made to the Board of Trade, with the signatures of the foreman and jury attached.—2. That a memorial from the jury be presented to the directors of the Company, in behalf of the widow of James Bolestridge.—3. That a petition, signed by the foreman and jury, be presented to Parliament immediately on its assembling, praying for an alteration in the law, which prevents the relatives of persons killed by culpable negligence from obtaining compensation. The jury also recommend that a similar petition be forwarded by the inhabitants of Nottingham. —On Saturday the grand jury ignored the bill against Mr. Lightfoot, who was immediately discharged. For the particulars of the proceedings, we must refer to our Law Report.—An inquest has been held on the body of the engineer, and stoker, who were killed by the explosion on the viaduct of the South Eastern Railway, noticed in our last. The engineer was killed on the spot, and the stoker died in Guy's Hospital on Friday. The jury in both cases returned a verdict that the deceased were killed by an accidental explosion of the locomotive engine, owing to an excessive pressure of steam on the boiler.—The amalgamation of the Grand Junction with the Liverpool and Manchester Railway was determined by the meetings of the respective shareholders held last week. The Grand Junction, it appears, is to create new quarter-shares, to bring them in a position with the other company as respects capital, after which the shares of both companies are to form one consolidated stock, the 100*l.* North Union shares to be included in the general consolidation, at 64*l.* 7*s.* 6*d.* From what was said at the Grand Junction meeting, there is every reason to suppose that the disputes between that company and the Birmingham Board are in a fair way of being finally settled.—The Liverpool and Manchester Company at their meeting authorised the directors to apply to Parliament for authority to construct the following extension lines:—1st. A new entrance into Liverpool, by means of a tunnel from the main line, near Wavertree Lane, Edge Hill, to the Waterloo Dock, with a commodious station at the latter side. 2d. A new approach line, by means of a tunnel, or open cutting, from the Old Goods Station, Edge Hill, to the company's yard in Crown-street, for the better accommodation of the coal trade. 3d. A line of railway from the immediate vicinity of the new docks, now constructing at the north end of the town, passing near Walton, behind Croxteth and Knowsley, and through Simmonswood to Rainford, there to be joined by a new line of railway from St. Helens to Rainford, Bickerstaff, Latham, Ormskirk, and Rufford; at this latter place, connecting with a proposed railway from Euxton, on the North Union line, to the popular bathing place of Southport. 4th. A branch railway, about 3 miles in length, from the main line at Patricroft to Clifton, on the Manchester and Bolton line; there to connect with the Manchester, Bury, and Rossendale Railway. 5th. A branch from the main line near Newton, to join the North Union Railway near Parkside, by which a more easy and rapid communication between the North Union line and the Liverpool and Manchester, in the direction of Liverpool, will be effected. Also, for authority to improve and extend the passenger station in Lime-street, and the goods station in Crosbie-street, and Wapping, extending the latter to the Queen's Dock. —The Lancaster and Carlisle Company have confirmed the proposed agreement for leasing in perpetuity the

Lancaster and Preston Junction. The Lancaster and Carlisle are to pay the Lancaster and Preston 5 per cent. on their paid-up capital of 400,000*l.*, from the 1st Sept., 1846, with an allowance of one-third surplus profit, or the option, within three years of the opening, of converting their shares into Lancaster and Carlisle stock at par. The Lancaster and Carlisle purchase about 12,000*l.* worth of property held by the Preston Company, which sum, it is understood, is quite sufficient to provide for the existing debt of the latter company.—It having been announced that the West London Railway, which has proved such an unfortunate speculation, was to be sold by auction on Tuesday, piecemeal, several capitalists and contractors attended at the station at Knightsbridge. No sale, however, took place, as it was announced that, since the advertisement announcing the sale, proposals had been received from the London and Birmingham Company for the purchase of the line, which, it was hoped, would meet with the approbation of the shareholders. The sale was therefore indefinitely postponed.

IRELAND.

Dublin.—An official announcement appears in a supplement to the *Dublin Gazette* of Friday, dated Dublin Castle, Dec. 18, stating that the Queen in Council has been pleased, by warrant under the sign manual, bearing date at Her Majesty's Court of St. James's, the 14th Dec., to appoint the following persons to be Commissioners of Charitable Donations and Bequests for Ireland, agreeably to the provision of the Act 7th and 8th of Her Majesty, cap. 97, viz. :—The most Rev. John George, Lord Archbishop of Armagh, and Primate of all Ireland. The Most Rev. Richard, Lord Archbishop of Dublin; the Most Rev. Archbishop Crolly; the Most Rev. Archbishop Murray; Right Hon. Earl of Donoughmore; Right Rev. Bishop Denvir; Very Rev. H. Pakenham, Dean of St. Patrick's; Right Hon. Sir Patrick Bellew, Bart.; Right Hon. A. R. Blake; Rev. P. S. Henry, D.D. In the preceding list there are five Roman Catholics, four members of the Established Church, and one Presbyterian, namely, Dr. Henry, whose appointment we mentioned last week. The total number appointed is ten Commissioners; but there are, besides, the *ex officio* commissioners named in the Act, who are members of the Established Church. This is the first time, since the enactment of the Penal Laws, that Roman Catholic prelates have been recognised by their titles in an official document, emanating from the Queen in Council, and published by authority. It will be observed that Dr. Denvir, Roman Catholic Bishop of Down, and resident in Belfast, has been named in the commission in the room of Dr. Kennedy, Roman Catholic Bishop of Killaloe, who resigned soon after his appointment. It will also be observed, that not only do the Roman Catholic Bishops get their titles, but they also get precedence according to rank. Thus Archbishop Murray takes rank before the Earl of Donoughmore, and Bishop Denvir before the Dean of St. Patrick's. —The agitation, however, against the Act is still carried on with the greatest vigour in all parts of the country. Dr. Keating, Roman Catholic Bishop of Ferns, presided at a meeting in Wexford on Sunday last, when he spoke at considerable length, vehemently protesting against the Charitable Bequests Act, as calculated to produce the most ruinous consequences as regards the Roman Catholic Church in this country. Dr. Keating thus concluded :—"There seems intended in this Act the commencement of a connection in ecclesiastical matters between the Catholic Church in Ireland and the State; and being convinced that such connection would be ruinous to the Church, and damage her usefulness to the people and the country, I feel it my duty to protest against it, and to inform you, my beloved people, of the evils which would flow from such an alliance." The Roman Catholic clergy of Meath, headed by Dr. Cantwell, the Bishop, have resolved that "any Roman Catholic, lay or clerical, taking a place on the commission to carry into operation the odious Charitable Bequests Act deserves the heavy censures of the Church, and the indignant reprobation of the people of Ireland." A meeting has also been held at Waterford, the Mayor in the chair, in compliance with a requisition numerously signed. A series of resolutions, condemnatory of the provisions of the Act having been moved and seconded by the Rev. Dr. Burke, of Clonmel, the Rev. Dr. O'Brien, President of the Roman Catholic College, and other clergymen, in energetic speeches. Mr. O'Connell addressed the meeting for upwards of an hour, urging the usual topics of objection to the Bill which have been so often reiterated at the parochial meetings in Dublin. He declared that the Bill was utterly uncalled for, and that it went to destroy a most useful body of the clergy—the regulars; that it could serve no single good purpose, and that in its end it was intended to excite division among a hierarchy and clergy hitherto distinguished by their unanimity and concord. He called upon the clergy to denounce it, and to remonstrate with those of their body who could give it sanction; and, above all, he declaimed against any surrender of ecclesiastical privileges for an *entrée* to the Castle or for Court favour.—The deanery of Killaloe has been conferred upon the Rev. Dr. Higgin, Vicar-General of Killaloe and Rector of Roscrea.—The weekly meeting of the Repeal Association was held on Monday, Mr. Nicholas Markey, of Walshetown, in the chair. The Secretary read a communication from Mr. Steele, head Pacificator, who had gone to Leitrim and Cavan for the purpose of putting down the system of Ribbonism, lately established in those counties under the name "Molly Maguires." It was accompanied by an address from Mr. Steele which he had promulgated among the inhabitants of the disaffected districts. The thanks of the Association, on the motion of Mr. O'Connell, were given to Mr. Steele for his exertions. Mr. O'Connell said he believed that every one would admit that a purer spirit, a more high-minded gentleman, or a soul of more chivalrous honour, never existed than in his esteemed friend. An address was read which Mr. S. O'Brien had drawn up for circulation among the inhabitants of Leitrim and Cavan, calling upon them to withdraw from all Ribbon Societies; and the thanks of the Association were voted to Mr. O'Brien for preparing it. Mr. O'CONNELL then adverted to his quarrel with the *Examiner* newspaper, and commented with some severity on another attack made upon him by that paper last week. Some contributions having been handed in,

Mr. O'CONNELL again rose, and said he had to apologise for not being prepared with the report from the committee on the ten propositions he had referred to on the last meeting. He would on the present occasion refer to but one of those propositions. The English press omitted all mention of them, with the exception of some notice of them that had appeared in the *Morning Chronicle*. The only one of them to which he would then allude was the financial injustice done to Ireland by the Union. That was a subject that had sunk deeply into the minds of the Irish people, but which had been most neglected by the English press. He then repeated the statement he has frequently made concerning the injustice done to Ireland in respect to the national debt. These facts, he contended, had sunk deep in the Irish mind, though they were totally unattended to in England. They had produced the monster meetings of 1843, the perseverance of 1844, and they would have their effect on the next great Repeal year of 1845. The approaching year ought to be one of high advantage to Ireland. It was the only country in the world where hundreds of thousands—ay, where millions of people could assemble without even an accident taking place among them. There could not be a better proof of the superiority of Irishmen. Professor Forbes, the Scotch philosopher, and Professor Quintelet, in Belgium, had, by a series of experiments, conducted for 12 years, proved that the Irishman was the first among the nations of Europe for every physical capacity. Professor Kane, an Irishman, made similar experiments in London, and he proved that when the power of raising burdens in an Irishman was 27, the highest number among any other people was but 25. He put these facts forward to show that the people of Ireland, to use a common phrase, were not a people to be sneezed at. The Tory press, ever anxious to degrade their own country, and to exalt above them the people of any other country, quoted some observations that he had made when addressing a procession of 60,000 or 80,000 of the men of Tipperary that had met him lately on coming into Nenagh. They said that he admitted the crimes that exist in Ireland, but he never attempted to deny them. He said nothing at Nenagh that he had not said before for the hundredth time, but they left out his admission of the wholesale murders of the landlords. He said that he was not there to deny the oppressions of which the peasantry complained, but he was there to show them that their crimes could afford them no redress, and even if they did that they were so horrible and detestable before God and man that they ought never again to be repeated. He did not care whether death was produced by the pistol shot, or by the more tedious, but not less certain mode of starvation in a ditch. He freely admitted those detestable crimes, but they took place in only a small and excepted portion of the country; and as there was found among the Apostles one traitor, so there was one criminal part of Ireland—that, however, did not constitute by any means a twelfth portion of the country. Would to Heaven that he had as much influence with the landlords as he had with the people, and those crimes would soon cease over the entire kingdom. He knew that the forthcoming report of the landlord and tenant commission would refer to the greater leniency of the landlords in the north of Ireland to their tenants. At the expiration of a lease in Ulster, the landlord came to an amicable arrangement with the existing tenant, instead of, as in other parts of the country, going about to try if they could get any other person to offer them more rent. That was the reason that no agrarian crimes were heard of in the north, and he would remind those who attributed the tranquillity there to the prevalence of the Protestant persuasion, that there was a majority of 500,000 Catholics in Ulster over the other sects, and that they, as well as the Protestants and Presbyterians, remained free from those crimes. The Government had, by the Clontarf proclamation, challenged the people of Ireland to war, but finding that they would not fight, they went to law with them. From October to May the litigation had been going on, and now he would turn back on those who caused that litigation, and he defied them to state any one crime of which he had been guilty. They might as well have indicted them for dining together, or for going to the same place of worship; but they could not do that, as they were of different persuasions. There were crimes committed, but not by the Repealers. They had, to be sure, the satisfaction of keeping him in jail for 100 days, when they had no right to detain him there for the hundredth part of a minute. After some further comments on the conduct of Government during the prosecution, he proceeded to say that they would hold but two meetings more of the Association in that year, but they should commence 1845 as if they were then only really beginning to agitate for Repeal, and as if all they had hitherto done were as nothing. 1843 was the Repeal year for monster meetings, 1844 for patience and for legal triumph, but 1845 should be marked by the weekly collection of the Repeal rent. If it were to be but 1*s.* or 1*d.* in any locality, still it should be collected weekly. They solicited from no man more than 1*s.* a year, or one farthing a week, with four weeks for nothing; but if every man subscribed that sum they would have 50,000*l.*, and he would expect even 100,000*l.* at the end of the year. Lord Cloncurry stated eight years ago, and it had never since been contradicted, that in 1830 the Duke of Wellington and his Ministry had agreed to propose a modification of the Union; and what he did then he could be compelled to do again, and when they had 50,000*l.* in one year, where was the man who would tell them that they were not in earnest, or that Repeal could be any longer delayed? Mr. O'Connell concluded by moving that the Repealers throughout Ireland be called upon to demonstrate their perseverance in the Repeal cause by sending in weekly contributions on and after the 1st January, 1845.—After the disposal of some routine business, Mr. O'Connell announced the rent for the week to be 179*l.* 12*s.* 2*d.*

Waterford.—The Repeal demonstration in this town, for which great preparations have been making for some time, took place on Thursday. Mr. O'Connell, on his entry into the city, was received by a procession of about 4000 persons. On reaching his hotel, he appeared at the window, and addressed the people, announcing a new organisation of the Repeal rent, to commence on the 1st January, when every one would be expected to contribute weekly. By this means, he said, before 12 months the result would be seen in the progress of Repeal. Having expatiated on the injustice of his 100 days' imprisonment, on the necessity of attendance on the registry, repeal organisation, perseverance, and on the physical, moral, and religious superiority of the Irish people to all other nations of the globe, he concluded by saying, that it was impossible that Ireland could continue a province.—At the banquet in the evening, the Mayor of Waterford presided, supported by Mr. O'Connell, Mr. Roche, M.P.; the Mayors of Cork, Clonmel, Limerick, and Kilkenny; Dr. Foran, Titular Bishop of Waterford, &c. Mr. O'Connell, in his speech, said—

There were two questions to be solved by thinking men—by every friend of Ireland. The first was, What would be the next step to take for Repeal? And the second was, When would they get Repeal? The result of the first was certain; the answer was sure. He positively did not think that they could by any possibility sufficiently mismanage the cause, even though they did so on purpose, so that they should not get Repeal. He had no more doubt of it than he had of his own existence. The Union was to be repealed, and the oldest amongst them, and few were more so than himself, had a right to see the Irish Parliament restored and in operation for many years. Let the question of time be disposed of first. It might be more remote than he anticipated—it might be nearer than the most sanguine could conjecture. Let there be but one violent concussion of the British Ministry. Let war break out in any country of Europe. Let Spain become weary of obeying the revolutionary Deputy of France, or France become impatient of conquering Spain—England must be a party to the quarrel, and if any two royal dogs of Europe had a wrangle, as England would take part with one or the other, they would get Repeal more readily than they could utter the word. Then she would want the people of Ireland, and she would have them, but the price would be—Repeal. At all events, it could not be far remote, for the accumulating strength of the Irish nation was enormous, considering that on the best authority she had no less than 900,000 able-bodied grown up men, without reckoning boys. The next question was What was the next step to be taken? They must first look back to the past, to ascertain the prudent and wise course for the future. To use a Spanish phrase, Ireland had "pronounced" for the Repeal. The learned gentleman then spoke of the 41 monster meetings in his usual tone of eulogy, of their peace and order, and of the superiority in physical activity, energy, and power, to any other nation, which had been attributed to the Irish people by foreign philosophers. They possessed every great moral quality as well. No nation in the world could or ever would be able to boast of such a year as their year, '43. To be sure they had kept him 100 days in gaol, where they had no right to keep him for the one-hundredth part of a minute. But did no good follow from it? Did they not hear the whisperings of another voice? Did they not hear the murmurings of another wave, that would ere long assist them in bearing the ark of Ireland's liberties into the haven of peace? Did they not mark how Catholic and Protestant were beginning to amalgamate into the Irishman? Were there no symptoms abroad that the Irish mind was in the throes of a new birth, and that the babe should be called "Liberty?" Mr. O'Connell then proceeded to show that a Protestant movement had taken place in favour of Repeal; and, as proofs of its existence and progression, instanced the adhesion of Mr. W. S. O'Brien, Mr. E. B. Roche, the Hon. Mr. Hutchinson, and Mr. Grey Porter's pamphlet, on all of which he bestowed the most exalted epithets of praise. He continued — The next question was, What was to be done with England? He had thought of making a pilgrimage to England to look for justice and demand inquiry. At one time he had thought such a plan wise, prudent—he might say, cunning—but he now differed totally from himself, and thought it savoured rather of degradation than cunning or wisdom. There was no possibility of making any impression on England whilst the adamantine wall of the press stood between him and the people. Three times since he left Derrynane had he brought forward Irish grievances, in the shape of 10 propositions, that they might find their way into the London papers, and there was only an abstract of them given, without the slightest remark. No answer whatever had been given to his assertions; no attempt to show that he was wrong. He showed that Ireland was entitled to 175 members. England did not care whether she was entitled to 1 or 500. They had them fettered and handcuffed, as they thought, in the chains of the Union, and imagined that they were too weak to break them. They never were more mistaken in their lives. They were both able and willing, and, with the blessing of Heaven, would break them into fragments. They should no longer continue in chains, and the hour of their thraldom was gone by. His propositions as to the injustice of the franchise and the national debt, had appeared indeed in the London papers, but had fallen still-born to the ground without remark or comment. Oh, but the time was fast coming when John Bull would be obliged to listen to them, and to hear them in a voice not to be misunderstood. Mr. O'Connell went on to argue that a change in the social elements of Ireland was inevitable, and admitted on all hands to be desirable. That day must not be then a mere idle pageant, but a precursor of hard work. It was not sufficient now for men or members of Parliament to be Liberals; he hated the nickname, and had translated the word "Liberal" into "Repealer," and by that he must stand. He continued to insist upon the necessity of returning Repealers only, and declared, that even if the Liberals appeared to have majorities at the registrations, candidates should be found to contest the counties and towns with them. There must be no laggards. A new year was approaching, and the Irish nation had only to will it, and there would be a Parliament once more in College-green. Would the British Ministry ever understand the Irish people? That had been a glorious day for him. He had been delighted to behold another monster meeting. Had they beheld the hundreds of thousands who listened to him that day, re-echoing every sentiment of nationality? That voice would reach Bristol, pass on to Whitehall, and startle the British Ministry. It would cross the Atlantic. It would be heard by the serfs of the crafty usurper of France. Ireland was a subject for the thoughts of the world. A little while ago, and it might have been asked, where in England stood Ireland? Now they might inquire, where in Ireland stood England? His answer was, nowhere. Let the Irish people stand together. They were entitled to the Parliament out of which they had been swindled, and let them protest so in the presence of their God, with all the sanctity of an oath, without its profanity, and Ireland would be a nation again.

The Provinces.—Another murder has been added to the terrible list of Tipperary during the present winter. The parties were a farmer called Brit, who was murdered by his two nephews in open day, in consequence of some long-standing dispute about the right of passage through a green lane in which the murder was committed. Another murder has been committed in Clare, where the magistracy had assembled last week to devise measures for bringing to justice the persons concerned in the assassination of Mr. Arthur Gloster, the magistrate. It appears that on Friday afternoon Mr. Thomas Heffernan, a farmer, residing near Ennis, the assize town of the county, was fired at by some miscreants who lay in wait, and died instantly. The murder was committed about 3 o'clock, and it is stated that some of the neighbours of the victim were quite near at the time. This murder, like almost all the crimes perpetrated in the south, was connected with disputes about land. It appears that Heffernan was proceeding by ejectment against his

mother and brother-in-law.—In the county of Sligo, too, there has been an all but successful attempt at assassination—the intended victim bearing the same name as the unhappy man who was so mysteriously murdered in the preceding week. This attempt was made on the 7th inst., about 7 o'clock, as Mr. T. M'Kerin, of Grangemore, was returning home from Sligo, on horseback. Two shots were fired at him on the mail-coach road, about midway between Ballysodare and the chapel of Currowna; the first ball hit him on the right side of the head at the back of his ear, knocked off his hat and cut the skin to the bone; the second ball marked him on the right eyebrow. No clue as yet has been discovered as to the perpetrators of this daring attack.

SCOTLAND.

Edinburgh.—The Scotch papers contain the reports of numerous meetings on the subject of the banking system in this country. A general meeting of the county of Lanark was held in the County-hall, Hamilton, on Friday. The meeting was called by Lord Belhaven, in consequence of a requisition, signed by about 2000 gentlemen. The resolutions passed were strongly opposed to the interference of Government, and every parish in the county will be called upon to sign the petition to Parliament in favour of the existing system. The town council of Dumfries have also adopted resolutions, strongly deprecating any interference with the present currency and banking system.—The papers state that the ancient and royal palace of Linlithgow has lately undergone extensive repairs at the expense of Government. This venerable building forms one of the noblest piles of ancient architecture in Scotland, and with the neighbouring loch, forms altogether an object of much beauty and interest. Some encroachments having been made on the boundaries of the loch by some of the small proprietors whose lands come down to the water's edge, an officer from Her Majesty's Works has inspected the locality, and fully confirmed the ancient right of the public to free access round the loch.

Perth.—On Friday week some bills becoming due at several of the Perth banking houses, and none of the parties concerned having appeared, it was discovered, on inquiry, that forgeries to a considerable amount had been committed. The steps usual under similar circumstances having been taken, it was ascertained that the guilty party had absconded. This was no less a personage than the minister of a neighbouring parish, whose name is not mentioned, but who had a stipend of 400*l.* a year.

Law.

CENTRAL CRIMINAL COURT.—*The Bank Forgery.—William Burgess* was placed at the bar on Thursday morning on an indictment for feloniously uttering a forged warrant of attorney for the transfer of 6305*l.* 3*s.* 5*d.* Bank Stock, standing in the name of William Oxenford, with intent to defraud him of the same. In other counts the intent was laid to be to defraud the Governor and Company of the Bank of England, and also to defraud certain directors of the Pelican Insurance Company. Mr. S. Wortley, Q.C., (with whom were Mr. Adolphus and Mr. Clarkson), stated the facts of the case on behalf of the prosecution, but the details of the circumstances out of which the case arose have been already so fully related in the accounts we have published from time to time, that a repetition of them would involve a consumption of space that is wholly unnecessary. The facts were fully proved by the evidence of the numerous witnesses, and the Jury after 10 minutes' deliberation returned a verdict of Guilty of uttering knowing to be forged. The prisoner, who heard the verdict without any manifestation of feeling, was immediately called up for judgment, and Mr. Baron Rolfe, in passing sentence, said, the evidence in the case had brought home to the prisoner the serious offence with which he stood charged with a degree of clearness which scarcely ever could be attained in a criminal court of justice. It was clear that the prisoner, taking advantage of the information which the confidential situation he filled enabled him to acquire, had concurred with the unfortunate man Elder, now no more, to effect this very extensive fraud, with the certain consequence of entailing upon some person or other a great pecuniary loss. A very few years ago, namely in 1830, the very act of Parliament under which the indictment on which the prisoner now stood convicted was framed, made the offence a capital felony, and he need hardly say, that if that provision still remained on the statute-book, the extreme penalty of the law would have been inflicted. Since that period an act had been passed by the Legislature, in its anxiety as far as possible to abolish capital punishments, by which capital punishment was removed from the crime of which the prisoner had been found guilty. The policy of the experiment made by the Legislature he would be the last man to question, though among some persons doubts existed on the subject. He believed the alteration to be salutary, but to keep it so, and to give it a fair trial, in grave cases of this kind, the law ought to be carried into effect to the utmost extent now warranted, and he for one would never render the policy of Parliament doubtful by a deviation from that course. The sentence therefore on the prisoner was, that he be transported beyond the seas, to such place as Her Majesty, by the advice of her Privy Council, might direct and appoint, for the term of his natural life.

ASSIZE INTELLIGENCE.—MIDLAND CIRCUIT, NOTTINGHAM.—*The late Railway Accident.*—The commissions of assize for the borough and county of Nottingham were opened before Mr. Justice Patteson on Saturday. The chief cases of interest for trial were of course those of *Robert Lightfoot* and *Jonathan Raven*, charged with manslaughter on the occasion of the late fatal accident on the Midland Counties Railway. In charging the grand jury, Mr. Justice Patteson said that the inquiry before them was, whether a particular person had been guilty of a particular crime, whereas the inquiry before the coroner was how the body, then lying before him, came to its death. That being so, they would not have brought before them the whole of the evidence taken before the coroner. Now, the law upon the subject was perfectly clear, but the difficulty was how to apply the law to the facts. It was perfectly clear that no man could be indicted for manslaughter for a mere mistake or error in judgment. If he acted to the best of his judgment or ability, in the discharge of his duty, he was not criminally responsible or liable for a mere mistake; but if, on the contrary, a person placed in a situation of great responsibility, duty, and trust, conducted himself with gross negligence and inattention, then in case of death he was unquestionably guilty of the crime of manslaughter. Therefore it was always difficult to apply facts in such a case as the present. The law was the same, whether applied to a man driving a waggon or carriage on the highway, managing a vessel on the seas, or conducting an engine on a railway; if he did not display due care and caution he was liable to the charge of manslaughter. But if a person so employed got into a difficulty, and, however untoward the result, if he acted to the best of his judgment, if he acted as he thought best under the circumstances, however unfortunate his judgment might be, he was not to be made to suffer for his error. It was very easy for persons to say, after a disastrous occurrence had taken place, that another course would have been better, but it was oftentimes very hard to judge of a man by particular circumstances—by events which happened afterwards. Persons too often said, "But he should have acted so and so;" but let such persons place themselves in a case of sudden difficulty, and then say whether he was fairly answerable for the consequences which followed. Now the particular facts of this case were very plain and clear indeed. It seemed that Mr. Lightfoot was the station-master at Nottingham, and that he had voluntarily put himself in a situation in which he had no right to be—that was, he went by a "down-train," the "up-train" being blocked up by the overturn of a tender. His object in thus going appeared to be to direct the engine driver to drive slowly and properly. He (Mr. Justice Patteson) thought Mr. Lightfoot wrong, and that he committed an error in leaving the Nottingham station at all, but for that he was not to be indicted for manslaughter. It was clear that when he went all was safe; there was no mischief as to that train, and it was plain and clear Mr. Lightfoot had taken up the notion when he went up the line that the tender would be shortly removed, the line speedily cleared, and the next up-train from Nottingham proceed upon its proper line. That was the opinion which he appeared to strongly entertain, and upon which he most unquestionably acted. Then they found Mr. Lightfoot proceeding back to Nottingham on his proper line in the front of the engine, himself in the most hazardous and dangerous position about the engine. He was apparently confident that when the train came up from Nottingham it would be upon its proper line. It turned out, however, unfortunately otherwise. A collision unhappily took place, and Mr. Lightfoot was committed upon a charge of manslaughter. That being so, another death ensued, and Mr. Raven, the station-master at Beeston, was next committed by another coroner's jury for the same offence, but for what reason he (Mr. Justice Patteson) could not divine. He supposed it was for not stopping the train when at Beeston. It did appear to him (Mr. Justice Patteson), that the charge of manslaughter against Raven was perfectly preposterous. In the consideration of this case no one seemed to him to have sufficiently considered the rate at which the up train was coming from Nottingham, and the circumstance that no person, in obedience to the company's code of regulations, had preceded it to see that the line was clear. It was in evidence before the coroner, that the up train was going upon its wrong line at the rate of between 20 and 30 miles an hour, while that upon which Mr. Lightfoot was travelling was going slowly. Then, again, as he had before intimated, no one, in obedience to the company's laws, had preceded the train. They were told, that a man was always understood to precede a train 800 yards, when danger was apprehended; but, on this occasion, no person preceded it. Much had been said about the company not having sufficient force for the proper and careful management of their business at the Nottingham station. If that were the case, then, most certainly, such a fact was decidedly in favour of the accused—blame rested upon a higher party. He (Mr. Justice Patteson) did not see that that charge was made out against the company, but if it were it could not be used as an argument against, but rather in favour of the prisoners. They would have all the evidence before them, and say whether they thought such a case was made out as would justify them in placing either one or both of the accused upon their trial for the crime of manslaughter; whether they had been guilty of gross and palpable negligence, or merely committed an error of judgment.—At the conclusion of the charge, the learned Judge proceeded to the County-hall, and opened the commission of assize for the county. During the afternoon speculation was afloat as to the probability or improbability of the borough grand jury finding bills against Mr. Lightfoot and Mr. Raven. The judge, having concluded the trial of prisoners at 4 o'clock, returned to his lodgings; but at half-past 7 the clerk of the arraigns was summoned to the court to hear the decision of the grand jury. The foreman announced that they found no true bills against Robert Lightfoot and Jonathan Raven for manslaughter. The result was generally expected. On Monday another bill was to have been preferred against Mr. Lightfoot for the manslaughter of Mr. Dean, but as no evidence had been offered in the former case after the charge of the judge to the grand jury, counsel for the prosecution decided on not preferring any bill.—Mr. Justice Patteson said: "Mr. Lightfoot, the recognizances may be discharged, so there is an end to this prosecution. I am very glad this inquiry has taken place. I am quite sure what the learned counsel for the prosecution has stated is correct, and judging from the circumstances that have actually occurred, looking at everything that has taken place, it is impossible to say there was anything greater than an error in judgment; certainly there is no ground for saying there was that culpable and gross negligence which would authorise a conviction for manslaughter; I thought so when I read the depositions in the first instance, and I think so still. I am quite clear that is the law, and the facts warrant us in coming to that conclusion. I am quite sure the termination of this prosecution is that which law and justice fully require. I cannot pretend to say there was not an error of judgment on your part, but it is clear everything that was done by you was done to prevent the mischief taking place which did occur, owing probably to a misunderstanding between you and another person. It seems to me that every person on a railway, and in almost every other situation in life, would do well not to step out of the strict line of their duties; if you had not done so, this accident might not have occurred. As I understand, it was no part of your duty to have left the Nottingham station at all. That was an error in the first instance; and the second error, if there was any, seems to be this, that although feeling persuaded, and as far as I can judge with very good reason, that the train coming from Nottingham would come on its proper line, and that that line would be free, still you did not wait to make it quite certain at the Beeston station; it would have been better to have waited, as it appears the train coming from Nottingham, whichever line it came on, was overdue at Beeston station; therefore it would have been better had you waited a few minutes; but to say, because a man certainly erred in judgment in a situation of great difficulty, he is guilty of manslaughter when death occurs, is not correct. I am very glad to hear the account of your good conduct in general that the learned counsel gave of you. I have no doubt it was through an error in judgment this unfortunate mischief took place. You left the station with the best of all possible intentions; certainly there was no wish on your part to do any harm; on the contrary, your intention was to do as much good as possible; unfortunately, however, the event turned out otherwise." Mr. Lightfoot was then discharged, and instantly left the court.—DERBY.—*William Thomas Gallimore*, a surgeon, who had been out on bail, surrendered and was placed at the bar, charged, upon the coroner's inquisition, with the manslaughter of Ann Warwick, during her confinement, at Hollymoorside, near Chesterfield, on the 9th September last. The jury found the prisoner Guilty. Mr. Justice Patteson said it was his duty to pass such a sentence upon the prisoner as the justice and law of the case required. The prisoner had conducted himself as a midwife in a manner which evinced either the grossest ignorance or inattention. How it happened the Court was left in great doubt. The offence of manslaughter, when it approached nearly to murder, subjected the party offending to very severe punishment. Counsel for the prosecution here said, that he was instructed to recommend the prisoner to the merciful consideration of the Court. Mr. Justice Patteson was glad to listen to that recommendation. He could not but think that there was something which led to this fatal occurrence that had not come to light. Under all the circumstances, he did not feel that he was bound to inflict so severe a punishment as he might have done had it been proved that there was a criminal intention on the part of the prisoner. The sentence of the Court was, that he be imprisoned for six months.

NORFOLK CIRCUIT, BURY ST. EDMUNDS.—*Mary Sheming*, aged 51, was charged with the wilful murder of John Sheming, a male infant child, her daughter's natural son. The prisoner was the wife of a labouring man, living at Martlesham, in the county of Suffolk. On the 3d July, Caroline Sheming, daughter of the prisoner, came home to her father's house with a male illegitimate child, then five weeks old; and in the evening of the 30th, the infant was taken very ill and shortly afterwards died. The most remarkable fact of the prisoner's conduct was her going, on the 19th of July, to the registrar of the district and registering the death of her daughter's infant, whereas at that time it was quite well, and did not die until the end of the month. It was also proved that about a fortnight before the child died the prisoner bought some arsenic. Another important fact was, that the Sunday before the death of the child (it was then quite well), the prisoner told the village carpenter "that she should soon want a coffin for Caroline's baby, as it was very bad." A witness had frequently heard the prisoner, when in great distress, complain of the expense of keeping her daughter's children, as they pressed heavily upon her; and on one occasion she heard the prisoner say, "If I do not soon receive some relief we must all go to the union workhouse." The jury returned a verdict of Guilty, and Mr. Justice Williams passed upon her sentence of death.—*William Howell* was charged with feloniously and maliciously murdering James M'Fadden, police-constable, by shooting at him with a gun, at Gisleham, on the 29th July, and *Walter Howell* and *Israel Shipley* were charged with aiding and abetting William Howell in the commission of the felony. The trial lasted from the 13th to the 16th inst., when the jury returned a verdict of Guilty, and the three prisoners were sentenced to death.

OXFORD CIRCUIT—STAFFORD.—*Paul Downing*, aged 19, and *Charles Powys*, aged 17, were charged with the wilful murder of Mr. William Cooper, at Audley, in the month of August last. The deceased was Sir Thomas Boughey's head gamekeeper. Downing, it appeared, was a man of notoriously-bad character, and had repeatedly been in gaol, sometimes upon charges of poaching, on one or two of which Cooper (the deceased) had appeared as a witness against him. He was proved on more than one occasion to have threatened, in terms devoid of much ambiguity, to wreak his vengeance upon Cooper as soon as he was liberated. The trial lasted two days; and the evidence developed a train of circumstances which scarcely admit of being arranged in the form of a narrative, but disclosing a cold-blooded and deliberate spirit of revenge on the part of the prisoners. After a long and patient investigation the Jury returned a verdict of Guilty, and Mr. Justice Coltman immediately passed sentence of death. The prisoner Downing, who throughout the trial had conducted himself in an insolent manner, laughing at intervals during the proceedings, here made a loud protestation of his innocence, and on being conveyed from the dock, catching a glimpse of some of the witnesses, looked at them in a menacing manner, and shaking his fist, poured forth a volley of threats and execrations against them. The district from which the prisoners come is described as occupied by the most desperate and lawless set, and has been the scene of more than one fearful tragedy of late. It is therefore to be hoped that the fate of these criminals may operate as a warning to others in the district which was the scene of their crime.

BIRTHS.—16th inst., at Meppershall Rectory, Beds., the lady of the Rev. H. HOWARTH, of a son, still-born—11th inst., the lady of Capt. G. DENNY, 32, Cambridge-terrace, of a son—12th inst., in Upper Gloucester-place, the lady of Captain THORNTON, R.N., of a daughter.

MARRIAGES.—Recently, at Shropham, in the county of Norfolk, the Rev. F. BIGNOLD, second son of S. Bignold, Esq., of Surrey-street, Norwich, to JANE M. HEMSWORTH, youngest daughter of Henry D. Hemsworth, Esq., of Shropham-hall—12th inst., at Aldbrough, C. S. STUBBS, second son of J. Stubbs, Esq., of Mecklenburgh-square, London, to JANE HIRST, eldest daughter of W. Hirst, Esq., of Boroughbridge.

DEATHS.—On the 12th inst., at his residence, near Richmond, the Hon. H. LEGGE, brother of the Earl of Dartmouth, aged 57—On Thursday last, at Lipson, near Plymouth, Rear-Adm. E. BOGER, aged 69—14th inst., at his house, in Reading, Capt. T. GILBERT, Royal Marines, H.P., father of the Bishop of Chichester, aged 86—16th inst., at Hampton Court Palace, LADY A. C. SMITH, daughter of Garrett, Earl of Mornington, sister of the late Marquis Wellesley, of the present Earl of Mornington, the Duke of Wellington, Lord Cowley, and of the Hon. and Rev. Dr. Wellesley—At St. Gluvias, at an advanced age, the ARCHDEACON SHEEPSHANKS, Archdeacon of Cornwall.

FOR WINTER WRAPPERS, GREAT COATS, AND OUTSIDE GARMENTS OF ALL KINDS, SEE

BERDOE'S VENTILATING WATERPROOF CLOTHING ESTABLISHMENT, 69, Cornhill, where an inspection is confidently invited of a large and Superior Stock of first-rate garments of the above description at reasonable charges, and really waterproof. Also of Berdoe's well-known FROCK for all Seasons, (which has stood the test of more than 6 years' extensive trial, and completely supersedes the "Macintosh"), SHOOTING JACKETS, &c. The above made to measure at same charges in a few hours.

W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill, (North side),

WANTED, to take the Management of a NURSERY, in the Isle of Man, a steady, industrious man of business habits, who has served a regular apprenticeship, and has a thorough knowledge, not only of the Forest Tree and Greenhouse department, but a taste for, and been accustomed to, Ornamental, and Landscape Gardening; forming out, and planting new plantations, &c. As there is a Seed business connected with the concern, a person with a knowledge of that department will be preferred, as his services may be in part required at the shop. None need apply unless he can produce good and sufficient testimonials of character, and ability for the work.—Apply to ALEXANDER SPITTALL DOUGLAS, Isle of Man.

WANTED, a strong and active young Man that has been used to Gardening and to work in a Seed Warehouse. As it will be a constant place, none need apply whose character will not bear the most strict investigation.—Direct CHA. FARNES, 128, St. John-street, London.

WANTED, a PROPAGATOR.—Apply personally to Messrs. C. D. SMITH, & Co., Nurserymen, &c., Elizabeth-street, South Pimlico.—None need apply whose character will not bear the strictest investigation.

WANT PLACES.—All Letters to be post-paid.

FIVE POUNDS will be given by the Advertiser to any one who can procure for him a situation as PROPAGATOR in a Nursery (near London preferred). He has been some years in a Nursery; and can have a most excellent character, from those both in London and the country, as to ability, steadiness, and assiduity.—Direct to A. M., 2, Church-street, Fulham, near London.

AS GARDENER.—A Single Man, aged 28, who understands Forcing Peaches, Vines, &c.; he also possesses a thorough knowledge of Flower and Kitchen Garden, and can be highly recommended by first-rate gardeners he has lived under.—Direct to T. B., 55, Goswell-street, St. Luke's.

AS GARDENER.—A Married Man, without incumbrance, who understands his business.—Direct to A.B., Mr. Wilmot's, Pine-grower, Isleworth, Middlesex.

LANDSCAPE GARDENING AND GARDEN ARCHITECTURE.

MR. GLENDINNING, since his residence near the Metropolis, has had the honour to be consulted by a number of Noblemen and Gentlemen in the improvement of their Parks and Gardens, and in the construction and heating of Horticultural Buildings in the most ECONOMICAL as well as effectual manner. He has now made such arrangements as will enable him to devote his particular attention to these important subjects; and Noblemen and Gentlemen desirous of consulting him, are respectfully requested to address him at Chiswick Nursery, near London.

THE ARBORETUMS, QUEEN'S-ELMS, BROMPTON, NEAR LONDON, AND EAST COWES PARK, ISLE OF WIGHT.

RAMSAY BROTHERS, LANDSCAPE GARDENERS, Contractors for Planting, Earthwork, Road-making, Forming Ornamental Waters, and Improvers in general of Landed Property.

Plans and Estimates submitted, and works contracted for in any part of the kingdom.

Messrs. R. invite Noblemen and Gentlemen to an inspection of their choice stock of Ornamental Plants, which have been selected for the Lawn, the Parterre, and the Shrubbery, and now growing at Queen's-Elms, one mile from Hyde Park Corner.

WILLIAM MAY begs to offer the following at the very moderate prices below quoted, Catalogues of which may be had.

100 Hardy Shrubs and Ornamental Trees, in 50 sorts, for 42*s*.; 200 do. do., in 100 sorts, for 80*s*.
100 sorts showy Hardy Herbaceous Perennial Plants, for 42*s*.; 200 do. do. do., 80*s*.
100 Roses in 50 good sorts, for 25*s*.; 100 do. do., in 100 fine sorts, 42*s*.; 50 do. do., in 50 extra fine sorts, 30*s*.
100 select Double Hollyhocks, for 42*s*.; 12 do., extra fine, named, for show, 20*s*.
100 Gooseberries, approved varieties, in 50 sorts, for 16*s*.; 100 do., in 100 fine sorts, for 20*s*.
Seeds of Hollyhocks, from double flowers, in packets, 200 seeds, 2*s*. 6*d*.; 500 seeds, 5*s*. each.
Seeds of Pansies, from finest named sorts of 1844, packets, 2*s*. 6*d*. and 5*s*. each (seeds post free).
Forest and Fruit Trees, Greenhouse and Stove Plants, Florists' Flowers, Garden Flower Seeds, &c., comprising in each department all the leading novelties in present cultivation.

Hope Nursery, Bedale, Dec. 1844.

PERFECTION IN PEAS.—FRASER'S SHANLEY MARROW.

F. FRASER, NURSERY and SEEDSMAN, Lea Bridge-road, Essex, in offering his friends and the public the above Pea begs to assure them it has no rival, its quality being as far superior to Knight's and all other Marrows as those surpass the commoner Peas. Its height is about 5 feet, a prodigious bearer, and continues in season much longer than the usual kinds. The stock on hand is very limited. Price 7*s*. 6*d*. per quart. A remittance expected to accompany orders from unknown correspondents.

CORNISH KIDNEY POTATOES.—THE EARLIEST OF ALL EARLY POTATOES. It is remarkable that this valuable sort should be so little known and cultivated in England. It is grown to some extent in the West of Cornwall, AND HAS BEEN PRODUCED IN THE OPEN GROUND DURING THE LAST TEN YEARS, FROM THE 15TH to 18TH OF APRIL, (on an average.)

Upwards of three hundred acres are annually grown in the neighbourhood of Penzance; and thousands of baskets are sent, by steamers, to supply the London and Bristol Markets.

The growers obtain them so early, that they are enabled to procure an excellent second crop on the same land.

It is a most valuable sort, and should be grown in every garden where early vegetables are required.

Sold in Hampers, containing 2 and 3 gallons, at 5*s*. and 7*s*. each, package and carriage free to London or Bristol, which will be forwarded on receiving a Post-office order, on application to WILLIAM E. RENDLE, Union-road Nursery, Plymouth. December 28, 1844.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

THE Fruit of the above RASPBERRY, upon which Dr. LINDLEY pronounced his opinion, was gathered by YOUELL and Co. in the garden of Mr. Edmonds, of Scrasby, in this county, whose Raspberries are well known to be far superior to what is termed the "Filby Raspberry."

The statement in last week's Paper made by a person by name of Crisp, that Mr. H. YOUELL had gathered fruit in what he terms the Filby Garden, may be correct; but in gathering fruit of the Raspberry, it was done solely with the view of comparing it with the fruit that was being submitted to Dr. Lindley, and found, as they have before stated, to be far inferior; and it was also done with a further view of satisfying themselves that the RASPBERRY they are offering to the public, and for which YOUELL and Co. have been awarded two Certificates of Merit, by the Horticultural Society of London, is the only genuine variety. The statement is thus far void of truth, and invented for the sole purpose of puffing off the variety sent out by the agent of the Filby Gardens.

YOUELL & Co. take the present opportunity of returning their sincere thanks for the distinguished, and perhaps unparalleled patronage they have received for introducing and widely spreading throughout the United Kingdom and Continent (at a cost of between 300*l*. and 400*l*.) a most valuable fruit, which would have remained in obscurity: and at the same time they are happy to state, the extensive demand it met with, and the satisfaction it has given, have fully realised all their anticipations.

In conclusion, YOUELL and Co. deeply regret they are called upon to animadvert upon the position that one of so sacred a calling as Mr. Lucas should have placed himself in, in this affair, by authorising and permitting to be published matters of which he was perfectly ignorant, and containing an assertion utterly void of truth, that the fruit upon which Dr. Lindley pronounced his opinion was gathered in the Filby Garden.

FINE CANES of the TRUE FASTOLFF RASPBERRY can be obtained only of YOUELL and Co., or their Agents, a list of whom appeared in the *Gardeners' Chronicle* of the 7th inst.

Great Yarmouth Nursery, Dec. 28, 1844.

T. AND C. LOCKHART, FLORISTS and SEEDSMEN, 156, Cheapside, London, respectfully beg to inform the Nobility and Gentry, that their List of Flower and Vegetable Seeds for the present Season will be forwarded post free, on application, together with a complete List of the most showy hardy herbaceous plants, giving their respective heights and colours.

T. and C. L. take the present opportunity to request early orders for Ranunculus and Anemones, as their unique collection will be planted by the end of January; therefore they will not be able to execute any orders received after the 25th January.

TRUE WILLCOVE BROCOLI.

WILLIAM E. RENDLE has much pleasure in announcing, that he has been fortunate in procuring a good and well-selected parcel of the

TRUE WILLCOVE BROCOLI,

a sort held in high estimation in the West of England, and considered by all who know it to be the *earliest and most valuable Brocoli* for spring use. It can be highly recommended. In sealed packets, 1*s*. each.

W. E. R. can also recommend the following as very choice and superior sorts of Vegetables, and ought to be cultivated in EVERY garden.

Superior Dark Crimson Beet
Dwarf, small-top Scarlet Beet
Chapple's Cream Brocoli
Early Cornish Cabbage
Large Paignton ditto
Myatt's Superb Curled Parsley
Wood's Earliest Frame Radish
Hammond's fine new White Cape Brocoli
True Drumhead Lettuce.

The above at 6*d*. per packet, or the whole set, including the "WILLCOVE" BROCOLI, will be sent free by Post, for a Post-office order, value 4*s*. All other kinds of Vegetable Seeds warranted new and genuine.

Union-road Nursery, Plymouth, Dec. 28.

UNRIVALLED YELLOW DAHLIA.—LANGLEY'S "DUKE OF YORK." Light primrose yellow, round, cupped petals, great depth, well arranged, and perfectly circular; centre, full, compact, and well up; general form and habit of "President of the West;" height, 4 ft.; strong plants early in May, 10*s*. 6*d*. Discount to the trade on not less than 12 plants.

C. LANGLEY can, with the greatest confidence, warrant the above SUPERB DAHLIA "FIRST RATE," and to give general satisfaction. It will be found a valuable acquisition to every one who grows for exhibition, as it will be sure to take its place in the best stands of 6 and 12 next season, being of the most exquisite form, and as *constant* as any Dahlia in cultivation.

It has been pronounced by Mr. Glenny, *very compact*, and by Mr. Bragg (Slough), to be, "he considered," the *most promising Dahlia* of 1843. It obtained a Certificate at the great Metropolitan Show, Sept. 25th, 1844, as a *first-class flower*.

Bernsley, Sept. 10. First prize, also 1st and 2d in class showing.
Bretton, " 12. Best specimen, yellow.
Kirkheaton, " 13. First prize.

The above are the only places where it has been shown.

N.B. Orders will be executed with the greatest punctuality, and in strict priority as received. Agents in London, Messrs. HURST and MACMULLEN, 6, Leadenhall-street; and Messrs. WARNER and WARNER, 28, Cornhill. Mirfield, Dec. 26, 1844.

THE FILBY OR FASTOLFF RASPBERRY.—On or about July 18, 1843, Mr. HENRY YOUELL came to the garden at Filby, and requested me to give him some fruit of the above Raspberry, to send to Dr. LINDLEY. Mr. H. YOUELL and myself then looked over the Canes, and gathered some; he said that about two dozen would be sufficient. He then consulted me upon the best way of packing them, and I recommended him to pack them in cotton wadding or wool; to this he assented, observing that he thought it would be the best method.

Signed, WILLIAM CRISP, Gardener to Rev. G. Lucas,
Filby, Dec. 10, 1844. Filby, near Yarmouth.

SUPERB SEEDLING DAHLIA, "LORD DENMAN" NEVILL'S. Colour dark claret part of the season, shaded petals, of firm texture, well arranged, good centre, round outline, an excellent flower to stand, and one of the best show flowers out. Being the property of an amateur it has been shown only at Nottingham, gaining the 1st Prize.

Sent out in dry roots, 50*s*. each, by J. NEVILL, Lenton, Nottingham.

EDWARD BECK informs the Public that in consequence of the greatly increased demand for his SLATE TUBS, he is enabled to reduce the price of the following sizes about 10 per cent. He regrets the too frequent delay which has occurred in the execution of orders. This he hopes to avoid in future by keeping a supply on hand.

Present Prices for Cash or Post-office order.

Slate Works, Isleworth, Middlesex.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16¼ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford street.—Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, INVENTORS and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

CONIFERÆ.—The Subscribers have this Season to offer the following:—

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

DRAINING OF LAND.—THE WORKMAN'S LEVEL, invented by Mr. BAILEY DENTON, is made and sold, as approved by him, by Messrs. JONES, Opticians, 30, Lower Holborn, London, price 30*s*.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

COTTAM AND HALLEN, ENGINEERS, IRONFOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

HOT-WATER HEATING APPARATUS.—J. PORTER begs to announce that, in addition to the many other and valuable purposes for which Galvanised Iron is peculiarly applicable, he is now manufacturing Tanks and Gutter for Vaporising, and Pipes for heating by top and bottom-heat, Hothouses, Pineries, Conservatories, &c. J. P. has also to state that, having secured the assistance of parties of the greatest skill and experience, he is prepared to furnish Plans and Estimates for Heating and Ventilating Horticultural Buildings, Public Edifices, Private Houses, Churches, Warehouses, Manufactories, &c., accompanied by references to executed works. J. P. does not profess to offer any one particular form of Boiler as the best, to the exclusion of every other, but adopts those which will insure the greatest share of efficacy and economy, in each particular case.—Grove Patent Galvanised Iron Roof and Fence Work, Southwark, second carriage turning to the right from Southwark Bridge.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Dec. 21, 1844.

THE PATENT PORTABLE SUSPENSION STOVES are admirably adapted for Conservatories and Greenhouses—a pure air, combined with warmth, being as indispensable to the health of plants, as of Human Subjects. Nearly Four Thousand have been sold since the commencement of the present Season. Specimen Stoves are in operation daily, at GEORGE and JOHN DEANE'S Opening to the Monument, 46, King William Street, London Bridge.

THE NOBILITY AND GENTRY desirous of increasing their collection of Stove, Greenhouse, Hardy, Herbaceous, and other Plants, Camellias, Roses, Geraniums, &c., are respectfully informed that Messrs. J. and H. BROWN'S Descriptive Priced Catalogue, for 1845, may be had per post on application.—Albion Nursery, Stoke Newington, London.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 28, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

FRIDAY,	Jan. 3	Botanical	8 P.M.
MONDAY,	Jan. 6	Entomological	8 P.M.
WEDNESDAY	Jan. 8	Society of Arts.	8 P.M.

ANOTHER point which Potato-growers have taken for experiment is the difference in produce where whole tubers and cut sets are employed. This is a question of no small importance, if we consider how considerable a saving of seed is effected in a bulky crop like the Potato, if we can only diminish the weight of the seed by one-third.

A good many persons are in favour of using whole tubers, notwithstanding the waste of material. Our correspondent *Falcon*, says:—"I always plant WHOLE Potatoes which INSURES a tolerable crop in all seasons, preventing *dry rot* in *hot* weather, and *rottenness* in *wet*, which cut pieces are so liable to."——*A Leicestershire Farmer* says that after many years' experience he has discontinued planting cut sets and substituted whole tubers, selecting small ones, but not the smallest; he adds, that adopting this rule, he has had an excellent crop this year, and the tubers are *extraordinarily large*. They were a late sort, and planted on the 25th of April in rows 3 feet asunder, and 9 inches apart in the rows.——*Mr. White*, of Uxbridge, has, for some years past, found the advantage of setting the second size of the small Potatoes, such as are not fit for market, without cutting them (he gives the very smallest to the pigs). Having an insufficient supply of tubers of one very large sort, he was obliged to cut them in order to get enough for seed, and many failed in consequence; nevertheless, his crop brought him 18 or 19 tons per acre. While, however, many of the cut sets failed, none of those missed which were planted whole. With his letter Mr. White was so obliging as to send one of those Potatoes that yielded at the rate of 18 or 19 tons an acre; it weighed 1 lb. 14 oz., and was a large coarse sort, only fit for cattle; the eyes were very hollow, especially near the top of the tuber, where several ran into each other, forming deep indentations or fissures upwards of an inch in length.——A correspondent near *Birmingham* finds his cut sets a general failure; and another at Woodstock gives a decided preference to whole Potatoes; the poor people "having lost almost all their cut sets, while their whole Potatoes stood the long drought."

On the other hand, *F. N.* writes thus from Bidston, in Cheshire.

"At p. 267 a correspondent recommends 'the largest size Potatoes, uncut, for sets, planting them in rows one yard apart, the sets being two feet and a half from each other,' &c. This induced me to try the experiment, and up to June the large whole sets appeared to have such a decided advantage over those cut, that I mentioned it in a short article on the subject, which you introduced at page 416. I now give the result of the experiment. I gave twelve rows (*i. e.* six of each alternate cut and whole) a fair trial: the season being very dry, after their being ploughed up with a 'broad shoulder' as recommended, I had them watered with diluted liquid manure; the haulm of the whole sets grew very rank, and in accordance with your advice in a Leading Article, No. 26, page 427, I nipped the flowers off the twelve rows as they appeared, and at taking-up time was very much disappointed with the large whole set rows. Instead of having lots of large Potatoes I had lots of small ones, which were near the surface, about the size of marbles and little Apples, the haulm of which sets was very tuberous, presenting excrescences similar to small green kidney Potatoes with leaves growing from them; in short, where I got one measure from the whole sets, I got a measure and a half from the cut, off the same quantity of land; and taking into consideration that nearly one-third of the cut sets missed, I cannot but think that a field planted with good cut sets will produce a better and rounder crop than the largest whole sets ever seen."

Now, in noticing this matter we labour under the great disadvantage of having no precise statements to deal with. In all cases of experiment the result should be exactly given—not vaguely. It is not sufficient to say that one crop is *much* better, or finer than another. One desires to know *how* much. Weights and measures give results from which only one conclusion can be drawn. It is, however, clear that during the last summer opinion has in general become adverse to cut sets, and favourable to whole tubers; and this too was the general conclusion of the late Mr. Andrew Knight. We, however, have never yet seen reason to concur in this view, unless perhaps in very dry seasons like the last. Our opinion is formed upon very numerous and exact experiments in the Garden of the Horticultural Society, made some years ago, for the express purpose of testing the accuracy of Mr. Knight's theory; and as those experiments are probably but little known it may be as well to state their results in this place.

In the year 1832 five plots of ground of equal size, and as nearly as possible of equal quality, were selected for the growth of five different varieties. One half of each of these plots was planted with whole tubers and the other with sets containing but one eye each; the plants were one foot apart in the rows, and the rows themselves 18 inches apart. Upon taking up the crop it was found that the estimated results were as follows:—

	Tons	cwt.	lbs.
Whole Tubers	113	2	72
Single Eyes	111	3	54

giving a difference in five acres of about two tons, which is hardly more than the difference between the weight of the tubers and sets originally planted.

At the time this experiment was prepared, it was thought advisable also to ascertain what difference in their rate of increase there really is between tubers and eyes, when each set or tuber has the power of growing undisturbed by its neighbours; so that the real productiveness of each could be ascertained with the greatest accuracy. In this case it was anticipated that the tubers, having full space to develope themselves, would certainly surpass the sets very materially in proportionate productiveness; but the result proved to be altogether the other way. A piece of ground was selected of quality as nearly uniform as possible; it was divided into four feet squares; and in the centre of each square was planted either a tuber, or a single eye, or a set containing three eyes, or the whole surface of a tuber pared off so as to leave the eyes safe but to remove the centre. In this experiment it was found that the rate of produce was in 13 cases out of 16, in favour of single eyes as compared with tubers; in 9 cases out of 16 in favour of single eyes as compared with sets containing three eyes; and in 10 cases in 16, in favour of single eyes as compared with parings; or, if we consider the results of the whole 16 experiments as belonging to one experiment, their proportions are expressed by the following figures.

Whole Tubers	338·38	or	2
Single Eyes	717·87	..	11
Three Eyes	613·94	..	5
Parings	504·69	..	4

} nearly.

And this conclusion corresponded with other experiments instituted with similar objects in view.

In the year 1834 a further trial was made with early Champion Potatoes, upon ground on which no Potatoes had been previously grown. No manure was employed, nor was the soil by any means in a fertile state for garden ground. The experiment was varied in four ways by planting at intervals of 30, 24, 18, 12, and 6 inches. We extract from the Society's Transactions the following tabulated return.

Distance between Rows.	Sets.	Weight planted	Weight taken up	Rate of Produce	Weight required per acre for seed	Weight produced per acre	Net return per acre, after deducting the weight originally planted
ft. in.		b. oz.	lb. oz.		lbs.	lbs	lbs tns cwt lb.
2 6	Whole tubers	120 0	957 8	1: 7 34	6497	47,72[illegible]	41,224 or 18 8 4
	Single eyes	29 8	748 0	1:25 35	1450	37,[illegible]	35,[illegible] 0 ,, 15 19 82
2 0	Whole tubers	149 0	887 0	1. 5 95	7456	44 20	36,782 ,, *16 8 46
	Single eyes	36 0	116 0	1:30.	1794	55,621	53,827 ,, *24 0 87
1 6	Whole tubers	238 4	1193 8	1: 4 98	11,674	59,[illegible]	47,560 ,, *21 4 72
	Single eyes	41 4	1068 0	1:25 89	2055	53,[illegible]	51,174 ,, *22 16 102
0 6	Whole tubers	643 6	1462 8	1: 2.18	32,065	69,900	37,835 ,, 16 17 91
	Single eyes	100 8	850 0	1: 8.55	5008	42,80[illegible]	37,[illegible]54 ,, 16 17 110

Crop small and bad.

Nothing could well be more conclusive than this in favour of good sets with single eyes. The first and the last trials being left out of consideration, because the distances were unsuitable to the variety under experiment, those marked * are the ones to which attention must be directed, and they show so great a difference against whole sets as to leave no room for doubting which is the better method under the circumstances. It showed too, what is of no small importance to poor people, that a better result was obtained by planting 1794 lbs. than by 7426 lbs., and that when the weight planted was increased to 32,065 lbs. per acre, a great loss was sustained instead of anything being gained.

We may add that further trials in 1836 confirm the accuracy of this conclusion, the *net* produce of Potatoes set in the 1st week in March having been 14 6 19, and even 17 10 96 against 13 11 23. It was only when the planting was delayed till April that tubers had something the advantage of sets.

There is one point, however, that still remains to clear up in this matter, and that is, whether small refuse Potatoes will not prove as advantageous as sets. Upon this we find no satisfactory evidence. By satisfactory, we mean no detailed experiments conducted with care, skilfully varied, and often repeated, the results being accurately ascertained by weighing when the crop is dry.

This, and some other matters, hereafter to be noticed, for which our correspondence furnishes us with data, we shall revert to on another occasion, before the time for planting Potatoes shall have arrived.

IVY.

IN the two last Numbers some observations occur on the probability of Ivy living on walls when its connection with the ground is cut off by the destruction of the stem. The following facts may illustrate the matter, and perhaps save one of your correspondents the mortification of the loss of his evergreen.

Any visitor to Amberley Castle, in Sussex, may observe that the right-hand tower (looking toward the front of the ruins), flanking the gateway, is in better preservation than the left-hand one, particularly its battlements and upper third. These twin-towers are now destitute of Ivy, but about 35 years ago, the one above mentioned was completely clothed with it. The occupier of the Castle at that time found it necessary, in making a gangway in the moat round the foot of this tower, toward a new-made door-way in the castle wall, to cover up the stem of the Ivy with many feet of earth and rubbish. The consequence was the suffocation of its roots and the death of the plant within a few years. As the dead branches decayed and dropped off, the masonry became exposed, and the conservative influence of its former drapery was manifest, as before said, in the more perfect condition of the battlements, and of the general aspect of the tower above its fellow, which never had any Ivy at all. Many years of exposure has now made the difference less remarkable, but it is still very striking.

When ruined walls, by the dissolution of their materials and the free admission of rain-water, assimilate to fissured rocks or the common earth, Ivy will often (as I suppose the Winchester case may be), send in auxiliary roots, which would take the place of the parent stem, and it is not uncommon to see Ivy growing sparingly and stuntedly on old walls of much thickness, as other plants will do contrary to their usual habit. But a large old plant, which has always had its main rooting in the ground, will not bear to be severed from it.—*P. P.*

NOTES ON THE TULIPS OF THE MIDLAND COUNTIES.

HAVING heard that there were many fine seedling and other Tulips to be seen in the Midland Counties, I, during the past blooming season, visited some of the principal beds in Staffordshire, Lancashire, Derbyshire, Leicestershire, Yorkshire, and Nottinghamshire.

Having made various memoranda at the time, I intend to lay the results of my tour before the readers of the *Chronicle*, feeling sure that notices of fine flowers, as well as good seedlings, will prove acceptable.

My first point of inspection was Derby, famed amongst the northern growers as the place where Sherwood raised his batch of seedlings, from which some fine Roses have been originated. Here I saw Lady Colville (Sherwood's), a flamed flower, but by no means first-rate; also Mrs. Darwin, of the same grower, with a broken and indistinct flame; Lady Wilmot (Sherwood's), another variety, was in splendid condition, but unfortunately has a slightly tinged cup; the beautiful bright cherry flame, joined to the perfect feather of this flower, rendered it extremely attractive; and were it not for the beforementioned defect, it would be an extremely popular variety. Lady Crewe, Mrs. Mundy, and Lady Middleton (all Sherwood's), were in a highly beautiful state. I had heard much for and against these flowers, but, in my opinion, they were the best feathered Roses I saw during the journey. I was informed that a person, who has obtained some notoriety in writing for a floricultural publication, in an article on the Tulip, some years ago, imputed some very unworthy motives to the Derby and Nottingham growers relative to these flowers. The Derby florists are very sore on the subject; for, as I understand them, the writer is convinced of his opinion being erroneous, but has not made the *amende honorable* in the work which contains his strictures.

The flowers were pointed out to me, and certainly no two feathered flowers are more distinct than the Ladies Crewe and Middleton. The feathering of the former is laid on lightly, with occasional breaks in the intensity of the pencilling, in the style of an old bizarre, known as the Yorkshire Trafalgar, the colour being of a bright cherry-red, and the tops of the petals slightly inclining inwards. On the contrary, Lady Middleton has a heavy plated feather, much darker than Lady Crewe: in fact, so much so, that when the flower is old, it has often been exhibited as a byblomen, in which state I saw several blooms. The petals also, when opening, rather throw back, like Count de Virginnes; it does not, however, retain this peculiarity, but assumes a perfectly globular form, and in fact has a fine cup. Some Triomphe Royales, growing in the next row, and which were in an unusually good state, were far inferior to this splendid variety; the best strain of which, I was informed, is remarkably steady. There was yet another Rose in great plenty dispersed through the various beds, of which there were a few excellent flowers, whilst there were many which were apparently worthless. I allude to Queen Boadicea, or Duchess of Newcastle; this is much larger than any other of Sherwood's varieties, but evidently is very uncertain. In the class of bizarres, I do not think that the Derby florists are above mediocrity. I saw, however, very superb blooms of Royal Sovereign, of which they have evidently a good strain, and which ap-

pears to be plentiful in the Midland Counties. This, with Magnum Bonum, Sultana (also one of Sherwood's seedlings, of rather inferior character), and Trafalgar, appear to be the principal varieties.

In flamed bizarres they are also deficient. Captain White, with its heavy breeder, beam or flame; Potter's Albion, with a tinged cup (not the Albion of the metropolis), Dutch Catafalque, Earl St. Vincent, and Polyphemus, are amongst their best. The growers here appear to be quite alive to the importance of raising seedlings from fine sorts, with clean cups and perfect shapes, and great quantities, of all ages, are coming forward, some of which were blooming, the majority being byblomens, and decidedly the best of this class that I saw was a seedling named Sarah Anne; it was a perfectly feathered flower, with the colours beautifully distinct; Washingtons are also well-grown here, with Queen Charlotte and Sable Rex, which last has a stained cup; Bienfait and Lilliard Violet are amongst their best feathered byblomens, and the Norwich Black Bagot was in very good character. After looking through the most noted collections, I walked to Chellaston, a village a few miles from Derby, where a large number of seedlings are grown. Here I saw but few old varieties, but this deficiency was made up by the quantity of really fine flowers, which have become rectified, or have assumed their proper character, by breaking into colour from the breeder. Unfortunately, hundreds have been sold in the self state, and dispersed over the country without name or number, which I fear will cause irremediable confusion. I was highly pleased with the collection, as all the flowers with foul or bad-shaped cups had been removed, leaving little to condemn, but much to admire. A flamed rose called Lady Stanley was extra fine, decidedly better than Strong's Duchess of Kent. Fanny Cerito, also a flamed rose, which was first broke into colour at Nottingham, is an acquisition to this scarce class. I saw fine flowers of every colour—superbly feathered and flamed byblomens, bizarres, and roses of every shade. Having purchased a few that took my fancy, I made the best of my way to Spondon, and from thence by train to Nottingham.

The collections here contain a greater quantity of London flowers than those at Derby, though one of the most successful exhibitors, who during the last twenty years has gained one hundred pounds worth of plate, has but few. In his beds I saw large quantities of old established favourites, at least sorts that are esteemed at Nottingham; for I must not attempt to conceal the fact that several of the varieties pointed out as his pan flowers, through the above-named series of years, would not have been tolerated amongst the metropolitan growers. The sorts were, Royal Sovereign, Magnum Bonum, and Victory—*Feathered Bizarres.* Captain White, Albion (Potter's), and Lord Milton—*Flamed Bizarres.* Lilliard, Norwich Black Bagot, and Pap Bienfait—*Feathered Byblomens.* Queen Charlotte, Sable Rex, and Violet Wallors—*Flamed Byblomens.* Lady Crewe, Triomphe Royal, and Lady Middleton—*Feathered Roses*, unique. Flambeau de la Duchesse, and Turner's Lord Hill—*Flamed Roses.*

These appear to be old standards, but I learn that several are repudiated, and will not now be countenanced, as the taste of the Nottingham florists is fast assimilating to that of the south-country growers. In my inspection of the various beds I recognised the following:—Polyphemus, which I have seldom seen in better condition; Titian, Leonatus, Posthumus, Lavinia, Paul Potter, Agalia, Bijou des Amateurs, Strong's Duchess of Kent, Goldham's Earl of Liverpool, Manteau Ducal, Lucullus, &c. Of the varieties peculiar to the neighbourhood I particularly noticed Plantagenet, broken from the breeder this season—a fine, heavy-feathered bizarre, perfectly clean, and equal to Royal Sovereign; Pilot, a fine cupped-flamed bizarre, in the style of Captain White, without showing the breeder colour, neither does the flame break through at the top of the petals; Prince of Wales, an extra fine-feathered byblomen, was also in the same collection; Lady Middleton (before noticed) in first-rate character; Incomparable le Grand, a flamed byblomen, an exceedingly pretty flower of rather a rosy-purple; Rider's Julile—the beam of this flamed bizarre is not very distinct, still I admired its style. Here was pointed out to me La Belle Nannette; *certainly* a very pretty flower, but as *certainly* a Triomphe Royal, though possibly possessing a superior strain.

Arlette, a splendid feathered Rose; the breeder was raised, I learn, near Manchester. This was "a gem of the first-water," and though said to be tender it is a great acquisition. Rose Camellius, a pure and excellently marked flamed Rose, rather too long in the cup, and very much like Flambeau de la Duchesse. Sancta Sophia—feathered byblomen. This was broke from a breeder, raised by the same amateur who originated Arlette from seed, and most certainly was a noble flower; it was something in the way of Lawrence's Friend, though not quite so heavily feathered. This was the first that had been grown at Nottingham, and was indeed a fine variety. Lord Milton, of which I saw many strains, from the veriest rubbish to a really good flower, but the bad ones preponderate; still, as a flamed bizarre, it is a sort that will be grown. Magnum Bonum, or Sir Sidney Smith, appears to be very plentiful in the neighbourhood, and being steady, it is much thought of as a stage flower; still it bears no comparison with the blooms of Royal Sovereign and Victory, which came under my notice. Tricolors are not much cultivated; Strong's Flora, and Lawrence's Duke of Clarence, being the only two that I observed. In byblomens, Queen Charlotte is considered a first-rate flame; still it has a long cup; and in comparing it with the Derby Seedling, which had here broke in a flamed state, I most certainly think that Sarah Anne was the best of the two, the white being of great purity, and with a shorter and better cup. La Bien Aimée, a flower somewhat like Violet Alexander, was beautifully marked; it was also too long in the cup, but still is an acquisition. That delicate and singularly marked flower, Cenotaph, I saw in only one bed; it was well grown, and the violet beam up each petal was very distinct. One of the florists pointed out two London flowers—Osiris, and Duke of Devonshire—remarking what inferior sorts they were; but in the miserable specimens submitted to me, I could not recognise a trace of the features of these really two fine varieties.

Before concluding my remarks on the Nottingham Tulip beds, I may allude to a few of the breeders grown there, which are of extraordinarily fine properties, and apparently much sought after. I give their names as they were pointed out to me: *Bizarres.*—Rienzi, Comus, Invincible, Duke of Hamilton, Earl of Nottingham, and Joseph Strutt. *Byblomens.*—Lady Clifton, Madonna, Miss Longden, and Mrs. Sherwin. *Roses.*—Arlette, Amelia, Pauline, Lady Sale, Favourite, and Anastasia.—*W.*

THE JERSEY GRATIOLI.

(*Syn. Norris's Pear.*)

This is the name proposed for a most excellent variety of Pear, specimens of which were received for inspection and a name from H. W. Bucknall, Esq.; from one of which, of medium size, the accompanying representation has been made. The following communication was forwarded by Mr. Bucknall along with the fruit: "Oct. 12.—I herewith transmit you half-a-dozen Pears; I sent you the same variety about this period last year. [Noticed, *Gardeners' Chronicle*, vol. iii., p. 721.] You then said you believed it to be in cultivation in the neighbourhood of London. I have since taken great pains to ascertain the variety, without any effect; and the only tree I can learn to be in existence is one in my own neighbourhood. Are you still of opinion that you cannot determine the name of the fruit? If so, please to take particular notice of it. As a Pear cultivator, I do not hesitate to pronounce that, according to my own taste, it is the finest Pear in flavour, and in all its qualities, I ever met with. I trust these will reach you in perfection, which I think they will be in two days or so. The fruit I have chosen is of an average size; the tree is a fine old standard of 40 or 50 years, and a very free and constant bearer. I think it a great pity that the variety should not be promulgated, and I shall be very happy to be the means of extending its cultivation." Fully agreeing with the above remarks, it is presumed the notice here given will prove acceptable, although the origin of the variety cannot be satisfactorily traced; neither can the application of the name Gratioli be accounted for, as this name has been for centuries the acknowledged synonym of the Summer Bon Chrétien, a very different fruit from the one in question. The

Gratioli, or Gracioli, being held synonymous, as above, by Duhamel, Dr. Diel, and many other French and German authors, was sufficient cause for demurring in naming the fruit in 1843, as alluded to in Mr. Bucknall's letter; and more especially as the name of Gratioli had only been heard indistinctly and casually applied to the present variety. But, according to Mr. Langelier, who is well acquainted with this fruit, it is cultivated in Jersey under the name of Gratioli. This being the case, it has been considered proper to designate it as the Jersey Gratioli, in order to prevent its being confused with the Summer Bon Chrétien, which of course it otherwise would. It is also called Norris's Pear, from having of late been extensively cultivated by Mr. Norris, one of the greatest fruit-growers in the neighbourhood of London. The fruit is regularly formed; the eye is in a very even depression, open, the segments of the calyx standing outright; flesh melting, like honey, exceedingly rich. It, however, continues but a short time in perfection, as is generally the case with early Pears. In its decay it does not become mealy or insipid, but still retains its honied nature. Its season is October. The tree grows vigorous, with erect, dark-brown shoots. The buds are rather obtuse and hoary. Leaves ovate-oblong, shortly acuminate.—*R. T.*

ENTOMOLOGY.

Dilophus febrilis.—(*The Fever-fly.*)—The economy of this insect is very similar to that of the Bibio marci, which was recently described in this Journal, and the perfect insects are nearly related. It was named *febrilis* by Linnæus, from its being frequently observed in the houses of persons suffering from intermittent fevers; and it certainly is a remarkable fact that, during the summer when the cholera visited England, these flies appeared in such multitudes, that even the lamp-posts were often covered with them, in the vicinity of London. If such occurrences be not altogether accidental, and merely extraordinary coincidences, the only solution I can give is, that the state of the atmosphere which superinduces certain diseases, is at the same time congenial to the metamorphoses of certain flies. During the last summer a genus of flies called Chlorops, whose larvæ are very injurious to the Wheat and Barley-crops, appeared in vast numbers, and one of the species in such swarms at the end of September in a house that had been visited by scarlet fever the preceding summer, that the ceilings were literally covered with these little flies; it was stated "that you could scarcely place your hand where they were not: small crowds of the house-fly also hung about the window-frames." In this instance the ceilings had been whitewashed, the glare of which had probably attracted the flies, and the windows being almost constantly open, they had free ingress. Such was the case in October, when I observed the same species of fly in multitudes in an unoccupied house; indeed, a cross-light, or even a mirror opposite to a window, will often attract insects, especially the Diptera, or two-winged flies, to a great extent.

About the end of July, 1841, I received a considerable number of the larvæ of Dilophus febrilis, that had been detected in a Vine-border amongst the horse-muck; they are a quarter of an inch long, shagreened, of a snuff colour, or ochreous brown; they are slightly convex, wrinkled, and destitute of feet; the head is much narrower than the body, very glossy, and of a chestnut colour; ten of the abdominal segments are wrinkled, with a spiracle on each side, excepting the second and third; the penultimate segment is rounded with four teeth, and the anal one has four similar teeth, with two large spiracles near the base: fig. 1, magnified—2, the natural size.

These larvæ changed to pupæ, in the earth, in the beginning of August; they were white with a yellowish tinge; the thoracic portion was very gibbous on the back; the short antennæ were visible through the skin, and the head was furnished with two short thick points, like many of the Papilionidæ, or White-Cabbage butterflies, &c.; the abdominal segments were slender, the edges somewhat projecting, the apical one was tuberculated, and the tip furnished with two acute teeth (fig. 3, magnified; 4, the natural size). On the 21st of the same month they produced perfect flies.

The *male* of D. febrilis is intensely black, shining, and hairy; the head is hemispherical and covered with large eyes, densely pubescent and of a reddish-brown colour, with three minute ocelli, forming an elevated triangle near the base. The mouth is furnished with a broad lip and two incurved palpi; the antennæ are very short, stout, cylindric, and composed of eleven perfoliate pubescent joints; the thorax is oval and gibbous, with two transverse rows of minute teeth before; the scutel is short and broad; the abdomen is rather narrower, and eight-jointed; the apex clavate; the wings are incumbent in repose, iridescent, perfectly transparent and white, excepting the costa, which is slightly tinged with brown; the costal nervures are piceous, the others are very faintly traced; a radial nervure, uniting with the costal one at the middle, forms a brown spot at the extremity; the halteres are terminated by a large compressed brown club; the legs are long; the anterior thighs are the thickest, and their tibiæ the shortest, the apex being surrounded by a toothed coronet; there are several short spines also on the outside; the tarsi are slender and five-jointed, terminated by claws and pulvilli (fig. 5). The *female* is very different: the head is much smaller; the eyes are small, oval, and not meeting on the crown; the abdomen is brownish, ovate, narrowed at the base, and the tip is furnished with two little styles; the wings are much longer and larger, entirely brown, the costa being

the darkest, with a stigmatic spot; all the nervures are piceous, and the anterior thighs are very much inflated (fig. 6; the cross lines show the natural sizes of the sexes). These insects, like the Bibios, fly heavily, with their hinder legs hanging down; and, after sunset, rest sluggishly on herbage and bushes. I have found them in abundance towards the end of May, as well as in August; from which it may be inferred that there are two broods in a year, or else a succession of them.

Towards the end of March, 1840, a considerable quantity of similar larvæ were found under a pot in a Grape-house, where a fungus had been growing; some of them were more than a quarter of an inch long; they had spines on the thoracic segments, and one on each side of the folds in the following. I am rather disposed, however, to think they were the larvæ of the B. marci at an earlier stage of growth. A correspondent also transmitted some larvæ last August, which were darker, equally long, but narrower in proportion, and he informed me they were found in a flower-pot containing a Pelargonium, which had been watered frequently with water saturated with sheep-droppings. The earth in the pot, as well as that in the Vine-border, was perforated by the larvæ in all directions, but the Pelargonium had not suffered in health. There can be little doubt, however, that they are prejudicial to the growth of plants, but their economy requires farther investigation before the extent of mischief can be ascertained. So little is known of such matters, that I believe figures of the larva and pupa of Dilophus, and its history, were never before published. —*Ruricola.*

ROSE GARDEN.

In the list of Roses inserted in the *Gardeners' Chronicle* on the 14th, one or two errors have crept in. Billiard, Conque de Venus, &c., to Ariel, colour intensely bright, &c. This, from colour bright, wood healthy, and growth free, was intended to apply to Billiard alone, though the latter qualities suit the others also. Again, Brennus was not intended to participate in the qualities and habits of Mordaunt de Launay, Aimée Vibert, and Conque de Venus. Free in flower, colour rosy lilac, applies to Noisette Bougainville only. Vigorous in growth, colour brilliant white, applies to Madame Hardy only. In the *Chronicle* of last week the observations following Celestial were intended to apply to the above, and not to the Cerise.—*A. H. B.*

Home Correspondence.

Lisianthus Russellianus.—As this beautiful stove-plant is seldom grown to anything like perfection, I beg to mention the mode of culture by which I have grown it to 2½ feet in height and 1½ in diameter. About the middle of January the seeds were sown in finely-sifted leaf-mould, and covered slightly over with white sand. The seed-pot was placed in a moderately warm situation, and little water was given until the month of March, when the pot was placed in a brisk bottom-heat, and watered more liberally. The seeds readily germinated, and by the month of May the plants were potted off. The soil used was a mixture of two parts peat and loam, one of three year old cow-dung, and one of leaf-mould, with a proportionable quantity of white sand. These were all well mixed together; the pots were plunged in a Melon-bed, where the bottom-heat was about 85°. During summer the plants were regularly shifted, as they filled the pots with roots, and the shoots were frequently pinched back to cause them to throw out laterals. The roots were kept very moist, and the plants were well watered over-head every night; frequent waterings of liquid manure were given, which were of much advantage to them. By the month of September they were nice bushy plants, about 8 ins. in height; they were then removed into the stove, where they were placed in a dry situation, and where they enjoyed plenty of light. During winter great care was taken not to allow any water to fall on their leaves, and when it was given to their roots it was never allowed to touch the stem, but was applied round the sides of the pot, no more being given than what was necessary to keep the plants from flagging. Pieces of glass were placed below the lower leaves, to prevent the latter from being injured by moisture arising from the mould in the pot, for no plant with which I am acquainted is more impatient of damp during winter than this is. As spring approached they began to grow, and were shifted into large pots; the shoots were all properly staked out at the same time, pinching back the strongest; the plants were again plunged in a hotbed as before; their roots, as formerly, were kept very moist, and liquid manure was used frequently. Under this treatment they did well, and by the beginning of July were covered with a profusion of bloom, which fully repaid my attention. If, after the plants have done blooming, the old roots are partially reduced, repotted in smaller pots, and treated as young plants, they will form handsome specimens in the third year.—*A. S., Edina.*

Naturalist's Pocket Almanack.—I fully concur in the opinion of "The Naturalist's Pocket Almanack, for 1845," expressed in the *Chronicle* for the last two weeks; I cannot conceive upon what principle the Editor introduces many of his new names for insects? The two, amongst several, to which I would particularly direct attention, are Stĕrŏpēs and Tĕphrosia. Now, every person at all acquainted with the nomenclature of insects must be aware that (in England, at least, *vide* Curtis, Stephens, Westwood's Classification, &c.) Steropus is the appellation of a group of predaceous beetles, and although the *u* has, unfortunately, been substituted for *e* by the founder of the genus (Megerle), yet I do not conceive that to be a sufficient reason for adopting it as a generic title in another order of insects. Again, the name is a bad one to have given to a butterfly; for, instead of being dark and one-eyed, as we might fancy the recipient of such a title should be, one species at least is a pretty chequered insect, having, in common with its congeners, a peculiar jerking flight, and might well have received an appellation after some more airy creature than a cyclops. Not so the beetle, which has a fine glossy black or dark-brown coat, and ever delights in dark holes, whence it only emerges to seek for prey. With respect to Tephrosia, although it is a happier name for the insects which the Editor of the "Naturalist's Almanack" arranges under it, than Steropes is, yet it must be remembered that Tephrosia has long been used by botanists to designate a genus of plants included in the Natural Order, Leguminosæ. If, then, the nomenclature of the various branches of Natural History is to be altered after this fashion, I would ask, How is the student ever to find the particular object for which he is searching? In fact, in one instance he would look for a butterfly and find a beetle described; and in the other he would seek for a moth, and the description would answer to a plant.—*Stura, Canterbury.*

Autumn Planting of Potatoes.—In addition to the evidence already before the public on the safety and propriety of autumnal planting with regard to the Potato, I may mention that the practice has been followed for two years, with beneficial results, by some of the farmers in Fifeshire. The plants have endured the winter, come up vigorously, and produced an excellent crop. Nor may the period of planting be confined solely to the autumn months; it is probable that any open weather during winter will be equally suitable for the operation, ■ the following example may testify:—On the 27th of January last, a portion of a field was planted by J. Williamson, Esq., of Clunie, Perthshire, with whole Potatoes, in a rather poor soil, in a hilly situation; the stem came up vigorously at the usual period, and the plants yielded, at the time of digging, an excellent crop of fine large tubers. Those, therefore, who have not tested the experiment of autumnal planting, may still, during any interval of fine weather, plant a portion of ground for a trial.—*Vidimus.*

Birch Coppice.—The chief cause of Birch-stools not shooting when their main stem or stems have been cut, may be traced to the neglect of properly cutting, or heading down the young trees in the second or third year after they have been planted. When the early heading of the young plants has been neglected, and the trees have attained to 10 or 12 years' growth, there must be always a good deal of uncertainty with respect to their shooting again. From experience I have found that, when the stems have been cut in spring, they have been more apt to send out fresh shoots. To my cost, I was first advised to try the contrary plan of cutting before Christmas, in order to prevent the stems, as it was said, from being weakened by bleeding. I was first led to alter the time of cutting from noticing the vigorous shoots from a few Birch stems which had been accidentally cut nearly as late as May. After much thought the bleeding of the stems seems to me to be a favourable symptom, as indicating the liquefaction, and flux and reflux of the sap, which is absolutely necessary for the formation, or at least the bringing into operation, of fresh buds. I have noticed in the stems cut before Christmas, that no bleeding has taken place, and that the fibres of the wood were filled with a hard resinous deposit of concreted sap. Whether this theory be correct or not, I leave to be proved by the observation of others; yet, in favour of it, I am able to show several single overgrown Birch stems, which were cut as late as March last year, and which bled most profusely, but which have also sent forth an abundance of strong vigorous shoots, and promise to become as good stools as I could wish.—*A. Forester, Romney.*——I have also suffered from young Birch-trees dying on being cut down; and I have tried the effect of cutting them at different seasons of the year, with but partial success. I have also covered the top of the stem, when cut, with a small turf, as recommended by old woodsmen. This fact, however, I have noticed after repeated trials, viz., that if Birch is cut for the *first* time after planting, *before* the bark assumes the white appearance it takes a few years after planting, and which happens at earlier or later periods, according to the soil &c., it seldom suffers from the cutting. The same may be remarked of Coppice-stools. It would be very useful if planters would communicate the results of their experience on the subject of cutting Birch in general.—*F. Berks.*

Mildness of the Season in Ireland.—I have a Jargonelle Pear-tree which blossomed late in October, and from which I inclose a Pear that set from one of three blossoms: it increased in size, and was evidently still trying to come to perfection, when I cut it.—*J. B. Warren, Warren's Grove, County Cork.*

Liquid Manure.—I have tried, and seen tried, several articles under the above name, with varied success, and I have seen such fearful havoc to arise from their use that I have now given them up altogether, and have substituted a manure which is within everybody's reach, and which has benefited every plant to which I have applied it. My manure is soot, dissolved or rather mixed with rain-water, in the proportion of one tablespoonful of soot to a quart of water for plants in pots, but for Asparagus, Peas, &c., I use 6 quarts of soot to a hogshead of water. It must never be applied to plants in a state of rest. It succeeds admirably with bulbs. By its means, and without artificial heat of any kind, I have now (Dec. 4th) a Van Thol Tulip in flower on my table, and I hope to have Hyacinths in bloom by Christmas day or shortly after.—*X. X.*

To Clear Frames of Insects, &c.—I have no greenhouse, but I have put up two shelves (back and front) in a two-light frame. About the middle of October I had everything taken out of the frame, which was then well swept with a birch broom—every crevice in the wood was stopped with putty, and any holes in the bricks, with mortar. I then had sufficient quick-lime put into water to form a mixture, about as thick as batter; to that I added a quarter of a pound of powdered brimstone, and while hot had every part, shelves, both upper and under sides, supports, and all covered with the wash as thickly as it could be put on. When dry, this was repeated, and as yet I have scarcely seen an insect, although the pots stand so thickly that it would be difficult to place another among them. From the commencement of the present frost, I have uncovered but once a day, and that is about 11 in the forenoon. I always burn a rushlight, and the piece that remains in the water in the morning is dried. I then put it into a lanthorn, light it, place it in the bottom and middle of my frame, and then close up by putting mats next the glass so as to hang down all around, and over them a covering of asphalte. With this trifling care and protection, I have now (Dec. 10th) Pelargoniums, Cinerarias, Fuchsias, Cacti, Primulas, Roses, and various other tender plants, looking as well and healthy as I can desire. I forgot to state that the ground is well drained, and that I put one fourth of ashes in the bottom. I never water a plant in the frame, but take it out when it requires water, and afterwards restore it to its place. —*X. X.* [Very good.]

Lime Putty.—In answer to "A. B. J." I beg to state that lime-putty is lime ground up with raw linseed-oil, and made to the same consistency as that of common putty.—*Junius.*

Mode of Destroying Tomtits.—Take mutton-suet, and grate it with a large kitchen grater, such as cooks use; make balls of the grated suet, and put a ball of it into a fine net; hang this on trees in the garden, and Mr. Tom will soon invite all his relations and friends, and the net will soon want another charge. Grate suet again, as before; and to 1 oz. of suet add 1 scruple of fine powder of nux vomica; mix this well with the suet, and put it into the net, placing the latter in the same situation as before; Tom will soon give the signal to his companions again, but he will not repeat this many times. This plan will possibly answer better than "W. K.'s" cage. I may remark, in passing, that "W. K.'s" redbreast, of which he speaks so much, is as great a thief as can be in a garden, and deserves to be killed as well as Tom.—*Scrutator.*

Modern Flower-gardens.—If we want to gain a correct knowledge of any object, we must not only see it, but look attentively at it; and so also, if we would arrive at correct notions of the principles of modern flower-gardening, we must exercise our understanding in regard to our object, and have a mental power of carrying the image of the object along with us, before anything like agreeable combinations can be produced. Now, I have observed that a square figure, divided into four triangles, and planted with plants of one height, but of two opposite colours, represents harmony and diversity; and when these are so arranged that the one side of the figure reflects the other, an agreeable effect is produced on the eye, indicating its healthy state, and at the same time illustrating the whole theory of colours. It is a principle of perspective, that a large figure is more imperfectly seen near a person than a small one, in consequence of the rays of light reflected from the large figure passing by the eye; and whether it is a square figure divided as above, or one differently arranged, so as it comes within the intersectional angle thus formed by the eye, the principle of planting in both cases will be the same.—*C.*

Onions.—I have this year an excellent crop of Onions, both in regard to weight and size; they were supplied with large quantities of manure out of the tanks in its original state. I should, however, mention that a good deal of pure water also runs into each of the tanks.—*Omega.*

Scorching Effects of the Sun.—If our hands or our faces are dipped either in cold or tepid water and exposed to the full sunshine till quite dry, they become stiff, and feel for a short time as if in a case of gum. Take a laundress's iron, or a poker made hot, dip a piece of linen in water or your hand, and take hold of the poker; do not remove the hand till either it or the linen is dry, and then if the hand do not exhibit an injured epidermis, I will believe that leaves may not be injured under similar inflictions. Again, it is admitted that leaves of plants are furnished with pores, similar to the breathing-pores of some insects, through which they receive the nourishment afforded by the atmosphere, and give off that which is superfluous, as we do by our lungs. In full sunshine they may be expiring or sweating; and I am inclined to believe that that man "burkes" his plants who would water them under such circumstances; for, these pores being shut up when wet, may have their expansive muscles injured by the sun and water, and thus the superfluous water or evaporating part, or perspiration, is checked; the system of the leaf receives a shock similar to that which the human frame would experience from being placed in a draught; colds, fevers, erysipelas follow from a sudden transition either to one extreme or the other, the body having an unnatural charge put upon it. The active presence of the rays of the sun makes a difference in the effect of the application of water. A large stone slab is laid outside of my drawing-room window, the aspect is

east, inclining to north; on this I have Fuchsias, &c., in pots; they are, in very warm weather, invariably watered as soon as the sun is fairly off them, and this is generally repeated once or twice afterwards during the day, and more healthy plants cannot be seen anywhere. The analogy between watering in the full sunshine, and a sunshiny shower, I imagine is widely different; because Cabbages, Beans, Lupines, and many flowers, which droop from the heat of the sun, hold up their heads before the shower—a sure indication of rapidly approaching rain. What can effect this but a susceptibility in the plants greater than that which the frame of man possesses, and a restringing of the flaccid muscles of the plants to open the mouths or pores for the grateful drops? The rays of the sun being broken by the glass of forcing-houses, a greater moisture does or should exist in the atmosphere of that climate than in the air; therefore, the application of water at any time of the day must cause a less shock to the plants than it would out of the house.—*A. W.*

Rats.—A few weeks ago a vast number of rats were driven into the Thames by the sudden damming up of a sewer. How very easily might London be cleared of these vermin by placing sluices in the sewers and drains, and once a month, on a given day, stop them all up for a certain number of hours, and then let the water, &c. off into the river! No rats could harbour and breed in them then. Again, if in the country, 1*d.* a head was given for every rat, they would soon be annihilated.—*D.*

On Budding the Vine.—About the first week in March I perform the operation, or as soon as I perceive the sap begin to rise. I cut from a Victoria Grape an eye about three inches in length, having attached as much wood as I could possibly get with it; at each end of the eye I cut off about a quarter of an inch of the upper bark, making the ends quite thin. I next measure off the exact length of the bud on the base of the Vine intended to be budded, and make a nick slanting upward at the upper part, and another slanting downward at the bottom. I then take the piece neatly out, so that the bud may fit nicely in, and by making the nick as stated above, each end of the bud is covered by the bark of the shoot. I bind the buds firmly round with matting, and clay it, taking care, however, that the clay does not cover the eye of the bud. I then tie it round with moss, and keep it constantly damp; and as the sap rises in the Vine the bud begins to swell. When the Vine commences to push out young shoots, take the top ones off, in order to throw a little more sap into the bud, and as you perceive it getting stronger, take off more young shoots, and so continue until you have taken off all the young shoots. Budding can only be performed where the long-rod system is practised, as in that case you have the power of confining the sap to the bud, which will grow vigorously. As soon as you perceive this, cut the Vine down to the bud. Budding has the advantage over grafting, by not leaving an unsightly appearance where the bud was inserted. A bud likewise grows more luxuriantly. I have seen a bud make a shoot fully 30 feet in length, with a beautiful bunch of Grapes at the base in the first season; whereas a friend of mine bought a plant and grew it for two years before he obtained fruit from it; and even then his Vine was not equal to the bud. I have budded many Vines in the same manner, and have always found them answer the end. I always allow the matting to remain on until about the month of September, when I take it off, and I have always found the bud perfectly united; and without minutely examining the plant the work is imperceptible. —*E. L. S.*

Rabbits.—When I lived at Seaton Sluice, my companions and I used to go at nights with a dark lantern on Hartly Links, and catch rabbits with sea ferrets, as we called them. We got large crabs (commonly called dog crabs) from off the rocks; we stuck a lighted candle about one inch long on the crab's back, and sent them into the holes, before which we placed a net. Before the crab got far into the hole, the rabbits came tappy lappy into the nets. In this way we caught numbers of them in a short time —*J. P.*

Plants for Hybridising.—Among other plants I would recommend the trial of hybridising the Daphne Laureola, and the Mezereum, so as to obtain a Laureola with red or white flowers, and to clothe the Mezereum with green leaves. There is a white Buttercup, which if hybridised with other kinds of Ranunculus, may give us a race of entirely new flowers.—*D.*

Strawberries.—As it is of great importance, in growing Strawberries in the open air, to make them produce fine fruit as early as possible, without loss by frogs or slugs, &c., which loss is generally very great, the following plan may be found useful:—Fix on each side of the row of Strawberries, just before they come into blossom, feather-edged boards at an angle of 50° or 55°. This may be effected by nailing two narrow slips of wood to each board, and pushing them into the ground. The boards should be painted black. This plan makes two or three weeks' difference in the ripening of the fruit; but glass, or an oiled-paper frame, being placed on the top, makes a greater difference still, and prevents any of the fruit from being trod upon, or eaten by vermin. This plan, at first sight, may appear to be an expensive one, but it is not so; any old boards will answer the purpose. I have bought old feather-edged boards at ½*d.* per foot; and, as they are only used in summer, they last for many years. The expense is saved in the first year; for the wood, although painted on each side with a coat of invisible-green, costs only about 1½*d.* the foot; while the increase of fruit in quantity, as well as in quality, quite compensates for the outlay. In conclusion I may observe, that watering with strong liquid manure two or three times in the month of February, and frequent waterings during bearing time with pond-water, are, I have found, very beneficial.—*G. L. Smartt, Enfield.*

Dry-rot in Timber.—I have had a great deal to do with this, and I have tried many remedies, but have found none to answer except the following, which I tried about four years ago. I took 3 lbs. of corrosive sublimate, and put it into a large glazed earthen pot; to this I put about 4 gallons of water, and when it was well dissolved I took a large painter's brush, and washed the timber and walls with the water, and no symptoms of rot have made their appearance since.—*Scrutator.*

Productive Variety of Apple.—The Rymer Apple, Caldwell, or Cordwall, as it appears to be called near Nottingham, proves a most productive and valuable sort. The following note accompanied a specimen of the fruit:—The tree will cover 100 yards; and 240 pecks have been gathered from one tree and sold for 14*l.* 15*s.* 8½*d.*—*S. R. P. Shilton, Nottingham.*

Pruning Forest Trees.—Much has been said of late in the *Chronicle* on thinning and pruning forest-trees; and much difference of opinion seems to exist on the subject. A good deal, nevertheless, of what has been written both for and against pruning is, in my opinion, calculated to mislead those who have not sufficient knowledge and experience to judge for themselves. "Prune not at all if you can help it," is a good maxim when properly understood and applied; but no practical man can deny that pruning is often necessary, and when it is so, must not be neglected. An unskilful pruner may overdo it, but abuse of a system is no argument against the utility of the operation. Mr. Thompson of Whitehaven, in his article (p. 795) makes some excellent remarks on the subject, in which I entirely concur; but the method he recommends, where plantations are extensive, would require too much labour and expense to be practicable. Admitting the fact, that the greater the quantity of foliage in a tree, the greater is the quantity of timber produced, it does not follow that the greatest quantity of valuable timber is produced: this, I am persuaded, can only be obtained by judicious thinning and pruning. The exact age at which to begin thinning and pruning a plantation must depend, in a great measure, upon the kind of tree, upon the situation, upon the closeness at which the trees are planted, and upon the rapidity of their growth. These things must be left to the judgment of the person having the management of them. The plantations of which I have now the charge afford good examples of the effects of thinning and pruning, and of the neglect of these two assistants of nature. These plantations are of different dates, the oldest being about 40 or 45 years of age, and the youngest about 20. For many years, according to what I have been told, the plantations were regarded, at any rate were treated, more as harbours for game than as sources of profit. They were left very much to nature. In course of time, however, it was discovered by the proprietor that he had run the risk of sacrificing all hopes of profit, without securing even permanent shelter for game. The trees were drawn up into an impenetrable mass, leaving the earth bare; the deciduous trees twisted themselves like whips through the branches of the Firs, originally intended as their nurses, in hope of catching a breath of air, or a gleam of light; and the Firs themselves grew indeed at top, but with all their lower branches rotting off. The mistake was happily discovered in time to save the later-planted woods; and for the last 10 years and more a judicious system of thinning and pruning has produced as fine a crop of trees (of young Oaks chiefly) as is rarely to be met with, forming a striking contrast to their elder brethren, who are still suffering from want of a timely and wholesome application of the knife. The method pursued here is as follows:—When a young plantation has arrived at such an age as no longer to require the Firs as nurses, the latter are thinned out, leaving them only scattered about in spots suited for them; the deciduous trees, which are chiefly Oak, are then moderately thinned wherever the branches are observed to interfere with one another, and, where it is required, a few of the under branches are cut off close to the stem, taking care, however, always to leave a sufficient proportion of top. The tops are carefully looked over in order to remove all shoots that are likely to rival the leader, and such branches are fore-shortened as appear likely to affect the proper balance of the top. In a few years the same operation is repeated, and so on until the trees are about 20 or 25 feet in height, when I consider pruning not only unnecessary but injurious, excepting in particular cases.—*G. S. H.*

Hereman's Vegetable Dilutium.—This destroys the mealy-bug, and may be used with safety for cleaning many plants, if Mr. Hereman's directions are strictly attended to. There are, however, some plants that, although the dilution is carefully administered to them, are apt to be injured by it. I have observed, in applying it for the destruction of mealy-bug on Mammillaria gracilis, that wherever the liquid touched the plant, that part of it perished; therefore, those who adopt this method of destroying insects should be cautious how they perform the operation.—*D.*

The Wren's Nest.—At p. 910 of last year's *Chronicle* I made some observations on the cock wren's nest, which have been again fully borne out this year: the same two birds have continued together as I have described, until their death, which happened yesterday morning (Dec. 14.) I found one of them dead on the ground, near the wall of the cottage where the nest was. This led me immediately to examine the nest, and there I also found the other (the cock) dead in the nest; no doubt their death was occasioned by hunger and cold, the frost being very severe here for the last fourteen days; indeed, supassing any we have had for some years at this season. These, however, are not the only birds which have suffered from the severity of the weather. I have to-day (Dec. 15) met with the P. pelagica dead at this place, which is seven miles from the sea; it was 6 inches in length, and weighed 7½ pennyweights. This bird inhabits most seas. It is seldom seen even near the shore. It braves the utmost fury of the storms; it is sometimes seen skimming with incredible velocity along the hollows of the waves, and sometimes on the summits, and if seen hovering around the sterns of vessels is a sure presage to seamen of the approach of severe weather. —*M. Saul, Fort Green Cottage, Lancashire.*

Stephenson's Boiler.—I was induced to purchase one of Stephenson and Co.'s improved Conical Boilers last year, for the purpose of heating my Grapery, in which I keep, during the winter, my Pelargoniums and a few other plants. I used for fuel coals and cinders, but I soon found, that although the heat in the cast-iron pipes was quickly raised to the requisite temperature, the fire soon went out; in fact, it could not be left an hour without attendance. In consequence of this serious defect, I called upon the manufacturer, who assured me that if I changed the fuel, and used coke broken into small pieces, I might leave the fire for 12 hours without attendance. I stipulated for eight hours, and they agreed that if the fire did not continue burning unattended for that period, they should consider their boiler a failure. I have since adopted the coke, and certainly find it answer much better than the coals or cinders; still I do not consider that the fire can be safely left even now for more than two hours; and, notwithstanding my man has remained up very late during the present frost, some of my plants have suffered. Perhaps some of the readers of the *Chronicle* who may chance to have one of these boilers, will have the kindness to inform me what they think of them; and whether my want of success hitherto arises from defective management.—*Thomas Canning, Elsenham Vicarage, Bishops' Stortford, Herts.*

Destruction of small Birds.—I perceive in the *Chronicle* of last week, that the "Laird o' Cockpen" seems almost to condemn the poor sparrow, whose cause I have often advocated, on account of its mischievous acts in destroying the buds of his Gooseberry-bushes. I certainly admit that it is difficult to excuse the acts generally of this mischievous little fellow amongst the Gooseberry-bushes, Lettuce-beds, &c., and in tapping the young Peas on their first appearance above ground. It is true such depredations are very grievous; but let us closely pursue his actions during the spring and summer months amongst the various fruit-trees, and we shall find his services in thinning the ranks of numerous Caterpillars, so destructive to both blossom and fruit, as well as in destroying various species of aphis, moths, butterflies, beetles, &c., to more than counterbalance the evils we have admitted. Bradley has calculated that a pair of sparrows having young to maintain, will destroy 3360 caterpillars in a week! And indeed, from my own general observation, I am of opinion that were it not for the sparrow and other birds destroying the caterpillars in seasons when bloom is scanty, little or no fruit would be the result. I think, however, the crimes of this little culprit may be a good deal prevented by frequently dusting the bushes well with quick-lime just after rain, that the dust may better adhere to the plant; and so with Peas, &c. I may here repeat what I have before stated in other publications, viz., never to destroy birds indiscriminately, but to notice their usefulness. Among the insectivorous birds I may mention the blue-cap, the fly-catcher, the spink, the thrush, the blackbird, the rook, &c.—*Joshua Major, Knosthorpe.*

Reviews.

Geology — Introductory, Descriptive, and Practical. By David Thomas Ansted, M.A., F.R.S. 2 vols. Van Voorst. 1844.

Geology, through the large accumulation of facts by later observers, has, within the last twenty years, assumed quite a new character. Its first cultivators had a large field before them, in which there existed only a few well-attested facts, and with these scanty materials did they build up the structure of their science. It is not to be wondered at that generalisations too large for their facts, and assumptions, that would not bear the rigid application of the principles of other sciences, occupied a prominent place in their speculations. Geology requires, perhaps, more knowledge of correlative sciences than any one we could name, and yet it was not uncommon to find that those who cultivated it were ignorant of the first principles of every department of science it embraced. Such was its position till very recently, when the vigorous minds and active hands of such men as Smith, Lyell, Phillips, Sedgwick, and others, came to its rescue, and geology and geologists are no longer a jest amongst the sister sciences. At the same time, we have a deep conviction that some of the most ardent cultivators of geology have much need to bring their minds in subjection to the admitted principles of the sciences of chemistry, botany, zoology, and comparative anatomy. The want of this knowledge is very evident in many of the works introductory to geology. We are glad, however, to find that Professor Ansted has been induced to publish these volumes, containing the subject-matter of his admirable lectures, and we have no hesitation in stating, after a careful examination of the work, that in regard to a knowledge of the relation of other sciences to geology, it is in advance of books hitherto written on the subject. The work is distinguished from others by its

being confined in the first place rather to the statement of the facts of geology, as at present known, than to the development of the causes which may have acted in producing the present relations of the facts stated; and in the second place, by the practical application of the principles of the science. Of the style and manner in which the subject is treated we give the following extract from the short introduction descriptive of the causes now in action affecting geological phenomena.

"Of the many constantly recurring phenomena, which owing to their perfect and undeviating regularity attract but little notice from the casual observer, there is none perhaps more remarkable than the quantity of solid matter held for a time in mechanical suspension in the water of rivers, and brought down to be deposited at the mouth of the stream, or spread over the bed of the ocean. The vast amount of mud thus conveyed by running water is occasionally seen in the extensive deltas, or tracts of swampy land, at the mouths of great rivers, such as the Rhine, the Po, the Nile, the Ganges, &c.; in each of which cases the river divides into so many channels before reaching the sea, that its actual character and apparent magnitude is completely lost.

"The origin of these vast deposits of rich alluvial soil must be sought for entirely in mud brought from the high lands or the plains through which the river passes, and held in suspension so long as the water is in rapid motion, but which sinks to the bottom when the current is checked. To obtain some notion of the actual quantity of solid matter thus continually brought down from the high land to the sea, an experiment was made some years ago by Mr. Leonard Horner,* on the water of the Rhine, the calculations founded on which possess considerable interest. Mr. Horner found that in the month of August, when the river was unusually low, one cubic foot of water taken fairly from near the middle of the river, near Bonn, supplied rather more than 21 grains of solid matter, and that in the month of November, when the water was turbid, about 35 grains of residuum were obtained. Now, taking the average of these two observations, and considering the Rhine at Bonn to be 1200 feet wide, to have a mean depth of 15 feet, and to run with a mean velocity of 2½ miles per hour, it appears that nearly 400 tons of solid matter would pass down the stream per hour; and that in the course of one year, between seven and eight thousand millions of tons would be carried along, the greater part of which must be deposited in Holland before reaching the sea, in consequence of the slow and meandering course of the river through that flat alluvial country. In the course of 2000 years, the Rhine may thus have brought down enough material to form a stratum one yard thick, extending over an area more than 36 miles square.

"But the delta of the Ganges far surpasses in magnitude that of any European river; and is, on the whole, perhaps, the most extensive and remarkable of all those at present forming of which we have any accurate data. The head of this gigantic delta commences at a distance of 220 miles in a direct line from the sea, and the base of it is 200 miles in length; the whole triangular space occupied, comprising upwards of 20,000 square miles, every part of which has been formed by deposition from the river and its tributaries.

"The quantity of mud and sand carried by the Ganges into the Bay of Bengal is, however, notwithstanding the vast deposit which previously takes place, still so great, that during the rainy season, when the stream is turbid, the sea does not recover its transparency even at a distance of 60 miles from the coast; and the quantity of mud held in mechanical suspension is so great, that a glass of water taken out of the river when at its height, is said to yield one part in four of mud. Calculating from the dimensions of the river and the rate of the current, Major Rennel has shown, that during the flood season the weight of the mud thus brought down daily and deposited either within the limits of the present delta, or at the mouths of the different branches, must be as much as 450 millions of tons—a quantity which is, perhaps, more readily understood by expressing it as equal to about 74 times the weight of the Great Pyramid of Egypt, supposing that to be a solid mass of granite."

The introductory remarks on the nature of fossils and their value in geology are very important. We would also point out the chapter on the fossils of the Palæozoic period to those geologists and botanists, who are so fond of the theory of a gradually more complicated development of animal and vegetable forms. From this chapter it will be seen that the theory which supposes the simplest animals and plants to have been first created rests on a mere assumption. The second volume is mostly taken up by the practical application of the principles of geology to civil engineering, architecture, and agriculture. We deem this not only the most novel feature of the work, but also the most important. If Professor Ansted does not possess that intimate knowledge of these branches of art, which is looked for in their professors, and which would render his opinions conclusive, he has at least opened up an important subject for inquiry, upon scientific principles. As an example, we give the following extract from the chapters on Agricultural Geology:—

"With regard to the relative value of different geological formations in agriculture, it will be evident, from what has just been stated, that no general rules can be laid down; and that, as it is rather the mineral and physical character than the geological age, the determination of which is important, the geologist can only bring his knowledge to bear in any given instance when he has informed himself of the actual structure of the district. In our own country, the older rocks are frequently barren, in consequence of the absence of limestone; but where that is present, and there is a due admixture of silica, argil, and limestone, as in some of the Silurian districts, and some parts of the old red sandstone, a strong and excellent soil is obtained. The old red sandstone, both in Herefordshire, and elsewhere, where its texture is good, is often exceedingly productive.

"The soil which covers the strata of the carboniferous or newer Palæozoic period is rarely of great value for agricultural purposes, owing to the preponderance of crystalline limestone in a condition which resists decomposition, and the almost uniform absence of argillaceous beds, except in the upper part, and associated with the coal measures. In these latter beds, however, the presence of argil does not tend to render the land productive, so that the whole series of these rocks is poor and valueless so far as the surface is concerned. Fortunately their mineral treasures beneath the surface far more than make up for this deficiency. The culm measures of Devonshire do not form an exception to the general agricultural condition of the upper carboniferous beds in other parts of the British Islands.

"The magnesian limestone, overlying the coal measures, and covered up by the beds of the new red sandstone, is not uniformly valuable for cultivation; but some of the districts where it preponderates are remarkable for being the best and richest grazing districts in the north. The magnesian limestone, if burnt, and used on the soil, is, however, extremely injurious, remaining for a long time in the same state, and seriously checking all kinds of vegetation.

"The new red sandstone, although not so thick as many of the older beds, covers a very large tract of England, and is remarkable almost everywhere for its great fertility. It consists of sandstones and sands, for the most part of loose texture, and alternating with innumerable beds of marl; and these are most abundant in the upper portion, which is not unfrequently characterised by a strong marly loam. Hence it arises that the latter, being the stiffest and most clayey bed, is usually employed as arable land; while the remaining portions are admirably adapted for pasture, and are celebrated in some parts of the country for the excellence of the hay grown upon them.

"The lias, with its associated marlstone, varies from a cold, wet, and extremely tenacious blue clay, to a strong and valuable clayey loam, and its value in an agricultural sense depends on the proportion of limestone and marl associated with it. In the upper part, where the sands of the inferior oolite rest upon it, they are sometimes turned in, and mixed with advantage: but there is always in such case a want of drainage, and the soil remains cold. The principal part of this formation is in old pasture, and forms the dairy districts of Somerset, Warwick, Leicester, &c.

"The oolites (including the wealden) consist of so many alternations of calcareous beds with sand and clay, that they offer almost every variety of soil, and are throughout capable of the highest cultivation. Where the limestone is too prominent (which is sometimes the case), the clays are generally at hand to correct the evil; and the clays, if sometimes too stiff and tenacious, require only a thorough system of drainage to furnish the best and richest crops of Wheat that can be grown in our island. The great oolite is, perhaps, the bed least readily turned into cultivation, and this arises from the small quantity of carbon it retains upon its surface. The wealden beds, also, are apt to form into hard pasty masses, into which the roots of vegetables penetrate with difficulty.

"The beds of the cretaceous group vary much in agricultural value: the lower beds, those of the lower greensand, are often exceedingly rich and capable of the highest cultivation, and the upper chalk forms extensive downs, which are well known for their short sweet herbage, supporting large flocks of sheep. The lower beds of chalk are without flint, and are often mixed with alumina, which converts them into a rich and valuable marl; while the soil at the junction of this marl with the upper greensand is a very productive loam, making an excellent corn land."

We think this work a valuable contribution, not only to the science of geology, but also to the practical arts to which its principles may be applied. It is written in a clear and pleasing style, and cannot fail to interest whilst it instructs. It is abundantly illustrated with woodcuts, and is a worthy companion, in point of getting up, to the many excellent volumes published by the house of Van Voorst.

* Edin. Phil. Journ. for 1831—5, p. 105.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ANEMONE OBTUSILOBA. Dr. Govan's Anemone. (*Hardy Perennial.*) Ranunculaceæ. Polyandria Polygynia. — This pretty Indian Alpine herbaceous plant has been already noticed, under the name of A. Govaniana, which is what Dr. Wallich called it. It escaped my observation that Professor Royle had determined that species to be the same as A. obtusiloba of Don, which name must take precedence. It is nearly allied to A. narcissiflora, which is, however, readily distinguished by its short flower-stalks and deeply divided leaves. The native situation of the species is stated by Dr. Royle to be the Choor mountain of the Himalayas, at elevations of from 10,000 to 12,000 feet, flowering in May. In cultivation it proves to be a hardy little Alpine plant, growing about six inches high, and well suited for pots, or a rockwork where the situation is rather shaded and damp. It is easily increased from seeds, which should be sown early in spring, in a soil composed of sandy peat and leaf-mould, and a small portion of loam; afterwards, when the young plants are large enough, they should be potted singly in very small pots, and kept in a cold frame, with the back turned to the sun during the summer. Afterwards they may be treated in the ordinary way, but they will not flower before the second season. June and July are the blowing months. It was raised from seeds received by the Horticultural Society from the Honourable Court of Directors of the East India Company.—*Botanical Register.*

SALVIA STRICTIFLORA. Erect flowering Sage. *Half hardy Greenhouse Shrub.* Labiatæ. Diandria Monogynia. — The genus Salvia is well known to consist of a vast number of species, many of which are as remarkable for their beauty and bright colours, as others are uninteresting in their general figure, and void of brilliancy in the hue of their flowers. The latter characters are more particularly the [illegible] of the strictly herbaceous species, whilst the larger number of the scrubby and suffruticose kinds rank under the first class. The subdivision of the genus to which this handsome plant belongs (Longiflora) is almost entirely composed of shrubby species, distinguished by the tube of the corolla being two or three times longer than the calyx, and the upper [illegible] overhanging to a somewhat greater length than the lower, and it is in this section that the majority of the most showy and charming species are enrolled. Although yet so little known in the country, we learn from the "Botanical Magazine" that specimens of *S. strictiflora* were flowered in England so long back as December 1831. The same authority states that it was discovered by Mr Cruikshanks between Yuzo and Obrajillo, in the valley of Canta, in Peru, and subsequently collected by Mr Matthews at Cuesta, of Huamantanga and Tarmatambo, Peru, where the natives distinguish it by the name of Soconcha. Being adjunct of rapid growth, liable to extend its soft wooded branches to a great length, and bearing its upright racemes of vermilion blossoms at their extremity, the propriety and utility of occasionally pinching off the ends of the growing shoots, to produce increased bushiness and quantity of bloom, is self-evident. And for the same reason it should never be planted in a too strong earth of an adhesive or retentive nature, as this would augment the natural proclivity to rank exuberance. Equal quantities of sandy loam and peat, with a little silver sand to carry away superabundant moisture, would be most consonant with the habit of the species. It should be placed in an airy part of a greenhouse or frame to stand the winter. Propagation is easily managed by preparing cuttings of the young wood in the usual way, and placing them in a gentle bottom heat. The upward direction of the tubular flowers has suggested the specific name.—*Paxton's Magazine of Botany.*

Garden Memoranda.

Royal Botanic Garden, Edinburgh.—In the Heath-house at this place are some splendid specimens of this beautiful tribe, and among them was one of Hyemalis, which measured 8½ feet in height, from the top to the surface of the earth in the tub, and fully 9 feet in diameter. From a careful calculation, by enumerating the flowers on several individual spikes, and multiplying the whole, I am satisfied that there could not be fewer than 120,000 blossoms on the plant! The tub in which it was growing measured 4 feet in width, and 3½ feet in depth. When we consider the short time that this hybrid has been in the country (about six years), those who know anything about the culture of the Heath will have no hesitation in pronouncing it to be one of the finest specimens of horticultural skill that has ever been produced, and which will still retain for Mr. M'Nab the palm in Heath-growing.—*A. S. Vester, Dec. 21.*

Miscellaneous.

Scotch Chemical Association.—Our letters inform us that this Association is prospering, as it ought to be. Professor Johnston has been invited to lecture in several parts of the country, and the knowledge and taste for Agricultural Chemistry are evidently spreading among the sharp-witted Scotch farmers.

Central America.—The following are some of the productions of the State of Costa-rica, in Central America, viz.:—The Sugar, wild and white cane, and that of the class called Brota, which spread out, forms strong planks more than half a yard in width, and 5 or 6 yards in length; Coffee (which, being properly plucked and dried, is exactly similar to that of Mocha); three sorts of Cacao or Chocolate, Indigo, Vanilla; three sorts of Maize, seven kinds of French Beans, Peas, Beans, Rice, Wheat, Musk, and Water-Melons. In a word, innumerable medicinal plants, and all the Cereal, so that Botany would find amongst us a vast field in which to range with unspeakable advantage to humanity and society in general; three sorts of Plantains, three of Cotton, Tobacco of many kinds; Timber, for mills and other works which require hard woods, such as Quapinol, the Lignum-vitæ, the Wild Medlar tree, and the Oak; for houses and joiners' work, mahogany of the most excellent quality; the Cisique, the Cocoa-nut tree, the Rouron, and the Cristobal; the Beech-tree, three sorts of Cedar, the Caragra (which, from very recent observation, is considered the best substitute for Cedar), the Chesnut, the Espavey (also called the Espavel, or Aguegue), and the Laurel. For house-props, not liable to rot in the earth, the Chirraca, the Tubus, the Baynilla, the Guachapelin (a very strong wood), the Quiebrahacha, the Black Wood, the Comenegro, which is exactly the same as the Iron-tree, so celebrated in the East Indies, and other countries; finally, dye-woods, such as are called Brazil and Nicaragua, found on the coasts of the Pacific and Caribbean; the San Juan, of a beautiful yellow; Poro, from which is extracted a very bright yellow cane-colour; and, above all, the wild Annona reticulata, which has the particular property of its wood being perfectly white, but when cut or split, in a few minutes turns to a clear and brilliant red colour, which can be extracted, and which is quite durable; Balsam cayuna, or canune, Copaiba, and Tolu, and Catico; the gums Copey, Resin, Copal, Arabic, Quitirri, Guapinol (an excellent perfume) incense, Chirraca, and that of the Chesnut-tree, the fruit of which contains much oil, and has the property of becoming hard, and of which candles are made, very like yellow wax, burning with a good clear and steady light, without giving out much carbon; this seed and substance being worked and purified, makes candles as fine as those of white wax.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Orchidaceæ.—In reference to the shy blooming kinds, the most essential part of their management is to compel them to

confine their growing season to our summers—say from the middle of May to the end of August. Stanhopeas are say bloomers in the hands of some cultivators, but with others they flower regularly. Young plants of them are more difficult to flower than established ones, because they are more susceptible of being influenced by changes of temperature or moisture. At this stage they may be made to grow in any month in the year. They will also endure more hardships than any other of the tribe, and are therefore fit subjects for experiment. From the end of September to the beginning of May give no water at the roots, and from the end of November to the middle of February 55° is the proper temperature. The atmosphere should not be drier than that for a collection of stove plants, therefore the coldest end of a stove is a good place to winter them in. Early in March remove them to a warmer place—under the shade in an early Vinery kept from 60° to 75°, or a Cucumber-house will do; but constant shade is necessary, as the leaves are excited with the moisture of the atmosphere, while the material about the roots is so dry that no atmospheric moisture can have any effect on it. Some plants, however, will be apt to grow at this stage, particularly in the first season; these must be kept in a drier atmosphere, or in the driest end of the house; 70° to 75° should be the temperature for April. Every bud now will be swollen, and the success of the plan depends in some measure on the length of time the buds can be kept in this state. As soon as they open into shoots plunge the roots in water till all the material about them is well soaked; after this, abundance of air, and as much light as the leaves will endure and a temperature of from 70° to 80° are essentials till their growth is nearly finished; under any mode of culture the young shoots must be preserved from too much moisture lodging in the centre till they are ripe enough to endure it. The *rationale* of some of the points in this course is not so obvious as one could wish, but in every instance which I have tried the result has been favourable.

Conservatory.—Next to Luculia, Gesnera zebrina is the best conservatory plant we have in November and December; if the terminal spikes of flowers of this plant are cut off when they are three parts blown, and the plant returned to the stove for a little time, a host of lateral spikes will come up and last some time. A regular stove is far too hot for this plant when in flower, though the stove culture assists it at other times; but to flower it in summer a greenhouse treatment is necessary from the beginning, as has been already noticed.

House Plants in General.—The surface soil in pots soon gets exhausted by repeated watering, and repotting is not applicable in winter, therefore surfacing from time to time with a little fresh soil is all that can be done at present. After discarding the present soil on the surface of the pots, loosen the next layer down to the roots with a pointed stick, mixing a portion of fresh compost with it, and the next watering will carry the more sandy parts down among the roots, which will be of essential service to the plants. A porous surface, whether in a pot or in the field, is a point in cultivation which cannot be overrated.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES

Out-door Department.

During the continuance of the present frosty weather, but little can be done in the regular work of this department; but where alterations and improvements are contemplated, such as making new walks, making new flower-beds, or reinstating the soil of old ones where necessary, hard weather rather accelerates than retards such operations. Holes for planting choice or new shrubs or trees may also be prepared, by removing the bad soil and replacing it by a compost suitable to the plants, and even where trees are planted, and not growing so well as could be desired, the soil may be carefully removed from the outer roots and replaced by proper soil. Should the weather send the men in doors, plenty of work may be found for them in cutting pegs, making brooms, cleaning old, making new, and painting flower sticks, repairing rustic baskets, painting wire trellises, garden chairs, water pots, &c.; in fact anything ought to be done rather than let a poor man lose a day's work; for even splendid gardens and finely grown plants lose, to a sensitive mind, the greater part of their attraction, when it is known they are produced by hardly-worked and badly paid men. My own experience with labourers is in favour of steady well paid men, and I would rather, at any time, have five men at 15*s.* or 18*s.*, than six at 12*s.* per week, as they will not only do more work, but, being satisfied with their position, will do it in a more efficient manner.

Pits and Frames.—Plants in these structures, if not artificially heated, will sustain no injury in frosty weather if they are left covered for weeks together; and, in truth, should they become frozen, it will be much better that they should remain covered and be allowed to thaw gradually, than be suddenly exposed to a heated atmosphere. In nature we see that plants sustain no injury under a covering of snow, even though it be a yard thick and continue for months; and why is this? not because, as some suppose, the snow is light-coloured, though that is very favourable to preventing the escape of terrestrial heat, but because the snow keeps the surface of the earth at an equal temperature, which is sufficient to prevent the plants from sustaining injury from a low temperature, and yet not sufficient to admit of their growth; therefore if we can keep the plants from growing, they will not sustain any injury by being for a time without light.—*W. P. A.*

IV.—PINERIES, VINERIES, &c.

Pineries.—In January of the present year I potted some Pine plants on the one-shift system, using green turf chopped into pieces about two inches square, fresh droppings, and pieces of charcoal. The pots were then plunged over the rim in tan, above hot-water tanks, and have required nothing to be done to them since, except sprinkling the foliage occasionally with the syringe or watering pot; the latter only in very hot weather. The plants have grown amazingly, throwing up leaves of a remarkable breadth and firmness of texture, while the lumps of turf are completely matted with fibres. Some of the plants are now in fruit, while others appear as if they would grow for some time yet. I intend to have a pit treated in the same way next year, but will use the dust from the charcoal pits as a plunging material instead of tan. I have reason to think that charcoal-dust used in this way acts in a beneficial manner on the plants, by impregnating the atmosphere with carbon. It is impossible to convey an adequate idea of the change produced in a few weeks on the foliage of a house of plants where this material had been used, every plant in the house, whether plunged or placed on the shelves, assuming the most dark and healthy hue possible.

Vineries.—The borders of the late Vineries should be slightly forked, as soon as the frost will admit of it. I prefer not putting on any top-dressing at this season, as the frost will be of more service to the border than manure. Top-dressing does more good in the growing season, as it nourishes the Vines and keeps the roots in a more uniform state of temperature and humidity. Let the roots of the Vines now forcing have every attention. The keeping of the roots warm is, perhaps, the most important point to be attended to, next to the avoidance of overcropping.

Peach-houses.—The last few days have been very unfavourable to Peach-trees now setting their fruit. Be careful to avoid too high a temperature at night, and take every opportunity of giving air till all the fruit is set, after which the temperature may be raised to 60° by night and 70° or 72° by day. Keep a very moist atmosphere, and thin out the young shoots, leaving always the top and bottom ones remaining on each of last year's shoots.

Cherry-house.—Be careful not to keep too high a temperature, particularly during this cold weather; 45° by night will be quite sufficient until the buds are about expanding, when it may be raised to 50°. Air must be admitted during a portion of the day, to strengthen the buds after they are perceived to be swelling.

Strawberries.—Let a quantity of these be brought in, according to the demands likely to be made upon you. Place them on the shelf of a Peach-house or Vinery just beginning to be forced, as near the glass and ventilators as possible. It is better when practicable to force them in pits where the temperature can be regulated to suit them, as they require more air than either Vines or Peaches till the fruit is set.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peas and Beans.—As soon as the weather will permit, make another sowing of Prince Albert Pea and early Mazagan Bean on the breast of wide ridges, as previously recommended; and, lest the ground should afterwards be frozen hard so as to impede their germination or cut them off when above the soil, have plenty of long litter or spruce branches in readiness to scatter along the ridges. As the Prince Albert, though the earliest, is by no means a great bearer, nor yet a fine-flavoured Pea, sow for succession greater breadths of the early Warwick, Frame, Bishop's Dwarf, and Shilling's early Grotto, and follow the Mazagan Beans with the best varieties of the Longpod and Windsor.

Asparagus, Sea-kale, Rhubarb, Chicory, &c.—Keep a regular supply of all these. Where a family is constantly resident, it is in general bad policy to commence forcing earlier than your stock will enable you to meet the demand, until they can be got from the open garden. *Forcing.*—Fresh beds of dung and leaves will require to be put in operation for Radishes, Horn Carrots, Potatoes, and early Cucumbers. Take care to make your beds large enough for the latter, if you wish to avoid trouble and annoyance afterwards. Of course, all these objects can be effected much easier in pits heated by hot water. *Mushrooms.*—Those beds out of doors will require to be carefully covered with litter, and mats, &c. To those who are fond of this vegetable (and in many families it is deemed as essential to good cookery as the Onion tribe), I would urge the importance of appropriating a house or back shed to the purpose, to be heated by hot water. A good supply will thus be easily obtained, and a great deal of pleasure enjoyed in witnessing their growth. A bed completely covered is a beautiful sight at this season of the year. With respect to the method of cultivation, I do not think I can add much to what has been stated in former Calendars. There is an able Paper on the subject from Mr. Hankin in last *Chronicle*, but there is nothing new in the system of using turf instead of loam. I have no doubt it would answer admirably in such circumstances as Mr. Hankin describes. He places "light" as the second requisite for growing Mushrooms, while I think they are better, and more appreciated by cooks for their whiteness when produced in comparative darkness. *Routine.*—See that Cauliflower, in all its stages, Lettuce, Endive, stored roots, fruit, &c. are secured from frost; do not waste time in attempting to trench and thus bury frozen ground, but rather forward in-door operations, such as making stakes, tallies, straw covers, wattling hurdles with spruce branches for the protection of Peas, Potatoes, &c. Prune and nail in fine days after breakfast, everything except Peaches, Figs, Vines, and Raspberries, the doing of which had better be deferred six weeks longer; wheel dung, drive soil, turn composts, and exercise judgment and forethought in regulating your operations according to the state of the weather, and recollect that if you wish to see your men energetic, able, and willing to push through labour in any emergency, you must study their health and comfort, by providing suitable labour in unpropitious weather. *In Conclusion.*—To my young friends I would say, as a general maxim, you may take the advice of an Edinburgh nurseryman, and "sow thick and keep friends with the cook," but do not attempt the latter object, by inducing him or her to connive at or conceal your deficiencies, or you may soon find that you have trusted to a bruised reed, but attain that object by securing to yourself the honourable position of comparative independence, by the faithful and diligent discharge of your duties—by keeping an abundant supply—and by rendering it imperative on the man who serves the house, to keep a regular account of all the garden produce, a memorandum, the knowledge of the existence of which will save you from many petty causes of annoyance.—*R. F.*

State of the Weather near London for the week ending Dec. 26, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

The Reprint of Mr. PAXTON'S COTTAGERS' CALENDAR is now ready, price 3*d.* each Copy. An Index has been added to this present Edition. Parties wishing to have copies for distribution among their tenantry can have them at the rate of 25 for 5*s.*

Bees.—*Apiarius.*—Wooden hives ought to be made of good deal about 1 or 1½ inch thick. The collateral hive is, perhaps, the best, being three square boxes about 12 inches in depth, and 1 foot in width. The centre box should be stocked with a strong early swarm, and the hive should be placed in a sheltered situation, open to the south or south-east. If the hive is well defended from the weather, and shaded a little from the winter's sun, it need not be removed to other quarters. The bees will survive the winter, provided they have plenty of store, say from 15 to 20lbs of honey, but as to quantity, much depends on the weather. The Polish hive is of simple construction, and, at your request, I shall notice it in a future paper. As regards the "temperature most suitable for the breeding and storing compartments," I would mention that that of the first is of much importance. If hives were kept warm in spring by extra covering (and feeding if wanted), that would insure plenty of early brood, on which success depends. Much has been said concerning cooling the store departments in beehives, and various plans have been tried with but little success; for the bees always seal up the vent holes when they are most wanted. In hot weather shading, or a hole large enough to admit a common-sized cork open at the top of the hive is quite sufficient. If that precaution is taken the rest may be left to the bees themselves. However neat the appearance wooden hives may have over that of straw, still the latter have the advantage of resisting both heat and cold better, straw being a much worse conductor of heat than wood. If you choose straw hives on the Storying plan, let them be about 9 inches in depth, and 1 foot in diameter, and flat on the top, for the caps to rest upon. You might try the "Bar-hive," which is highly recommended by Dr. Bevan and Mr. Golding; but if you purchase fine novel hives, with various appendages, at 5*l.* each, you must not expect "a return for a given outlay" equal to the Rev. W. C. Cotton's statement, viz, that "bee-boxes will pay what they cost in the first year, and leave some profit besides." Such profit cannot be had from bees in this country, nor yet in Wales or Scotland, where they can frequent the blooming Heather. *J. Wighton.*——*A Subscriber.*—In order to protect your hives from the attacks of mice, make the hole so small that they cannot get in; that is the only effectual way.

Camellias.—*T. A. N.*—Nothing bears the knife better. Prune them when they are breaking their leaf-buds in the spring.

Cucumbers.—*Melonia.*—Syon House, and Allen's Victory of Suffolk, are good kinds.‡

Foreign Fruits.—*Inquirer* asks if any one will give him some good method for packing exotic fruits and vegetables, such as the Guava, Custard Apple, &c., so that they will keep well during a voyage of two or three weeks. He asks whether they should be packed up when ripe, or in an unripe state?

Heating.—*G. N.*—Brick flues answer ill for bottom-heat, and are a nuisance; for there is no getting at them to clean them when choked with soot, as they soon will be. They will dry the soil as well as heat it. We should think it quite hopeless to expect to grow Orchidaceæ by such means. If your master will not use hot water for heating such a place as you describe, it would be better to advise him to go back to a bark-bed for his Orchidaceæ, and a wooden stage for his greenhouse plants. If any one, in your knowledge, "has done for hot water," as you say, he must be a very unskilful person, and quite unfit for an example.

Insects.—*A. T.* will find the information he requires in the history of the Earwig, given in vol. i. p. 580, of this Journal. *R.*——*An anxious Lady's* Scales are the Coccus Testudo. *R.*

Kidney Beans.—*A Young Beginner.*—They will do well enough where they are. If, however, you can get them nearer the light it will be better. We doubt whether the book you name will prove worth having. We shall know better in a month or two. Wait a little.

Manure.—*J. Moon.*—Parings of hoofs form a very durable and excellent manure; but it acts slowly. It will, we presume suit Orange trees. Sickly trees of that sort can only be recovered by repotting in very rich soil, cutting close in, and plunging in a good bottom-heat in the spring.——*S. E. Turnbull.*—We are not aware that any very extraordinary effect is producible by two parts of carbonate of soda and one of sulphate of soda. If you wish to try the experiment, use them at the rate of 1½ lb. to a rod of ground.

Melons.—*Theta.*—The Sirdar Melon proved to be the same as the Cabul. I exhibited fruit of it at Chiswick, in June last; some of the fruit were excellent. If Theta will send his address to the office of this Paper, he can have seeds of it. *G. Fleming.*——*W. J. B.*—Cuthill's Early Cantaloup, and the Improved green-fleshed, are two good early green and scarlet-fleshed varieties for immediate sowing.‡ —— *Melonia.*—Cuthill's Early Cantaloup.‡

Mistletoe.—*Mr. Oldham*, of Mansfield, is so obliging as to offer to give seeds of this plant to any one who will apply to him for them.

Names of Fruits.—*W. D. F.*—The Forme de Marie Louise has been fully ascertained to be the same as the Marie Louise, in the Garden of the Horticultural Society, and by fruit-growers in the neighbourhood of London. It varies according to situation; and even the fruit from adjoining trees will differ in appearance, quality, and period of maturity. If doubts are entertained of the identity of varieties, the best way is to graft on the same tree. ‖——*Chichester.*—Your Pear is the Old Colmar. ‖

Names of Plants.—*W. Todd.*—1, Jasminum gracile; 2, Hermannia incana; 3, Boronia alata.

New Garden.—*Clericus.*—The slope is too great for turf, in dry weather, if the land is apt to burn; if not it will not be too much. For a kitchen garden the slope is an advantage. Dig in the turf by all means. Plant as soon as you can. Cut your old spurs close in, and get some young bearing wood on your old trees.

Pine-Apples.—*A. B.*—You can maintain a steady bottom-heat for Pine-apples without tan, by hot-water gutters or pipes in a chamber, the latter extending underneath the whole bed. ‖

Sea-Kale.—*Subscriber.*—You *may* force it two years successively, but you should not do so unless it has made a very good autumn growth. Plant a new bed any time between November and February.

The Rose Garden.—*T. A. N.*—Yes.

Transplanting.—*C. F.*—Lose no time. Do what you have to do whenever the weather will allow you. December is better than January, January than February, and so on.

Miscellaneous.—*H. H. N.*—We are not aware of any instance of a Golden Pippin tree invariably bearing double fruit, and nothing else; if there be such a tree, we should be greatly surprised to find that scions from it failed to produce double Apples also. There is no accounting for the first case, and the second would be more unintelligible still. The first is, however, not without a parallel.——*Flavius.*—An advertisement is the only course we are aware of.——*B.* will see the advertisement in this day's paper.——*Begonia.*—It is Hydrocotylifolia.—— *W. S.*—We never saw the plan of pouring boiling water on Rose bushes tried, for the purpose of killing the larvæ of the green-fly. As has been long since stated, green-fly is readily destroyed on Roses by syringing with weak gas-water. There is no periodical, upon such subjects as you mention, which we should like to recommend. Loudon's "Arboretum Britannicum" is very full of such information, as far as hardy plants are concerned.—— *J. W. D.*—What sort of pepper do you mean? If you wish for information, you should be a little more explanatory.—— *Inquirer.*—The Christmas Rose may be propagated by dividing the roots; but the plants should be well established before the operation takes place.‡——*A Subscriber* will find a receipt for killing the Mealy Bug in last week's Paper, p. 852. ‡——*J. O.*—The Post-office order was received. ——*X. Y. Z.*—Really we cannot answer such questions. Inquire at the coach-office.

VERY FEW CORRESPONDENTS NOW REMAIN WHOSE KIND COMMUNICATIONS ARE UNPUBLISHED. TO THOSE WHICH ARE STILL IN OUR HANDS WE PROMISE SPEEDY ATTENTION; FOR SUCH AS HAVE APPEARED WE OFFER HEARTY THANKS. AND WE CORDIALLY INVITE ALL TRUE LOVERS OF GARDENS TO CONTINUE WITH UNFLAGGING ZEAL THEIR CO-OPERATION IN THE PLEASANT TASK OF INTER-COMMUNICATION.

Erratum—We regret that an error was made by our Compositor in Mr. Waite's List of Seeds, inserted last Saturday. Nemophilla discoidalis, priced at 1*l.* 1*s.* *per gallon*, should be 1*l.* 1*s.* *per ounce.*

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN; BASINS IN IRON, &c. 70, STRAND, LONDON.

F. FOE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

WATER RAM.

The Agricultural Gazette.

SATURDAY, DECEMBER 28, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Jan. 1—Highland and Agricultural Society.
THURSDAY, Jan. 2—Agricultural Imp. Soc. of Ireland.
THURSDAY, Jan. 9—Agricultural Imp. Soc. of Ireland.

IN CLOSING OUR FIRST VOLUME, we take the opportunity of heartily thanking those who have contributed to its pages. It is on its practical Correspondents that an Agricultural Periodical must depend for its real value. Its Editor may certainly speak authoritatively when he treats of the *principles* of the art; but when he descends to any department of its *practice*, he can only state his personal experience, and the circumstances under which it was acquired, and then he only occupies the situation of one of his own correspondents. We say again—it is on the number and qualifications of *these* that the value of an Agricultural Journal must depend. That periodical is necessarily the most useful whose pages are filled with communications of the experience of its readers in all the various circumstances of soil, climate, &c., to be met with in the district where it circulates. We can say, without boast, that we have readers on all the varying soils, and in all the different climates to be met with in the three kingdoms, and if we could induce a greater number of them to state the agricultural experience of their respective neighbourhoods, the usefulness of the *Agricultural Gazette* would be much increased. For, as we said at the beginning of the year—*then* only shall we consider ourselves to have made much progress in the course of usefulness on which we have endeavoured to enter when our readers shall have been brought to consider themselves as the members of one large Farmers' Club for mutual instruction, ourselves occupying the place of the mouth and the ear through which they may communicate with each other.

The value we attach to reports of local agriculture when qualified by a full statement of the circumstances which justify it, makes us regard, with particular satisfaction, the sketches of East Lothian husbandry by Mr. SULLIVAN, the last of which series is this day published in our columns. If the *Agricultural Gazette* had done nothing more in its first year's existence than clear up the misconceptions which have existed as to the state of farmer and farming in that celebrated county, no one need have blushed for it. We venture to assert, that for quantity of valuable agricultural information, in so small a space, these "Sketches" are unequalled by any district report of farming hitherto published; and any one may see if we are wrong, by examining the volumes on the several counties, called forth by the premiums of the Board of Agriculture. We may also point, under this class to the "Geo-Agricultural Notes of South Gloucestershire," by "M. S.," as clearly bringing out the influence of Geology upon Agriculture—a point which of late years has been deemed of considerable importance. Among the other series of papers which we have this year published, we may refer to the articles on the "Application of Chemistry to Agriculture," on rational principles, by C. R. BREE, Esq., of Stowmarket; the papers on the "Flax Plant," by Mr. SPROULE; and those on "Black Horseponds and Liquid Manure," by Mr. GYDE, of Painswick, to show that our columns have been by no means deficient in useful matter. Much attention, too, has been excited amongst our readers during the past year, to the waste of home manure in the ditches and horse-ponds of farm-yards, and to the loss in foreign manure by adulteration. This latter, in particular, was shown to be carried on to an extent before unconceived of.

We have already made arrangements for the appearance, during the ensuing year, of many important papers, amongst the subjects of which we may mention Drainage, the Economy of Cottages, the Economy of Farm-buildings, the Weeds of Agriculture, &c., and these will guarantee a continuance of the usefulness which the Paper has hitherto possessed. Nevertheless, we must continue to solicit our readers themselves to enter upon the great task of mutual instruction. Our columns are always open to *details of facts bearing upon Agricultural practice.*

MANY benevolent persons who make the welfare of the agricultural labourer their care, appear, some 60 years ago, to have expected as great advantages from THE DIBBLING OF WHEAT as is now justly expected from the allotment system.

The origin of the practice, in Norfolk, is well known. A poor labourer, in order to economise seed in sowing a small patch of Wheat on the plot of ground attached to his cottage, planted it with the dibble. The produce was so great as to attract the attention of the neighbouring farmers, by whom the experiment was repeated on a larger scale with such success as to lead to the extensive adoption of dibbling in the practice of that county. Great efforts were made to extend it to others, by philanthropists, in order to increase the amount of agricultural employment and human food—by the political economists, to render the labour of women and children a source of national wealth, in imitation of the system adopted in our factories at too dear a rate. These efforts, however, met with little success; they were opposed by the usual *visinertia*, and the usual objection of, "It may do *there* but it will not do *here*." The strong soils were considered too wet for dibbling; the dry soils as not possessing sufficient strength to enable the plant to tiller. Even in Norfolk the dibbling of Wheat appears soon to have reached its culminating point, for when Arthur Young made his report to the Board of Agriculture, early in this century, he described it as on the decline.

An objection to the practice, which we have recently heard urged against it, has probably some weight, namely, that it can only be well performed in the early part of the season; for as the weather becomes cold the droppers cannot feel the grains, and deposit too many in a hole. We know not whether a desire to increase the means of giving employment in agriculture, combined with the fine autumn we have enjoyed, to cause a more extensive adoption of dibbling this year than usual; but from our own observations in East Norfolk, we should estimate that full one-third of the Wheat crop in that district is put into the ground in that manner. The preparation of the ground is the same as for drilling. The dibbling is paid for by the acre, at the rate of 7*s.* to 8*s.* for dibbling and dropping. The lower price is, for broken ground, the higher for that put in on the whole "flag:" 1*s.* 6*d.* a-day for men, and 6*d.* a-day for women, is the current rate of wages in the district. The dibbler usually employs his own family for the dropping. Two droppers to each dibbler is the general proportion. The dibbles are of iron, about 4 feet long; the workman bending his back uses a dibble with each hand; he makes the holes about one inch deep, the distance between the holes being sometimes 4 inches each way, sometimes 4 inches in the rows, and the rows in pairs 3 to 4 inches asunder, with an interval of 6 inches between each pair.

On counting, in numerous fields, the spears issuing from the ground, we found that rarely less than four or five grains had been deposited in a hole, and not unfrequently more than 10. Even under the disadvantages of crowded plants which thus arise, the superior strength of the stubbles of dibbled over drilled crops is very obvious. There are in this district no broadcast stubbles with which to compare them. The saving of seed by the process thus conducted is not very great, 10 pecks an acre being the quantity usually drilled, and a little less, or when more precise information can be obtained, 8 pecks an acre, when dibbled. A large farmer, who dibbles none himself, from the difficulty of having the dropping well performed, declared to us, that if any method could be devised to insure the deposit of one or two grains in each hole, he had no doubt that this way of sowing Wheat would be superior to all others. Now, two grains to a hole, at the above distances, amount to no more than two pecks of seed to the acre; so that it is easy to calculate the saving which might be effected were even three pecks used, in order to provide for casualties. The difference between three pecks an acre dibbled and ten drilled amounts, on a farm of 400 acres, cultivated on the four course rotation, to 175 bushels. The difference between three bushels an acre sown broadcast and three pecks dibbled is 225 bushels. The saving in money, at 6*s.* the bushel, is 52*l.* 10*s.* in the one case, and 67*l.* 10*s.* in the other, or 2*s.* 7*d.* and 3*s.* 4*d.* an acre over the whole farm, 13 or 16 per cent. on a rental of 20*s.* This saving is independent of the increased produce to be obtained by dibbling, which, to put it in the least favourable point of view, more than compensates for the increased expense of the process over drilling and broadcast sowing.

The dibbling-machine invented by Mr. Newberry, of Hook Norton, Oxfordshire, appears to fulfil the conditions of thin and regular dropping, insisted upon as necessary to secure the superiority of this mode of sowing. The price of the implement is high, but on a farm of 400 acres the saving of seed pays for it in one season on the Wheat crop alone. This explains the great demand which we know to exist for the implement; and it may safely be predicted, that by its aid the dibbling system will make much more rapid progress in every part of England than in that in which it commenced, more than half a century ago. On dry soils, there can be no doubt that this is the best way of sowing Wheat. The inventor of the dibbling-machine uses it on clay. To Barley, Oats, and Tares, dibbling is as applicable as to Wheat; and for spring crops, there is less to be feared from it on stiff soils. Nothing contributed so much to promote the extension of drilling as the system of travelling drills owned by professional drillers, performing the work by the acre for those farmers who, by reason of the small size of their holdings, or their want of confidence in a new practice, were unwilling to purchase so expensive an implement. We would therefore suggest to landlords, Agricultural Societies, and others anxious to promote the diffusion of improvement, and to encourage the agricultural labourer, the propriety of purchasing, against the approaching spring, a few of these machines, to be placed in the hands of meritorious labourers, who shall dibble by the acre for the farmers, and pay for the machine by instalments. Care, however, must be taken, for obvious reasons, not to introduce too many into a district, while the practice is in its infancy.—*E. W.*

AGRICULTURAL EXPERIMENT.

(*Continued from page* 858.)

THE only other experiments which I have to record at present, are some which were designed to test the advantage of steeping seed, both alone, and combined with the other advantages of being hoed, and of being watered with different proportions of the same solutions in which it was steeped. Four breadths of ground adjoining those last mentioned were sown with 20 rows of Wheat in each, and each was divided into four parts; in the first five rows, the seed was previously steeped for 24 hours, and nothing more was done; in the second, besides the steeping, the intervals were hoed; in the third, a solution of 8 oz. of the salt in which it was steeped was added on the 13th of April; and in the fourth, a solution of 4 oz. at the same time, in 9 gallons of water, but these two last portions received also additional hoeings; the third was hoed twice, the fourth three times. This perhaps complicates the experiments too much, and introduces some uncertainty into the results; however, it is necessary to state the facts: the dimensions of each portion were 36¾ square yards; the quantity of corn sown in each was a quarter of a pint:—

	Weight of Corn.		Weight of Straw.		Quantity of Corn.		
Nit. of potash.	lb.	oz.	lb.	oz.	gal.	qt.	pt.
1 not hoed	10	2	20	4	0	5	0¾
2 hoed once	11	6	21	8	1	2	0¾
3 twice, 8oz. sol.	13	5	23	8	1	3	0¾
4 thrice, 4 oz.	15	5	25	7	2	0	0¾
Mur. of ammon.							
1 not hoed	14	2	24	4	1	3	1¾
2 hoed once	15	2	25	4	2	0	0¾
3 twice	17	12	27	14	2	0	0¾
4 thrice	16	10	26	12	2	0	0¾
Phos. of potash.							
1	17	2	27	4	2	1	0¾
2	16	10	26	12	2	0	1¾
3	16	0	26	2	2	0	0¾
4	16	10	26	12	2	1	0¾
Sulph of soda.							
1	16	4	27	6	2	0	1¾
2	17	2	27	4	2	1	0¾
3	19	15	30	1	2	3	0
4	21	2	31	4	2	3	1

In order to explain the remarkable inferiority of that part on which the nitrate of potash was employed, it is necessary to observe that one end of that land was entirely overshadowed by a large Apple-tree, which deprived the corn of its food from light, and air, and earth; and therefore its produce cannot fairly be compared with the others; but its own sections, being all under the same circumstances, may be compared with one another; and the comparison shows that the hoeing was of use probably as often as it was repeated, but how much, it is impossible to determine, on account of the solution with which 3 and 4 were watered. One thing, however, is clear, that the increase, which bore some proportion to the number of hoeings, was in no proportion to the quantity of solution which it received, but rather in an inverse ratio; and so, too, with respect to the sulphate of soda, which was much the most efficient of these manures, and in one instance gave a return equivalent to more than six quarters per acre; the same progression may be remarked, but not at all in conformity to the quantity of it used. The muriate of ammonia, indeed, seems to have observed a different law, and the ascending scale is more governed by the quantities of the manure, but still No 2 affords the same evidence of the beneficial effects of stirring the soil; the only exception is in the instance of the phosphate of potash, which is a most anomalous and inexplicable case; for it would seem, not only that hoeing was injurious to it, but that an addition of the same solution was equally injurious, and a further addition more injurious still: and yet, that the saturation of the seed with the salt was so beneficial as to raise the produce higher than any of the others. The only inference that I can draw from this is, that there was some local peculiarity in the composition of the soil, which modified the action of ordinary causes; and if this be so, the utility of a practice which has lately been much recommended, the practice of sending to a chemist for analysis a handful of soil selected for a sample, must appear to be extremely doubtful; the elements of vegetation

are scattered so unequally through the soil, that such investigations are encompassed with fallacies and uncertainty; and even if their combinations most favourable or adverse to fertility were certainly determined, which they are not, still the discovery of their existence in one patch of ground would be no guarantee of their presence a yard beyond it. I allude not so much to those palpable differences which may be observed by the eye, such as the alternations of sand and clay, which are not uncommon, but rather to those minute homœopathic doses of some of the rarer ingredients, which, it may be, are essential to fertility, and of which the quantity, and sometimes the existence, can only be detected by long and laborious research; and yet all this expense of time and money and toil would be useless (unless it could be repeated for every rood—I had almost said every rod—of land upon a farm), to prove that the facts so discovered were not confined to some trifling locality. Nor, if some prevailing deficiency *were* discovered, would it always be easy to apply a remedy; for the operations in the laboratory of nature materially vary from those which we employ, and the ingredients might not be combined, in any addition which could be made, exactly in the same proportion which is necessary for the production of the same effects. Nevertheless, although the farmer must not expect immediate assistance from this quarter, yet I am fully convinced that ultimately, by long perseverance and many analyses of the most fruitful soils, patiently and skilfully conducted, the chemist will arrive at some general truths, which will throw important light upon those principles of agriculture which are now involved in obscurity; and with a view to present benefit, if he can only show within what limits and in what forms lime and iron are essential to fertility, they being easily within the grasp of a rude analysis, the farmer will soon see his way more clearly into the causes of plenty or barrenness in his fields, and will be more ready to avail himself of the means within his reach to cure defects which are not beyond his comprehension, nor beyond the hope of remedy.—*L. Vernon Harcourt, West Dean House.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Conclusion.—The reader who may have honoured these cursorily-written Sketches with a perusal, must have perceived that my object has not been to hold up the system of farming pursued in this locality as a model of judicious husbandry for general imitation, or as suitable for introduction into districts dissimilarly circumstanced. I have throughout, for the most part, contented myself with a simple statement of facts. This course I considered more satisfactory than that so frequently adopted by tourists, of publishing extraordinary and often extravagantly enormous statements of produce and profits, without at all entering into the details of the grand system of cultivation by which such startling results are represented to be realised. East Lothian is, no doubt, a highly-cultivated district, and occupied by respectable and enterprising farmers; but still the system of management adopted there is in many respects susceptible of great improvement. The statements of produce given in connection with the cultivation of the different crops may strike many of my readers as contrasting strangely with the ideas they had previously formed on the subject; but after diligent and repeated inquiries, as well as from personal observation, they will be found to be perfectly correct. On another occasion I hope to be able to place before the readers of this Journal a statement of the actual results obtained from individual farms on each of the several classes of soil into which the county is naturally divided; and in this paper I shall introduce a few general remarks on the system of management which I have hitherto so minutely described.

The soil and situation of any district properly exercise an important influence in determining the precise course of management which can be most profitably adopted, the former consideration, for the most part, determining the class of crops to be cultivated, and the latter the manner of their disposal. Wheat has been seen to be the staple crop of the East Lothian farmers, the strong tenacious soil there abounding being peculiarly suited to the Wheat plant; but by the more general adoption of the various improvements recently discovered, it is believed that not only might an increased produce be obtained but a greater diversity of cropping might also be introduced. Though naturally very fertile, the general character of the soil is a stiff, tenacious clay, in its present state difficult and disagreeable to labour; commonly requiring four or five ploughings, and an endless number of rollings, harrowings, grubbings, &c., even in favourable seasons, before it can be sufficiently pulverised and prepared for a Turnip crop; while in adverse seasons, such as that of last year, it is almost impossible to labour it to any degree of perfection. In its natural state it retains water like a sponge, and when once thoroughly saturated with it, requires a long time to become dry and ready for working. Hence draining and subsoil-ploughing are important primary operations before the resources of the soil can be fully developed; but although the former of them has been long practised to a greater or less extent, the great and essential importance of perfect drainage, and a thorough pulverisation of the soil, is not so generally appreciated or carried into operation as it is desirable that it should be, and hence a principal cause of the comparatively low produce frequently obtained, notwithstanding the superiority of the management in other respects.

In too many cases, the system of drainage effected by cross drains and open furrows is still the only method employed for the removal of superfluous moisture; nor is pulverisation carried deeper than the ordinary furrow-slice in ploughing. The system of parallel drainage is efficiently carried into operation in some cases; but even here erroneous ideas seem to prevail in reference to the means by which these effect the desired purpose. Wherever this system of draining is required, the action of the subsoil-plough is necessary to insure perfect dryness, it being no less necessary to provide the means for the water to enter the drains than to carry it off afterwards. The general prevalence of erroneous ideas on this subject can alone account for the trouble taken after drainage, even when it has been properly practised, to insure the open furrows of the field being directly over the drains, to facilitate thereby the water finding its way into them, as described in my paper on the subject in the *Gazette*, p. 395.

It is almost incredible that subsoil-ploughing has made so little progress among the East Lothian farmers, especially when it is considered that their soil, of all others, is that likely to benefit most from the operation. The use of the subsoil-plough may, indeed, be regarded as among the most important improvements which have recently been effected in British agriculture; for without it, as already observed, drainage is incomplete. When this circumstance is taken into consideration, it will not be regarded as surprising that the summer fallow should still be regarded so essential as a preparation for the Wheat crop—a process which, whatever may have been its advantages under former management, is now very properly regarded as unnecessary wherever the use of the drain and the subsoil-plough is properly understood.

The necessity of deep pulverisation to facilitate the escape of moisture contained in the soil into the drains has on former occasions been so forcibly brought before the readers of the *Gazette*, that it is scarcely necessary to enlarge on it here. An important result of the removal of superfluous moisture from the soil—the production of increased temperature in it—does not, however, seem to be generally understood.

The first and most obvious result produced by perfect drainage, by means of the frequent drain system and the action of the subsoil-plough, is the comparative facility with which the usual operations of husbandry can afterwards be performed at almost any season, and without any injury to the soil, unless while rain is actually falling, or immediately after. How often is the proper period for sowing unavoidably allowed to pass before the seed can be got deposited in the ground, owing to the unfavourable state of the soil! This is a circumstance with which the East Lothian farmers are familiar; and it is scarcely necessary to add, that it is almost invariably followed by a scanty crop; but even on wet soils, when, through the intervention of a favourable season, the seed-time may not be unnecessarily delayed beyond the proper period, how often may the crop afterwards be seen to languish and assume a sickly hue, in consequence of the saturated state of the soil on which it is produced! In dry seasons the value of perfect drainage is not so fully appreciated; nay, in such cases, it is too commonly supposed to aggravate the evils of drought; but the reverse of this is the fact. The evils of drought on the growing crop are greatly aggravated by the fissures thereby produced in tenacious soils, which still further contribute to facilitate the escape of whatever moisture may still remain in them; but it will be invariably observed that land saturated with moisture during the winter has the greatest tendency to suffer from this cause in the summer. Perfect drainage, therefore, instead of aggravating the evils of drought in the summer season, contribute more than anything else to alleviate them.

But one of the most important results of dryness in the soil is the increased degree of temperature thereby produced, the beneficial effects of which on vegetation, as contributing to increase of produce and early maturity, are sufficiently well known. As rain falls from the heavens it must either escape by subterranean channels or by evaporation. On certain geological formations, such channels are formed by nature, the substratum abounding in innumerable natural fissures, through which the water is carried off almost as quickly as it falls; and whatever may be the natural fertility of such soils, they are invariably distinguished by the comparatively early period at which the crops produced on them are ready for being harvested. Wherever such channels do not naturally exist, they must be formed by art before the productive powers of the soil can be fully developed. It should be constantly borne in mind that the smallest portion of water cannot escape from the soil by evaporation without the abstraction of heat. Every one must be familiar with this effect in the case of allowing the hand to become dry by evaporation after immersion in water, and the sensible degree of cold thereby produced; and, if alcohol or ether be substituted for water, the cold produced by evaporation will be much increased, in consequence of the rapidity with which these substances pass into vapour; indeed, so great is the degree of cold produced by the evaporation of ether that it may readily be made to convert water into ice in the warmest day in summer, the water in this case being merely placed in a thin glass tube, and the ether being made to fall on the outside in drops. Water evaporates more slowly than ether, and hence its effects in causing a diminution of temperature are not so apparent, the loss of heat being extended over a greater interval of time.

The maximum degree of heat in the soil is therefore produced when the greatest possible facility for the escape of the moisture contained in it has been secured. In a well drained field a day will, in most cases, be sufficient to carry off the water which may have fallen the preceding one in rain, leaving little to be carried off by evaporation; but in undrained tenacious clays, where evaporation is the only means of carrying off the moisture, the soil will often be completely saturated for weeks after heavy rains, and while it is in this state none of the ordinary operations of tillage can be performed on it, without imparting to it a degree of tenacity which it will require much subsequent labour to remove.

There are many of the details of East Lothian husbandry well worthy of imitation, and which might be advantageously introduced into other parts of the kingdom; but in the department of agriculture, now the subject of consideration, there is no question but the East Lothian farmers have much to learn, and considerable exertion to make before they are on a par with less highly favoured districts. If the subsoil-plough had been judiciously employed in conjunction with the drain, not only would the position of the furrows of the field, in relation to the drains, be a matter of perfect indifference, but open furrows would, in fact, be altogether unnecessary, the whole being in that case advantageously laid quite flat, without the intervention of ridges of any kind. The waste in cropping occasioned by open furrows, as well as the diversity in the quality of the produce thereby occasioned, are familiar to every farmer. Occasionally, it is true, a field so laid down may be seen in this district, but the practice is not general; nor, in fact, can it be so until more effectual means are extensively employed for drying the soil. Much of the soil of East Lothian was drained with tiles before the use of the subsoil-plough became generally known, and the drains then made being seldom more than 20 inches in depth, the use of that implement was afterwards inadmissible without destroying the drains; and hence a principal reason of so much of the surface of the county being now in an imperfectly drained state.

In conclusion, I may be allowed to state that if the Sketches of East Lothian Husbandry, which have now occupied so much of the space of this Paper, shall have had the effect of correcting misstatements, of removing erroneous impressions, or of contributing, in any degree, to the improvement of agriculture in less favoured districts, my object in their preparation will have been attained.—*T. Sullivan.*

ON GYPSUM AS MANURE.

It has been mentioned before, that gypsum is now strewed with great effect over the dung, and ploughed under with it; we may be assured, however, that this operation will especially succeed in dry localities and dry seasons; because, as the gypsum requires 450 parts of water for its solution, and the now formed sulphate of ammonia merely $\frac{2}{3}$ parts of water, the plants will, in this case, be the surer supplied with the required sulphuric acid. It is advantageous, on the same ground, if gypsum (as it is done in some places) is mixed with the dung in the stables, or in the dunghill. He, however, who asserts that gypsum can only operate if previously decomposed by ammonia, is in error, because it manures well, even when the soil contains no ammoniacal salt which could decompose it; nay, we see that it acts powerfully, even if merely lying on the leaves, and solved in the water of dew.

It has been also often asserted that gypsum acts advantageously on vegetation only, because it constantly attracts water from the air, and thus supplies the soil with it. A trifling experiment, however, can convince us that this assertion is groundless. If a certain quantity of dry earth be mixed with a little powder of gypsum, and another be left by itself, we shall find by repeated weighings, that that portion which has been mixed with gypsum has not attracted any more water from the atmosphere than that which is unmixed. Fresh-burnt gypsum, it is true, attracts $21\frac{1}{2}$ per cent. of water; but it does not give it up to the earth, but fixes it chemically.

If it is the case at times, that one coat of gypsum is more effective than another, it will be because it has been better burnt; it is especially important that it be not too much burnt, else it will become vitrefied, and soluble in water with difficulty. The few useful substances which it contains are of no consequence, because as only 80 to 90 lbs. of gypsum are used on the acre, the former cannot exercise any important effect on vegetation. It is, however, possible that gypsum, which contains much sulphuret of calcium, may be one of striking effect, as plants can then assimilate the sulphur and calcium without previous de-oxidisation. Some assert, also, to have found by experiment, that the sulphuret of calcium, which is formed by the influence of the carbon on gypsum, during the process of burning, improves vegetation to a considerable degree. It is natural that the fine dust of gypsum will dissolve easier in water than its coarser grains, as the former affords more points of contact to the fluid. It therefore is another instance of one sort of gypsum acting more powerfully than another; this may be caused by its different degree of pulverisation.

As it acts especially on the formation of leaves, the crops of Beans, Peas, and Vetches, which have been manured with much gypsum, will yield much straw, but little additional grain, as the former will grow on without producing any husks; for the sake of avoiding which, no more than 20 lbs. of gypsum ought to be used on some sorts of soil. Gypsum will avail most plants belonging to the families of the Leguminosæ and Coniferæ, which is easily explained by their containing many vegetable substances, into whose chemical composition sulphur enters to some amount. It is less useful to the Cerealia, and Buck-wheat does not derive any benefit from it at all; to Maize, on the other hand, it is very useful. It operates very quickly, because Clover, manured with gypsum, can be recognised even after eight days, by its

dark-green colour. Such Clover, however, must be given to cattle with some caution, as they become easily inflated thereby, which is, doubtless, caused by the great amount of sulphur the plants contain, as it is known that the gas, which mostly causes inflation, is sulphuretted hydrogen. If gypsum is strewed over the Clover, sown amongst Oats or Barley, immediately after the former has germinated, it will, at times, grow so luxuriantly as to choke the crop; the same will at times take place after the burning of turf, viz., if the ashes thereby obtained contain much gypsum. Once, after burning turf, planted Clover amongst Oats, which flowered the first year, and was 3 feet high.

It has been also found that the straw of Peas, Beans, or Vetches, which had been manured with gypsum, had given horses the colic; and it was believed to have been caused by the gypsum which had passed into the plants. Still, this may only have resulted from the crops (most luxuriant after that manure) not having been properly dried before being brought into the barns, and that the cholic was caused by the mould thus generated. It may be taken as a general truth that all crops, grown after gypsum, are more nutritious than usual, as sulphur is one of the essential components of the animal body.

Gypsum, applied in the usual quantities (80 to 100 lbs. per Magdeburg acre of land), acts merely for 3 to 4 years, the reasons of which have been stated above. It is never necessary to use large quantities, partly because gypsum is easily soluble in water, partly because the plants require but little sulphur for their perfect development. In some places Clover is manured after every crop; but then, every time but a very little is taken, which deserves to be imitated, especially in cases when the subsoil is very pervious, because then the gypsum solved in water would be quite lost for the crop, with the exception of Lucerne. There are yet some other mineral substances containing gypsum, which are used as manures, viz., the pan-stone and thorn-stone of salt works, which are obtained by the boiling and evaporation of the salt ley, and have long been known as superior manures.

a. The pan-stone consists, according to the chemical analysis to which I have subjected it, of 60 to 70 per cent. gypsum, at times 10 per cent. common salt, little chloride of potassium, sulphate of soda, oxide of iron, and magnesia. [Analysis will give very different results in different specimens.] Although, therefore, the pan-stone owes its manuring properties chiefly to gypsum, it is to be observed that the common salt also will exercise some influence. The other substances can avail the plants but little, and they are contained in it but in small quantities; and as, moreover, the quantity of pan-stone brought on a certain area is so trifling that it cannot be expected to exercise any great influence.

On some soils the manuring with pan-stone, like that with gypsum, will be quite useless, whilst on others it will be exceedingly beneficial. Similar effects always follow similar causes, and it is clear that pan-stone can produce no effect on soils which possess already a sufficient amount of gypsum and common salt, as the plants have previously satisfied their want of these two mineral substances. It is also to be considered, that the amount of pan-stone used (100 to 120 lb. per acre) conveys not sufficient common salt on the soil for producing any extraordinary result, as we shall see afterwards, that at least 110 lbs. common salt must come on an acre, if the result shall be favourable, and that area will obtain through 100 lbs. of pan-stone (assuming it to contain 10 per cent.) only 10 lbs. of common salt.

Pan-stone will prove itself useful to all plants to which gypsum is of some use, this being its chief manuring substance. It will especially advance the growth of Peas, Beans, Vetches, Lime, &c. Previous to its being used, it must be carefully pulverised, which will cause much trouble, if it be not done in a stamping-mill. It is generally strewed over the young Clover, or the young crops. If it contains (as is at times the case) much carbonate of lime, magnesia, &c., a greater quantity than that above stated is to be employed.

b. Thorn-stone is either beaten off the thorns which have been used for the refining of the salt ley, and around which it has formed a hard crust, or they are burnt, after which they are pulverised and used as a manure. It consists, as I have learnt from several experiments, mostly of gypsum, as it contains only 5 per cent. of carbonate of lime and magnesia, silica, iron, &c. If the thorns are burnt, they manure, as a matter of course, also by the ashes of the wood. It is used like gypsum, and will avail all leguminous plants, Clover, &c., in the same way as the former.—*From the German of Professor Sprengel.*

Home Correspondence.

The No-pasture System.—No one can be a greater advocate for abolishing permanent pasture than myself; and I am convinced, from experience, that milch cows and working horses are kept most advantageously by being soiled; but Mr. Mechi ought to tell us that he has found, experimentally, that young cattle and colts can be reared equally well by soiling as by pasturage, otherwise his system must be faulty. It appears to me, also, that there is an objection to his favourite Lucerne and Saintfoin, inasmuch as they interfere with rotation, and are almost as bad in this respect as permanent pasture. In other points they are certainly superior to the Clovers, as, when established, they make us more independent of the seasons, and afford a more frequent cut. On the failure of the Clovers, we have no alternative but Vetches. Mr. Mechi has, I think, said that he cuts all his green meat into short lengths. Does he do it by hand or horse-power? If the latter, with how many knives? I have broken a one-horse power machine by attempting it, owing to its clogging. Is there any good reason for a cow giving more milk when the hay she eats is cut into inch lengths, or when given uncut?—*W. C.* [We know of none, excepting that the process of digestion may be more effectual when the food is administered in a somewhat reduced state. There is not that reason for reducing the food of animals that chew the cud, that there is in the case of the horse, and others which do not.]

Failure of Oats.—I am a reader of your very valuable Paper, and have seen several articles which I approve of upon rotation of cropping, but have met in neither anything accounting for the deficiency of a crop of Oats in some parts of fields, whilst in other parts of the same field a good crop is produced. This failure is by some farmers called "blowing," that is, the Oats grow until the ear is about formed, when it begins to assume a stunted and withered appearance, and consequently comes to little use. It generally happens after ley; but when the ground has produced a crop of Potatoes or Turnips, and is properly cleaned, the Oats after are a good crop. Is it a deficiency in the soil, or is it a weed which robs it? I am inclined to think that it is the latter, as the spots are much overgrown with plantain, &c., and likewise the failure happening after ley. Would Beans answer in such parts after ley? Here we sow Beans after Turnips, along with Grass-seeds. Be so good as to state what is the cause of failure of Oats, and if Beans would grow after ley in such soil. Our soil here is, for the most part, a stiff loam.—*An Aberdonian.*

Experiments on Nutrition.—The experiments of Boussingault with his two cows fed on Mangold Wurzel alone, are somewhat akin to those made by his countryman, Macaire, on plants, some years ago, when the excretionary theory was propounded. In both cases the subjects experimented on were placed in such a state that disease was sure to be the consequence; in the one case the fatty matters found in the milk and the excrements of the cows were proved to be produced at the expense of the fat previously deposited in the animal tissues; so the much-talked-of brown matter found in the water in which Beans had grown (or rather had been soaked), would, there is good reason to believe, be found to be produced by the destruction of some portion of the tissues of the seed or plant. No experiment of this kind can be satisfactory unless it be so conducted that the subject experimented on shall be continued in a perfectly healthy condition. The experiments made by Earl Spencer, as detailed in the 2d vol. of the "Journal of the Royal Agricultural Society," were conducted on such a plan that the health of the animals was preserved. Barley when malted, will cause an animal to become sooner fat than when unmalted. Will the disciples of Messrs. Boussingault and Dumas inform us how this takes place?—*Inquirer.*

Gas-Water.—Having seen in your Paper lately an article recommending one of your correspondents to add gas-water to a heap of decayed leaves, &c., I intend to try the plan; but on going to the gas-works I found that there are two sorts of gas-water—one, a sort of brown oily substance, which distils from the gas, and from which, I believe, they make naphtha; and another, lime-water, which is used for purifying the gas. Now, would you be good enough to inform me which I should use, and what quantity for a heap of about six cubic yards, and oblige an—*Amateur.* [Two or three hundred gallons of the former, which is the *ammoniacal liquor*, should be applied per acre; if you intend to apply these 6 yards of leaves on an acre, soak them with that quantity.]

Guano versus *Farmyard Dung.*—At a time when so many conflicting opinions are afloat respecting the fertilising properties of guano and other manures, I think it but right that every one who has the opportunity and the will to try experiments in this way, should give to the public the result of such trials; and having no doubt but that the following particulars will be of interest to some of your readers, I with pleasure record them, with a further promise to report also the result of other trials now in progress. Last spring, to test the efficacy of guano as a manure for Potato crops, and also to try its relative merits with good farmyard dung, I dressed about an acre and a half with guano, at the rate of 6 cwt. per acre, at a cost of 3*l.* 18*s.* per acre; sowing it in the drill, and covering lightly with mould before planting the set. I also had drills opened and the dung laid in; the set being planted on the dung. In order to bring the expense of manuring per acre as near as possible to each other, I manured with dung accordingly, thereby giving what we here term a good dressing: the land is rather poor, inclining to a peat. Those sets planted on the guano showed a very marked superiority in their growth, even up to the very day of digging, when the result fully realised my most sanguine expectations, and justified me in my previous predilection for this new-fashioned fertiliser, by giving the following return*:—

No. 1.—Short row.. Dung 6 bsh. 6 galls.
No. 2.—Ditto .....Guano 8 bsh. 2½ galls.

Thus giving a difference of 1 bsh. 4½ galls. in favour of the guano; and this superiority was very general throughout the whole crop. I have witnessed its very powerful effect upon Grass land. In the beginning of August, having selected a very poor miserable piece of lawn or pleasure ground, I applied a dressing of guano, at the rate of 5 cwt. per acre, having previously mixed it with a quantity of leaf-mould; the effect was instantaneous, for in less than a fortnight, the plot assumed a darker hue, and rapidly recovered from that sterile appearance it had for two months previously borne; and at the time of cutting, which was less than seven weeks after the application, the Grass had grown to fully 7 inches in height, and of a most healthy appearance, while the ground (for it could not possibly be called Grass) adjoining had more the appearance of a gravel walk than otherwise; and at this period (December 1st), the selected spot appears to have undergone quite a change, still maintaining its verdure-like appearance. In order to be quite sure that the leaf-mould had not a great share in the improvement, I dressed another plot from the same heap, but the continued dry weather prevented its having any beneficial effect whatever; consequently I was quite satisfied that the astonishing effect was attributable entirely to the powerful agency of the guano.—*Quercus II.*

* I had not leisure to superintend the measuring of a larger quantity; but am quite satisfied, from my daily visits to the men, that the measured part bore a fair proportion to the whole.

Feeding Cows.—I keep two cows tied up day and night in the cow-house, except on fine days, when they are turned out into the yard for two or three hours in the middle of the day. I give them as much meadow hay as they choose to eat, and each cow has one oil cake, about 3lb., divided into three portions, for morning, mid-day, and afternoon. I have plenty of Potatoes—200 bushels at the least—but no apparatus for steaming, no copper large enough to boil the Potatoes in, and firing is very dear. My question is, May I venture to give the cows the Potatoes in a raw state? and if so, in what quantity? I have made many inquiries among the neighbouring farmers, and have conflicting answers. Some say, the Potatoes will do the cows no harm—others that raw Potatoes will ruin the cows, make them poor, lousy, and the milk no better than mere water, with many other objections.—*Hatfield.* [The results of experiments on feeding with Potatoes, strange as it may appear, have as often been favourable to using them when raw as when boiled or steamed.]

Inclosure of Land from the Sea.—If the "Strathern Farmer" will refer to the *Agricultural Gazette* of Oct. 26, and the following Numbers, he will find inquiries made on the subject he is anxious to give information upon. In the case referred to he will see that the difficulty was to get rid of the superabundance of salt. It does not appear whether there was any great admixture of salt in the overflowings from the Tay—probably much less than in the case before inquired into, which related to a tide-river in the south of England. Having seen the Tay, I should suppose there was more fresh water in that noble river than in all the rivers that flow into the sea, in Sussex or Hampshire, at any time of the year, except, perhaps, in very wet winters, for during the dry months the quantity of fresh water, compared with what flows in by the tide, is very insignificant. After the tide is gone down, the water left in the pools is still so salt that common sea-weed flourishes in it. Of mud there is no deficiency, but, from the superabundance of salt in it, it is hardly fit for the purpose of manure by any process I know of. There is no doubt an alluvial deposit from the fresh water above the tide-way, brought down by heavy rains from the land above; but no land, fit for cultivation, can be gained from the river, as is described to be the case in the Tay. The directions as to the slope of the banks to the sea are very valuable. The sea has been excluded from about 30 acres, which in September last was very dry. It will be brought into cultivation whenever the best method of getting rid of the salt can be ascertained. Any information as to what will accomplish this will be thankfully received. The "Strathern Farmer" will perceive that I am enough of a Scotchman to answer his questions by asking another; but I conceive he is far more likely to know how to convert his reclaimed mud into arse land than I am.—*M. D. P.* ["M. D. P." shall soon have evidence on this subject from another quarter.]

Allotments.—Not long ago, a correspondent from Tottenham wrote in the *Agricultural Gazette* about the many difficulties in the practical working and letting of allotments, and especially as regards the trouble of getting them into one's own hands again out of those of bad tenants. I meant to have let some land for allotments this Christmas, but thy correspondent has alarmed me, and unless he can put me in the way of letting, so as to be safe, and so that they will require but little trouble, I must reluctantly decline. I think he says that he has managed allotments for 20 years; and if so, he surely by this time must have hit upon some well defined plan, and rules, and regulations, and agreements, by which the matter may be managed almost to a certainty. If he would furnish such to the world through thy Paper, it would doubtless be useful to others as well as to myself; or if he will not do that, perhaps he will communicate his plans and modes privately to me, through thy introduction. I hope to see something about it in next Number, or to hear from him this week, as the time is drawing so near when the labourers would like to begin, and I understand they are very anxious to do so.—*Robert Warner*, 8, *Crescent, Jewin-street, London.*

Hedgerow Timber.—I wish to call attention to the management of hedgerow timber, the early pruning of which is generally totally neglected; although from its unsheltered position it more especially needs judicious treatment. It is commonly left entirely to the discretion of such farm labourers as may chance to be, at intervals, engaged in making and repairing the hedges in which it stands. They, of course, seldom feel much in-

terest on the subject, or can exercise much judgment respecting it. On many estates the timber is almost exclusively confined to the hedgerows, where it is very abundant, but has been suffered to grow up without the slightest attention to pruning. On every side trees of considerable magnitude may be seen spreading their limbs widely over the inclosures they surround, so low as, in many instances, scarcely to leave headroom for the plough teams; yet it is with difficulty that a tree can be found having a clear bole of sufficient length to be converted into plank for a barn floor, or even into materials for common field-gates. The total neglect of pruning hedgerow trees is a severe injury to the farmer. The massive heads of the trees reach almost to the surface of the soil, destroying that portion of the crop over which they immediately extend, and injuring the remainder by shutting out the light and air from them. It also leads to the wretched practice, wherever it is not strictly forbidden, of lopping off the lower limbs when of large size. This practice exists to a great extent; the limbs are commonly cut off at the distance of 2 or 3 feet from the bole, under the notion that the stumps will throw out young shoots, and thereby prevent their decay. This may be the case when trees are felled within a few years after having received such treatment; but if they remain standing for a longer period, some of these stumps must inevitably decay, and then they serve as channels to convey the falling rain into the bole, much to its injury. If landowners could be induced to give instructions that all young saplings standing in the hedgerows on their farms, should for the future be reared with clear stems of reasonable heights, and if these instructions were attended to at the periodical times of making the hedges, it would contribute equally to the advantage of themselves and their tenants; and at the same time put an end to this sad habit of lopping. Many timber merchants are altogether adverse to pruning. On my speaking of the subject to one of very extensive experience in the Wealds of Surrey and Sussex, he most emphatically said, that "it is better at once to cut down an Oak sapling, than to attempt to prune it; the Oak," he added, "will not bear pruning." Your correspondent, P. P., appears to have received a very similar reply from the Sussex timber merchant; he, however, ultimately qualified his opinion by admitting that you might keep a clear stem while the tree was young, so that you did not interfere with its top, thus assenting to nearly all that most advocates for moderate pruning would desire. It is doubtful whether much deference is due to the opinion of timber merchants on the subject. Their attention is almost exclusively directed to timber trees of mature growth; and they are too apt to attribute the defect discovered, in the conversion of timber, to the injurious effects of pruning, when, in truth, they should be referred either to the pernicious practice of lopping, to which allusion has before been made, or to the trees in which these defects appear, having been permitted to grow up so close together, that, for want of air, the lower limbs in time ceased to vegetate, and at length became rotten. It may be objected, that it would be folly to attempt to rear trees in hedgerows, with lofty stems; that, standing without shelter, they are naturally disposed to throw out a profusion of branches; and that, to oppose this tendency would be to combat against nature. It is not contended that we should aim at obtaining lofty stems; but that we should endeavour, by early pruning, to secure boles of such heights as may, according to situation, be reasonably hoped for, and be capable of forming valuable timber. Experience proves we need not despair of this.—*W. A.*

Potatoes.—I wish to reply to the notices which have recently appeared in the agricultural part of the *Chronicle*, casting doubts on the manuring properties of the Garnkirk fireclay for growing Potatoes. The experiment I reported was certainly made on a very limited scale, and, consequently, less satisfactory. For the accuracy of the details I communicated, however, I can vouch, on evidence that your correspondents will not question. [This was not in the least doubted; we only suggested the unreasonableness of inferring anything in agriculture from trials of such limited extent.] Mr. Sprot planted the Potatoes in presence of Archibald M'Neill, Esq., Director of Chancery, and others, who can attest the truth of what I stated as to the relative qualities of dung and clay used respectively. The produce of the four shaws was taken up in the presence of Capt. Marshall, of the Royal Terrace here, Mr. Sprot, of Garnkirk, Mr. Thomas Sprot, and myself. In answer to Mr. Goodiffe I may observe, that so far from the influence of the dung having extended to the shaws manured with fireclay, it was the shaw farthest off from he dung that gave the greatest return, the produce of which alone was more than both the dunged shaws put together. Suppose the figures 1, 2, 3, 4, to represent the position of the shaws, 1 and 2 being the fireclay, and 3 and 4 the dunged shaws; the shaw No. 1 was more productive than both Nos. 3 and 4. Yet I own the experiment was too limited. It will be put to the severest test next season; for not only Mr. Sprot, but his neighbour, Mr. Campbell, of Bedlay, and others, are to try it on a large scale, by growing, say three or four drills of Potatoes manured with clay, and three or four drills manured with dung alternately over the field. Let your readers have the kindness to await the issue, and till then suspend their judgment.—*N. Anderson, Maryfield, Edinburgh, Dec. 7.*

To get rid of Moss.—Fold your sheep on the parts overrun with it, and give them Turnips or Swedes, &c., to eat in troughs.—*J. B.*

Societies.

HIGHLAND AND AGRICULTURAL SOCIETY.

The first monthly meeting of this Society for the session was held on Wednesday last, under the presidency of Mr. Graham, of Balgowan.—Mr. Borthwick of Crookston commenced the business of the meeting by reading a report on the plantation made by the Duke of Richmond, on his estates in Aberdeenshire, during the last five years. The ground planted comprises the Binhill and adjoining moors, situated in the parishes of Cairnie and Huntly, and distant one mile from the town of Huntly. It extends 2¾ miles from east to west, and 2¼ miles from north to south, comprehending an area of 2258 imperial acres. The aspect of the ground is much diversified by irregular rocky hills. The surface is either rocky or occupied with very large earth-fast stones, which rendered it quite unfit for tillage, and had been pastured as a common by sheep and cattle belonging to small tenants and crofters. The soil is various. On the low grounds the soil is in some parts wet gravelly clay, retentive of water; in others of deep rich loam, damp, and even swampy; and at other parts it is of friable loam, on dry porous subsoil. On the high rocky grounds the soil is friable loam of good quality. On the braes along the base of the rising grounds it is deep and mellow. The vegetation consisted of benty Grass upon the wet retentive clay, green sward with long Heather upon the damp deep soil, and green sward and short open Heather upon the high rocky grounds. The land was surveyed, and a plan made in 1838, by Messrs. Beattie and Walker, land-surveyors in Aberdeen, and they also made out the specifications of the contract for fencing the grounds and planting them. The fence consists of a Galloway dyke of angular stones, built 3½ feet in height, at 6*d.* per yard, carriage included, at a cost of 464*l.* 4*s.* 3*d.* A number of open drains were made through the wettest parts of the ground, from 1 to 2 feet in depth, 12 inches wide at the bottom, and from 1½ to 3 feet wide at the top, at a cost in all of 225*l.* 15*s.* 7*d.* A road of 15 feet in width was made for the purpose of giving access to a moss from which the servants were in the habit of supplying themselves with peat fuel, and which cost 180*l.* The roads afterwards required for conveying away the thinnings of the woods, and the timber itself, will be made as occasions require. The grubbing of Whins and other plants cost 54*l.* 0*s.* 9*d.* The ground was subdivided into seven portions before being planted, and the trees which each division was to receive were specified in the contract. The first lot was planted with Scots Fir and Larch, 2 years' seedlings; the second lot with Spruce alone, 3 years' seedlings; the third lot with Scots Firs alone, 2 years' seedlings; the fourth lot with Larch alone, 2 years' seedlings; the fifth lot with hardwood, 4 years transplanted, consisting of Oak, Elm, Ash, Birch, and Beech, in equal quantities; the sixth lot with Larch alone, 2½ years transplanted; and the seventh lot with Scots Fir and Spruce, 2 years transplanted. The exact quantity of ground thus planted consisted of 2257 acres, 2 roods, 1 pole, with 6,387,017 trees. The contractors for planting the whole ground were Messrs. Lawson and Son, Edinburgh, Seedsmen to the Highland and Agricultural Society, and their contract price was 1956*l.* with obligation to uphold the plants for 4 years. The operation of planting commenced in March, 1836, was resumed in November, and finished entirely by the 20th of December of the same year, and the task was performed by from 50 to 80 men and boys. The cost of all the operations stands thus:—

	£	s.	d.
Estimate for planting	1956	0	0
Inclosing with a stone dyke	464	4	3
Making a road	180	0	0
Draining with open drains	225	15	7
Grubbing up bushes	54	0	9
Expenses of survey, &c.	76	12	11
	£2956	13	6

Giving an average cost of about 26*s.* per acre.

It seems that about 100,000 plants were required to fill up the blanks caused by ordinary failures during the four years in which the contractors were bound to uphold the plants; but as many of the plants had been placed in situations unsuited to their nature, though in accordance with the terms of the specifications, the blanks occasioned by their failure were filled up at an additional expense to the proprietor. For this purpose, 260,000 Larch, 340,000 Scots Fir, and 50,000 Spruces, were required. "It remains only to be added," concludes the report, "that during the past summer the plantations have made rapid progress, excepting in those portions of the ground where, from various causes, the plants have failed to some extent; and that the Binhill and moors adjoining it already begin to assume something of a clothed appearance." Mr. Borthwick remarked, that one might learn from the Paper which he had the honour to be appointed to read to the meeting, that although much attention had been paid to the drainage of the land, and to the prevention of the Grasses originally growing on some parts of it from choking the young plants, yet that a greater degree of precaution might have been advantageous. There are many instances of plantations being made, which have either failed, or, advancing in a feeble and languid state, have not made more progress at the end of ten or fifteen years than they would have done in four or five, had more time and pains been taken, before the act of planting, thoroughly to drain, cultivate, subdivide, and inclose the land. As appeared in the present case, considerable injury had been done to the young plants on the more fertile divisions of the land (where the hardwoods, the most extensive of them, were put), from being overlaid and killed by the Grasses. Mr. B. was of opinion that on such situations where the plough could be used, advantage arose from ploughing the land with a shallow furrow, and taking a crop of grain, for a season or two, so as to pulverise the surface, and remove the old established Grasses, the roots and stems of which, on land never before in tillage, or on old lea, formed a thick matting, which, as it were, thatched the ground, and thereby, unless in very wet seasons, prevented the rains from fully penetrating the soil. But by this preparatory process the humidity of the showers during the first season after young trees are planted reaches and invigorates their roots, which, soon striking into the subsoil, give them a firm hold of the ground. Where the land is so situated as that it cannot be ploughed, from steepness or otherwise, benefit might be derived from paring the land to some distance round the space where each plant is to be put.—The next Paper, on the Results of Comparative Experiments made by Mr. James Melvin, Bonnington, near Ratho, on Potatoes imported from different countries on the Continent, with the common varieties cultivated in this country, was read by Mr. Boyle, gr. of Shewalton. The foreign varieties consisted of two from Hamburg and one from Holland. They all had when planted an unpromising appearance, being small, even smaller than the out-riddlings in this country—green and watery when boiled—having a clear thin skin when washed, and showing a great many eyes. The soil in which they had grown had stained them with a brownish-black colour. Of the two varieties from Hamburg, one was white, the other pink; and that from Holland was white. They were planted in two fields, occupying in all fully a Scotch acre, in a manner precisely similar to the Potatoes of this country. The Hamburg Pink almost entirely rotted in the ground. The two white varieties manifested at first an unfavourable appearance, sending up puny shoots—every eye, however, sent up a shoot—and as most of the tubers had been planted whole, and the people, fearing to lose the crop, from their smallness, insisted on planting two together, and the number of shoots that came up crowding together, showed at once that the crop had been too closely planted. After the stems had risen about two feet they interlaced in the drills, and presented a surface of uniform levelness, and at length towered far above the common varieties in the same field. The Dutch White exhibited a white blossom, with a few seed-apples; the Hamburg White a beautiful purple and highly odorous blossom, but no seed-apples. The leaves of the Dutch sort had fallen, while those of the Hamburg remained vigorous and green when the crop was taken up. In regard to comparative produce, in one field, the Hamburg White yielded 12 tons per acre, while the common Dons gave only 6 tons, with 20 tons of farmyard dung and 3 cwt. of specific manure, of the value together of 7*l.* 7*s.* per acre. In the other field the Dutch White also yielded 12 tons, and the Dons 7 tons per acre, with 24 tons of farmyard dung, and 3 cwt. of specific manure, at a cost of 8*l.* 11*s.* per acre. The few Hamburg Whites which had been planted by accident among the Hamburg Pinks that rotted, having plenty of room to grow—about 4 yds. to each plant—their stems spread greatly about, and in taking up the crop, scattered as it was, each stem produced from 10 to 20 marketable Potatoes; others had as many large ones, with from 20 to 60 small; others had 90; and one had 102 Potatoes, from the size of a boy's marble to those of an ordinary-sized Potato. The Dutch White are the best to eat, but none of the foreign varieties are good for the table, being watery, though they seem well adapted for cattle, producing at least one-third more than either the Buffs or Dons. On another farm the Hamburg White gave from a sandy meadow 15½ tons per acre; while the Dons only yielded 8½ tons, and the Early-lates 9¼ tons. On a third farm from strong soil, but drained, the Hamburg White yielded 7 tons an acre more than the common sorts beside it.—Mr. Stephens then shortly described the Stone or Stubble-turnip, and exhibited some specimens sent to the Museum by Mr. Richard Makins, Shellacres, near Cornhill, in Northumberland. This Turnip possesses all the characters of the garden Stone-turnip, and may have acquired its larger size from having been cultivated in the fields. This Turnip may be raised with bone-dust or guano, like any other kind, and it may be sown as late as the 11th July, and yet afford a good-sized firm bulb by the beginning of the ensuing September, when they may be laid down on the stubble or lea for the use of the cattle or sheep. Mr. Stephens prefaced the description of the Stubble-turnip, with a few remarks on the utility of Rape for sheep early in autumn. It is raised like Turnips, and in order to avoid the inconvenience of ploughing in its strong stems when the consumption of Rape is delayed till late in autumn, he recommended portions of it to be sown at different times, so that each portion may always be in a young growing state, with slender stems, when the stock arrives to consume it. With the possession of Rape for sheep, and of Stubble-turnips for cattle, Mr. S. remarked that farmers themselves would be to blame should their stock want sufficient food early in autumn from the failure of the Grass, till the winter Turnips are led into the straw-yard.—Sir Charles Gordon, the Secretary, then intimated that he had received notice of the melancholy death of the celebrated M. Fellenberg, of Hofwyl, in Switzerland.

STURMINSTER AGRICULTURAL SOCIETY.

At the late Annual Meeting of this Society, at which Earl Grosvenor presided, the Rev. Mr. Huxtable, of Sutton Waldron, delivered an excellent speech, from which the following are extracts:—"Before I proceed to practical farming, I hope you will not object to my making an observation on the great question of emigra-

tion in reference to the labourers. I do not agree with those who consider emigration as the great panacea for the evils of the country, nor do I think, under present circumstances, that it is necessary to resort to this plan for the purpose of relieving us from what some term our redundant population. On the contrary, I am satisfied that, at present, in agricultural districts, we are far from having a surplus population, and that, instead of sending our labourers to a foreign land, away from their country and kindred—where there may be no dwellings for them, and where they would be without spiritual care, far from all churches, schools, and ministers of religion—we could profitably employ them in our own country. Why, my lord, I think, if the farms were cultivated as they ought to be, and if the necessary improvements were made, instead of sending our labourers out to Canada or other distant colonies, we should want to go abroad for labourers. And whilst this is true of our rural districts generally, it is emphatically true of Dorsetshire, where, in the Vale of Blackmoor, thousands of acres require draining, and where, on the hills, thousands of acres of down land might be profitably brought into cultivation. Let us consider the extent of labour that would be created in breaking up waste lands. Each fresh acre taken into cultivation would call, at least, for an outlay of 28*s.* a-year in labour; and although gentlemen may love to gallop over those beautiful downs without control, yet they should remember that there is in the valleys a loud cry for *labour*, and for *bread!* I do not object to the harmless and healthful recreations and sports of the country, but if we cannot employ our people in the valley, then I say, let us mount the hills. Is not, I ask, the demand for labour enough to move the sternest heart? What is it the destitute labourers ask from us? They do not come knocking at our doors, as idle mendicants, asking alms, but they ask for work. I have seen such men at the cross of my parish; and who can observe, in almost every parish, strong and yet peaceful men, standing at the cross-road, soliciting, not charity, but employment, saying, 'Here we are, sir, able in body and strong in nerve and arm; won't you give us work?' Who can see this, and not on his pillow revolve in his mind by what expedients this great power of our country, this noble race of fellows, more free from the taints of crime, more patient and enduring than perhaps any other class of their countrymen, may be turned to beneficial and practical uses? My own firm conviction is, that if we avail ourselves of improved arts of cultivation, remunerating labour may be found for all. First and foremost stands draining. I have executed many miles of drains $2\frac{1}{2}$ feet deep, a perch apart, up and down the furrows, and I can truly state that, after the first season, the effect has been almost magical in the altered appearance of both soil and crops. No outlay, I am convinced, can produce so great a return. Why, then, do not gentlemen of capital employ their resources in this way? How contemptible, in comparison, those miserable 3 per cents. above par. The Kohl Rabi and some of the Wurzel shown this day in the yard, was grown on land which, before draining, was valued at 8*s.* an acre. Another means of employing our surplus population, as they are called, may be found in transplanting Mangold Wurzel, Swedes, and Kohl Rabi. The right practice is that the seed should be sown in a seed-bed, at the end of March or the beginning of April. As soon as the Vetches, Rape, Rye, or other winter crop is consumed, the land should be ploughed into ridges, and good dung laid in them, to be then covered over by splitting the ridges; after which the Wurzel, Swedes, or Rabi should be transplanted on them. This, I can tell you, is a certain means of obtaining a good crop, care being taken that the Wurzel be nearly as thick as one's middle finger. It is only the sickly plants which fail. The expense of this transplantation can never exceed 15*s.* an acre, even when, in drought like that of this year, it becomes necessary to make a puddle with liquid manure to receive each plant. On my hill farm, upon land which, when in down, was supposed not to be worth more than 2*s.* 6*d.* an acre, in the burning month of June, this year, whilst the chalk stones were quite hot, I succeeded in raising 12 acres of good Turnips, in utter defiance of the fly. The plan pursued was to mix the Turnip-seed with pig's manure, and then to dibble both together into holes made with a bean-setting stick. This, of course, employed many hands, but the cost was not more than 7*s.* per acre in labour; and I invite any one to inspect the crop, and then decide whether the employment of surplus labour be not remunerating. Generally, the plan of increasing the demand for labour is to grow more green crops, and more abundant ones. Last winter I subsoiled, 18 inches deep, a field previously well drained, and before horses could stand on it this spring, I sowed with artificial guano in drills made by hand, Belgian Carrot seed previously steeped in liquid manure; and in consequence of using this manual labour I have gathered a harvest of 29 tons of roots, and 11 tons of tops. Let me now, my lord, mention the success and particulars of a method, which I learned from the American translation of Burger's German work (and this will serve to illustrate the advantage of 'book farming,' when corrected by practice), of preserving the surplus leaves of our green crops as winter food for cattle. The plan I pursued was to dig a long and deep pit, say 12 feet long, 6 feet wide, and 7 feet deep, in some dry spot, or made dry by draining; then to put a bed of straw or Vetch haulm at the bottom; upon this a layer of leaves, Carrot or Mangold, was strewed a foot thick, and trampled firmly down by two or three men; then a layer of salt, at the rate of 4 lbs. of salt to every cwt. of leaves, distributed evenly; then another layer of leaves, and another of salt, until the pit was filled; then it was covered with bavins, straw, and earth, so as effectually to keep off the weather, and to be as far as possible air-tight. In a few days a violent fermentation came on and a great subsidence of the materials; the pit was re-opened and again filled as before. This morning I opened one of the pits, containing Carrot tops, to see, after three weeks' fermentation, in what state things were; the appearance was at first certainly most unpromising; it seemed to be a mass of greasy dung; but, not dismayed, I carried some to the cows and found they ate it eagerly. So I have covered up my pit again, feeling assured that when, in perhaps a month, the fermentation is over, I have a large bulk of valuable winter fodder for my milch cows. Practical men will see the value of this plan, when they bear in mind that on taking up their roots they have on their hands from 10 to 14 tons of roots per acre. But there is another mode of employing our rural population, more important perhaps than any other yet suggested. That is in the cultivation and after-management of the Flax crop, equally valuable for the fibre and the seed. Here, however, we are met with the general objection, that Flax is an exhausting crop, and its growth forbidden in gentlemen's leases. But this prejudice I believe to have no other foundation than the classical authority of a line in Virgil's first Georgic. I have the experienced authority of a gentleman at Gillingham, who has grown Flax for many years, and who declares that his best Wheat crop is after Flax! If we wish to estimate the value of a Flax crop, we must recollect the following facts (for which, as well as for all the information which I possess on this subject, I am indebted to that able gentleman, Mr. Warnes, jun., of Trimingham.) The importation of Flax (from Belgium chiefly) amounted to more than 5 millions a year—viz., a sum very nearly equal to the amount of poor-rates of all England, and the value of this fibre consists chiefly in the labour expended on it. Now, besides these 5 millions paid by England for foreign labour, 2 or 3 millions more are sent, annually, out of this country for linseed cake; and what stuff it is! I appeal to any gentleman who has examined it with a microscope, to bear witness of what incongruous and worthless materials it is, in a large measure, composed—of Mustard and refuse seeds, &c., &c. (And 'old rope,' by Mr. Farquharson, which elicited a loud laugh.) Whilst we are sending away all this money for fibre and seed, we might ourselves most advantageously be growing and manufacturing this admirable crop ourselves. In our farm houses and cottages four acres of Flax would employ from 10 to 12 hands, the whole winter months, in shelter and amidst their families. And as to the value of the seed, I have learned, by the use of 2 lbs. a day, grown on my own farm, properly ground, and diluted with boiling water poured over cut straw or chaff (consisting of straw and Turnip-tops), to feed my cows at $2\frac{1}{2}d.$ a day, and to obtain unusually rich cream for the breakfast table, and this without giving any hay. Indeed, so great a discovery do I consider this, that I mean utterly to discard in future the use of that fodder (hay), hitherto considered so indispensable for milch cows and a breeding flock. I have two cows which I call my experimental cows. I assure you that when I first had them they were miserable-looking animals; but now they have sleek coats and are in good condition, giving excellent milk. I shall be glad to show them to any gentleman who will be kind enough to pay me a visit." After other observations, the rev. gentleman said—"This, my lord, is but a most imperfect and rudimentary sketch of some of the methods whereby we can, by improved husbandry, employ our rural population to their great happiness and our own advantage. On another occasion, if we are allowed to meet another year together, I shall, I believe, be able to set forth other approved plans of engaging all our people; but I have already trespassed too long on your indulgence ('No, no'), and therefore, in conclusion, I can only lift my humble warning voice against any system which shall impress our labourers with the notion that we regard them as an incumbrance and a nuisance, instead of their being, as indeed they are, God's gift to us, and in the words of the Society's motto, which your lordship has so effectively set forth, 'Our country's dependence.'"—(The rev. gentleman then sat down amidst loud and long-continued applause.)

FARMERS' CLUBS.

Maidstone.—Sir E. Filmer spoke as follows on the allotment system here, at a late meeting of this Society:—It had been said that the worst master a poor man could have was himself, but he thought that had been fully disproved. He had 80 allotments, which had been worked for ten years, and for the last four years there had been only one defaulter; and that was the case of a poor widow, who had not her money ready at the time, but paid it within a week. To prove that the poor man was not a bad master to himself, he could give them a statement with which he had been furnished by one of his own labourers:—

Rent, 1 quarter of an acre . .	£0	7	6
Manure, 17*s.* 6*d.*; Garden Seeds, 1*s.* 6*d.*; Potatoes, 11*s.* 8*d.*	1	10	8
	1	18	2
The produce of this was as follows:—			
Potatoes, 4*l.* 1*s.* 8*d.*; Fruit, 10*s.* . .	4	11	8
Vegetables for own consumption . .	0	10	0
	5	1	8
From which deduct	1	18	2
There would be a clear profit of .	£3	3	6

He went over the whole allotments afterwards, and found them much better farmed than they had been, and although he did not think the allotment system was a panacea, yet he thought it relieved the poor man from a great deal of anxiety, and taught him better his duty to himself and his master than anything else did.

Darlington.—At the November Monthly Meeting of this Club, the subject under discussion was, The proper Time for Ploughing, Preparing, and Manuring Land for Beans, and other Crops. A lengthened discussion took place, and the unanimous conclusions come to at the meeting were, that the best time for manuring and giving the land the first ploughing is in autumn previous to the winter's frosts, after which the land should be ploughed once at least in the spring; the manure applied is best about half rotten, and the land should be ploughed deep, and kept thoroughly gripped, *i.e.* the water furrows well opened through the winter, so that no stagnant water may remain in the land. Drilling and dibbling Beans was recommended in all cases in preference to sowing broadcast, as by that means the land can be hoed and kept free from weeds whilst under crop: the Suffolk drill answers well on most soils, as does also ribbing and drilling with the barrow drill in many cases; but owing to the seed spreading more in the rows by this process, it makes the crop more difficult to hoe than when drilled with the Suffolk drill. From 18 to 20 inches was considered a good width betwixt the rows.

Dorchester.—At the annual meeting of this Society Mr. Sheridan said:—One of the objects of this and similar societies is to increase the produce of the soil; I have, with that view, made one or two experiments this year. I mixed 80 lbs. of bone-dust and 40 lbs. of sulphuric acid together, and added 400 gallons of water; the cost of this was about 10*s.* 8*d.*—4*s.* for the bone-dust, and 6*s.* 8*d.* for the sulphuric acid. The liquid was conveyed to the field in a barrel, and applied in small quantities over an acre of ground after the seed was sown; it was drilled fourteen inches apart, on ridges, with Skirving's Swede. The result has been, that I have a more abundant crop of Turnips than I have seen elsewhere in the neighbourhood, and this at an expense only of 10*s.* 8*d.* per acre; whilst the general practice amongst my neighbours, I believe, is to apply two quarters of bone-dust per acre, at a cost of 2*l.* 2*s.* I think it right to add that there is a great deal of trouble attending the application of this manure, and much caution is necessary in conveying the liquid to the field where it is to be used, as the sulphuric acid, unless sufficiently diluted, is very destructive both to wood and metal. Then again, I tried thin sowing on an acre of ground upon our hills, exposed to the S.W. wind: I sowed one bushel and a half of Marigold Wheat; the drills were ten inches apart. The result has been, where the tenant before only obtained 8½ bushels (!) from 3 bushels sown, I have reaped 11 sacks, the bushel weighing 61 lbs.

Holt.—The Exhibition (for a sweepstakes) of Swedish Turnips, grown by gentlemen in the neighbourhood of Holt, in Norfolk, took place at the Feathers Inn, on Saturday last, when the Prize was awarded to Mr. Walter Thurtell, jun., of Wighton, the six Turnips shown by him weighing upwards of 65 lbs. In growing these Turnips, various manures were used, and the highest garden culture applied, the particulars of which were detailed in a very clear and satisfactory manner by Mr. Thurtell. The other Turnips exhibited were from field culture, and weighed as follows:—

	lbs.		lbs.
By Mr. Bolding, Waborne	42½	Mr. Sheringham, Thornage	33¾
Mr. Page, Barningham .	41¾	F. L. Astley, Esq., Burgh Hall	32
Mr. Sayers, Field Dalling	41½		
Mr. Burrell, Thornage-hall	36½	Mr. Thos. Norton, Holt .	27¾

Mr. Sayers also produced—

5 Carrots, weighing .	16¾ lbs.	2 Kohl Rabi . . .	14 lbs.
4 roots Mangold Wurzel	81 ,,	2 Cabbages . . .	26½ ,,

After the Show, the party, consisting of upwards of 20, spent a very pleasant evening together, when it was agreed to renew the sweepstakes for the ensuing year, and also to have another sweepstakes of 5*s.* each, to be laid out in plate, and presented to the member who should grow the greatest weight of Swedish Turnips upon a field, or part of a field, containing not less than three acres.—Mr. Sayers also offered a Prize of a Silver Pencil-case, value one sovereign, to the member who should grow in the ensuing year six plants of the Kohl Rabi of the greatest weight. Lord Hastings is a subscriber to both the above sweepstakes.

Staithwaite, Huddersfield.—At the Annual Meeting of the Earl of Dartmouth's Spade Husbandry Tenants, the prizes for Wheat were awarded to—John Sykes, who, although the land on which it was grown was an old stone quarry, had by his industry raised from a quarter of an acre, 745lbs., which was equal to 6 quarters and 2 bushels to the acre, at 60 lb. to the bushel; John Balmforth, whose produce had been 46 bushels to the acre, and C. Varley, whose produce averaged 40 bushels to the acre. On one plot of ground two crops had been raised this year; in the months of March and April Peas and Beans had been sown, which were cut in July, and produced about 30 tons to the acre of green food. Turnips were then sown, which were gathered in this day, and on calculation, will yield about 10 tons of bulb and 12 tons of top, and better Turnips need never be seen. John Balmforth read a statement of his proceedings in the various processes required by the land he had made his care. His conclusions were as follow:—

	£.	s.	d.
Expenditure, including labour, calculated at 2*s.* per day	28	13	3
Total returns	35	16	9
Leaving a net profit (off about ⅔ of an acre of land!)	7	3	6

Miscellaneous.

Rowlandson on the Influence of Lime.—As the farmers of Britain and Ireland (he says in the *Journal*

of Agriculture) expend much above a million sterling yearly on lime, it must be of primary importance that the action of this manure be fully understood. He promises to point out an "unerring method" by which any ploughman may, for the merest trifle of expense, determine when lime is required by any soil! According to Mr. Rowlandson's view, "nine-tenths of the money expended on lime are an utter loss to the farmer." While occupying a large farm in Ireland he pared, burnt, and limed a portion of peat-soil, and from it raised splendid crops of Carrots, Potatoes, Turnips, &c. He pared and burnt a contiguous portion of the same peat, but gave it no lime, and the crops on it were an entire failure. He observed that the burnt but unlimed portion gave a deeper colour to rain-water than it had before burning, while, on the contrary, the heaviest rains were no more coloured on the limed part than on the most fertile loams. He next gives a familiar account of the experiments by which his views are established. He buys "two or three pennyworth of ammonia" (or hartshorn) from the druggist, takes a specimen of the barren pared and burnt, but not limed, peat soil, and another of the fertile limed peat, goes to the kitchen, procures from "the dame" two clean tall glasses, and with this "complete laboratory for the purpose," he begins by putting a portion of the barren in one glass and the fertile peat in the other, labels the glasses, covers each specimen for about a quarter of an inch with the hartshorn, and sits down to mark the result. The glass containing the unlimed specimen has its liquid soon coloured deep brown. He waits the limed specimen a little longer, but its liquid continues perfectly clear. He throws out the coloured liquid and its peat, cleans the glass, puts another portion of the same unlimed peat in it, fills up the glass with clear lime-water, goes to bed, sleeps soundly, "rises with the lark," goes to the glass with lime-water, shakes it up, and goes to his farm-work. After breakfast, he again visits this glass, tastes the contents, and finds that the water has lost its alkaline taste. He next takes oxalic acid, which he tells the ploughman is poison, dissolves a little in cold water, and pours some of the liquid from the lime-water glass into the solution. If the lime had been still dissolved in the water, the oxalic acid would have made it milky, and soon caused a white powder of oxalate of lime to fall; but all remains clear. Hence he infers that all the lime has been removed by the peat. For some time, he daily pours off the water, and adds fresh lime-water, till at length, on testing as above with oxalic acid, he observes a milky appearance, and from this infers that the peat can absorb no more lime. He now pours off the liquid from the peat, pours ammonia in its place, and lets it stand for some days, to see if the ammonia can be coloured by peat, after the peat has been saturated with lime; "but no such thing occurs." This experiment taught him to lime the other burnt lot: he did so, and had splendid crops of Mangold, Cabbage, &c. He supposes he has now fairly proved that the alkaline humates are poisonous to plants, and that lime fertilises soils, not by rendering inert vegetable matter soluble, but, on the contrary, by rendering the poisonous humic acid insoluble, in taking it from the alkali. Though his paper extends over 16 pages of the *Journal*, it is not all published, and we are not told what is his "unerring method" of determining when any soil requires lime. But as he ascribes the barrenness of soils which abound in vegetable matter "solely to the presence of free humid acid," and has already shown us how to detect this acid, we may suppose that his method is detailed in the above experiments. And as many farmers, if not many ploughmen, may wish to try his method, I shall give a brief plain sketch of the practical part of it, as I suppose he would give it himself. If the farmer wishes to discover whether one of his fields needs liming, he may take a few specimens from different parts of it, each from 2 to 4 oz. weight, put them, one at a time, moist as in the field, into a clear tall drinking glass (a quinine bottle, which may be had for 2*d*. or 3*d*. at the apothecary's, is better), cover the soil for about a quarter of an inch with common "spirit of hartshorn," and when it has stood a little, observe whether the liquid is coloured brown, and pour it off cautiously (withholding the soil) into another glass containing clear lime-water. If ammonia has taken any "humic acid" from the soil, the whole lime-water will now become turbid, and a dirty brown flaky precipitate gradually falls to the bottom. This, according to Mr. Rowlandson, gives clear evidence that the soil needs lime, and if the ammonia causes no brown turbidity in the lime-water, the soil does not need lime. I do not vouch for the uniform accuracy of this method; but as the trial is so easily made, and to reflecting farmers may lead to important inferences, I think many might try it, especially for cold, clayey, and peaty soils. To prepare the lime-water, take a large clean bottle, put in it a spoonful of slaked lime, fill the bottle nearly to the top with rain-water, agitate, fill up, cork, and set it aside for several hours to let the lime settle. It requires to be kept closely corked to exclude carbonic acid.—*P. Garden, Glenæ, in the Dumfries Herald.*

Management of Farm-yard Manure.—The best-constructed farm-yard and management of manure I ever saw is Mr. Spooner's, the lately elected M.P. for Birmingham. This gentleman has a farm of from 150 to 200 acres, situated near the city of Worcester, in the highest state of cultivation, on which he grows the most luxuriant crops, without having expended a shilling for manure for many years (with the exception of a trifling sum for those lately-introduced novelties, by way of experiment), but has sold much farm-yard manure to his neighbours, not knowing how to dispose of it on the farm. Although he does not possess an acre of watered meadow, he has generally hay for sale. The farm-yard is an oblong square, the back of the house occupying the south end; at the south-west corner is the piggery; the west side a cow-house, containing standing for upwards of 20 milking cows, which is kept full all the year round; in the summer they are fed on Tares, Lucerne, and Grass; in the winter a little hay is given them in the morning, Swedes or Mangold at noon, and as much bruised Gorse (Furze of one year's growth) as they will eat. They have hay in lieu of Gorse on Sundays, as it is necessary for the Gorse to be consumed on the day on which it is prepared; at the back are sheds for storing roots and the hay-stack yard. At the north-west corner the Gorse-mill is erected, communicating with a passage to the heads of the cattle, for the purpose of feeding. At the north end are the barns, with the rick-yard behind. On the east side are the stables and sheds, a road at the back, and an entrance adjoining. In the centre is the manure-pit, six or eight feet deep, covered by a roof, and surrounded by a dwarf wall, so as to prevent the possibility of any water getting into it. It is entered by an inclined plane, wide enough to back in a cart, opposite the approach to the yard. Into this pit the dung from the stables and cow-house is promiscuously thrown; in the middle of the side contiguous to the latter is a well and a pump, which receives the drainage therefrom and the stables, which is pumped up and spread over the manure by a shute. The surplus liquid that is not absorbed is drawn off by means of a drain under the barn into a receiving well in the stack-yard, where it is pumped up into the liquid manure-cart, and drawn out on the mowing-ground as soon as the Grass is cut, until such time as it is laid up again; in the spring it is otherwise disposed of on headlands and heaps of soil. Liquid and solid manure, prepared in the way above described, preserves all its nutritious qualities; the one is not diluted by water, and the other not suffered to deteriorate by over-heating, and is of treble the value of that made in the comman manner.—*W. B.—Bell's Weekly Messenger.*

Rape for Winter Feeding.—What must the farmer resort to for winter feeding, now that the Turnips have utterly failed in many places? I answer, let him still try Rape Kale on his Turnip-field, without ploughing afresh. The ground may be harrowed and then sown; or the patches of ground where Turnips have failed may be sown with Rape-seed after a shower; or steep the seed and let it dry so that it may not clog in the sowing. If after early Potatoes, the following plan has been recommended:—As you lift your Potatoes, sow Rape-seed, 14 lbs. or 15 lbs. per acre, not later than the end of this month (Aug.). The price of the seed will not exceed 5*s*. per acre. If the season is favourable, you may lay on two and a half scores of sheep to 4 acres, about the middle or end of October. With the addition of the produce of half an acre of Turnips thrown among the Rape, you will have your sheep in first-rate condition for the spring market. In one similar instance, which came under my observation last season, the profit per score amounted to 9*l*. 10*s*., not deducting the price of seed. The land will be in excellent order for the reception of spring Wheat, which will be found to yield better, and the quality of the grain will be much superior to that of winter Wheat, which is unsuited to early soil. Turnips have been recommended on early soils after Potatoes, but will not suit a cold situation. I would recommend farmers to sow Rye and Vetches upon their stubbles for spring feeding: they will find this a valuable assistant where the Turnips have failed. — *Correspondent of Shrewsbury Chronicle.*

The Management of Heavy Soils.—Farmers have often remarked that lime does least good to cold, wet, clayey, and peaty soils, when spread on them in autumn; and that it can be profitably laid on them only in the early part of the season, when in their driest state. The reason of this is also plain: lime is dissolved more largely in very cold water than in warmer water. The rains of winter thus dissolve much of it, and carry it off. When Turnips have remained on clayey soils till spring, the crop has in part sheltered the soil from frost. It has been farther consolidated or bound by the winter rains, and the exclusion of air; and when in this wet state sheep are put on it, say in March, they soon reduce it to mortar: in this state it is ploughed, and rises in adhesive lumps resembling subsoil. The advanced period of the season demands that it be sown as soon as the harrows can break the top of the clods. The Oat-seed has thus a thin scraping of coarse soil about it; but at the depth of only 2 or 3 inches, the lumps of solid clay deny admission to the roots. This evil is much increased when the advanced period of the season has rendered it necessary to sow Barley instead of Oats. As this seed requires a looser soil and a finer tilth than Oats, it is not to be wondered at if it fail in such cases, especially where much drought follows the stage of germination. Only the strongest plants in the best positions come forward; stoling is prevented at the proper season; a thin yellow blade is all that can be seen in May and June: the Potato ground on the same soil affords a striking contrast. If July and August are moist, after-growths continue to rise, and a crop deficient in quantity and unequally ripened is the result. Too many evidences of this, both in Barley and Oats, were afforded by the crop, lately reaped after Turnips. If Turnips must be eaten by sheep on heavy soils, the fields ought to be cleared in time for their being all ploughed by Christmas. But I raise and store all my Turnips grown on heavy and medium soils, and give them to stock on the pasture fields, in the court, and in the byre; as good dung is liberally given for the Turnips, this keeps the soil open in winter, and the dung is thus farther prepared for next crop. I find it most advantageous in this case not to plough up the dung till the approach of seed-time. On light soils it is highly advantageous to have the ploughing deferred, and, of course, the eating of crop as long as possible.—*P. Garden, Glenæ, in the Dumfries Herald.*

Notices to Correspondents.

*** Will the author of the letter on Smithfield be good enough to excuse our delaying its publication for another week?

After-Grass.—*A. L.*—If you have a witness who can prove the agreement as stated, although only a verbal one, you may recover the amount agreed on. *W.*

Burnet.—*L.W.*—It is to be sown just as Sainfoin, using about a bushel of seed per acre. You will not find it worth your while to cultivate it.

Drainage.—*W.F.G.F.*—If the lines you have drawn in your little plan are those of greatest descent on the field, they are precisely those which you should mark out for the drains. It will take about 1600 tiles, 15 inches long each, to drain an acre, at 20 feet apart. Cover the tiles with the turf reversed, and then fill in the rest any how.

Farm Accounts.—*G.B.M.*—Swinborne's "Farmer's Account Book" is pretty well; but, like all of its class, it is imperfect. We shall return to this subject.

Gas Lime.—*G.B.M.*—This is imperfec hydro-sulphuret of lime. When exposed to air, it is gradually converted into sulphite, and ultimately into sulphate of lime or gypsum; three or four cwt. per acre is a plentiful application: 7*s*. 6*d*. a chaldron have been given for it.—*A Subscriber, Andover.*—It is useful as a manure, because, after long exposure to the air, it becomes sulphate of lime or gypsum, the fertilising properties of which everybody knows. You had better not mix it fresh. Three or four cwt. per acre spread now on the land, and ploughed under in spring, would be as effectual as a larger quantity; and this would be a better way of using it than the plan you propose of mixing it with bones.

Gorse.—*Niex.*—Can any one give us information respecting the Furze that has no thorns? It is sometimes called Irish Furze.

Murrain.—*Maillew.*—We cannot give advice for the diseases of cattle, unless the symptoms are described. The term "murrain" is used in various districts to designate different and distinct diseases.—*W.C.S.*

Sheep Farming, Manure, &c.—*E.*—Your object clearly is, that the tenant should buy as much of as valuable manure as the hay would produce were it consumed upon the land. If he knows the value of manure he will be able to do this for less than three-fourths of the value of the hay. One-half its value so spent would, we think, be quite a sufficient security for the fertility of the land. In the country, here, we should say that *the whole* of the value of the straw, if allowed to be sold, should be spent in manure; but near town, where this part of the corn crop is so much more valuable, and where rent, on this and other accounts, is so much higher, this, we presume, would hardly be a fair arrangement. Three-quarters of its value spent in manure would probably be more just. If your farm of 150 acres, under a five-shift course of cropping, be in good cultivation, and capable of yielding, on an average, 22 tons of roots, 30 cwt. of Clover hay, and 25 cwt. of straw, per acre; then, besides your cow and six fatting beasts, you ought to be able to keep a flock of 200 breeding ewes, which we may suppose to yean 220 lambs every spring; of which 50 may be sold fat by July, and 130 may be sold fat as shearlings in the month of May following, along with 20 old ewes, whose places may be supplied by 20 of the ewe-tegs; or, as we should then call them in this part of the country, *chilver tegs*, or *theaves*; the remaining number of the lambs go to balance the profit and loss account of disease and death. The following is our calculation:—The produce of the farm will be off 60 acres of grain crop, 30 acres of roots, 30 acres of one-year-old Clover, and 30 acres of two-year-old Clover. The first will yield 75 tons of straw, the second 660 tons of roots, the third 45 tons of hay and 30 acres of aftermath, and the fourth 30 acres of pasture. This last will keep 170 ewes, and so many of their lambs as remain, till the 1st of October. The aftermath is equal to the keep of the cow and six horses in Clover, and also of 30 ewes and lambs till the same period. We suppose, however, 50 lambs to be sold in July, so that on the 1st of October there will be 6 horses, 1 cow, 6 fatting beasts, 200 ewes and 150 tegs; to keep which till the 1st of May there are 660 tons of roots, 45 tons of hay, 73 tons of straw; and 15 tons of oilcake will need to be bought. This will be consumed as follows:—

	Hay.		Roots.		Oil-cake.	
	tons.	cwt.	tons.	cwt.	tons.	cwt.
6 horses will eat daily, besides Oats and straw, 5 lbs. of hay, 20 lbs. of roots; equal to	2	10	10	0	—	
1 cow, at 12 lbs. of hay and 40 lbs. of roots daily; equal to	1	0	3	6	—	
6 beasts at 5 lbs. of hay in their chaff, 60 lbs. of roots, and 6 lbs. of oilcake daily, till 20th Feb.; equal to	1	15	21	0	2	
200 ewes, at 2 lbs. of hay each, daily, and 12 lbs. of roots, till 1st Feb.; then 2 lbs. of hay and 30 lbs. of roots	33	10	360	0	—	
150 tegs, at ½ lb. of hay chaff, daily, and 1 lb. of oilcake, and 20 lbs. of roots; equal to	6	5	250	0	12	18
	45	0	644	6	15	0

Supposing all this stock to be kept under shelter, 40 tons of straw may be needed for litter and food, leaving 25 for sale.

Turnip Machine.—*M. Saul.*—We have your drawing by us, and shall call attention to your machine, when, in the course of our articles on Agricultural Mechanics, we touch on this subject.

Wheat.—*G.B.M.*—Bellevue Talavera will probably suit you well.

Erratum.—For the word "feeding," in the 2d line from the top of the 2d col., at page 857, read "breeding."

Calves	4 0	4 8	Pigs	3 4	4 0

Beasts, 1319; Sheep, 18,420; Calves, 17; Pigs, 250.

As is usual so near to Christmas day, scarcely any business is transacted in our Market to day. Our supply of Beef is tolerably good, and some of the best qualities maintain late rates; but there being so slack an attendance of buyers, reduction in price must be submitted to to effect sales to any extent. The trade amongst the Mutton is even slower than for the Beef. There is very little indeed wanted, and a very great many remain unsold. There are but very few Calves here to-day, which are sold dearer. Pork-trade continues heavy.

Friday, Dec. 27.

Again we have a kind of holiday Market; the large supply of the "Great Market" is not yet forgotten; indeed, since then the quantity has been large for the season. For what little business is done, both in Beef and Mutton, the prices continue the same as Monday, except in the second-rate qualities, which are a little lower. Veal is short and considerably dearer; several good Calves have made fully and we think a little over 5s per 8 lbs. The second quality also finds a much more ready sale, at a proportionable rise in price. Pork-trade continues steady.

Beasts, 633; Sheep, 2100; Calves, 54; Pigs, 227.

41, West Smithfield.

MARK-LANE, Monday, Dec. 23.

There was a fair supply of Wheat from the near counties this morning, which met a slow sale at last week's prices; business in Foreign continues limited, but its late value is fully supported. Barley, Beans, and Peas maintain our quotations. Oats are still very scarce, and where sales are effected, extreme rates are obtained.

Friday, Dec. 27.

The arrivals of Corn and Flour during the week have been very moderate, and the attendance at market this morning was small; we observe no alteration in the value of either English or Foreign Wheat; the only bonded transaction we have heard of is the sale of 3000 barrels of American Flour at 18s. per barrel, and there was some inquiry for low Baltic Wheat. Barley, Beans, and Peas fully maintain the quotations of Monday. Being still without any arrivals of Irish Oats, factors are enabled to obtain a trifling advance.

Kingsford and Lay.

COVENT GARDEN, Dec. 28.—The Market has been well supplied during the week with vegetables of almost every kind, and the quantity of fruit has also been sufficient to meet the demand. Among Pine Apples we noticed some handsome specimens, which are offered at nearly the same prices as are quoted in our last report. Grapes, which chiefly consist of foreign sorts, are also selling at last week's prices. Apples are plentiful, but the demand for them is not great. Among Pears, good samples of Glout Morceau and Winter Nelis, which are the principal dessert varieties in the market at present, are selling at about 8s. per half sieve. Nuts are scarce, and consequently realise high prices. Oranges, of good quality, are abundant, and Lemons are also sufficient for the demand. Of vegetables, there are plenty of most sorts; Cauliflowers are, however, scarce; and Broccoli, owing to the late frosty weather, is not so plentiful; but Cabbages, Brussels Sprouts, and Savoys are good in quality and abundantly supplied; Carrots, although somewhat inferior in quality, are plentiful; Turnips are very good, and sufficient for the demand. A considerable quantity of American Shallots are in the market, and being good in quality they meet with a tolerably ready sale. Rhubarb, Asparagus, and Sea-kale, are offered at last week's prices. Celery is plentiful and good. Endive, Lettuce, and other kinds of salading are pretty plentiful. Among cut flowers we noticed Euphorbia jacquiniflora, Bignonia venusta, Coronilla glauca, several species of Cape Heath, also Camellias, Cinerarias, Acacias, Amaryllises, Azaleas, Chrysanthemums, Tulips, and Roses.

THE BEST AND MOST DURABLE ROOFING, FOR BUILDING AND GARDEN PURPOSES.

By Her Majesty's Royal Letters Patent.

THE PATENT ASPHALTE FELT for ROOFING, AS IMPROVED BY THE ORIGINAL INVENTOR AND PATENTEE, AND NOW IN USE AT THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT CHISWICK,

Can be had only by applying to

THOS. JOHN CROGGON, 2, INGRAM-COURT, FENCHURCH-STREET, LONDON.

The above Material has been used and approved of by the Nobility, Gentry, and Agriculturists generally, as a ROOFING and COVERING to SIDES of FARM BUILDINGS.

The Felt is perfectly impervious to rain, snow, and frost, and being a non-conductor, it has been proved an efficient PROTECTIVE MATERIAL TO PLANTS.

The price of the Felt is ONLY ONE PENNY PER SQUARE FOOT, being much less than half the expense of Slates, Tiles, &c., and from its Lightness, Warmth, and Cheapness is particularly well suited for Hothouses, &c. A discount allowed to the Trade.

Thos. John Croggon, 2, Ingram-court, Fenchurch-street, London.

Patent Asphalte Felt Works, Dec. 28.

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT

Is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Rope-walks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

TESTIMONIAL.

London, Nov. 1, 1844.

H. C. Bowden, Esq., Agent for McKibbin's Roofing Felt.

It is with much pleasure I add my humble testimony to the superiority of your Felt over any other preparation of the kind with which I am acquainted. This Testimony I give with the greater cheerfulness from the many reports I have heard in its favour, and from the likelihood of its being used extensively in Agricultural purposes. I shall not fail to notice it in my Lectures when on the subject.

(Signed) John Robinson, M.B., Senior Lecturer on Chemistry, &c., as applied to Agriculture and Rural Economy in this Kingdom.

Sold in Sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet).

Apply to H. C. Bowden, Agent to the Manufacturers, No. 18, East India Chambers, Leadenhall-street, London.

CHEAP AND DURABLE ROOFING.

AND THE BEST RESISTER OF FROST FOR GARDEN USES.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and particularly for COVERING GARDEN FRAMES, TO PROTECT PLANTS AGAINST THE EFFECTS OF THE FROST, beg to call the attention of Gardeners and others to their superior article, *which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and obtained the Prize for being the best and cheapest article for roofing, &c.* It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. This Felt is composed of the strongest and most durable materials, and is saturated with the BEST OF ASPHALTE OR BITUMEN, (THE SAME AS SELECTED AND USED BY SIR ISAMBERT BRUNEL FOR THE THAMES TUNNEL, BEING FOUND THE MOST ELASTIC AND EFFECTIVE RESISTER OF WET.) NO OTHER FELT HAS THIS ASPHALTE BUT F. M'NEILL & CO.'s, and which renders it impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—PRICE ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.

PATENT FELT MANUFACTORY (THE ONLY FACTORY IN GREAT BRITAIN WHERE THE ABOVE DESCRIPTION OF ROOFING IS MADE), LAMB'S BUILDINGS, BUNHILL-ROW, LONDON.

A Sample Roof and Frame to be seen at the Factory, and a Discount allowed to the Trade.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH-STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, MARY WEDLAKE, 18, Fenchurch-street, London

STOOPING of the SHOULDERS and CONTRACTION of the CHEST are entirely prevented, and gently and effectually removed in Youth, and Ladies and Gentlemen, by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily employed outwardly or invisibly, without bands beneath the arms, uncomfortable constraint, or impediment to exercise. Sent per post, by Mr. A. Binyon, 40, Tavistock-street, Strand, London, or full particulars on receiving a postage-stamp.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers, as follow.—Cottage Pattern—1 Cover of 12 inches, 3l. 19s.; 1 do. of 18 inches, 4l. 8s.; 2 do. of 14 inches, 5l. 5s; the set of 4, complete, 14l. 10s. ONLY. Double Thread Pattern—1 Cover of 20 inches, 4l. 16s.; 1 do. of 18 inches, 4l. 19s.; 2 do. of 14 inches, 5l. 5s; the set of 4, complete, 13l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks at 6s. 6d., Fiddle Pattern, 7s 2d. per oz. Queen's Pattern, 7s 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 Engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. West, Silversmith, &c., 18, Ludgate-street, London

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made quite new by Messrs. ELKINGTON and Co.'s Patent Process. As this process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their establishments, 22, Regent-street, corner of Jermyn-street; or 45, Moorgate-street, City. New Goods plated upon White Metal in great variety. Lists of Prices and Drawings sent to all parts of the Kingdom and abroad free.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON AND Co., West End—22, Regent-street, corner of Jermyn-street, City—45, Moorgate-street. The Patent Electro processes being exclusively under their licence, the Patentees beg to state that they conduct their own Manufactures on a superior and warranted quality only, which invariably bear their mark, "E. and Co.," the only Crown. Old articles replated and gilt.

BUTTER MADE IN TEN MINUTES.—Much time and labour will be saved by the use of the SUSSEX CHURN, manufactured solely by GREEN and HALE, late Attwood, Winbow, and Warner, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream by placing the Churn in a pan of hot or cold water, which ensures the butter coming in from twelve minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 00	0	1	2	3
To Churn	2½lb.	4lb.	7lb.	14lb.	28lb.
Price with pans	18s.	20s.	25s.	33s.	40s.

Delivered (carriage paid) to any part of London.

N.B.—Pans for making clouted cream.

London Agents:—Benham, 19, Wigmore-street, Cavendish-square; Bailey, 71, Gracechurch-street; Yates, Arthur-street East; Deanes, London Bridge. Export Agents, Barnes and Co., 109, Fenchurch-street.

LOANS.—TO FARMERS AND OTHERS.—The sum of 20,000l., and several smaller amounts not less than 150l., to be advanced upon Leasehold or Freehold Property, Reversions, Money in the Funds, Annuities, Life Interests and good Personal Security, or upon Assignment of Farm Stock.

Apply to Mr. Mullins, St. Michael's Chambers, St. Michael's-alley, near the Royal Exchange, Cornhill, London, (personally, between the hours of 11 and 3 o'Clock. Letters pre paid.

HEAL AND SON'S LIST OF BEDDING.—Containing a full description of weights, sizes, and prices, by which purchasers are enabled to judge of the articles that are best suited to make a good set of Bedding, sent free by post, on application to their establishment, the largest in London exclusively for the manufacture and sale of Bedding (no Bedsteads or other furniture being kept). Heal and Son, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham Court Road.

LINGHAM, BROTHERS, BIRMINGHAM. — MANUFACTURERS of the IMPROVED MENOGRAPH, or PERMANENT LABELS, for Garden-borders, Flower-pots, &c. In Boxes of One Hundred each.

The above Labels have been manufactured by Lingham, Brothers, for the last five years with increasing demand, and acknowledged by those parties who have used them as superior to anything of the kind before offered to the Public, and for neatness, durability, and cheapness, have superseded all other kind of Labels for Horticultural purposes.

Sole Agents in London:—George and John Dean, Horticultural Implement Warehouse, opening to the Monument, 46, King William-street, London-bridge.

FOR WINTER WRAPPERS, GREAT-COATS, AND OUTSIDE GARMENTS OF ALL KINDS, SEE BERDOE'S VENTILATING WATERPROOF CLOTHING ESTABLISHMENT, 69, Cornhill, where an inspection is confidently invited of a large and Superior Stock of first-rate garments of the above description at reasonable charges, and really waterproof. Also of Berdoe' well known FROCK for all Seasons, which has stood the test of more than 6 years' extensive trial, and completely supersedes the "Macintosh", SHOOTING JACKETS, &c. The above made to measure at same charges in a few hours.

W. Berdoe, Tailor, Waterproofer, &c., 69, Cornhill. North side.)

NEWSPAPER OFFICE, 15, Coventry Street, Haymarket, London.—Established upwards of 30 years.

T. MUDIE and SONS, Agents for the supply of the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE, forward that and all the other London Newspapers (a correct list of which may be had on application), with the strictest regularity to all parts of the Kingdom, and to the Colonies, free of postage; and by the morning Mails if requisite. T. M. and Sons beg to state that they print the exact address of their Customers on the wrapper when ordered for six months or longer.

Containing 36 Plates, elegantly bound, One Guinea,

FISHER'S DRAWING ROOM SCRAP-BOOK

"Comes forward with claims which must secure for this deservedly popular Annual in 1845, that distinguished place which it has fairly and honourably won in preceding years. The binding is rich, yet chaste and tasteful. The engravings are numerous (thirty-six), and finely executed, and the literary portion is worthy of Mrs. Ellis's pure and graceful pen."—*The Watchman.*

Containing 16 Plates, handsomely bound, 8s.,

THE YOUNG LADY'S AND GENTLEMAN'S ANNUAL—The Juvenile Scrap-Book, "is judiciously adapted to amuse the fancy, inform the mind, and improve the morals of the young reader. As a Christmas present, its numerous beautiful engravings, and its elegant binding, invest it with strong claims to preference."—*The General Advertiser.*

Fisher, Son, and Co., the Caxton Press, Angel Street, Newgate Street, London.

PUNCH'S ALMANACK FOR 1845 is now before the public. One of the most prominent features of the ALMANACK is

A Pictorial Chronology for 1844.

ILLUSTRATIVE OF

London: Published at the Office of the TABLE-BOOK, 194, Strand.

Just Published, 1*s.* sewed,

JOHNSON'S GARDENERS' ALMANACK, FOR 1845.

"I see several improvements are introduced in the GARDENERS' ALMANACK for 1845, which make it still more useful. The first attempt last year obtained great praise and patronage, and that very justly—a proof that sound useful information at a cheap rate, even in an Almanack, is a profitable subject; and it must be a source of great pleasure to those, like the editor, who see their industry and talents thus appreciated."—*Mr. D. Beaton, Gardener to Sir W. Middleton, Shrubland Park, Dec.* 11.

"This is much the best Gardeners' Almanack which has yet appeared; it abounds with useful information for the horticulturist, and should be taken by all true lovers of gardening."—*Mark Lane Express, Dec.* 2.

Complete in Four Volumes, with Wood-cuts, price 3*s.* 6*d.* each,

CHRONICLES OF THE SEASONS; or, the Progress of the Year; being a Course of Daily Instruction and Amusement selected from the Popular Details of the Natural History, Science, Art, Antiquities, and Biography of our Father-Land.

III. MEDICAL BOTANY; consisting of a Classified List of the Principal Medical Plants that are known in a living state in Europe; with an Explanation of the Purposes to which they are applied Medicinally.

TAYLOR and WALTON, and all Booksellers.

UNIVERSITY COLLEGE HOSPITAL.—The favourable consideration of those beneficent persons who at this festive season seek for opportunities of heightening their own social enjoyments by the exercise of their power to relieve the sufferings of others is earnestly supplicated in behalf of this Charity.

Ths unusual severity of the early winter, and the eagerness, not only of the destitute sick of the neighbourhood, but of poor persons afflicted with disease in distant counties, for the advice and treatment of the medical officers and attendants of this Hospital, have recently occasioned a great increase in the number of patients, and consequent augmentation of expense, which the funds of the Institution are but ill able to bear.

Under such circumstances the attention of the benevolent is requested with confidence to this appeal for their assistance.

The number who annually receive relief at this Hospital is nearly 15,000. The expense amounts to about 4500*l.*, of which the principal portion, namely, 2800*l.*, is derived from the fees of students for attendance on the practice of the medical and surgical officers, by whom they are devoted to the maintenance of the Hospital. The annual subscriptions, notwithstanding a late considerable increase, do not exceed 600*l.* After allowing for casual donations, a deficiency of about 1000*l.* has yearly to be provided for.

The Hospital, as it at present exists, is calculated for the reception of 25 more in-patients than it actually contains, and it is the limited income of the establishment alone which prevents the admission of that additional number. The ground for a second wing to the Hospital is lying waste; while such a wing, if the means of erecting, furnishing, and maintaining it existed, and it were completed, would allow of a further increase of 50 in-patients.

The Committee take this opportunity of acknowledging the following contributions recently received:—

DONATIONS.

* Life-Governors.				† Additional Subscriptions.

Donations and Subscriptions will be received by the following Bankers:—Coutts and Co., 59, Strand; London and Westminster Bank, Bloomsbury Branch; Scott and Co., 1, Cavendish-square; Smith, Payne, and Smith, 1, Lombard-street. At the Hospital, the House Physician, the Matron, and Clerk to the Committee have printed receipts, signed by the Treasurer, ready for delivery to benefactors.

Dec. 23, 1844. WILLIAM LONG, Clerk to the Committee.

SEASONABLE FESTIVITIES.—The gaiety that reigns supreme at this festive season, when friends and lovers assemble at the social board, or whirl in the giddy mazes of the dance, induces both sexes to be more than usually desirous of shining in personal attraction, and to devote a greater share of attention to the toilet. It is at this particular season, that the VIRTUES and SINGULARLY HAPPY PROPERTIES OF THOSE AUXILIARIES OF PERSONAL BEAUTY, ROWLAND'S KALYDOR, ROWLAND'S MACASSAR OIL, & ROWLAND'S ODONTO, shine pre-eminent in their power; while the *white* and *swan-like neck*, the *rich luxuriant tress*, and the *Pearly set of Teeth* form admirable trophies of their INESTIMABLE QUALITIES! The august Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence, and the confirmation by experience of the infallible efficacy *of these creative renovating Specifics*, have characterized them with perfection, and given them a celebrity unparalleled. As presents for both sexes, none can be more recommendatory, or more now in general use.

*** Ask for "ROWLAND'S" Articles. All others, under the same names, are SPURIOUS IMITATIONS!!!

SATURDAY, DECEMBER 28, 1844.

NOTICE is hereby given, that the ACHILLES LIFE ASSURANCE ASSOCIATION has been UNITED with the GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY; and the holders of Policies effected with the said Achilles Life Assurance Association are hereby requested to pay the renewal premiums on such Policies at the Office of the Great Britain Mutual Life Assurance Society, No. 14, Waterloo-place, London. E. GILBERTSON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO PLACE, PALL MALL, LONDON.
The Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.
GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

PROFITS.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

CREDIT.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

Loans granted upon approved Security.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l*.

AGE.	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.
	£. s. d.	£. s. d.	£. s. d.

By order of the Board,
No. 37, Cornhill, London. F. G. SMITH, Secretary.

SCOTTISH UNION FIRE AND LIFE INSURANCE COMPANY, No. 37, Cornhill, London.—NOTICE IS HEREBY GIVEN that a Dividend of 5 per Cent. on the Capital Stock of this Corporation will become payable on the 2d of January next, and Proprietors resident in and near London can receive the same at the Office, No. 37, Cornhill, on that or any subsequent day between the hours of Ten and Four o'clock.
By order of the Board,
No. 37, Cornhill, Dec. 1844. F. G. SMITH, Secretary.

ARGUS LIFE ASSURANCE COMPANY,
39, Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.
Thomas Farncomb, Esq. Alderman, *Chairman*.
William Leaf, Esq. *Deputy Chairman*.

Richard E. Arden, Esq.	J. Humphery, Esq. Ald. M.P.
William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq.
James Clift, Esq.	Lewis Pocock, Esq.

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l*. the assured have the serurity of the Company's Income of nearly 60,000*l*. per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure 100*l*.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

LIFE ASSURANCE.—The following are specimens of the low Rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age	20	30	40	50	60
Ann. Pr.	1*l* 10 3	2*l* 0 7	2*l* 15 3	4*l* 1 8	6*l*. 3 9

and of these Premiums one-third may remain unpaid, in the hands of the assured, at interest to be deducted from the sums assured, when they become claims.

Persons assured to the amount of £500 for the whole term of life participate in the profits of the Company.—Subscribed Capital £200,000.

For Forms of Proposal, and other particulars, apply at the Office, 126, Bishopsgate Street, corner of Cornhill, City.

WEST OF ENGLAND and SOUTH WALES LAND DRAINING COMPANY. Capital 250,000*l*., in shares of 25*l*. each.

Provisional Committee (all of whom have taken shares).
The Right Hon. the Earl of Devon.

Messrs. Robarts, Curtis, and Co., Lombard-street	London & Westminster Bank, Bloomsbury Branch.

Bankers in Exeter.

The Devon and Cornwall Banking Company	The City Bank, Exeter
	The Exeter Bank.

Consulting Draining Engineer.
Josiah Parkes, Esq., C.E., Consulting Engineer to the Royal Agricultural Society of England.
Solicitor.—R. T. Head, Exeter.
Secretary.—Thomas May, Mount Radford, Exeter.

The object of this Company is to afford increased facilities for the Draining of Land, by executing the necessary operations with the most suitable materials in such manner as shall be deemed the most scientific, economical, and effectual; the cost incurred thereby to be adequately secured on the property drained or otherwise, and to be repaid, with interest, by instalments.

The profits resulting from scientific Draining are admitted by every Agriculturist.

Tiles (the material for Draining most frequently used) can be made by machines at less than one-half the cost for which they are now selling within the probable sphere of the Company's operations; from this source it is estimated that a large profit will result to the shareholders, combined with equivalent advantages to the Agricultural Interest.

Deposit, 1*l*. per share, and the Calls not to exceed 2*l*. 10*s*. per share, nor be made until after two months' notice.

*** Above 200 letters have been received from landowners, many of them holding large properties in the district, approving the objects of the Company, and containing ample assurances that it will be fully employed as soon as it is prepared to commence operations.

Applications for Shares or Prospectuses to be addressed to Messrs. Mullens and Marshall, 3, Lombard street, London; or to Messrs. Downes, Gamlen, and Scott, Solicitors, 7, Furnival's Inn, London; Messrs. Cook and Mansford, Solicitors, Bath; Richard Anstice, Esq., Bridgewater; Edward Bradley, Esq., Treguff Place, Glamorganshire; Hy. Phelps Goode, Esq., Scotchwell, Pembrokeshire; George Goode, Esq., Croft, Carmarthenshire; George Smith, Esq., Cranford Court, Manchester; Messrs. Neilson and Co., Liverpool; or to Mr. R. T. Head, Solicitor, Exeter.

FORM OF APPLICATION FOR SHARES.
To the Provisional Committee of the West of England and South Wales Land Draining Company.
I request that you will allot me Shares of 25*l*. each in the Capital Stock of the West of England and South Wales Land Draining Company, and I hereby undertake to pay a Deposit of One Pound per Share on the Shares allotted to me, and to execute the Deed of Settlement when required.

News of the Week.

THE opening of the French Chambers, which took place on Thursday with a speech from the throne, is the leading event of our political news. The speech is said to be from the pen of M. Guizot, and it will be read with general satisfaction, as an additional proof of the stability of his Cabinet and of the continuance of peace. The transactions in Algeria and Morocco, the marriage of the Duc d'Aumale, and the loan lately contracted under circumstances which afford a sufficient proof of the financial prosperity of the country, all supply gratifying topics, on the domestic policy of the Ministry. But the portion of the speech which will excite the liveliest interest in this country is that which adverts to the amicable relations with our own Government, and to the recent visit of His Majesty to these shores. The speech states that the discussions in which the two countries were lately engaged might have given rise to apprehensions, but a mutual spirit of goodwill and equity has maintained that happy accord between France and England which guarantees the repose of the world. The speech dwells with evident satisfaction on the King's visit to this country, and regards the manifestation of English feeling on that occasion as complimentary both to France and to himself. It states, that His Majesty's visit was in order to testify to our Queen the value which His Majesty sets upon the intimacy which unites them, and on the reciprocal friendship of which the Queen has given so many marks; and the reception given to the King by the people at large, is gracefully acknowledged as a fresh pledge for the long duration of that peace which secures to France, among other blessings, the quiet enjoyment of her constitutional liberties. No mention is made of the right of search, or of the dotation of the Duc de Nemours, and it may therefore be concluded that no progress has been made on either point. In regard to the prospects of the session, M. Guizot is said to have declared that he has no apprehensions, the home policy of the Government affording no subjects of uneasiness, while on foreign affairs they are prepared with the fullest answers.

At home, the affairs of the Church are the absorbing topic of the day. The pastoral letter issued by the Bishop of Exeter, commanding the strict observance of the Rubric, and the use of the surplice in preaching, has excited an agitation never before known in that large and important diocese. The bishop's subsequent publications on the subject, have exhibited an uncompromising spirit, little likely to reconcile the people to the proposed innovations, and his assertion of absolute authority has increased the spirit of hostility to an extent which his lordship had evidently not anticipated. The laity in various parts of Devon and Cornwall have held meetings on the subject, and adopted the most stringent resolutions, condemning the bishop's letter, declaring their determination to resist his orders, and even suggesting their intention to attend divine service in unconsecrated buildings, if his directions be enforced. In many instances the parishioners have adopted petitions to the Queen, praying for Her Majesty's interference as the Head of the Church, to avert a crisis which they believe will lead to still greater divisions. The bishop, however, has yielded to the feelings of the people in regard to the surplice, and has this week issued a letter to his clergy, withdrawing his order in respect to its use in preaching, adhering, however, to the enforcement of the rubrics. The agitation does not seem likely to be appeased by anything short of a full concession of the points at issue, and it remains to be seen whether his lordship will still persist in requiring the use of forms which the laity are determined to oppose. As a contrast to these proceedings in the diocese of Exeter, we give long extracts from a charge delivered last week by the Bishop of Worcester, the brother of Lord Cottenham, the late Lord Chancellor. In this document Bishop Pepys advises his clergy to continue the practices which have so long prevailed in the Church, and shows that there is no authority for any of the recent innovations. His lordship adduces various facts to prove that the surplice is not the proper dress to be worn in the pulpit—that the rubric is inconsistent with itself in regard to the prayer for the Church-Militant, and that the weekly offertory was superseded by the enactment of poor-rates. His lordship adds, that in all cases where the offertory is adopted, the consent of the congregation is essential, and that the money so collected can only be legally applied for the relief of the parish poor.

Home News.

COURT.—Her Majesty and Prince Albert, with the infant Royal Family, continue at Windsor Castle. Her Majesty and the Prince have taken their usual walks in the grounds of the Castle, and the Prince has shot almost daily in the royal preserves. On Tuesday the Queen and her suite went to the small lake in Frogmore grounds, when the Prince and the gentlemen of the household enjoyed the exercise of skating. On Christmas-day Her Majesty and His Royal Highness attended Divine service in the private chapel of the Castle. Her Majesty and Prince Albert, according to present arrangements, will next week honour the Duke and Duchess of Buckingham with a visit at Stowe. The Court is expected to leave Windsor on Tuesday for Stowe, where the most extensive preparations are in progress for their reception. It has been arranged for the Court to proceed to the Wolverton station, on the Birmingham railway, when Her Majesty will be received by the Bucks Yeomanry and Hussars, under the command of the Marquess of Chandos, which will form the escort thence to the residence of the Duke. Her Majesty will likewise be met at the Wolverton station by the whole of his Grace's tenantry on horseback, by whom Her Majesty will also be escorted to Stowe. The visit of the Queen and Prince to the Duke of Wellington at Strathfieldsaye will take place, it is expected, about the middle of the ensuing month. The Lord Chamberlain has appointed the Hon. M. S. West to be one of the Gentlemen Ushers Quarterly Waiters in Ordinary to Her Majesty, in the room of the Hon. H. Legge, deceased.

Knighthood.—The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignity of a Knight of the United Kingdom of Great Britain and Ireland unto Chevalier Robert Schomburgh, recently at the head of the expedition for exploring the boundaries of the colony of British Guiana.

Pensions.—Our readers will be gratified to learn that a pension from the funds of the Civil List has been conferred upon Mr. Thomas Hood, the author of "The Song of the Labourer," which appeared in a late Number of this Paper, and of numerous works which have rendered his name popular in all parts of the empire.

Importation of Wheat.—A Parliamentary return, which was procured in September last, on the motion of Mr. Darby, the member for East Sussex, has been published, showing the quantity of Wheat imported from the United States into Canada, from the 11th Oct., 1843, to the 31st July, 1844; also the quantity of Wheat and Wheat flour imported from Canada into Great Britain and Ireland, distinguishing the quantity into each, during the same period. It appears that the quantity of Wheat imported into Canada from the

United States, from the 11th Oct., 1843, to the 5th July last (to which day the returns received only extend), was, by sea, 634 quarters; and, by inland navigation, or land carriage, 21,161 quarters. The quantities of Wheat and flour, the produce of Canada, imported for home consumption during the same period, were, into Great Britain, 18,199 quarters 6 bushels of Wheat, and 262,506 cwts. 1 qr. 2 lbs. of flour; into Ireland, 4007 cwts. 1 qr. 10 lbs. of flour; making, in the total, 18,199 quarters 6 bushels of Wheat, and 266,513 cwts. 2 qrs. 12 lbs. of flour.

Foreign.

FRANCE.—By extraordinary express from Paris, the *Times* of yesterday morning was enabled to give the speech of King Louis-Philippe, on opening the Session of the Chambers on Thursday, and of which the following is a translation :—

"*Gentlemen, Peers, and Deputies*—At the moment your last Session closed, complications, which might have become serious, were the object of my solicitude. The necessity for protecting our possessions in Africa from reiterated and hostile incursions had obliged us to carry the war into the empire of Morocco. Our brave land and sea armies, worthily commanded, have attained with glory, and in a few days, the object designated to their courage. Peace has been as prompt as victory, and Algeria, where three of my sons have this year had the honour of serving their country, has received a double pledge of security, for we at the same time proved our power and our moderation. My Government was engaged with that of the Queen of Great Britain in discussions which might have given rise to apprehensions of the relations between the two States being weakened. A mutual spirit of good will and equity has, however, maintained between France and England that happy accord which guarantees the repose of the world. In the visit I have paid to the Queen of Great Britain, in order to testify to her the value which I set upon the intimacy which unites us, and on the reciprocal friendship of which she has given me so many marks, I have been surrounded with manifestations the most satisfactory to France and to me. I have gathered, in the feelings which have been expressed to me, fresh pledges for the long duration of that general peace which secures to our country abroad a position dignified and strong, and at home a prosperity ever increasing, and the quiet enjoyment of its constitutional liberties. My relations with all the foreign powers continue pacific and amicable. You are, gentlemen, witnesses of the prosperous state of France. You see our national activity, protected by wise laws, display itself over every part of our territory, and reaping, by the protection of order, the fruits of its labours. The improvement in national credit, and the equilibrium established between our annual receipts and our expenses, bear testimony to the happy influence of this situation over the general affairs of the State, as well as over the welfare of all. The financial laws will shortly be presented to you. Bills for the improvement of our roads, of our ports, of our internal navigation, for the finishing of our railroads, and for various objects of general utility, will also be submitted to your deliberations. Amidst the prosperity of the country Heaven has blessed the interior of my family: it has increased the number of my children, and the marriage of my beloved son (the Duc d'Aumale), with a princess already connected with us by so many ties, has been to me and to all mine a source of lively satisfaction. Gentlemen,—Providence has imposed upon me great labours and sorrowful trials. I have accepted the burden. I have devoted myself—I have devoted my family—to the service of my country. To found, for a long time to come, their union and their happiness, such has been for 14 years past the aim of my constant efforts. I have the confidence that, with your loyal co-operation, the Almighty will enable me to attain it, and that the gratitude of free and happy France will be the reward of our mutual devotedness, and the glory of my reign."

The fog was so dense, and the distance at which the public was kept by the troops was so great, that it was impossible to catch a glimpse of the royal *cortège* as it passed along the quays from the Tuileries to the Palace of the Chamber of Deputies. A considerable military force had been called out on the occasion, and twelve battalions of National Guards, together with an equal number of troops, lined the quays on the passage of their Majesties.—In consequence of the meeting of the Chambers, Paris, during the past week, has been in all the bustle of the commencement of a parliamentary campaign. On Wednesday, the Chamber of Deputies was to hold its preliminary meeting to ballot for the deputation of its members who received the King on the opening day. On the same day the provisional officers of the house were to be appointed, the oldest member becoming provisional president, and the youngest provisional secretaries. For the last two sessions the office of provisional president assumed an unwonted importance, from the fact of its being filled by M. Laffitte, who took that opportunity of declaring his bitter disappointment at the results of the Revolution of 1830, in which he was so prominent an actor, and calling for forgiveness for allowing himself to be deceived. On this occasion, the provisional presidency has ceased to have so much significance, but still some difficulties have occurred on political grounds. The senior member, M. Gras-Preville, a legitimist, has absented himself, because he will not be made the organ of the Chamber, in offering congratulations to Louis-Philippe, and M. Dupont de l'Eure is also absent, because he partakes of M. Laffitte's feelings of disappointment at the course followed by the Government founded by the Revolution of July. M. Sapey is the next oldest member, and he would, it was supposed, be chosen. The nomination of the definitive president of the Chamber was to take place on the 27th. The struggle will be between two candidates, M. Sauzet and M. Dupin, the first of whom will have the support of the Ministry, and the second, though a Conservative, the support of the Opposition. It is still supposed that M. Salvandy will be put in nomination by the Molé party, but it is more probable that he will retire before the day of election, or that, at all events, he will not go to the final ballot. It is generally thought that M. Sauzet will be the successful candidate. The first important matter to be brought before the Chamber after the speech from the throne, and generally the first test of the strength of parties, is the nomination of the committee to draw up the address in answer to the royal speech. It is generally believed that this operation will take place on the 31st inst. The Ministry are anxious to hurry on this part of the business, in order to prevent the divisions and difficulties which might result from delay. The subjects to be introduced into the King's speech have been looked forward to with some interest. The speech, it is said, has been written by M. Guizot, who is represented as being secure of his position for at least another year. At a Parliamentary dinner of his adherents on Monday, given by M. Guizot, he is said to have declared, "That they were in no ways uneasy at the proposed combined attacks, as they were prepared for all that the Opposition could do. They had no subjects of uneasiness in their home policy; and as to foreign matters, he was prepared with the fullest answers."—Some surprise has been occasioned in Paris by the announcement that the Reine Blanche frigate, with Adm. Dupetit Thouars on board, has been seen off the Azores, and is hourly expected at Cherbourg. The whole population of that town immediately resolved upon giving him a grand reception, and the National Guard, at the risk of being disbanded, determined on turning out to do him honour, and present him with a crown of laurels. This news, if true, is more likely to revive the hostility to England in which the French press indulged last summer, than any other that could be imagined. It was also reported on Monday that letters had been received from Admiral Dupetit Thouars from Rio, in which the admiral speaks of his having been informed of the disavowal of his conquest of Tahiti, and of the sensation which this act, upon the part of the Government, had created in France. The admiral, it is said, writes in moderate terms of the disavowal, declaring that he had only done what he considered his duty, but that the Government was the best and only judge as to whether the sovereignty should be received or not. He declares that he will not receive the sword of state, for which *la Jeune France* has subscribed in his favour, which he considers a slur upon the act of the Government, and he expresses his regret that the subject should have given rise to such strong party feeling at home. —It is reported in some of the Opposition papers that King Leopold's presence in Paris had suggested the renewal of negotiations for a treaty of commerce between Belgium and France, but there seems to be little foundation for the statement.—A curious instance has occurred to show the insecurity of the streets of Paris at the present moment, and the wretched state of the police. M. Lehon, the son of the late Belgian ambassador in Paris, had alighted from his carriage at his own door, in the Rue Castiglione, at 9 in the evening, but before he could knock was attacked by thieves, and not only robbed, but severely beaten. This is but one of the numberless robberies which have recently taken place in the most public and populous parts of Paris.

SPAIN.—We have accounts from Madrid to the 19th inst. The Chamber of Deputies on the 17th approved of the report of the committee of both Chambers, authorising the Government to promulgate the organic laws it had applied for. In the sitting of the 18th, the Chamber commenced the discussion on the bill to authorise the conversion of the debt proceeding from contracts into Three per Cent. stock. M. Burgos, the first speaker, without opposing the bill, observed, that the Minister did not appear to have adopted measures to insure the liquidation of the new burdens about to be imposed on the Treasury; that a change in the tributary system was indispensable, for otherwise it was to be feared, that in the present state of the revenues and debt of Spain, the dividends on the Three per Cents. might cease to be paid, which would occasion a revolution that no power could avert. The Minister of Finance replied, that there need be no apprehension for the non-payment of the interest of the Three per Cents.; that the Government had employed a very simple and well-known mode by which to insure that payment, having concluded an arrangement with the bank of San Fernando for the liquidation of the six months' interest due on the 31st inst., as well as the two dividends of June and December, 1845—an arrangement highly advantageous to the state, since it only cost 6 per cent. per annum and a moderate commission. The Minister justified other measures of his administration and his operations with the bank for the collection of the revenues, and declared, that in a few days he would present to the Chamber a plan which would provide the means of fulfilling all the obligations of the state in a more complete manner than had been done since 1824. Several Deputies subsequently addressed the house for and against the bill; and the general discussion having been closed, the debate on the articles was to commence on the 19th. M. Donoso Cortes had tendered his resignation of the post of Private Secretary to the Queen, in consequence of some personal difference with General Narvaez. Her Majesty, however, had refused to accept it. M. Cortinez is spoken of as the successor of General Ferroz, who has been dismissed from the Presidency of the Supreme Court of Marine and War for declaring that the proceedings in the case of Colonel Rengifo were illegal. Fresh orders had just been issued for the careful guarding of the coast, and a division of troops was about to be marched to the frontier of Portugal, whence some attack on the part of the revolutionists or Esparterists seemed to be apprehended. On the 9th, Generals Prim, Ramirez, and Espinosa were transferred to Fort Santa Catalonia, Cadiz, where they will remain until the man-of-war destined to convey them to the Philippine Islands is ready.—The *Phare* of Bayonne, of the 20th, states that M. Capdevila, a merchant at Rosas, and performing the functions of Vice-Consul of England at that port, has been arrested by order of the Captain-General of Catalonia, and sent under escort to Barcelona, on a charge, it is said, of complicity in a plot to arouse the Lampurdan to insurrection against the Government.—The Journals contain accounts from various parts of Spain, which concur in representing the weather as excessively cold, and expressing the fear that the winter will prove as severe as that of 1829.—Accounts had been received at Irun on the 20th inst. of the death of General Jauregui (El Pastor) at Vittoria, who had rendered essential service to the national cause during the war of independence.—The Opposition print, *El Clamor Publico*, publishes a list of individuals who have been shot for political offences in Spain from December 1, 1843, to December 13, 1844. This document will form a melancholy conclusion to our summaries of Spanish history during the past year. It contains no less than nineteen articles, each recording executions by some one or other of the Ministerial Generals:—1. In the Barrack of San Francisco, General Narvaez being present, three serjeants, a corporal, and a soldier, 5; 2. By the Captain-General of Galicia, Feb. 21, 1844, a peasant, 1; 3. By General Roncali, at Villafranca, Feb. 14, 1844, seven officers, 7; 4. By General Roncali, at Alicante, Mar. 11, 1844, officers and peasants, 24; 5. In Galicia, Mar. 13, 1844, 4; 6. By General Roncali, Mar. 13, 1844, 3; 7, By General Roncali, the unfortunate secretary, Garrido, Mar. 20, 1844, 1; 8. By the Baron de Meer, at Barcelona, Mar. 23, 1844, 4; 9. By the Baron de Meer, in Upper Catalonia, April 23, 1844, 6; 10. By General Villalonga, in the Maestrazgo, shot in cold blood, after being made prisoners, besides those who fell in the field, July 1, 1844, 120; 11. By General Breton at Saragossa, suspected of having been implicated in the shooting of Estella, July 13, 1844, 3; 12. By General Breton, at Caspe, July 16, 1844, three officers, 3; 13. By the Baron de Meer, at Barcelona, suspected of being engaged in the Theatre conspiracy, Nov. 1844, 4; 14. By the Baron de Meer, Capt. Sanjust, Nov. 1844, 1; 15. In Nov. 1844, at Valencia, two officers, 2; 16. In Nov., 1844, at Logrono, Zurbano's two sons, brother-in-law, and five others, 8; 17. In Nov., 1844, at Anso, Aragon, by Gen. Breton, 3; 18. At Anso and Echo, by the same, 12; 19. At the same places, Dec. 13, 1844, 3; Total 214.

PORTUGAL.—Accounts from Lisbon inform us that the Queen prorogued the Cortes on the 14th inst. with a speech from the throne. The improvement of the finances formed the chief topic of the speech, which was very brief, and alluded but slightly to the late disturbances. The project of a law had been introduced by Ministers into the Chamber of Deputies for the abolition of the conservatorial privileges of foreigners in Portugal, having especial reference to the privileges hitherto enjoyed by English residents. By the last treaty it was agreed that these privileges should be suspended, so long as the Constitutional system existed, and Englishmen in Portugal enjoyed the same protection as Portuguese in England, from trial by jury, and other legal institutions. The discussion of this project was interrupted by the closing of the session; but there is no doubt of its being resumed, and that the measure will be made law early in the ensuing session. *A propos* of this subject is the case of Mr. Tozer, of which frequent mention has been made, as illustrative of the trifling with the liberty of the subject, and the delays which prevail in the administration of the law in Portugal. This gentleman was at length tried before the Criminal Tribunal of the British Conservatorial Court in Oporto on the 11th inst., when the jury unanimously declared the charges not proved, and the judge acquitted the accused. Mr. Tozer has therefore suffered 240 days of unjust imprisonment.

BELGIUM.—The commercial treaty concluded by the Belgian Government with the Zollverein has been passed by the Chamber of Deputies by a large majority, but only after a debate which kept the Ministry in check for 10 days. The treaty, it is said, would have been more powerfully opposed but for the general impression that, having been signed and ratified by the King, the Chambers could not refuse their sanction without disturbing the relations of the country with foreign powers. Notwithstanding this result, a Ministerial modification is considered probable.

GERMANY.—Accounts from Berlin of the 14th state that on that day the regicide Tschech, who attempted to assassinate the King of Prussia, was executed at Spandau, where he had been conveyed under an escort of cavalry. The King had remitted that part of his sentence which stated that he was to be broken on the wheel, and commuted it into simple decapitation. The King, it is well known, was anxious to have spared his

life, and it is said that it was not without a severe struggle against the well-known mildness of his disposition, and yielding only to arguments and considerations of the deepest gravity, that the monarch was induced to sign the warrant. The *National* publishes letters from Berlin, which leave no doubt as to the intention of the King of Prussia to give a Constitution to his subjects. His Majesty, it appears, feels it impossible to stem the torrent which threatens to carry away the existing forms of government, and under that impression he replied to Prince Metternich, who reproached him with his defection—"It is preferable to govern as a constitutional king than not govern at all."—Letters from Munich state that the gigantic head of the statue of Bavaria, a bronze statue, which is to be 68 feet high, was withdrawn from the mould in which it was cast at the Royal Foundry of Munich on the evening of the 14th inst., in presence of the King and Queen of Bavaria, and a considerable number of distinguished personages. The beauty of the head of Bavaria, which is the work of the celebrated Schwanthaler, excited such enthusiasm amongst the spectators, that they joined in a chorus of 300 of the Philharmonic Society, who chanted a hymn composed for the occasion by the Baron de Poissel, director of the Theatre Royal.

SWITZERLAND.—The disturbances of Lucerne are apparently suppressed, but great excitement prevails in all the cantons, popular assemblies are held, and a general impression prevails that the late events were the mere prelude of a crisis which might yet put in peril the present constitution of Switzerland. At Berne, notwithstanding the cold and snow, a popular assembly was held in the church of Fraubrunnen. About three thousand persons, consisting mostly of citizens of Berne, Soleure, Argau, and refugees from Lucerne, were present at it. A project of association against the Jesuits was read, and received with acclamation. A number of speeches were delivered, which breathed the liveliest exasperation against that religious order. It was finally agreed to address a petition to the Government of Berne, requesting it to place itself at the head of the cantons opposed to the establishment of the Jesuits in Switzerland, urging the adoption of the measures it might deem advisable to attain that end, and promising the efficient aid of all the members of the association. At Zurich the Grand Council has approved of the measures taken during the late events at Lucerne, and adopted a motion that it should address to the Government of Lucerne a friendly request that it would reconsider the measure for the recall of the Jesuits. In the event of a negative or evasive answer being given, the executive council is requested to call upon the Vorort to convoke an extraordinary Diet, to deliberate on the means to be adopted to re-establish and maintain the peace of the country.

ITALY.—Letters from Turin state that considerable sensation had been produced in that city early in the present month, by the violation of the Piedmontese territory by a body of French Gendarmes, douaniers, and soldiers, who, under pretext or real authority of certain French magistrates, arrested six or seven Sardinian subjects, and carried them prisoners to Grenoble, to answer for alleged thefts committed in a forest on the French side of the frontier. On becoming acquainted with this outrage the Sardinian Government made the necessary representations to that of France, by whom, no doubt, full satisfaction will be given.—The winter has set in with unusual severity. At Turin, on the 5th, the thermometer fell to 16 degrees below zero (about four Fahrenheit), and on the 7th, at 9 o'clock, it was at 13. The poor, who are not at all prepared for such extraordinary cold, suffer amazingly, and the Government is employed in giving them assistance. Apprehensions are entertained lest the excessive cold should be fatal to the mulberry-trees, which form, with the growth of silk, one of the most important of the national resources.

TURKEY.—Letters from Constantinople of the 4th, state that Sir Stratford Canning has returned from his excursion to the Dardanelles, to his country house at Bujukdere. It is said that Abdullah, Pacha of Trebizond, alarmed by the order of the Porte to justify himself, has offered a large pecuniary indemnification to the ill-used Greek. The Pacha is said to be also threatened with an address of the chief Turks of Trebizond to the Porte, representing the tyranny which makes him hated by all classes, and earnestly desiring that he may be removed. The weather is still very severe, the thermometer at zero, and the houses covered with snow.

WEST INDIES AND SOUTH AMERICA.—By the Royal Mail steamer Thames, advices have been received to the following dates:—Jamaica, Nov. 24; Demerara, Nov. 19; Trinidad, Nov. 21; and Barbadoes Nov. 27. From Demerara there is not a word of news of any kind, and scarcely more is to be collected from the papers and despatches from the rest of the islands. There seems to be a doubt about the full powers of Coolie emigration being carried out; and it is a question whether the Jamaica Assembly will allow a greater supply than 2000 to be admitted for the first year. The settlement of a penal colony for convicts was exciting some attention in the islands, and the Earl of Elgin was to meet some of the other governors on the subject, with the view of disposing of the difficulty attending the punishment due to culprits sentenced to transportation. —Advices from Arica to the 4th Sept. state that some unpleasant occurrences had taken place between the British and Peruvian authorities on the coast of Peru. H.M.'s steamer Cormorant, on her arrival at Arica, on the 2d Sept., was refused permission to water, in consequence of which she fired several shots, and threw some shells into the town with such an effect that she was allowed to take in water; and the accounts state that the dispute, the particulars of which are not given, was settled. H.M.'s ship Dublin, Admiral Thomas, had released the British barque Horsburgh, at Islay, and placed the Peruvian squadron that detained her under embargo.

CITY.

Money Market, Friday.—Consols for the account closed at 100⅜; Red. Three per Cents., 100⅞; New Three and a Quarter per Cents., 103¼; Bank Stock, 210½; Exchequer Bills, 62 to 64; India Bonds, 78 pm.

GAZETTE OF THE WEEK—BANKRUPTS J. P. BIRLEY, 26, Brompton row, Kensington, plumber—J. CHRISTIE and J. ROGERS, Nottinghill, stonemasons—E. BRENNAN, North Brixton, Surrey, builder J. W. WOOD, Churton street, Vauxhall bridge-road, wine merchant—W. PRESTON, 4, Monmouth road, Westbourne grove, Bayswater, builder—H. M. WALLER, Foulsham, Norfolk, merchant H. HOSKINS, Leeds, merchant—M. GRAHAM, late of Middlesbrough, Yorkshire, but now of Darlington, Durham, attorney—N. T. HAWKE, Penzance, Cornwall, tea dealer—J. P. BURDETT, now or late of Uttoxeter, Staffordshire, grocer—J. HALLEY, Wolverhampton, plumber—L. I. THEMANS, Sidney place, Commercial road, tea dealer—A. SERR, Liverpool, licensed victualler—C. STRANGE, Baglan, Glamorganshire, and R. PARSONS, Swansea, merchants—C. WATSON, jun., Church-street, Darlington, tea dealer—J. R. KING, Bath, druggist.

Metropolis and its Vicinity.

State of the Church.—A meeting of noblemen and gentlemen took place on Friday, to consider the propriety of adopting some active measures with respect to the present disturbed state of the Church on those matters which have recently been so much the subject of discussion. The meeting, which had been convened by private circular, took place at Lord Howard's, in Belgrave-square. The proceedings were all preliminary, but a committee was appointed to draw up for approval a memorial, to be addressed to the Queen or the Archbishop of Canterbury, as may hereafter be determined.

The late Collision on the River.—On Monday the inquest on the two persons killed by the late collision between the Orwell and the Sylph was resumed. The Jury, after examining various witnesses, returned a verdict of accidental death, with a nominal deodand on the Orwell, and a censure on the captain of the Sylph for navigating his vessel with such speed.

Common Council Elections.—On Saturday, being St. Thomas's Day, the various wards into which the city of London is divided were busily engaged in making their annual returns to the Court of Common Council. There were only 4 contested wards, Farringdon-within, Coleman-street, Billingsgate, and Portsoken. The elections in these were concluded on Monday, but the details are of little interest except to the parties concerned.

Frauds on the Revenue.—In consequence of numerous irregularities which have been lately discovered in the St. Katharine's Docks, four officers connected with the vaulting and delivery department have been suspended, and a rigid inquiry is going on which, it is expected, will lead to important disclosures.

Victoria Park.—On Monday, by order of the Commissioners of Woods and Forests, the ancient residence formerly belonging to Bishop Bonner, called Bonner Hall, situated on a part of the site of Victoria Park, was sold by auction. It is stated to have been a part of one of the wings of the original palace.

The Improvements in Westminster.—On Friday the long-talked of improvements to be effected from Westminster Abbey to Buckingham Palace were commenced, several men being employed to pull down the houses on one side of Little Tothill-street. It is contemplated to remove the Almonry, Orchard-street, Duck-lane, and to form one wide and spacious street from the west door of Westminster Abbey to the Palace-end of Pimlico. Orchard-street contains the remains of some of the oldest houses in Westminster, and a part of one of Oliver Cromwell's palaces still stands there.

The Police Offices.—The *Gazette* of last week contained a lengthy Order in Council defining the boundaries of the divisions assigned to the different metropolitan police-offices. Heretofore they were very unequally divided, but in the new arrangements, considerable pains have been taken to divide them in equal proportions, and the following are the extreme points of the spaces they now include: *Bow-street.* — Temple-stairs, Holborn-hill, King-street, by Southampton-row to New-road, Tottenham-court-road, Trafalgar-square, Cleveland-row, Storey's-gate, crossing the Park, Westminster-bridge, N. side; Temple-stairs. *Queen-square.*—Westminster-bridge, S. side; Hyde Park-corner, Knightsbridge and Fulham-roads to Stamford-bridge, Kensington-canal to the river Thames, Westminster-bridge, S. side. *Marylebone.*—Victoria-gate, Hyde Park, eastward by Oxford and Regent-streets and New-road to Tottenham-court-road, Upper Seymour-street, Maida-lane, near the North Cemetery, Shoot-up-hill, Kilburn, Westbourne-green to Queen's-road, Victoria-gate, Hyde-park. *Marlborough-street.* — Victoria-gate, Oxford and Regent-streets to New-road, Tottenham-court-road, along Bow-street boundary to Hyde Park-corner, Knightsbridge and Kensington-roads to the Camden Arms, thence, including the Palace and Gardens, to Victoria-gate. *Clerkenwell.*—Type-street, by Worship-street boundary to Stamford-hill; Hanger, Hornsey, and Maida-lanes; Camden-road, Red Cap public-house; High-street, Camden-town, and Seymour-street, to New Road, by Bow-street boundary to Holborn-hill; and by City of London boundary to Bunhill-row. *Worship-street.*—High-street, Whitechapel, by Thames police-boundary to river Lea; northward to Highbridge; westward to Stamford-hill; Kingsland-road, to Regent's Canal; Ashley-crescent, Shepherdess-walk; Bunhill-row, Type-street, to City of London boundary; thence to High-street, Whitechapel. *Thames-police.*—Tower-stairs to High-street, Whitechapel, Globe-lane, Mile-end Road, Eastern Counties Railway, Hackney-cut, Bow-bridge, along river Lea to the Thames, Tower-stairs. *Southwark.*—(Office removed from Union-street to Blackman-street.—Waterloo-bridge (south-east side), by Lambeth boundary, southward to Greenwich boundary, northward to the Thames, Waterloo-bridge. *Lambeth.* —(Office removed from Whitechapel to Kennington-lane, Lambeth).—Waterloo-bridge, S.W. side, Waterloo, London, New Kent, and Kent-roads, to Greenwich boundary, westward to Wandsworth boundary, thence to the Thames, Waterloo-bridge.

Christ's Chapel, St. John's Wood.—The incumbency of this chapel, vacant by the preferment of the Rev. Daniel Moore, M.A., to the ministry of Camden chapel, Camberwell, has been conferred on the Rev. George Fisk, L.L.B., Vicar of Walsall.

Model of the Battle of Waterloo.—A model of this great Battle has just been opened for public exhibition at the Egyptian Hall. It has been constructed by Captain Siborne, the historian of the War in France and Belgium in 1815, and will doubtless become popular among the holiday folks of the season. The principal scene it represents is the repulse of the attack made by the French troops upon the British centre and left wing—one of the most brilliant episodes in the combat. The Household Cavalry are charging in the centre, and putting to flight the French Cuirassiers, while Kempt's, Pack's, and Ponsonby's brigades are routing the attacking forces towards the left. The disposition of the troops, the celebrated farm-house La Haye Sainte, the Charleroi and Wavre roads, are all seen at a glance, while the eye runs along the contending lines, and easily comprehends the nature of their movements. The mechanical part of the model is very well managed, the little figures carefully constructed and painted, while the different crops of Rye, Potatoes, &c., in the fields, are accurately represented.

Panorama of Naples.—Mr. Burford has this week opened, in Leicester-square, a new panorama of Naples, representing the city and bay by moonlight, and the eruption of Vesuvius in 1822. All the well-known features of the scene are given with truth and effect, and it is generally admitted to be one of Mr. Burford's most successful attempts.

East India Company.—The Quarterly Court of Proprietors was held last week. The Chairman laid before the meeting the correspondence which had passed relative to the grant of 1000*l.* a year to Sir W. Nott, and the sanction given to it by the Board of Control. The Chairman stated that Mr. Poynder was unable from indisposition to bring forward his motion on the Temple of Juggernaut, but he was happy to state to the Court that the necessary documents having been received from India, the Court of Directors had taken the subject into their consideration; and, although he was not in a position at present to lay before the Court the despatch which they had come to the determination of sending out to India, yet he felt himself justified in informing the Court that their decision was such as would, he hoped, complete the severance of the management of the temples from the Government of India altogether. Mr. Thompson again brought forward the case of the King of Delhi, and moved for a variety of papers, but on a division, the motion was lost by a large majority.

Fires.—On Saturday morning, at an early hour, a fire, attended with a greater loss of life than has occurred in the metropolis for some time past, broke out in the residence of Mr. Farey, civil engineer, 67, Guildford-street. The origin of the fire is not known, but its progress was so rapid, that Mr. and Mrs. Farey, their brother, and servants, escaped with difficulty to the roof of the adjoining house. A young man, who acted as Mr. Farey's clerk, was asleep in one of the attics, and it being impossible to awake him, he perished in the flames, with two policemen and a groom, who were killed by the fall of the timbers on the ground floor. The house was totally destroyed; and as all the floors fell in, and several persons were seen about the wine-cellars intoxicated during the fire, it is feared that other bodies are still buried in the ruins. The coroner on Tuesday held an inquest on the four bodies, which have already been found, but after examining two or three witnesses, it was agreed to adjourn the inquiry to Monday next.—A fire broke out on Monday morning in the house of the Earl of Harrington, in Whitehall-gardens, next door to Sir R. Peel's. It originated under the hearth of the dressing-room, and passed along the joists of the flooring. The supply of water was very scanty, and the fire was burning in so large a body under the flooring, that it was found necessary to cut away the floor into the ball-room beneath, a considerable portion of the ceiling of which is destroyed. In the dressing-room also much injury is done, and a great quantity of furniture has been damaged by water and removal.

The Royal Alms.—Her Majesty's royal charities of five shillings each to upwards of 900 poor and aged persons were distributed on Monday and Tuesday, under the orders of the Lord High Almoner, the Lord Archbishop of York, and of the Sub-Almoner, Archdeacon Wilberforce. In consequence of the severity of the weather the distributions were extended to a greater number of persons than usual. The Royal Gate alms were distributed at the same time to 108 persons, who received thirteen shillings each. Many of the aged poor who received the royal bounty are blind, and labouring under bodily affliction. The distribution of the Queen's and Prince Albert's annual gifts to the poor of Windsor, will take place on New Year's Eve, in the riding-school of the Royal Mews; and it is expected that Her Majesty and the Court will be present on the occasion.

Repeal of the Window Duties.—On Tuesday evening a meeting of builders and master carpenters of the metropolis took place at the Freemasons' Tavern, for the purpose of considering the propriety of petitioning Parliament for the abolition of the window duties, to promote better ventilation. Mr. Biers, president of the Master Carpenters' Society, was called to the chair; and among those present were observed Mr. Cubitt, and other well known builders. The Chairman and other gentlemen addressed the meeting on the subject of the window duties, dwelling particularly on the hardships which they entail on the occupiers of small houses, as the slightest aperture above eight windows entails an additional tax, and contending that the abolition of those duties was necessary to secure ventilation. In this view it was stated the whole of the medical men of the metropolis concurred, and the evidence of Dr. Reid and other men of eminence before the committee, went to show that, without a better system of ventilation, an increased supply of water, and an improved sewerage would be of little avail in the preservation of health in crowded districts. A petition to Parliament praying for a modification of the duties was unanimously adopted.

Metropolis Improvements.—The Commissioners of Woods and Forests have published their 24th Report, from which the following are extracts:—"In the several lines of improvement authorised by the acts 3 & 4 Victoria, we have, since the dates of those acts respectively, completed purchases to the amount of 457,844*l.* 15*s.* 10*d.*, and have contracted for further purchases to the amount of 191,617*l.* 15*s.* 10*d.*; and, besides these, the purchases now remaining to be made in order to clear the whole of the ground required for completing the several lines of improvement, it is estimated, will cost the further sum of 54,256*l.* 5*s.*, or thereabouts, viz.:—1. In the line from Oxford-street to Holborn we have completed purchases to the amount of 211,684*l.* 14*s.* 10*d.*, and have contracted for further purchases to the amount of 56,969*l.* 3*s.* 4*d.*, and besides these there remain to be made purchases estimated to cost the sum of 14,571*l.* 15*s.*, or thereabout. 2. In the line from Bow-street to Charlotte-street, Bloomsbury, we have completed purchases to the amount of 70,958*l.* 18*s.* 3*d.*, and have contracted for further purchases to the amount of 3009*l.* 11*s.* 9*d.*; besides these there remain to be made purchases estimated to cost the sum of 17,595*l.*, or thereabouts. 3. In the line from the London Docks to Spitalfields Church we have completed purchases to the amount of 96,742*l.* 16*s.* 11*d.*, and have contracted for further purchases to the amount of 30,236*l.* 8*s.* 7*d.*, and besides these there remain to be made purchases estimated to cost the sum of 6740*l.*, or thereabout. 4. In the line from Coventry-street to Long-acre we have completed purchases to the amount of 77,078*l.* 5*s.* 10*d.*, and have contracted for further purchases to the amount of 89,202*l.* 12*s.* 2*d.*, and besides these there remain to be made purchases estimated to cost the sum of 8097*l.* 10*s.*, or thereabout. 5. In the line from East Smithfield to Rosemary-lane we have completed purchases to the amount of 1420*l.*, and have contracted for further purchases to the amount of 12,200*l.*, and besides these there remain to be made purchases estimated to cost the sum of 7252*l.*, or thereabout. By a statement of receipts and expenditure in respect of moneys applicable to these improvements, it appears that of the sum of 500,000*l.* mentioned in our 19th report to have been borrowed of the Equitable Assurance Company for the purposes of these improvements, upon the security of certain portions of the land revenue of the Crown in the county of Middlesex, and of moneys arisen from interest on Exchequer-bills and profit on the purchase and sale of those bills, in which part of that loan was temporarily invested, from the sales of old materials, and from rents of property purchased for the purpose of these improvements, there remained a balance of 1420*l.* 6*s.* 6½*d.* These funds being, as will be seen by the statement above mentioned, nearly expended, we are taking measures for obtaining a further loan of 250,000*l.*, which we find it will be necessary to raise for the purpose of making the several remaining purchases requisite for the completion of these improvements."

Opening of Lloyd's Rooms.—On Thursday the great commercial establishment known as Lloyd's, took possession of their new apartments at the Royal Exchange. The rooms were greatly crowded during the day, by the subscribers and their friends, and the increased accommodation and convenience were subjects of much satisfaction.

Walthamstow.—A tradesman called Hobson, who keeps the post-office at this place, has been brought before the magistrates at Bow-street this week, for embezzling the postage of a letter to Calcutta, and unlawfully detaining newspapers. The magistrates on Tuesday committed him for trial, and refused to take bail.

Wandsworth.—A decision of some importance to parishes in respect to the disbursements of sacrament money among the poor has recently taken place. It appears that on the 1st inst. Mr. Prior, a gentleman residing at Wandsworth, placed in the sacrament plate a 100*l.* enclosed in an envelope, as his offering to the poor of the parish. The clergyman, Dr. Pemberton, took possession of the whole amount, and, without consulting the churchwardens, went to London, and laid out the principal portion of the money at a wholesale linen-draper's in clothes for the poor. The churchwardens, who had always been in the habit of receiving half the sacrament money, to be distributed by them, complained to the Bishop of Winchester respecting Dr. Pemberton's conduct. The bishop's answer was, that he had already decided in a similar case, that one moiety of the alms should go to the clergyman, and the other moiety to the churchwardens, for distribution, and he saw no reason why the custom should have been departed from in this case. At a subsequent meeting of the parishioners, thanks were voted to the churchwardens for their conduct in the matter.

Provincial News.

Birmingham.—A burglary of a daring character was committed during the night of Tuesday, in the residence of Miss Chambers, of Radway, near Kineton, on the borders of this county and Worcestershire. The robbers, who were three in number, with blackened faces and armed with pistols, having made a forcible entrance into the house, two of them proceeded to Miss Chambers's apartment, whilst the third kept watch at the door leading to the apartments of the servants, who were disturbed, and whom he threatened to murder if they made any noise. The same threat was made to Miss Chambers by the two who entered her room; they then proceeded to rifle the house, and carried off plate and other property to a considerable amount.

Bradford.—The Rev. Dr. Scoresby, much to the astonishment of the public, has resigned the vicarage of this town. The *Leeds Mercury* states, that Dr. Scoresby had formed a scheme for the division of his extensive parish, and notice had been given of an application to Parliament next session for a bill to authorise it. The Ecclesiastical Commissioners are said not to approve of Dr. Scoresby's scheme, and for this reason it is supposed he has resigned the living.

Croome.—On Friday morning, at an early hour, as five keepers were watching the preserves of the Earl of Coventry, in the parish of Croome, about seven miles from Worcester, they were surrounded by a gang of about 20 poachers, armed with guns and sticks, and carrying with them a number of snares for taking game. The poachers at once attacked the keepers, who, seeing the number of their assailants, offered no resistance, but fled, and the gang immediately fired upon them, wounding two of them slightly on the head. One man, however, did not succeed in escaping from the poachers, who set upon him and beat him about the head, leaving him senseless on the ground, with his skull fractured. The poor man was conveyed to the Worcester Infirmary, where he has since died. Some of the poachers are known to the police, who are engaged in their pursuit, and one man, named Turvey, is already in custody. They belong to a large gang who have long infested this part of the country, and by whom threatening letters have been sent to several game-preservers in the county.

Exeter.—The Bishop of Exeter has published a letter to the Dean on the recent memorial from him and the residentiaries of Exeter to the Archbishop of Canterbury. The greater part of this document, which occupies nearly three columns and a half of the *Times*, refers to the Bishop's personal differences with the memorialists, and especially with Dr. Bull, whom he condemns in terms of great harshness and severity, for having committed what he considers a breach of confidence in making known the proceedings of the recent chapter before the Bishop's pastoral letter was made known. The Bishop denies that the memorialists possess any power whatever in the matter, and at the same time manifests great indignation that they should have given the first impulse to the agitation going on throughout the diocese. His lordship says:

"The manifest intention of the memorial was to make 'the Bishop of Exeter pause in the hope that a conference of Bishops, with the view to such concurrence, might be more generally applied for and ultimately obtained.' I admit the wisdom and fitness of seeking that object, as I proved to the Chapter that I had myself anxiously sought it; but I deny that the course taken by the residentiaries was such as it became men in their position to take. What was the original purpose for which Cathedral Chapters were instituted? To be the councils of their Bishops. What is the highest privilege of members of such bodies? To give their counsel honestly, frankly, unreservedly—under a strong sense of duty, not only to their Bishop, but to the Church, which has intrusted them with this important, though indirect influence on the government of the diocese to which they belong. But then they are, in this regard, only councillors—and one and all ought to remember that they are no more—that they must be content to see the counsel of others followed in preference to their own, if the Bishop, whose high privilege it is to call for their counsel, shall so decide. This ought to be felt by every one among them on every such occasion, but, above all, when his own counsel happens to be opposed to that of the great majority. But in saying this, do I say or think that every councillor is bound to render implicit obedience to every measure which his Bishop may decide to take on the advice of such majority, or even by silent acquiescence to seem to share the responsibility of having advised it? Very far from all this; in due time, he is at perfect liberty to declare himself against it, and, if it be a measure which can be properly opposed, to use all proper means in opposing it. But this due time does not come until the Bishop has acted upon the advice given to him. Until then every member of the Chapter is bound by fidelity to the Bishop, of whose council he is, to abstain from every act and every word which tends to thwart or counteract him—which can make his acting, as he may judge best, on the advice which he has received, more difficult, more inexpedient, or more obnoxious to popular objection."

In regard to the object of the memorial praying the Archbishop to consult with all the Bishops of his province, and to procure their concurrence in some uniform interpretation of the rubrics, the Bishop says that—

"If acted upon by his Grace the Archbishop and the bishops of his province, it would bring them, I fear, one and all, under the very heavy penalties of the law. Without the special permission of the Crown, such a meeting for such a purpose would be not only incompetent to do what the memorialists prayed, but would be absolutely illegal. This you may think to be very hard; perhaps it is hard. But such is the law of the land, as stated by Archbishop Wake, after very grave inquiry; and the law of the land I, for one, shall always obey when it is not contrary to the law of God. Will it be said that the difficulty may be overcome by obtaining the licence of the Crown? Let the memorialists seek to obtain it, and they will probably hear, from higher authority than mine, that such a licence cannot be granted *for such a purpose* by any power known to the Constitution. If it were granted, which it never will be, and if the Archbishop and all the Bishops of the province acting under it should do what the memorialists desire—nay, should obtain the assent of the Crown to what they had done,—they and the memorialists might perhaps find themselves at last to have been travelling on a fool's errand, and to have wasted so many sheets of paper or skins of parchment as shall have recorded the result of their deliberations. There is no legal mode in which 'the prelates of the church,' as a body can come to a 'concurrence in some uniform interpretation of rubrics and in some uniform rule for the direction of the clergy,' or can 'sanction such a measure by their united authority.' We, the Bishops, cannot hold a provincial synod, with power to make ordinances. The convocation only, according to the present law of the Church, is competent to this: the convocation lawfully called by the Archbishop executing the writ of the Crown. Its ordinances must receive the assent of the Crown before they can be even promulged; and moreover they must be confirmed by the authority of Parliament in every particular in which they may be contrary to the existing law before they can have any force. This then is the course which must be taken, in order to give effect to the prayer of the memorial. In such a course I should not be backward to concur, and if the result of the present excitement be to lead to the actual adoption of any measure by which uniformity can be legally secured, without unnecessarily offending any prejudice, we shall all have reason to rejoice that an inestimable benefit has been obtained. But in the meantime the law is plain and precise; it points out one mode by which, and by which only, doubtful rubrics are to receive an interpretation; and this is the mode which was recommended to me by the smaller chapter of October the 19th, when you, Mr. Dean, and two other of the memorialists, gave to me the benefit of your then unanimous counsel—to observe the course prescribed in the preface to the book of Common Prayer."

On the general question his lordship says,—

"I am not ignorant, and as little am I surprised, that the measure which I have announced has not only been received with much hostility by those who hate the Church, and by those who know not what the Church is, but that it is disapproved by many whose judgment I respect, whose principles I venerate, whose approbation I should receive as among the most valuable of earthly rewards. I am aware that it is urged by many of these that mine is a rash and dangerous experiment, thwarting popular opinion, loudly as it has been declared in so many different parts of England, and triumphant as it has been in almost every conflict. I am aware too that it has been further said, and, thank God, truly said, that the diocese of Exeter has long been distinguished by the faithful and warm attachment of the people to the Church; and, therefore, that it is peculiarly unwise to embroil a diocese so circumstanced in adverse discussion about a surplice or a rubric. Now, I meet the objection with a full admission of the facts on which it is founded; and then I avow, not with unseemly or hasty reliance on my own judgment (for it has been formed on much observation, on cool and deep reflection, after communicating with some of the best and ablest men I ever knew; above all, after repeated, and earnest, and humble prayer to Him who is light to the blind and strength to the weak),—after all these precautions against a rash decision, I hereby avow, that those very facts, which are urged as reasons to restrain me, are among the most powerful stimulants of my course. I see a resolute determination in many parts of England to resist all Church authority; I see schism in its most mischievous form, under the guise of nominal churchmanship, rampant, and, of course, intolerant wherever it is seen. I will not, I dare not, be a tacit or timid spectator of the introduction of this spirit into my own diocese. Yet have there not been indications of the approach of the enemy? and am I to wait till he has firmly established himself among us? No. 'By Divine permission' (oh, how does the awful phrase humble the poor sinful being of whom it is spoken!)—'by Divine permission' I am bishop of this see,—I have 'received the Holy Ghost for the office and work of a Bishop in the Church of God;' and I will not sink into a mere official of 'the Establishment.' So long as I shall be permitted to live on earth, I will strive, with God's blessing, to maintain the Church, as the Church, in the diocese over which I am placed. I have vowed to be ready, and 'I will be ready, God being my helper, with all faithful diligence, to banish and drive away all erroneous and strange doctrine contrary to God's word.' And I know no more erroneous or strange doctrine contrary to God's word, none more destructive in its tendency (for it involves the danger of all Christian truth) than the denial of the authority of that Church which is commissioned by God to be the guide of souls."

His lordship then mentions the case of several clergymen who have told him that they cannot conscientiously accept the cure of souls without being permitted faithfully to keep their ordination vows in their full extent of meaning, and asks "How can they be effectually protected, if they are left as mere marks for the scorn and ribaldry of the irreverent, or self-willed, or giddy crowd, which takes its notion of church government from harangues in the vestry-room, and finds its principles of Christian faith in the columns of a newspaper? The truth is, that my present measure has been forced upon me. In deciding on the case of Helston, or others (and several more were likely to arise), I had to pronounce judicially—to put forth principles which, if they were true and right at Helston, are true and right everywhere. To assert them in one place, and pass them over as worthless in all others, would be a solemn mockery, or rather a dangerous trifling with the Church's law, to which no honest administrator of that law could long be content to lend himself."

In conclusion his lordship declares—

"The firm resolution, which duty compels me to take, of calling, as I now solemnly call, on every one of those who have sworn that they will 'obey their bishop in all things lawful and honest,' to keep this oath by obeying him when he charges them to obey the law of the Church in the rubric of the Book of Common Prayer. The rubric may be—and in some particulars, perhaps, most of us might wish it to be—altered by competent authority. But, whether in its present or an altered form, the rubric must be the rule of every faithful minister in the performance of public worship—not the clamour of the people, however excited, or by whomsoever encouraged."

In a postscript to this letter, the Bishop states, as an additional reason for uniformity, that he has heard of a clergyman in the diocese who lately preached without surplice or gown, in his great-coat; but this postscript his lordship has since withdrawn, the statement made to him having originated in a mistake which has been explained. The Bishop has also addressed a long letter to the Churchwardens of the united parishes of St. Sidwell's and St. James's in answer to their petition, that he would withdraw his pastoral letter. His lordship in this document shows the same uncompromising spirit, and states that, if the parishioners will inquire into the changes which may be necessary in their several churches in order to bring the services into strict conformity with the rubric, they "will be found so trifling, that I venture to think you will be almost ashamed to recollect that you have suffered the arrogant dictation of London newspapers, or the baseless suggestions of persons nearer home, to terrify you with so mere a bugbear." His lordship again asserts his absolute authority over his diocese, by saying—

"There is a text which is only one part of the great sum of

Christian truth, which I must not be prevented from calling to your minds by a foolish fear of seeming thereby to be elevating my claim to your obedience; obedience, I say, for that is the very pith and marrow of the text. 'Obey them that have the rule over you, and submit yourselves; for they watch for your souls, as they that must give account.' Now, by the law of the Church, ay, and of the great Head of the Church, I 'have the rule over you.' You are bound, therefore you cannot, without sin, refuse to 'obey me, and to submit yourselves,' when, even in 'watching for your souls, as he that must give account,' I issue any lawful order in conformity with the word of God. You may think that I am a rash and injudicious ruler; be it so: still, if the word of God be true, it is your duty to obey me while I keep within the limits of the law which I have to administer—the law of the Church. For if those who are subjects of authority will obey it only so long and so far as it is exercised according to their own notions of what is wise and prudent, I am afraid that the ruler and the ruled must change places (one of the changes which I am quite determined to resist), in other words, the rulers must obey, and those whom God has made subject to their rule will have to command. I am sure that, on reflection, this is not a result to which you would desire to bring the matter. Now let me say one word about myself. Whatever you may think, I believe that there is scarce one among you who has a lower opinion of my own wisdom than I myself have. So far, indeed, I have some wisdom; for I do not rely on my own lights. I have recourse (after humble prayer to God) to the wisdom of the Church, and direct my government of my diocese by the Church's rule. On this great occasion (for I feel the occasion to be great, however small are the objects immediately in question) I have issued an order, which the circumstances of the time made me deem it right, and therefore my duty to issue."

Since the above document was published, the Bishop, in consideration of the strong feeling against the use of the surplice, has withdrawn his order on that point, but adheres to the enforcement of the rubrics. His lordship has announced this decision in the following letter to his clergy:—"Dear and Rev. Brethren,—It has been represented to me by many of you, in different parts of the diocese, that the use of the surplice in preaching is more repugnant to the feelings of the people than could have been reasonably anticipated. To those feelings, however erroneous, I deem it my duty to surrender what may be abandoned without the sacrifice of any principle. I therefore withdraw my order as respects the surplice. That order was avowedly issued by me, not for the sake of enforcing an express rule of the Church, but in execution of the power given to me to 'appease a diversity' in divine worship, and so to remove a symbol of disunion amongst ourselves. If my object cannot be obtained in the way which I had pointed out, without leading to other evils of as grave a kind, let me, however, hope and entreat, that in using your own discretion in this particular, you will so use it as shall least expose you to the reproach of cherishing party spirit. Wherever, therefore, the surplice is now used without offence, there I hope it will be continued in use. The enforcement of the rubrics rests on different ground. In them the Church has spoken clearly; and to the voice of the Church, when it gives not an uncertain sound, every true Churchman, and especially every faithful minister, will hearken with reverence and submission. I am, &c."

—In the mean time, the agitation still goes on throughout the diocese, and while the clergy of some of the rural deaneries have determined to comply with the bishop's injunction, the laity at every vestry meeting that has been held have resolved, either unanimously or by large majorities, to resist the innovations. In the parish of the Holy Trinity, in Exeter, the parishioners in their resolutions "contemplate the exercise of this individual power, on the part of the bishop, with the most painful apprehensions," and pass a vote of thanks to Dr. Bull and the other dignitaries of the Cathedral for their appeal to the Archbishop. They also express their concurrence with their fellow-citizens in the duty of an appeal to the Throne. At Plymouth the feeling excited by the pastoral letter far exceeds what had been anticipated by any party. In the two parishes of St. Andrew and Charles, and in two of the episcopal chapels, meetings of the congregations have been held, and measures adopted in opposition to the bishop's views. Besides these congregational meetings, the parishioners have met in vestry, with the churchwardens in the chair, and adopted the most stringent resolutions, not only declaring their hostility to the proposed forms as being at variance with the spirit of the Reformation, but proposing a systematic arrangement throughout all the parishes in England, for the purpose of organising a general opposition to any change in the Church services. In the parish of Charles, of which the celebrated Dr. Hawker was so long the vicar, one of the resolutions adopted makes the following important statement:—"This meeting most emphatically declares, that should the bishop persevere and succeed in his object, the most ready means by which the parishioners can testify their dislike and determination to resist, will be to retire from any Church in which the innovations may be attempted, and seek to carry on the Church service in unconsecrated buildings, until the bishop shall remove the mandate and restore peace."

Hurst.—On Friday another meeting of the parishioners of this place took place at the Church-house, having been convened by Mr. Leveson Gower, the Chairman, in order that the parishioners might have the opportunity of hearing the letter received by him from the Bishop of Oxford, in answer to his letter to the Bishop, communicating the resolutions adopted at the last meeting, expressive of the dissatisfaction of the parishioners in reference to the innovations recently introduced into the performance of Divine service at the parish church. The Rev. Mr. Cameron attended this meeting, as did likewise Mr. Gower, Mr. Walter, the Churchwardens, &c. The letter of the Bishop of Oxford having been read, a considerable discussion on the question ensued. Mr. Cameron defended himself from the misconceptions put upon his conduct, and strongly urged the meeting to abide by the Bishop's decision, which declared that in reading the offertory sentences, and the prayer for the church militant, Mr. Cameron was only obeying the law of the Church. Mr. Walter then proposed two long resolutions, condemnatory both of the Bishop's decision, and of Mr. Cameron's perseverance in resisting the feeling of the parishioners. After a long and irregular discussion, during which Mr. Walter expressed his readiness to withdraw the resolutions if Mr. Cameron would accede to the wishes of the parishioners, and a strong appeal to him to do this was made by the one or two present from whom Mr. Cameron had most reason to expect support. Mr. Cameron at length intimated that, to prevent worse evils, he would consent to apply for the Bishop's sanction to his returning to the mode of concluding morning service, in the parish previous to September last. He still, however, contended for some recognition embodied in the resolution to be then carried of the right of the Bishop to decide the question, as one of ecclesiastical jurisdiction solely; but finding that this was refused by Mr. Walter, and met by impatient clamour on the part of many present, he ultimately agreed that the resolution should pass in the following form:—"That this meeting, having heard Mr. Cameron's declaration, that he, in accordance with the wishes of his parishioners, will not persist in reading the offertory sentences every Sunday from the communion-table, cannot refrain from expressing its satisfaction at that communication, and trusts that in consequence of this return to the old practice of performing Divine Service in the parish church, the harmony which up to a late period existed between Mr. Cameron and his flock will be restored, and never again interrupted." The resolution was unanimously agreed to, and the service will consequently be performed henceforth in accordance with the wishes of the parishioners.

Ipswich.—An order for the execution of Mary Sheming, the woman who is under sentence of death in the county gaol, in this town, for poisoning her grandchild at Martlesham, arrived here on Friday, directing that it take place on Tuesday next, the 31st inst. The judge, by the same post, sent a respite for William and Walter Howell, and Israel Shipley, who are in the same place under sentence of death for the murder of M'Fadden, until the 25th January. A petition has since been forwarded from the authorities to Sir J. Graham, praying that the execution of Mary Sheming may also be stayed until the 25th January, so that the town may be spared the pain of two executions.

Manchester.—On Friday the Corporation and Merchants of this borough gave a dinner to Sir Henry Pottinger. Previous to the dinner, addresses were presented to the gallant officer by the Mayor and Corporation, by the merchants and manufacturers, and by the operatives of the town. At the dinner the Mayor presided, supported by several members of Parliament, and the other authorities of the district. The proceedings and the speeches were necessarily of a similar character to those which we have already reported in our account of the dinners in London and Liverpool. Sir H. Pottinger was welcomed with great enthusiasm, and was evidently much gratified with the warmth of his reception. In addition to this entertainment, the inhabitants of Manchester, as our readers are aware, intend to present Sir H. Pottinger with a lasting memorial of their approbation. The local papers state that the subscriptions already amount to about 3000*l.*, and that an opportunity will be taken of consulting Sir Henry's wishes as to the form in which this testimonial will be most acceptable.

Oxford.—The Vice-Chancellor of this University, in addition to the intended proceedings in the case of Mr. Ward, has announced that the Board of Heads of Houses are of opinion that the constitution of the University requires a new and extraordinary power for the extirpation of heresy. At present, by the statutes, the Vice-Chancellor is empowered to test the opinions of every one in the University respecting the doctrine and discipline of the Church, by requiring subscription to the 39 Articles. But as those Articles, in which unsound opinions, and "especially the errors of the Romanists are condemned, have been by some persons unadvisedly interpreted as if they were either scarcely or not at all opposed to those errors," it is proposed that no one who may be hereafter required to satisfy the Vice-Chancellor of the soundness of his opinion shall be permitted to subscribe the Articles without first subscribing a new declaration that he is about to subscribe the Articles "in the sense in which he sincerely believes them to have been originally put forth, and in which he believes them to be then proposed to him by the University, as a certain and indubitable token or test of his opinions." It will be proposed to the Convocation on the 13th Feb. to introduce this declaration into the statutes, and to give full power of using it to the Vice-Chancellor. This measure is avowedly designed to check the progress of Puseyism, and as several members of the University holding Fellowships have resolved to decline taking the test, the question will be brought to a direct issue, viz., Whether or not Convocation will vote for the expulsion of the individuals in question; such being the penalty proposed to be annexed to the third refusal of the test. Among others, Dr. Pusey has announced that he cannot take it. He says that he is prepared for the consequences which may attend his refusal, but even if he could satisfy himself that he could take the test according to any general meaning of the words, he must know from past experience that he should not take it in the sense in which it was proposed to him, and therefore could not then take it without a feeling of dishonesty. The friends of Mr. Ward have also issued a circular to Members of Convocation, requesting their attention to the following considerations:—"1. That the proposed statute institutes a new religious test in the University. 2. That a local test, thus instituted, places the members of the University in a religious position different from that of all other members of the Church, and the whole body of the clergy. 3. That the imposing any new test of doctrine beyond those which rest on the authority of the Church is a serious innovation, and alters at once the constitution of the University, and its relations to the Church. 4. That a great difference of opinion has always been permitted among those who subscribe the Articles, and that it is now proposed to introduce a new limit and restriction to that difference. 5. That the test proposed, being itself liable to different interpretations, is likely to cause perplexity, and to operate as a snare to consciences. 6. That it is not right or safe to rest on the supposition that this test will not be applied; since the obvious presumption, from its being proposed, is, that it is meant to be used. 7. That a test not applied to all, but liable to be imposed upon suspected individuals, according to the will of the Vice-Chancellor for the time being, is an objectionable form of test, likely to encourage a system of secret and underhand information, and to destroy mutual confidence and freedom of intercourse in the University."

Portsmouth.—We lately mentioned the determination of Government to restore the fortifications of this port. It is now stated that it has been determined to erect barracks in Portsea for 1000 men of the Line on the Ordnance ground, between the Lion and Unicorn gates.

Southampton.—At a meeting of the Dock Company a few days since, the Directors were empowered to raise the sum of 50,000*l.*, for the purpose of making a graving dock, which was considered necessary to render the docks complete for the accommodation of shipping, and for applying to amend their Act of Parliament. The Chairman gave a favourable report of the position and prospects of the Company.

Staines.—A melancholy occurrence has just taken place at Ashford, near this place, a man and his wife named Oliver, who occupied a miserable cottage by the roadside, having been found dead in their bed on Tuesday morning. It is supposed, from what has been gathered from their two children, who were found ill in the house at the same time, that the father intended to poison the whole family, and that the death of himself and wife was caused by arsenic. At present, however, nothing certain is known, but the coroner's inquest will doubtless clear up the mystery.

Swansea.—On Monday week, soon after the workmen entered the Pentrafelin Colliery, the property of the Swansea Coal Company, near Morriston, they were alarmed by an explosion of foul air in one of the headings, ignited by a collier who was most severely burnt On examining the spot it was found that two men and a boy were killed. In the course of the inquiry it was proved that the fan for ventilating the mines had not been worked for two days. The jury returned a verdict of Accidental Death, with an opinion, "that had the fan been worked during Sunday night, or early on Monday morning, the explosion would not have occurred.

Tamworth.—On Monday week Sir Robert Peel gave an entertainment, at Drayton Manor, to above 40 of his principal tenants, mostly in the occupation of large farms on his estate. Dr. Buckland, Dr. Playfair, and Mr. Smith, of Deanston, who were on a visit to the right hon. baronet, after dinner addressed the company. Dr. Playfair delivered an eloquent discourse on the different descriptions of manure, and the most approved systems of manuring land.

Wells.—The Bishop of Salisbury on Sunday last held an ordination in this cathedral on behalf of the Bishop of Bath and Wells. In his charge, his lordship expressly enjoined the candidates to make no deviation whatever from the accustomed mode of performing divine service in their respective churches, without first consulting with their diocesan. It is understood that the Bishop discountenances the introduction of novelties, or the revival of obsolete practices.

Windsor and Eton.—On Monday evening a fatal accident occurred at the Windsor theatre by the wife of a tradesman falling over the front of the gallery into the pit. It appeared at the inquest that the back row of seats was five feet higher than the front row, and the height of the railing in front of the gallery was only two feet eight inches. The jury returned a verdict of "Accidental death;" but wished the lessee of the theatre to erect a rail in front of the gallery to prevent similar accidents.—In consequence of the marriages, during last week, of the Rev. F. E. Durnford, and the Rev. J. E. Yonge, both assistant masters at Eton College, two fellowships have become vacant at King's College, Cambridge, which will be given to the captain of the Eton school, Mr. Wright, and to Mr. Woolley, the next senior scholar at Eton.

Worcester.—The Bishop of Worcester, Dr. Pepys, has delivered a charge to the candidates for ordination at their final examination on the 21st inst., which will doubtless excite great interest in the present state of the Church. The Bishop draws a striking contrast between the prosperity and usefulness of the Church prior to the appearance of the Oxford Tracts, and the dissensions which their publication has produced. He requests his clergy "to make the comparison, and then ask themselves whether the advantages, whatever they may be, which can be derived from a minute regard to ritual observances and the usages of antiquity, may not be purchased at too dear a rate, if purchased at such a price." His lordship considers the use of the surplice as a thing insignificant in itself, but

"Acquiring importance when it is considered as the badge

of a party, and when it becomes a stumbling-block and an offence to others." On this ground the Bishop says—"I should be disposed to advise you to continue the practice which has so long prevailed, of preaching in your academical habit, even though by so doing you deviated from the precise directions of the rubric. For the sake of those, however, whose consciences are tender on this point, I have carefully considered the question, and I have satisfied myself, and I hope that I may satisfy you, that it never has been the custom since the Reformation for the clergy to preach in their surplices. The whole argument upon this point turns upon the sermon being a portion of the communion service. If, therefore, we can show that the sermon is not a part of that service, there will remain no longer the slightest ground for an innovation which, though in itself indifferent, will be sure to shock the prejudices and excite the suspicion of your congregation. The 58th canon, which relates to this matter, is thus headed, 'Ministers reading Divine service and administering the sacraments to wear surplices;' and it directs that every minister saying the public prayers, or ministering the sacraments, or other rites of the Church, 'shall wear a decent and comely surplice with sleeves, to be provided at the charge of the parish.' Now, can it be said that when we are preaching a sermon we are either saying public prayers or administering a sacrament? That we are not doing the former is self-evident, and I will proceed to show that the sermon, though introduced in the course of the communion service, forms no part of the proper sacramental service of the Lord's Supper. It is worthy of remark that in the first Prayer-book of Edward VI., so little were the ten commandments or the sermon considered a part of the sacramental service that, after this portion of the service had been concluded, the following rubric occurred:—'Then so many as shall be partakers of the holy communion shall tarry still in the quire, or in some convenient place nigh the quire, the men on the one side and the women on the other side. All other (that mind not to receive the holy communion) shall depart out of the quire, except the ministers and clerks.' It is clear, therefore, that at that time, so far from the sermon forming part of the sacramental service, a complete interruption occurred after the sermon, during which those who did not mind to receive the holy communion are directed to retire, and then the proper sacramental service commences. This rubric is indeed not repeated in the second Prayer-book of Edward VI., or in the Prayer-book which we now use; but it is clear that the like interruption of the service was contemplated, for immediately after the Nicene Creed the curate is directed to declare unto the people what holydays or fasting days are to be observed in the week following; and all briefs, citations, and excommunications, are directed to be read; and can these be said to form part of the sacramental service? 'Then,' the rubric proceeds, 'shall follow the sermon,' so that you perceive the preaching a sermon is classed with reading briefs, citations, and excommunications, which, certainly, in the words of the 58th canon, can form no part either of Divine service, or of admistering the sacrament, during which ministers are directed to wear a surplice. The inference which I have attempted to draw from the rubric is further confirmed by the practice adopted at our two universities. It is well known that in no places is a regard for strict ritual observance more observed than in our universities; and yet so little is the sermon considered a part of the sacramental service that it is preached in a different place and at a different time from the college chapels, where the sacraments are administered; and here I cannot but observe that if the surplice had ever been worn, as the proper habit of a preacher, it would have been adopted in our University pulpits; but here we know that at the present time the gown is always worn, and I believe I may venture to say, that no record exists of the surplice having ever been used on such occasions, and the gown substituted for it; but such a change could not have been effected in a place where old customs are so strictly adhered to as in our universities, without authority, and if effected by authority, some record of it would unquestionably exist at the present day. Again, so far was the sermon from being considered as included in the reading of public prayers or ministering the sacraments, that we know it was frequently preached by some of our most eminent reformers at St. Paul's-cross, and it can hardly be supposed that the surplice was worn on such occasions. The true state of the case I take to be, that you are directed to use the surplice only when reading divine service or administering the sacraments; you then appear in your proper character of priest or deacon, appointed to minister in holy things; but when you preach you assume the character of a teacher, and as such your proper habit (if, indeed, proper or improper be fit words for a matter so utterly insignificant), is your academical gown, with a hood, denoting your degree at the University. I have thus attempted to prove that it is a mistaken notion to suppose that the surplice is the proper dress for you to wear in the pulpit."

The Bishop says, on another disputed point—

"Another change which has, of late years, been attempted in our Church service is the reading of the prayer for the Church militant, which, if originally intended to form part of the Church service, had been almost universally discontinued in our parochial churches, and even in many of our cathedrals. Upon this point the rubrics are certainly inconsistent. In that which immediately precedes that prayer the following words occur:—'And when there is a communion the priest shall place upon the table so much bread and wine as he shall think sufficient, after which is done the priest shall say, Let us pray for the whole state of Christ's church militant here on earth.' Did this rubric stand alone, there could be no doubt that the prayer for the church militant was to be read only when the sacrament was about to be administered; but another rubric occurs inconsistent with the above, at the conclusion of the communion service, where we read 'that upon Sundays and holydays, if there be no communion, shall be said all that is appointed at the communion until the end of the general prayer for the whole state of Christ's Church militant here on earth.' It is difficult to account for these two contrary rubrics, which appear to have been inserted at the same time, that is, at the second revision of the Prayer Book in the reign of Edward VI.; but as they do exist it is not extraordinary that the clergy should have felt themselves at liberty to observe which they pleased, and partly on account of the length of the service, so distressing to those who are in advanced years, partly on account of the awkwardness of being obliged again to exchange the gown for the surplice, this prayer became gradually discontinued. And here I cannot but observe, that the disuse of this prayer is of itself a proof that the surplice was not usually worn in the pulpit. Had it been so there would have been no difficulty in the minister returning from the pulpit to the communion-table, and reading the prayer as directed by the second rubric to which I have referred. It was because he wore a gown, and not a surplice, that this practice was found inconvenient, and therefore was discontinued."

In reference to the weekly offertory the Bishop observes:

"There is no doubt that originally this collection was intended as a substitute for the alms which used to be given at the doors of convents, and as it is still continued in Scotland and the Isle of Man, where no poor-rates exist, we may reasonably conclude that it would never have been discontinued in this country, if the poor had not been otherwise provided for by a rate levied on all the parishioners. The custom then became almost universal that it should only be used at the administration of the Lord's Supper. Attempts, however, have of late years been made by some of the clergy to renew the practice of reading the offertory and making collections every Sunday for the purpose of procuring contributions towards the support of our Church Societies; and where this can be done without offence to the congregation, it is impossible to object to a practice which, while it encourages the charitable feelings of the congregation, might, if extensively adopted, materially aid those most valuable institutions. The consent however of the congregation is a material element in the propriety of adopting such a practice; for we have no right to force upon a congregation, without their consent, what is not strictly legal, and I have always been intimately convinced that no collection can be legally made in a church, during the reading of the offertory, except for the benefit of the poor residing in the parish, and where the church is situated, or under the authority of a Queen's letter. The phrase of the 'poor-man's box,' which occurs in the rubric, can have reference only to that box which used to be placed in all our churches to receive the alms of the charitable for the benefit of the poor of that particular parish. A very curious decision of Sir Lyttleton Powys, in the reign of George I., has been lately published, which sets this matter at rest, for it is therein distinctly stated as the law at that time (and it does not appear that any adverse decision has been since made to reverse it), that no collections can be legally made in churches during the reading of the offertory, except for the poor of the parish, but by the leave and permission of the Crown. If, therefore, you think fit to restore the use of the offertory in any of the churches where you may be appointed to serve, you will bear in mind that all the money so collected can only be legally applied to the relief of the poor of the parish. There can be no objection to collections being made for other purposes, in cases where the congregation themselves are consenting parties to them; but, wherever such collections are resisted it will not be safe for you to persist, while the law upon this subject remains, at least, so doubtful."

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2067*l.*; Bristol and Gloucester, 980*l.*; Eastern Counties, 4021*l.*; Edinburgh and Glasgow, 1835*l.*; Great Western, 14,845*l.*; Grand Junction, 7350*l.*; Glasgow, Paisley, and Ayr, 1365*l.*; Great North of England, 1526*l.*; London and Birmingham, 15,108*l.*; South Western, 4579*l.*; Blackwall, 606*l.*; Greenwich, 722*l.*; Brighton, 3542*l.*; Croydon, 338*l.*; Liverpool and Manchester, 4490*l.*; Manchester, Leeds, and Hull, 5672*l.*; Midland, 8319*l.*; Manchester and Birmingham, 2814*l.*; Newcastle and Carlisle, 1524*l.*; Newcastle and Darlington, 1002*l.*; Preston and Wyre, 303*l.*; South-Eastern and Dover, 4145*l.*; Sheffield and Manchester, 579*l.*; York and North Midland, with Leeds and Selby, 2045*l.*; Yarmouth and Norwich, 251*l.*—The North British Railway Company have been authorised by the shareholders to make an application in the ensuing session of Parliament for powers to form a line from the southern terminus of the Edinburgh and Dalkeith Railway to the town of Harwich, and to raise an additional capital of 400,000*l.*, by the creation of 32,000 shares of 12*l.* 10*s.* each. The shareholders have also permitted the subscription of 25,000*l.* for part of the stock of the projected Edinburgh and Dundee Railway. Although the meeting was not quite unanimous, the majority was sufficiently large to carry the resolutions on these subjects.—The Taff Vale Company have resolved to enter into a contract for working the line for a period of seven years, upon the principle of a per centage on the weekly receipts.—The Guildford Junction Company have sanctioned the agreement made by the directors with the London and South Western Board, for the sale of the Guildford Junction line, granted in the last session of Parliament. The directors' report detailed the negotiations on this subject. The company, by the agreement, were to give over the railway to the South Western Company, completed with a single line of rails, receiving in return the sum of 75,000*l.* From this the Guildford Junction were recommended to pay a sum of 20,000*l.* to the proprietors of Prosser's Wooden Railway Company, as a compensation for their abandonment of the agreement to lay down Prosser's wooden rails on the line. The report concluded with an assurance on the part of the directors that, after all the requisite expenditure, sufficient would remain to reimburse the shareholders, with good interest on their outlay. After some discussion the report was unanimously adopted, and the directors were authorised to take the necessary steps to complete the agreement. In the course of the discussion, the chairman explained that the directors, owing to the opposition which threatened them on all sides, were not altogether to be considered as free agents. They were, therefore, compelled to agree to the best terms they could, for had they refused the offer of the South Western, and the projected opposition lines had progressed, the property of the Guildford Junction would have been rendered valueless.—The alteration made in the fares and accommodation of the Eastern Counties Railway has been attended with the greatest success. Already two large omnibuses and a coach have started in conjunction with the Company, running from Ipswich to Colchester, and scarcely a day passes without every one of them being filled with passengers. In addition to these, a number of fast coaches run from Norwich and various other towns in the district, and it is anticipated that a few weeks more will see others on the road. The inhabitants of Ipswich look upon this as a surprising change, as only two coaches passed through the town some few years back. As the spring approaches, three or four more conveyances will be started; and as the experience of the last six weeks justifies the belief that the passenger traffic will, before that time, have been nearly doubled, there can be little doubt that the penny-a-mile system will be completely successful.

IRELAND.

Dublin.—Archbishop Murray, the Roman Catholic Archbishop of Dublin, has issued a Pastoral Address to the clergy and laity of Dublin, the object of which is to defend his acceptance of the commissionership under the Charitable Bequests Act. In this important document the Archbishop gives a full exposition of his views upon the subject which has of late excited so much disunion in the bosom of the Roman Catholic Church. He exposes, with great force, the inconsistencies of the majority of the hierarchy, who, it appears, about three years since drew up a memorial to Government, which, with one exception—that of Dr. M'Hale—bore the signatures of the whole body, praying, as an act of especial justice, that "one" Roman Catholic ecclesiastic might be appointed to the Board of Bequests. The matter being thus officially brought under the notice of the Executive subsequently led to the passing of the new Act, and the formation of a board at which, not one, but five Roman Catholics are to take their seats along with four members of the Established Church and one of the Presbyterian. After detailing all these events, Archbishop Murray says that conscience told him it "would be in him a gross derilection of pastoral duty to fling away, through any human respect, the opportunity which this Act, imperfect as it is, places within his reach of guarding in safety the treasury of the poor, and of securing for the services of the Church whatever property benevolent individuals may choose, in the new board, to be permanently dedicated to that purpose." He then proceeds to review the Act, its merits and demerits; and, after going through this branch of the case, says—"Thus have you obtained, by this abused Act, important benefits, compared with which its defects are of but little moment. And yet, surprising as it must appear, denunciations of the most awful nature have been poured out unsparingly against those who, without any hope of earthly remuneration, but the consciousness of doing good, undertake the meritorious task of carrying into effect the beneficent objects which it contemplates. Let us hope that more attentive reflection on the nature of their office will gradually dissipate the prejudices which exist most undeservedly against it."—The acceptance of the Commissionership by three of the Roman Catholic Prelates, notwithstanding the clamour raised against the Bill, has caused some surprise among its opponents. At a meeting in Dublin on the day after the announcement, Mr. O'Connell addressed the meeting on the subject.

He commenced by adverting to the *Extraordinary Gazette* of the previous night. When he last spoke in opposition to the board, he did not know how it was constituted. Now he had the names of its members officially announced, and any remarks which he had to make in reference to the Catholic prelates who had consented to act upon it, should be with the greatest respect and veneration. It was a triumph of one portion of the Catholic community over another, and he was one of the defeated party. This was regarded as a triumph by the government, who could not wait to announce it in the ordinary course, but adopted the mode used in time of war—they announced their victory in an *Extraordinary Gazette*. He regretted not being able to agree in opinion with these venerated prelates; but, after all, they were like himself only fallible men, and, with great respect, he expressed his opinion that they were in error. He feared that the bill would have the effect of seriously checking Catholic bequests. Men would not like to have their affairs ransacked by a board the majority of which were hostile to their religious belief. Mr. O'Connell stated that he had seen a letter from Rome, and from a quarter entitled to the most implicit credence, stating that a Mr. William Petre, an English agent, was in that city negotiating a concordat with England, in connection with the Austrian envoy.

Mr. O'Connell afterwards left his residence in Merrion-square for Derrynane Abbey, in order to pass the Christmas with the members of his family there assembled. Mr. O'Connell intends to leave the Abbey on the 6th January, on his return to Dublin.—The weekly meeting of the Repeal Association was held on Monday in Conciliation Hall, Mr. Hobart, in the chair.

Mr. Smith O'Brien, who was loudly cheered, commenced the business of the day by reading a communication from Alderman Delahunty, of Waterford, inclosing the sum of 20*l.* The letter stated that the people of Waterford were determined to return two Repealers at the next election. Mr. O'Brien said that, after an absence of three months, he had no doubt but the Association would require to know whether his opinions were still unchanged as to their probability of success. He would tell them that at no former period was his determination more fixed, or did he consider their prospects more brilliant. Through good report or evil report, whether in prison or out of prison, he was determined to co-operate with his fellow countrymen in their exertions to achieve the legislative independence of their country. Their success depended upon themselves. If the people of Ireland wavered in their present purpose, if they swerved in the least, they would be handed down in history as a weak and vacillating people, but if they persevered, he would tell them his solemn conviction was that success should crown their efforts. He then proceeded to take a review of the prospects of the Repeal cause, and in doing so combated the assertions of the English press, that Repeal meant separation, and denounced such assertions as gross calumnies. What they required was an Irish Parliament, with an Irish ministry responsible to that Parliament. They did not intend to seek that change by a rebellion. Ireland had suffered enough already by an unsuccessful rebellion, but he would assert that there was a time when resistance would become justifiable. Into that question he would not then enter—he would merely express his confidence in Almighty God that he would not permit the good, the noble, the generous people of Ireland to continue in a state of misery. It was his intention to propose that every board of guardians in the country should, in the ensuing year, pass a resolution in favour of a Repeal of the Union, as he considered that the condition of the poor would be materially improved by the passing of that measure. He considered the power to crush the people resided, not in the bayonets or fortifications of England, but in the Irish minority that was opposed to them, and to win that party over should be their paramount object. There was, however, a class of men who were opposed to them, but they were the most despicable of all noxious animals—he meant the anti-Irish Irishmen; and any endeavours to conciliate them would, he considered, be fruitless. The hon. gentleman then dwelt upon the importance of cultivating a moral, intellectual, and political education of the people, and recommended the preparation for a crisis, which, he stated, the appearance of the political world warranted him in saying was not far distant."

The meeting was subsequently addressed by Mr. Grattan, M.P., and other gentlemen, and at the termination of the proceedings Mr. O'Brien announced the rent for the week to be 178*l.* 11*s.* 2*d.*

Tipperary.—The *Evening Post* contains the following:—"A letter, we understand, has been received in town, announcing the lamentable intelligence that another murder has been committed in the northern division of Tipperary. The victim of agrarian crime, in this instance,

was Mr. Henry Carden, who resided near Templemore. It was stated that he was fired at yesterday, and died soon after. No details are given. The Tipperary papers contained some weeks since accounts of proceedings on the part of Mr. Carden against some tenantry.

Limerick.—The following is an extract of a letter furnished by the proprietor of the *Limerick Chronicle* in anticipation of the regular publication of that journal. It should be remarked that the late Earl of Limerick, by his last will, bequeathed a sum of 500*l.* to be distributed amongst the poor of that city, and yet they could not permit his remains to be deposited in their final resting-place without indulging in one of those displays of barbarity which bespeak, to say the least, an imperfect state of civilisation:—"*Limerick Chronicle-Office*, Monday, 2 o'clock.—The funeral of the late Earl of Limerick has just passed our office, and such disgraceful conduct as took place was never witnessed in a civilised country. The yelling of the mob was terrific, and the tenantry who attended to pay the last tribute of respect to their landlord were assaulted, and their scarfs torn to atoms. The relatives of the deceased, in their carriages, received similar treatment, having been pelted with stones, and compelled to take refuge in the houses adjoining the cathedral. Lord Monteagle and Sir A. De Vere were amongst those who were so treated. Lord Monteagle is son-in-law of the late Earl; and Sir A. De Vere, nephew."

Belfast.—The Mayor and inhabitants of this town have invited Sir H. Pottinger to a public dinner, as an acknowledgment of his services to the mercantile community. Sir Henry has accepted the invitation, and promised to avail himself of it as soon as he can make arrangements to visit Belfast.

SCOTLAND.

Edinburgh.—It appears by the Scotch papers that it has been determined to erect memorials in this city to Wallace and Bruce, but some doubt exists as to the nature of the monuments. The *Scotsman* states that the idea of a Tower on Arthur's Seat is objected to on the score of taste, and also from the expense attendant upon the conveyance of materials to the summit of the hill. The proposal to erect a fountain and statues in the North Loch is condemned as wanting in grandeur and effect; while another proposal to erect a colossal statue on Arthur's Seat, and another of Bruce on the summit of a tower on the castle rock is again rejected, and a building after the model of the Temple of Theseus, at Athens, is suggested.—It is said to be in contemplation to celebrate the Centenary of the Rebellion of '45, next August, in the West Highlands.

Glasgow.—This city on Friday and Saturday last was visited by the densest fog ever remembered in this part of Scotland. It came on on Friday soon after daybreak, and people had literally to grope their way in the streets at midday. In the suburbs it was necessary to use torches, and all the traffic of vehicles was entirely suspended; the steamers in the river either brought to an anchor or went aground, and several persons lost their lives by falling into the canal. The fog lasted till Saturday morning, but the hard frost by which it was accompanied still continues.

Theatricals.

THE PANTOMIMES.—The theatres have been crowded as usual this week by holiday-folks anxious to see the Pantomimes.

DRURY-LANE.—At this theatre the subject is "Harlequin and Robinson Crusoe." The first scene represents *Crusoe* wrecked on the desert island, and carrying out his cargo from the ship, which lies high and dry on the shore. Some laughter was excited by the acting of Mr. Payne (*Crusoe*) in this scene, who displayed much broad pantomimic humour. We next find him introducing himself to a party of Caribee Indians, with some of whom he dances the Polka in a very whimsical style. His man *Friday* (Mr. Wieland) now makes his appearance on the stage, and a laughable scene takes place between him and his master in the latter's house, "built with his own hands," when he teaches his servant how to cook a leg of mutton and boil a pudding. While they are seated at supper with a party of young Caribs, other Indians rush in; the scene changes to the old wreck, and Crusoe immediately afterwards is seen taking his departure by the "Waterman" steamer for London-bridge. The usual transformations now take place:—The Caribee King is changed into the *Clown* (Mr. T. Matthews), his club-bearer into *Pantaloon* (Mr. Howell), *Prince Paramatta* into *Harlequin* (Mr. Wieland), while Miss Carson comes forward as *Columbine*. The first scene of the pantomimic transformations is the exterior of a music-shop, wherein the *Clown* and *Pantaloon*, while playing on the violoncello and bassoon, are suddenly lifted up into the air, and let drop again on their music-stools—an ingenious trick, which was much applauded. The exterior of the Insolvent Debtors' Prison, which changing to the baths and wash-house for the labouring classes, was a very bustling affair, but deficient in point, except in the solitary instance when the warm-water baths were changed into boiling-water baths by the mal-adroit pumping of the *Clown*, and the bathers come out parboiled. The trick of *Harlequin* in the bag with his head cut off was also ingeniously managed; but the concluding scenes were exceedingly heavy, and were scarcely redeemed by the humorous manner in which the Clown sang the old song of "Hot Codlins." The last scene of Her Majesty's christening the Royal Exchange was, comparatively speaking, flat, and indeed the whole pantomime went off heavily, for it is not remarkable for splendid scenery, or recommended by humour or ingenuity.

COVENT GARDEN.—The pantomime at this theatre was entitled "Harlequin Crotchet and Quaver, or Music for the Million." The first scene is the Hall of Discord; the body-guard of the *Demon* is a band of brass instruments, endowed with motion as well as sound; to these the *Demon* rises in a gigantic drum, from which he emerges, and, after lamenting the progress of music, he summons *Sharp*, *Flat*, and *Natural*, three of the ordinary masked spirits of *Pantomime* to aid him in spreading discord, he having already gained them over from the cause of *Apollo* and *Melody*—the last the good genius of the plot. He also engages them to carry off *Young Crotchet* who is in love with *Miss Semiquaver*, the daughter of *Demisemiquaver*. *Apollo* sends *Mercury* to challenge the *Demon* to a trial of skill, a pantomime, and a scene succeeds in which *Mercury* commands the aid of *Melody* for his master in the coming contest. The cottage of *Demisemiquaver* is then shown—a house, which is an entire musical composition, for it is roofed by music books, with trumpets doing duty for chimneys, and the front covered with notes. The *Demon* offers old *Demisemi* to change all these notes into gold if he will give him his daughter. He consents and the transformation takes place, in a very effective manner, every dot being turned to a sovereign. The *Clown* was Mr. C. Marsh; *Pantaloon*, Mr. T. Blanchard; the two *Harlequins*, Messrs. Smithers and Frampton; the *Columbines*, Misses Massall and Ryalls. The comic business includes hits at most of the topics of the day; the best of them was a Lord Mayor's procession, with the "man in brass," and placards hinting at "parish settlements," &c., which produced roars of laughter, and the washing-houses of the people, with a lecture on bathing, the *Clown* including a dissertation on soap. The gaming-houses, photography, union dietaries, cheap tailors, and miraculous pills, all furnish their quota of fun. The last scene, presenting an exterior, which changes into a clockmaker's shop, with all the pendulums moving, and clock-dials walking about the stage, was capitally managed, and told exceedingly well.

HAYMARKET.—The entertainment at this theatre consisted of a connection of dioramic views in Switzerand of a very superior class, and of a fairy extravaganza, founded on a well-known tale of the nursery by the Countess D'Anois, entitled "Graciosa and Percinet." The piece turns upon the love of *King Uxorious*, a widower, unexpectedly bewitched (Mr. J. Bland), for the *Duchess Grogon*, a maiden lady of very uncertain age, who is the owner of a capital cellar (Mrs. Stanley), and the jealousy of the latter against her step-daughter, for whom she conceives an inveterate dislike at first sight, which she evinces by inventing every method of torturing her. In working out her plots against *Graciosa* ample opportunity was afforded for introducing a very sprightly and unexpected collocation of words, which as they fell upon the ear called forth shouts of laughter. Miss Julia Bennett, as the *Princess Graciosa*, a model for daughters, and Miss P. Horton, as a Fairy Prince, and the perfection of lovers, each sustained the characters throughout in the most effective manner. Several duets were executed by them during the progress of the piece. The ballet evinced that great care had been taken in its preparation. A number of tiny dancers were introduced incidentally, and, judging from appearance, they could not have been, on the average, more than five or six years old, yet the greatest order was preserved; and Masters *Dot*, *Trot*, *Tiny*, *Tip*, *Mite*, *Atom*, and *Grain*, together with Misses *Midge*, *Mok*, *Speck*, *Spangle*, *Drop*, *Pinshead*, &c., exhibited a perfect miniature of the elder ballet.

Miscellaneous.

Dr. Wolff.—We are glad to find, from letters received from Trebizond of the 16th November, that Dr. Wolff has arrived in safety at Teheran, on his way to Tabreez and Erzeroum, on his way to England.

The Ancient Frescoes in East Wickham Church.—The churchwardens have entirely destroyed these interesting remains. Great efforts were made by the British Archæological Association to preserve them, and letters on their behalf were forwarded, by order of the Association when at Canterbury, to Archdeacon King, and the Bishop of Rochester, but the result has proved that they were unsuccessful. It was urged by the churchwardens and the ecclesiastical authorities that the paintings were not worth saving; but several eminent artists had pronounced them to be fine examples of church decorations of the 13th century, and it was hoped that at least the better preserved portion would be spared, and that other paintings in the church, from which the whitewash had not been removed, would have been examined.

Strasburg Cathedral.—The Paris *Presse* states that the belfry of the Cathedral of Strasburg has deviated considerably from its perpendicular within a short time, and has inclined more than six feet, calculating between the elevation of the summit and the base. A catastrophe is feared, which the most skilful architect is incompetent to prevent.

Catholic Missions to Oceania.—The Paris papers announce the departure from Lyons for England of M. Epsle, Bishop of Sion and Vicar Apostolical of Western Oceania. The prelate took with him eight missionaries and several brothers of the Christian doctrine to assist him in his evangelical labours. He will first proceed to Sydney, in New Holland, and thence repair to his diocese, which comprises New Guinea, the land of Papua, which is inhabited by a ferocious population, in whose country no Europeans have as yet made establishments; the Carolinas, the Archipelago of Salomon, and all the islands situate under the equator. M. Epale assisted, during several years, M. Pompallier in converting the natives of New Zealand.

British Enterprise.—The Monte Videan papers mention some particulars of a British enterprise, one of whose remarkable features is a ship sailing on a level of 18,000 feet above the sea. In 1826, says the account, Messrs. Rundell and Bridge, the London jewellers, purchased the gold mines of Sipuani and the emerald mines of Illimani, and sent over Mr. Page as their agent. These mines are situate on the banks of the Lake Chiquito, 248 English miles long, 150 in breadth, and hitherto unfathomed in many parts. In the neighbourhood of Sipuani are other productive mines, belonging to General O'Brien and an Englishman of the name of Begg. The only vegetable produce of the district is a species of red potato, called *chusma*, and a few nutritious plants; but to the east of the lake, at Copacatana and in the valleys of the Bolivia, are cultivated maize, barley, and fruit-bearing trees. The difficulty of feeding, in their own scanty region, the large body of Indians working in the mines, suggested the idea of building a vessel for the navigation of the lake; and General O'Brien and Messrs. Page and Begg determined to make the attempt. Mr. Page purchased an old brig in the port of Arica, stripped her of her anchors, sails, and rigging, and succeeded, with extreme difficulty, in conveying the hull to the mouth of the Apolobambo, whose waters fall into the Chiquito Lake. Thither he brought workmen from Arica, built stocks, and, after two years of painful and unceasing labour, succeeded in launching his vessel on the lake, and opening a regular communication with the produce of the valleys of the Bolivia. The brig is well found in all things—save for her want of anchors, which it has been impossible to carry to such a height. General O'Brien and Mr. Begg are reported to have executed other works of a boldness not less surprising. They have transported a steam-engine across the Cordilleras, dug through the metalliferous hills of Lacaycota, a canal 2000 feet in length, traversed by nine locks, and laid down a railroad at its extremity for the conveyance of their ore. In this Lake Chiquito is the Island of Titicaca, assigned by tradition as the cradle of the earliest Peruvian civilisation, and the sacred burial-place of the ancient kings of the country.—*Athenæum.*

An Antediluvian Relic.—The *Presse* states that there has been discovered near Bonn the carcass of an enormous crocodile, which, by the nature and the conformation of its scales, differs entirely from all species of that animal hitherto known. These animals are divided into different species, according to the countries they inhabit. Those of the Nile bear no resemblance to the crocodiles of the Ganges or the caimans of America. It would appear by the recent discovery, that before the Deluge the Rhine possessed a peculiar species of crocodile.

The Valley of Jehoshaphat.—At the last meeting of the Institute of British Architects, a very interesting paper, describing some remarkable tombs in the Valley of Jehoshaphat, near Jerusalem, was read by Mr. J. J. Scoles. The tombs more particularly noticed were the pillar of Absalom and the tomb of Zechariah. The latter is cut entirely out of the solid rock. It consists of a square base, decorated with Ionic columns, and has a pyramid on the top. The whole mass is supposed to be solid; it is the height of the surrounding rock from which it has been excavated, and is separated from it by a space of 10 feet. The pillar of Absalom is near to the tomb, and is also partially cut out of the rock, but on the solid square base there is erected a conical top, the interior of which is hollow. Near to these ancient monuments is the cemetery within which the apostles are supposed to have retired during Christ's agony on the mount. Absalom's pillar and Zechariah's tomb have given rise to much speculation respecting the periods of their erection. Some travellers have ascribed them to the periods in which the individuals whose names they bear lived, but Mr. Scoles is of opinion that they are of much more recent dates, and from the mixed styles of architecture they exhibit he conceives them to have been constructed by the Romans about the time of Augustus. Being situated in the deep valley of Jehoshaphat, they have escaped destruction during the many sieges Jerusalem has endured. At the entrance of the cemetery there are four columns, and the interior consists of many chambers excavated in the rock. The paper was received with much applause, and the thanks of the meeting were cordially given to Mr. Scoles for his description of these interesting monuments.

Discoveries at Nineveh.—The news of the progress of M. Botta's excavations at Khorsabad, near Mosul, Palestine, are always interesting. There are at present 160 workmen engaged thereon, and besides the walls, which are covered with sculptures and inscriptions, many antiquities of a peculiar and at present inexplicable nature are met with. For example, under the large bricks, of which the floor consists, are stone repositories, which are filled with small clay enamelled figures of men and beasts, without anything on the surface indicating the existence of such repositories, or there being anything within them to explain their contents. In another place they discovered great rows of earthen vases of a remarkable size, placed on a brick floor, and filled with human bones, and similar to those which have been found at Babylon, Ahwaz, and other places, in South Persia. The palace seems to have been totally plundered before its destruction, for neither jewels, nor instruments, nor even the small cylinders so numerous in the neighbourhood, are anywhere found

merely some bronze images of beasts (for instance, a very fine lion), have been discovered, as also a part of the bronze wheel of a war-chariot. But the most incomprehensible circumstance is, that the alabaster slabs with which the walls are cased, and which are covered with inscriptions and sculptures, bear on the back, likewise, inscriptions in arrow-headed characters, and certainly not in the Assyrian, but in the Babylonian language. As it is naturally not to be presumed that the architects would have been so foolish as to have graven these inscriptions where no one could have seen them without pulling down the wall, it must be presumed that the slabs have served twice, first belonging to a Babylonian palace, and afterwards have been transposed by the Assyrians and freshly graven. At present no sculptures have been found on the back, which would, indeed, be of the greatest interest, no Babylonian sculptures having ever yet been discovered. Some of the lately-found bas-reliefs are especially remarkable; for instance, one representing the siege of a town situate on an island; the sea is covered with ships, the fore part of which form a horse's head, and which are occupied in bringing the trunks of trees for the purpose of erecting a dam. The water is covered with all kinds of marine animals—fishes, crabs, and winged sea-horses. The richness of the details, and the mass of sculpture which the palace contains, are amazing, and it is incomprehensible how so magnificent a building should have been so strangely buried in the earth. The French Ambassador at Constantinople has not yet obtained permission from the Porte to send to Paris those articles of antiquity which will bear transport, which says little for their interest there, at a time when the English are removing whole cargoes of antiquities from Lesser Asia to London.—*Augsburg Gazette.*

Bad Bread.—At a recent meeting of the members of the Devon and Cornwall Natural History Society, Dr. Tripe read a paper on "Ropy Bread," in the course of which he stated that the state of bread termed "ropy" was generally admitted to depend on the presence of fungi. After promising to write a paper on the subject, he had made numerous inquiries of several parties practically interested in the question, but he regretted to say he had found a total ignorance both as to its origin, its true nature, and the best remedy. As to the remedy, it was true that experience had taught bakers that washing, both with lime-wash and plain water, would frequently answer; but, in spite of these remedies, it frequently continued for weeks, and that to their great loss, and not unfrequently ruin. Recent writers on the subject agreed in attributing the ropy state of bread to the presence of fungi. And they all accounted for the presence of fungi on the ground of the quality of the flour; but he thought it might, in all probability, originate from three causes—that of atmosphere, from yeast, which he thought the main cause, and from the flour. With respect to yeast, he said it appeared, from a microscopic examination of a mass of yeast, that it consists of minute disconnected vesicles, that appear to constitute one of the simplest forms of vegetation. These, like seeds, may remain for any length of time in an inactive condition without losing their vitality; but when placed in a fluid in which any kind of sugary matter is contained, they commence vegetating actively, provided the temperature be sufficiently high, and they assist in producing that change in the composition of the fluid which is known under the name of fermentation. Having referred to several opinions on fermentation, the learned gentleman went on to say, that if a small portion of the fermenting fluid be examined at intervals with a powerful microscope, it is observed that each of the little vesicles at first contained in it puts forth one or more prolongations, which in time become new vesicles like their parents. These organs perform the same office, so that in a few hours the single vesicles have developed themselves into rows of five or six. This is not the only way, however, in which they multiply, for sometimes the vesicles burst, and emit a number of minute granules, which are the germs of new plants, and which soon develope themselves into additional cells. By the time that five or six vesicles are formed in each group, the fermentation is sufficiently far advanced for the purposes to which it is to be applied, and measures are then taken to check it, by which the vegetation of the yeast-plant is checked. If they could suppose any circumstance to arise by which the vegetation of the yeast was not supended, or after it was checked and the yeast amalgamated with the flour, for the vegetation again to be active, they would have a sufficient cause for the origin of fungi in bread. The progress of the disease, as it may be called, in bakehouses from one lot of bread to another were elaborately gone into and pointed out, and instances cited in which its ravages had prevailed to the extent of even ruining the bakers. As a remedy, he suggested ventilation, fumigation with chlorine, and the application of cold instead of hot washing. At the conclusion of the reading of the paper a committee was appointed to inquire and report upon the subject.—*Plymouth Times.*

Law.

NORFOLK CIRCUIT, NORWICH.—Mr. Justice Williams passed sentence on 11 prisoners called *Rutland*, *Dye*, *Medlar*, *Rump*, *Parker*, two *Quantells*, *Baker*, two boys *Harvey* and *Lessams*, and *Jane Watts*, who had all been convicted of incendiary fires in different parts of the country. His Lordship said that the exhibition before him was most painful to his mind, coming as it did so close upon a recent penal example in which he had borne a part, in the adjoining county of Suffolk. It had been hoped that the example and exhibition then made would have tended to diminish and check the commission of a crime, which, in his opinion, ranked next in atrocity to that of murder, being one which resulted from a settled determination to do wrong, and was attended, moreover, by no benefit to any single human creature, while it inflicted incalculable injury on those whose property was destroyed, and, indeed, on all the labouring class too. In one of the cases now before him, a witness had well said, that "a fire would be a bad job for we labourers," and if persons of that rank in society would but think seriously on the subject, he was sure they would all come to the same conclusion. His Lordship having then briefly adverted to the distinguishing features of the charges against the several prisoners, proceeded to sentence all the men, and Parker (who had pleaded guilty to two indictments) to transportation for fifteen years, but adjudged to the boys, Harvey and Lessams, in consideration of their extreme youth, imprisonment for one and two months respectively; and to Jane Watts, whose case was of so singular a character as to induce the Jury to believe that she must have been mad, the like punishment for twelve months.—At the close of these Assizes the Grand Jury presented their unanimous opinion that the present winter assize was uncalled for in this county, inasmuch as a large majority of the prisoners in the calendar would have been tried at the next quarter sessions, within a fortnight from this time.

WESTERN CIRCUIT.—EXETER.—*John Bendle*, a miserably clad and lame man, was charged with having, on the night of the 27th September, set fire to a rick of Oats, the property of John Land, a farmer residing at West Buckland, in this county, where the prisoner existed as a pauper. The jury returned a verdict of Guilty. Mr. Baron Alderson: You have been convicted, prisoner, by the clearest evidence, of this crime of attempting to burn down Mr. Land's ricks, since there can be no doubt, had not the fire been discovered when it was, the whole of the ricks would have been destroyed. You did this for revenge, and you must now suffer the consequences of that revenge. I saw too much of this most detestable crime last summer to feel any doubt as to what my duty is in this case. Those who deal with such crimes with lenity make themselves, in a certain degree, accountable for the crime when again committed. I will not do so, but will wash my hands of all responsibility, by inflicting the heaviest penalty of the law. His lordship then sentenced him to be transported for life.

MIDLAND CIRCUIT—LINCOLN.—*Charles Shipworth*, aged 22, was charged with having, on the 21st November, in the parish of Swaby, feloniously set fire to a wheat-stack, of the value of 100*l.*, the property of Edward Enderby. The prisoner, after a long trial, was found guilty. Mr. Justice Patteson, in passing sentence, said that no possible benefit could be derived by the labourer from incendiarism, but he was injuring himself and his fellows by destroying that which would have employed some of them in threshing it, and was also probably preventing his employer, by the destruction of his property, from having the means of finding work for others. He should inflict the full sentence of the law, which was transportation for life.

OXFORD CIRCUIT—STAFFORD.—*Jane Railton*, aged 32, was indicted for concealing the birth of her illegitimate child, at Wolverhampton, in the month of October last; and *John Sheriff*, a surgeon's assistant, aged 28, and *James Hildreth*, a printer, aged 38, were charged with aiding and abetting her in such concealment. The facts of this case have been already noticed. It excited attention at the time from the respectable station of the parties, and the evidence now adduced went to show that Miss Railton had given birth to a child, and that Hildreth, the supposed father, had applied to Sheriff to procure a miscarriage. The child was stated by Miss Railton, in a conversation with the inspector of police, to have been born alive, and its dead body was afterwards found in the privy of Mr. Quintin, the surgeon to whom the prisoner Sheriff was assistant. The evidence, however, was deficient in the proof of the identity of the child, and the jury consequently, after an hour's deliberation, acquitted the prisoner.—Next day the prisoner *Sheriff* was indicted for having procured the miscarriage of Miss Railton, but as she did not appear on her recognisances, it was impossible to carry on the case in the absence of so material a witness, and the prisoner was discharged.—*Joseph Penn* was convicted of the manslaughter of Prudence Hughes, at Sedgley. Mr. Justice Coltman said, "You have been found guilty, upon the clearest possible evidence, of the manslaughter of Prudence Hughes. The jury, by their verdict, have evidently taken a most merciful view of your case, and have acquitted you of the more serious crime of murder. The sentence of the Court is, that you be transported for the term of ten years.

NORTHERN CIRCUIT.—LIVERPOOL.—*Richard Leach* was indicted for arson, in setting fire to a steer of timber, the property of Thomas Graham, at Little Bolton, found guilty and sentenced to be transported for 15 years.—*Thomas Stew* was found guilty of the wilful murder of Alice Nolan, at Manchester, on the 7th July. Prisoner was paying his addresses to the young woman, and in consequence, it is supposed, of disappointment at the postponement of their marriage, he murdered her, and afterwards attempted to commit suicide. An attempt was made to set up a plea of insanity, but it failed, and the jury found him guilty. His Lordship then proceeded to pass sentence. Towards the close of his Lordship's address the unhappy man sank back, apparently partially insensible, in the arms of the turnkeys. At the close of the sentence he seemed to wake, as it were, from a dream, and clinging to the front of the dock endeavoured to address the court, but a few hoarse, unintelligible whispers were all that could be heard, his tongue refused its office, and he was led half fainting from the dock. At the same moment some person at the back of the dock was seized with a fit, apparently of epilepsy, and his cries and struggles were appalling. The crowd endeavouring to rush to the spot increased the confusion, and it was only by great exertions on the part of the officers that the unfortunate man was carried from the court and order restored.—*George Evans*, 20, was indicted for the wilful murder of Jane Millen, at Manchester, on the 14th August last. The trial of this prisoner was postponed from the last summer assizes, in consequence of certain publications which had appeared in one of the Manchester papers shortly before, which were likely to prejudice the prisoner in his defence. The evidence was purely circumstantial, but the jury returned a verdict of guilty, and Baron Gurney passed sentence of death.—YORK.—Mr. Justice Coleridge on Friday passed sentence on *Mr. Maddison*, the police inspector, who was found guilty of embezzlement last week, and sentenced him to imprisonment for 18 calendar months, with hard labour.—His Lordship also sentenced the six *Bradford rioters*, who were convicted of manslaughter last week, to be transported for life.—*William Thompson* was charged with having, on the 22d January, 1843, feloniously shot at Thomas Carr, of Hall Moor, near York, with intent to murder, disable, or to do him some grievous bodily harm. This is the case for which a man named Mason was tried at the time, convicted, and transported. It was now proved that Mason was not present, and in fact was not known to the parties who committed the robbery. The principal evidence against the prisoner now on trial was a confession made by himself to the police. The jury found him guilty, and he was sentenced to 20 years' transportation. His Lordship, in passing sentence, intimated that immediate steps would be taken for the recal of the innocent convict, Mason, and that Government, in all likelihood, would award him compensation.

COURT OF REVIEW.—*Exparte Hammond in re Hammond.*—This was a petition praying for a *supersedeas*. Mr. Anderdon said that this petition prayed to annul the fiat, under circumstances of considerable importance to farmers and other parties engaged in the cultivation of land. The question immediately at issue was, whether the alleged bankrupt, Samuel Hammond the younger, was a market gardener or not, within the spirit and meaning of the recent act of Parliament (5 & 6 Vic.), which added that to the employments which would subject a man to bankruptcy. The bankrupt was tenant of a farm at Upminster, in Sussex, of about 138 acres, which he held at a rent of 316*l.* 8*s.*, the lease requiring the proper cultivation of the farm according to the custom of the country. The trading alleged as a justification for the issue of this fiat was, that the bankrupt had cultivated peas and new potatoes, and that he was in the habit of sending these articles to the salesmen in Covent-garden Market, who had made affidavits to that effect, and this was supported by the affidavit of a labourer to the same effect. The case for the petitioner was supported by seven respectable farmers in the county, whose affidavits went to show that the kind of cultivation carried on by the bankrupt was pure farming, and that the produce disposed of was the cleaning crop, and that this cultivation was merely subsidiary to the purposes of farming, in the ordinary sense. Upon the entire farm, consisting of 138 acres, there were only twenty acres of peas and ten acres of potatoes. The bankrupt paid no more than 3½*d.* to the income-tax, while market-gardeners paid 7*d.*; or according to the profits of their trade, which fact clearly distinguished him in the opinion of the tax-collector as a farmer. The adjudication, under the circumstances of this case, had excited great alarm amongst the farmers, who were in the habit of cultivating fields of potatoes to an enormous extent, without entertaining hitherto the remotest idea that the sale of this produce in the market would subject them to the operation of the bankrupt laws. Mr. Rolt, who followed on the same side, said that if the manner of disposing of certain produce, without reference to the mode of cultivation, was alone to be taken into consideration, under these circumstances it would affect not only farmers, whom the policy of the legislature had hitherto sedulously protected from bankruptcy, but persons who cultivated their own lands. Mr. Chandless, for the respondents, said that the fiat had been issued chiefly upon the affidavit of the bankrupt's father-in-law, who must be supposed to have had full knowledge of his occupations; and the other affidavits showed that every day, for two or three weeks at a time, during a space of five or six years, this produce was regularly sent to market in baskets, with the bankrupt's name upon them, exactly like other market-gardeners. He contended that the manner in which the crops were raised, whether by the plough or the spade, was immaterial. The Chief Judge said in Todd's Johnson there were two definitions of the word "garden;" the first was a piece of ground inclosed and cultivated with extraordinary care, and the second was a place particularly fruitful and delightful. The produce sent to the market by this bankrupt was grown in the open fields, in the usual manner of farm culture. It was difficult to give an exact definition of the term market-gardener, as used in the act of Parliament. He was of opinion that the bankrupt was a farmer, and not a market-gardener, under any just or reasonable construction of the act of Parliament. The fiat would therefore be annulled.

BIRTHS.—On the 14th inst., at Saltford, the lady of the Rev. J. B. DOVETON, of a son—15th inst., at Bryntirion, near Wrexham, North Wales, the lady of Capt. E. JONES, of a son—18th inst., at Clapham, Mrs. A. WRIGHT, of a daughter—18th inst., in Granville-square, Pentonville, the lady of Mr. W. E. NEWTON, of a son—19th inst., at the Grove, Walthamstow, the lady of G. D. TYSER, Esq., of a son—19th inst., at 10, Eaton-place, the lady of G. C. ELWES, Esq., of a son—20th inst., at Sydenham, Kent, the lady of S. FRY, Esq., of a daughter—21st inst., in Stratford-place, Oxford-street, the lady of J. R. BARRETT, Esq., of a daughter—21st inst., at Willow-walk, Kentish Town, the lady of H. WOOD, Esq., of a daughter—22d inst., at Upper Clapton, Mrs. J. T. HAWES, of a son—22d inst., at Golder's Hill, Hendon, the lady of R. BRADFORD, Esq., of a daughter—22d inst., the lady of Commander Henry J. MATSON, R.N., of Her Majesty's ship Daring, of a daughter—22d inst., the lady of C. RING, Esq., of Doctor's Commons and Mitcham, of a son—23d inst., in Moorgate-street, the lady of F. J. HILLS, Esq., 1st West India Regiment, of a son—23d inst., in Bruton-street, the lady of C. E. SCOTT, Esq., of a son—18th inst., at Ballachin-ho Strath Tay, the lady of Capt. R. SCOTT, of a son.

MARRIAGES.—On the 7th ult., at St. Mary's, Islington, the Rev. S. S. KNIPE, M.A., youngest son of the late Rev. Francis Knipe, B.D., rector of Sandon, Essex, to MARIA L. HODGSON, youngest daughter of the late C. Hodgson, Esq., of Chelmsford, and Grove-cottage, Sandon, in the same county—17th inst., at Fermoy, T. H. TAYLOR, Esq., of Gray's Inn, to HELENA GERTRUDE WATERS, daughter of the late P. Waters, Esq., of Fermoy—18th inst., at Luton, Bedfordshire, D. C. NOEL, Esq., of Worcester, surgeon, to JANE WALLER, eldest daughter of T. Waller, Esq., of Luton—19th inst., at Marston Bigott, C. S. BOYLE, of the 48th Regiment, youngest son of the late Vice-Admiral the Hon. Sir Courtenay Boyle, to ROSE SUSAN ALEXANDER, second daughter of Capt. C. Alexander, Royal Engineers—19th inst., at St. Mary Abbott's, Kensington, G. LEADBEATER, Esq., of Winchester, to CATHERINE BUTLER, youngest daughter of the late Richard Henry Butler, Esq., formerly of Egham—19th inst., at Eton College, the Rev. J. E. YONGE, Fellow of King's College, Cambridge, to the Hon. CATHERINE C. LYSAGHT, second daughter of Lord Lisle—19th inst., in the Cathedral Church, Salisbury, R. J. PHILLIMORE, Esq., D.C.L., to CHARLOTTE A. DENISON, youngest daughter of the late John Denison, Esq., Ossington, Notts.

DEATHS.—On the 22d inst., at her house, 66, Park-street, Grosvenor-square, ANNA S. BLUNT, eldest daughter of Sir Charles William Blunt, third Baronet, aged 79—22d inst., GEO. WOODFALL, Esq., of Great Dean's-yard, Westminster, aged 78—3d inst., at Bishop's Waltham, Hants, Captain C. RICHARDS, R.N. C.B., second son of the late Rev. W. Richards, of Little Chiverell, aged 47—10th inst., at Florence, ANN AUBER, widow of the late Peter Auber, Esq.—13th inst., at Southgate, deeply regretted, DINAH E. EDGCOMBE, the only surviving daughter of the late Frederick Edgcombe, Esq.—18th inst., SARAH BROWNE, widow of William Browne, Esq., formerly of Her Majesty's Customs, London—20th inst., at Walthamstow-house, of dropsy, A. K. GREIG, third son of Dr. Greig—21st inst., Major-General J. NESBITT, of the Bengal Army, after a long and severe illness, aged 65—21st inst., MARY Y. PETERS, eldest daughter of Captain John Peters, of Fort-place, Bermondsey, Surrey—21st inst., at his residence in Greenwich Hospital, Captain T. HUSKISSON, Royal Navy, son of the late William Huskisson, Esq., of Oxley, Staffordshire, deeply lamented by his family—22d inst., suddenly, CHARLES M. K. LOCK, Esq., of Upper Cheyne-row, Chelsea—24th inst., at Shouldham Thorpe, near Downham, Norfolk, J. BRACKENBURY, Esq., aged 64—25th inst., after a long and painful illness, Mrs. M. R. DENHAM, wife of George Denham, Esq., of the Colonnade, Albany-road, Camberwell, aged 72—25th inst., at his residence, Buckhill, near Calne, R. HUGHES, Esq., M.A., late Fellow of King's College, Cambridge, aged 72—26th inst., at 12, Norfolk Crescent, Hyde Park, MAGDALEN PASLEY, daughter of Major-General Pasley—26th inst., at Blackheath, E. H. RITHERDON, youngest son of R. Ritherdon, Esq.

WANTED, to take the Management of a NURSERY, in the Isle of Man, a steady, industrious man of business habits, who has served a regular apprenticeship, and has a thorough knowledge, not only of the Forest Tree and Greenhouse department, but a taste for, and been accustomed to, Ornamental, and Landscape Gardening; forming out, and planting new plantations, &c. As there is a Seed business connected with the concern, a person with a knowledge of that department will be preferred, as his services may be in part required at the shop. None need apply unless he can produce good and sufficient testimonials of character, and ability for the work.—Apply to ALEXANDER SPITTALL DOUGLAS, Isle of Man.

WANT PLACES.—All Letters to be post-paid.

FIVE POUNDS will be given by the Advertiser to any one who can procure for him a situation as PROPAGATOR in a Nursery (near London preferred). He has been some years in a Nursery; and can have a most excellent character, from those both in London and the country, as to ability, steadiness, and assiduity.—Direct to A. M., 2, Church-street, Fulham, near London.
